[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the VSA modulator-control unit via the F-CAN lines for at least 1.5 seconds.
- The information sent from the VSA modulator-control unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open

- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- F-CAN circuit F-CAN C_H line open
- F-CAN circuit F-CAN C_L line open
- F-CAN circuit F-CAN C_H line short to ground
- F-CAN circuit F-CAN C_L line short to ground
- VSA modulator-control unit failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

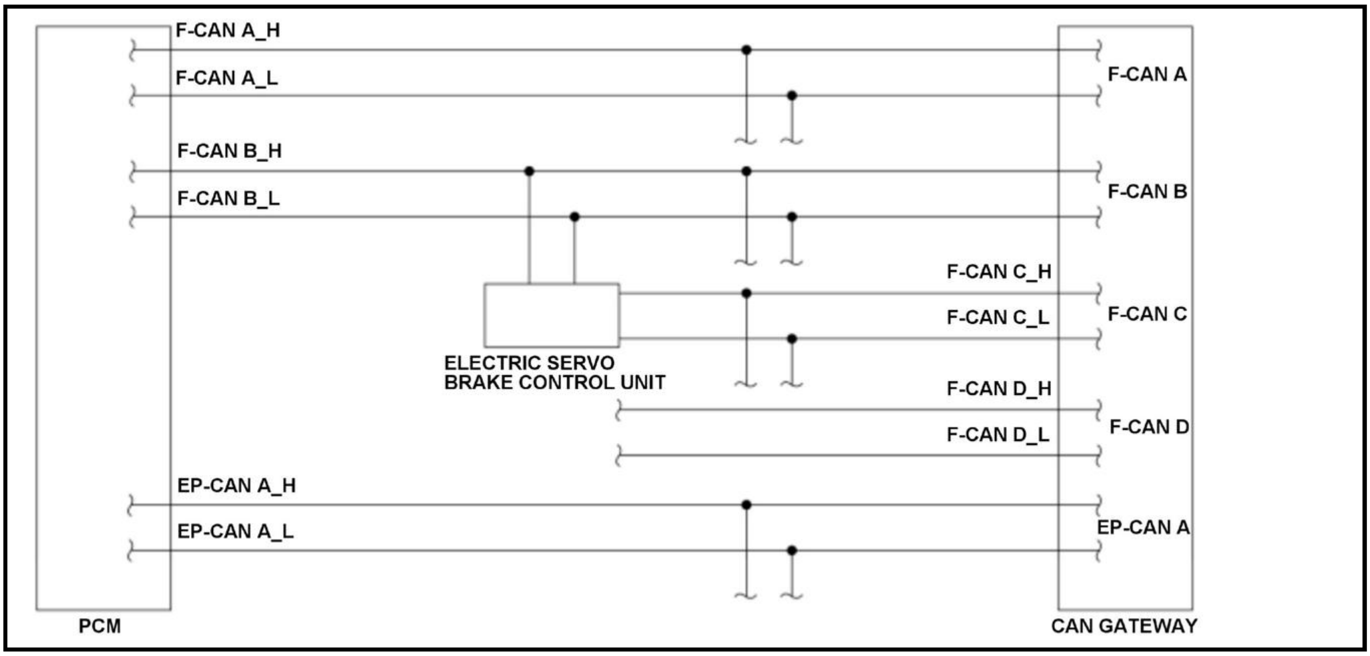
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0129 (PGM-FI SYSTEM)

DTC U0129: F-CAN Malfunction (Powertrain Control Module (PCM)-Electric Servo Brake Control Unit)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the electric servo brake control unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the electric servo brake control unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the electric servo brake control unit via the F-CAN lines for at least 1.5 seconds.
- The information sent from the electric servo brake control unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- F-CAN circuit F-CAN C_H line open
- F-CAN circuit F-CAN C_L line open
- F-CAN circuit F-CAN C_H line short to ground
- F-CAN circuit F-CAN C_L line short to ground
- Electric servo brake control unit failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U012D (PGM-FI SYSTEM)

DTC U012D: EP-CAN Malfunction (Powertrain Control Module (PCM)-Motor Control Module)

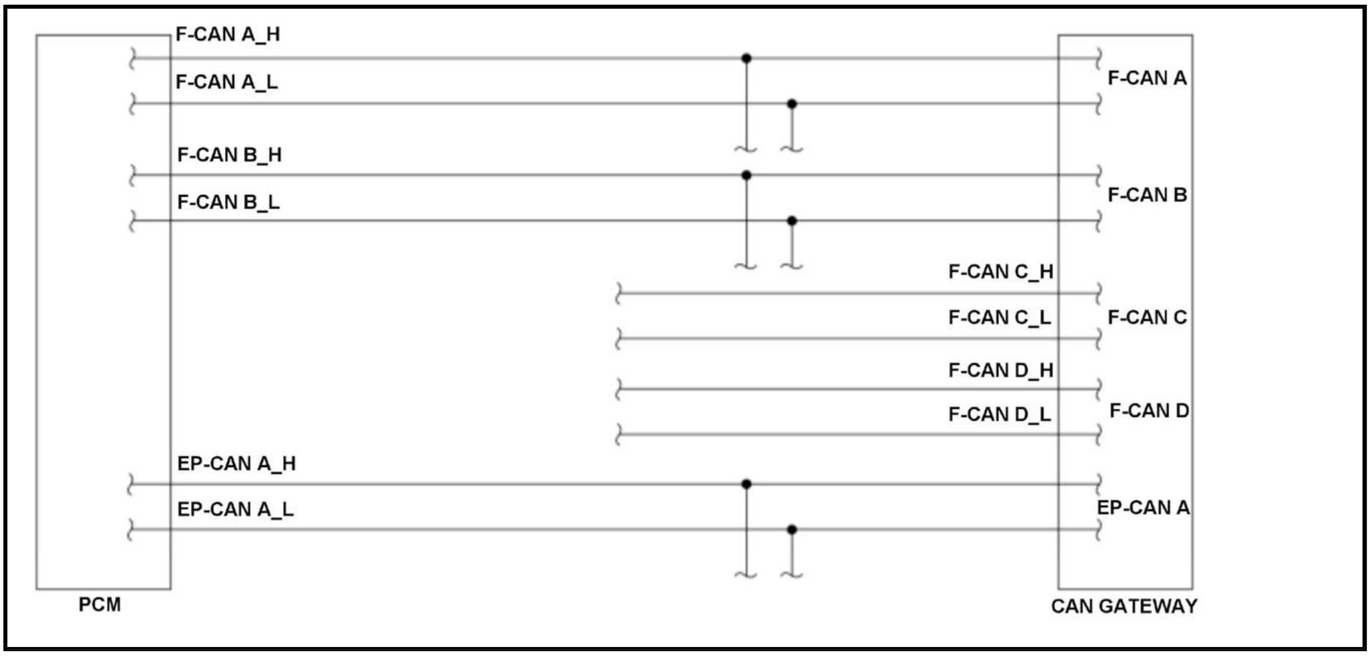
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the DTC code U12A5 is detected.

DTC U0146 (PGM-FI SYSTEM)

DTC U0146: F-CAN Malfunction (Powertrain Control Module (PCM)-CAN Gateway)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the CAN gateway via the F-CAN lines and this condition continues for a specified time or when the information sent from the CAN gateway is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the CAN gateway via the F-CAN lines for at least 1.5 seconds.
- The information sent from the CAN gateway is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- CAN gateway failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

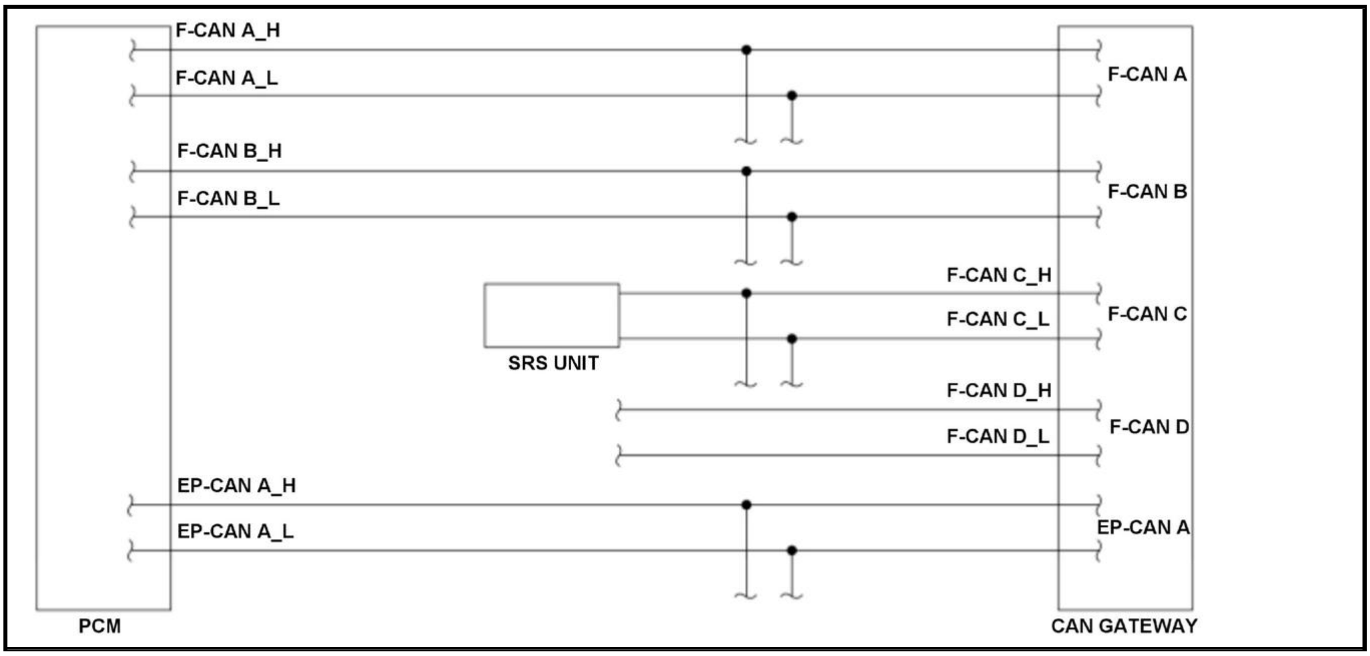
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0151 (PGM-FI SYSTEM)

DTC U0151: F-CAN Malfunction (Powertrain Control Module (PCM)-SRS Unit)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the SRS unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the SRS unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the SRS unit via the F-CAN lines for at least 1.5 seconds.
- The information sent from the SRS unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open

- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- F-CAN circuit F-CAN C_H line open
- F-CAN circuit F-CAN C_L line open
- F-CAN circuit F-CAN C_H line short to ground
- F-CAN circuit F-CAN C_L line short to ground
- SRS unit failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

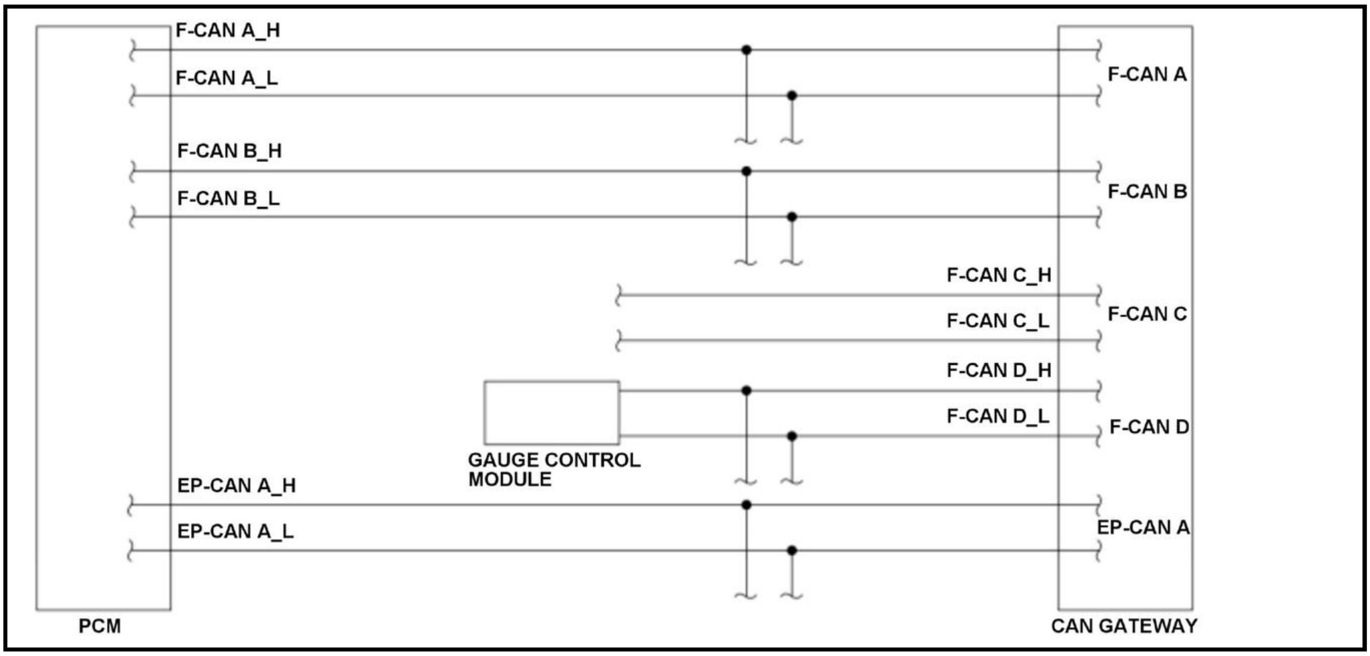
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0155 (PGM-FI SYSTEM)

DTC U0155: F-CAN Malfunction (Powertrain Control Module (PCM)-Gauge Control Module)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the gauge control module via the F-CAN lines and this condition continues for a specified time or when the information sent from the gauge control module is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the gauge control module via the F-CAN lines for at least 1.5 seconds.
- The information sent from the gauge control module is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- F-CAN circuit F-CAN D_H line open
- F-CAN circuit F-CAN D_L line open
- F-CAN circuit F-CAN D_H line short to ground
- F-CAN circuit F-CAN D_L line short to ground
- Gauge control module failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

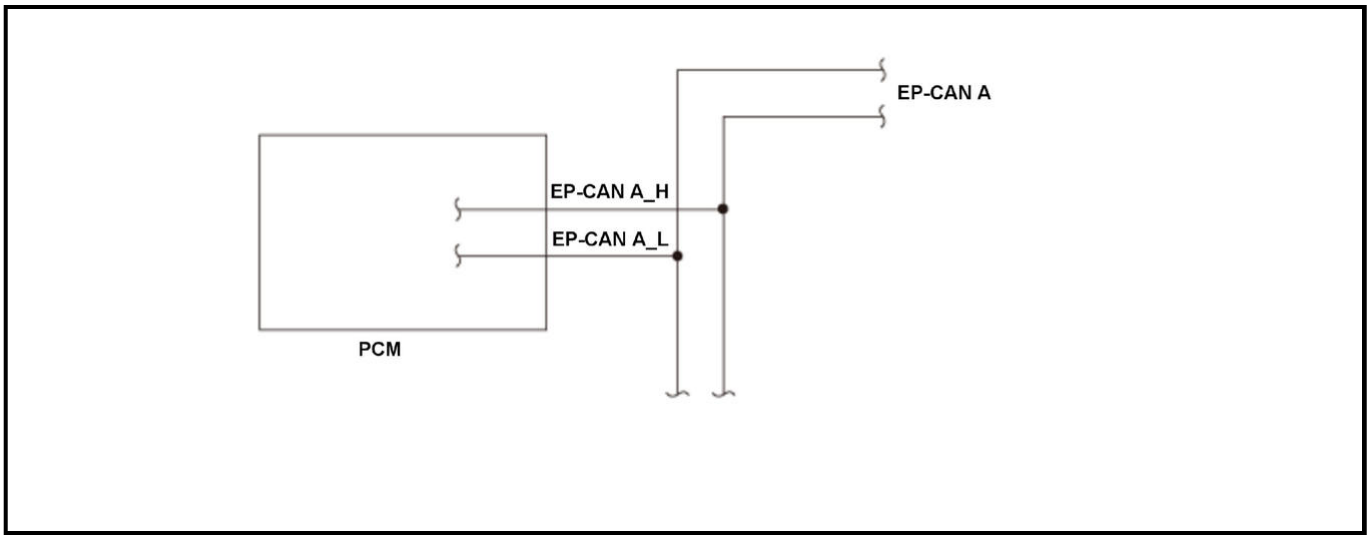
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0301 (PGM-FI SYSTEM)

DTC U0301: PGM-FI System and Transmission System Program Version Mismatch

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the software version in the power control module (PCM) and a various unit are mismatched for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The software version in the PCM and a various unit are mismatched for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM software data not updated

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

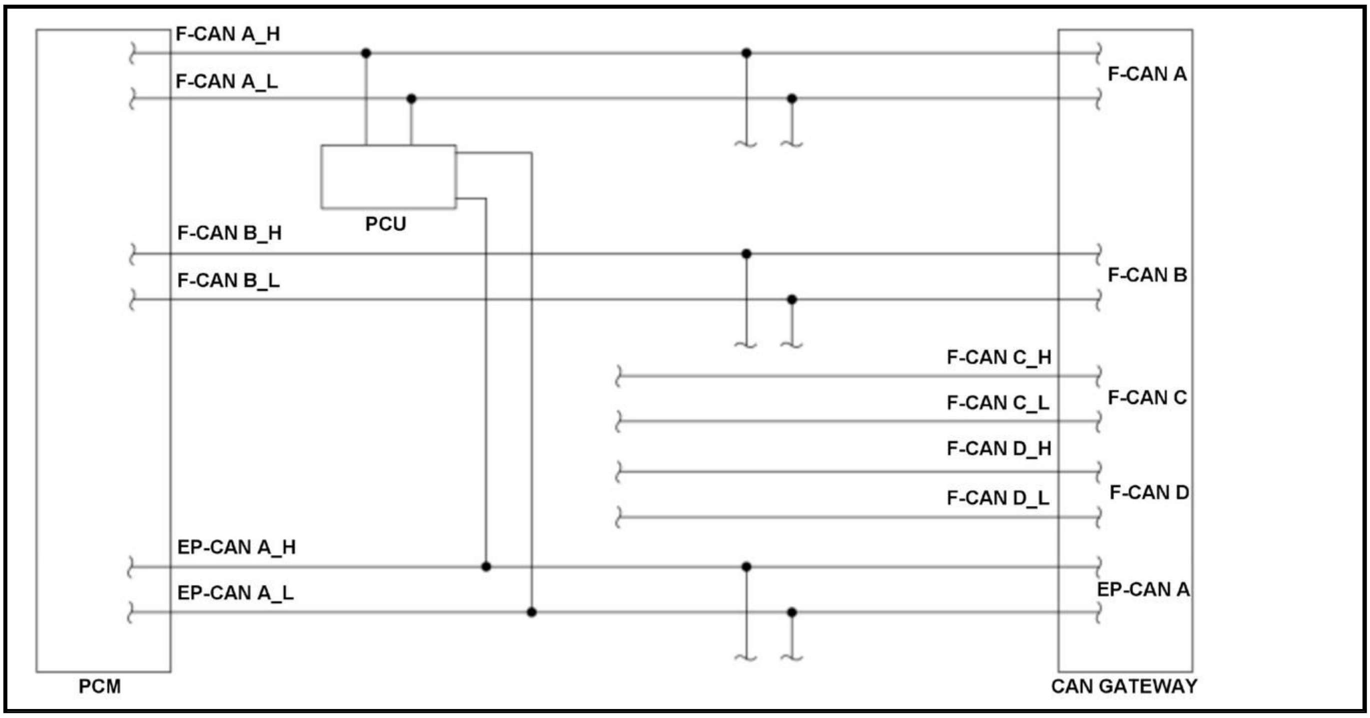
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U1205 (PGM-FI SYSTEM)

DTC U1205: EP-CAN Malfunction (Powertrain Control Module (PCM)-Motor Control Module)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the power control unit (PCU) via the EP-CAN lines and this condition continues for a specified time or when the information sent from the PCU is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the PCU via the EP-CAN lines for at least 200 milliseconds.
- The information sent from the PCU is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short to ground
- EP-CAN circuit EP-CAN A_L line short to ground
- PCU failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

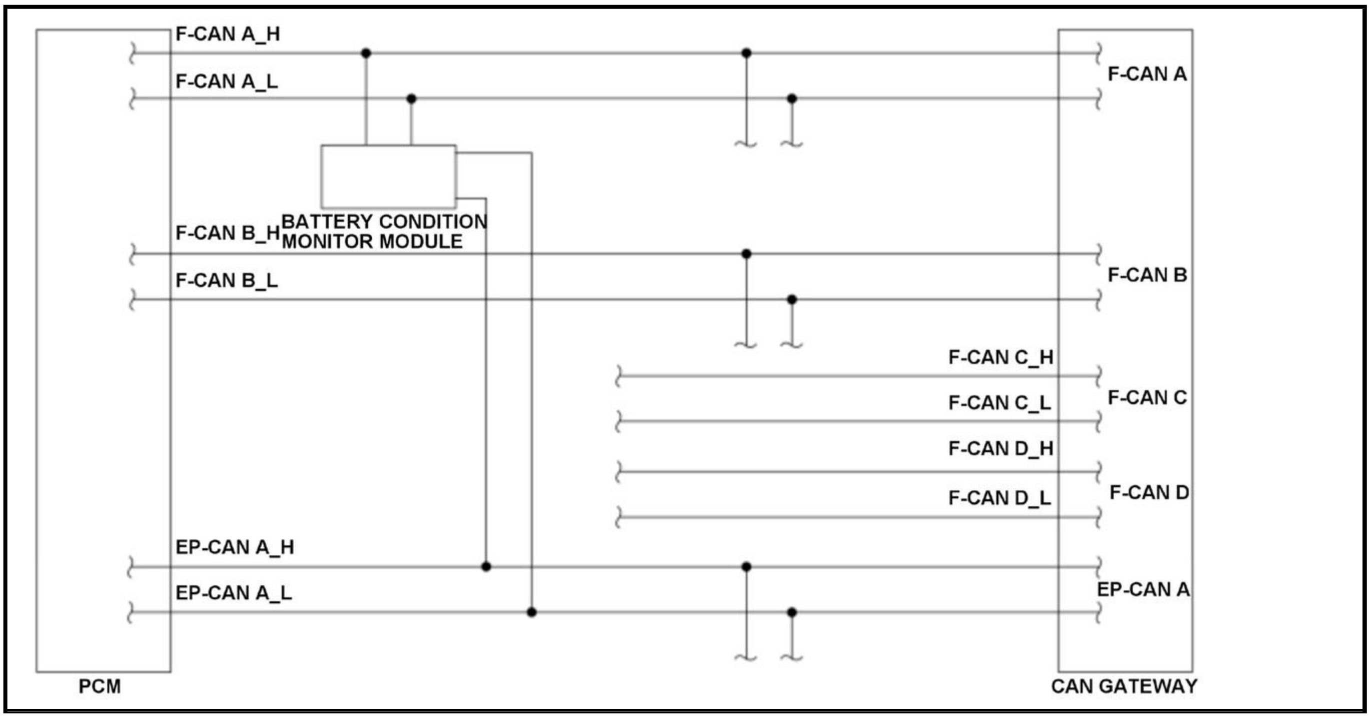
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U1206 (PGM-FI SYSTEM)

DTC U1206: EP-CAN Malfunction (Powertrain Control Module (PCM)-Battery Condition Monitor Module)

General Description



F-CAN A_H
F-CAN A_L
BATTERY CONDITION MONITOR MODULE
F-CAN B_H
F-CAN B_L
F-CAN C_H
F-CAN C_L
F-CAN D_H
F-CAN D_L
EP-CAN A_H
EP-CAN A_L
PCM
F-CAN A
F-CAN B
F-CAN C
F-CAN D
EP-CAN A
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the battery condition monitor module via the EP-CAN lines and this condition continues for a specified time or when the information sent from the battery condition monitor module is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the battery condition monitor module via the EP-CAN lines for at least 200 milliseconds.
- The information sent from the battery condition monitor module is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short to ground
- EP-CAN circuit EP-CAN A_L line short to ground
- Battery condition monitor module failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

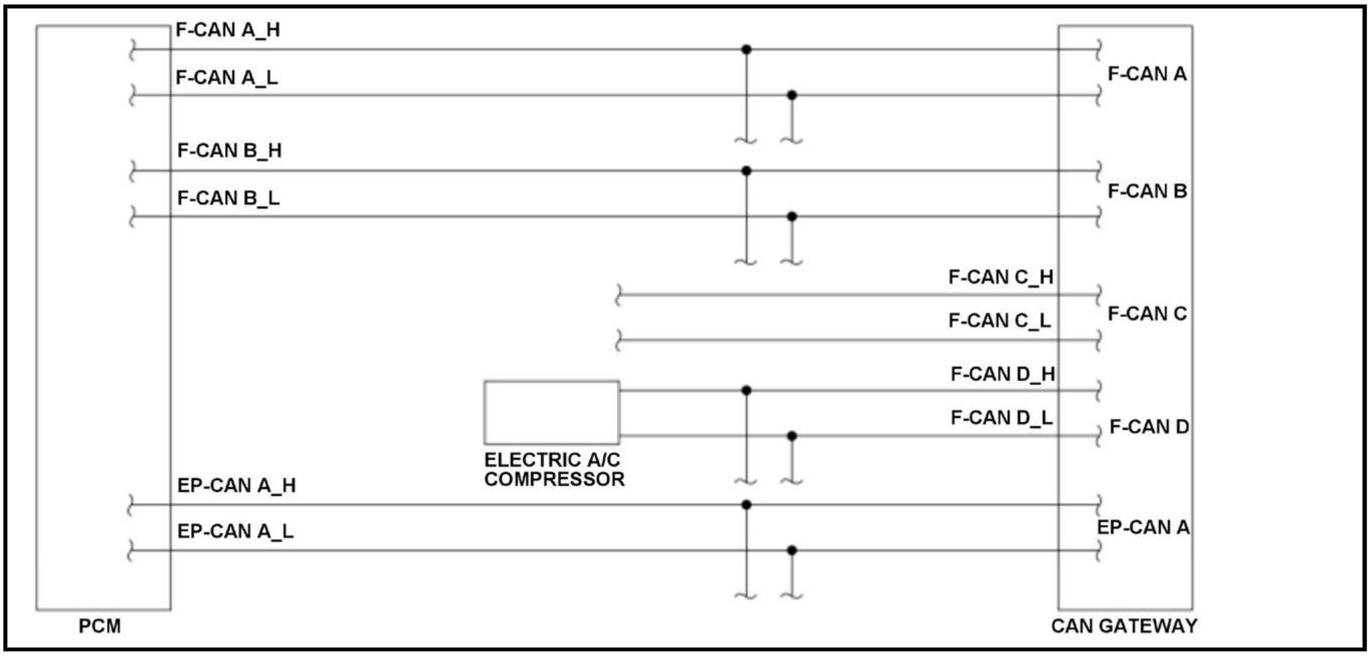
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U1207 (PGM-FI SYSTEM)

DTC U1207: F-CAN Malfunction (Powertrain Control Module (PCM)-A/C Compressor Driver)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the electric A/C compressor via the F-CAN lines and this condition continues for a specified time or when the information sent from the electric A/C compressor is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the electric A/C compressor via the F-CAN lines for at least 1.5 seconds.
- The information sent from the electric A/C compressor is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- F-CAN circuit F-CAN D_H line open
- F-CAN circuit F-CAN D_L line open
- F-CAN circuit F-CAN D_H line short to ground
- F-CAN circuit F-CAN D_L line short to ground
- Electric A/C compressor failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

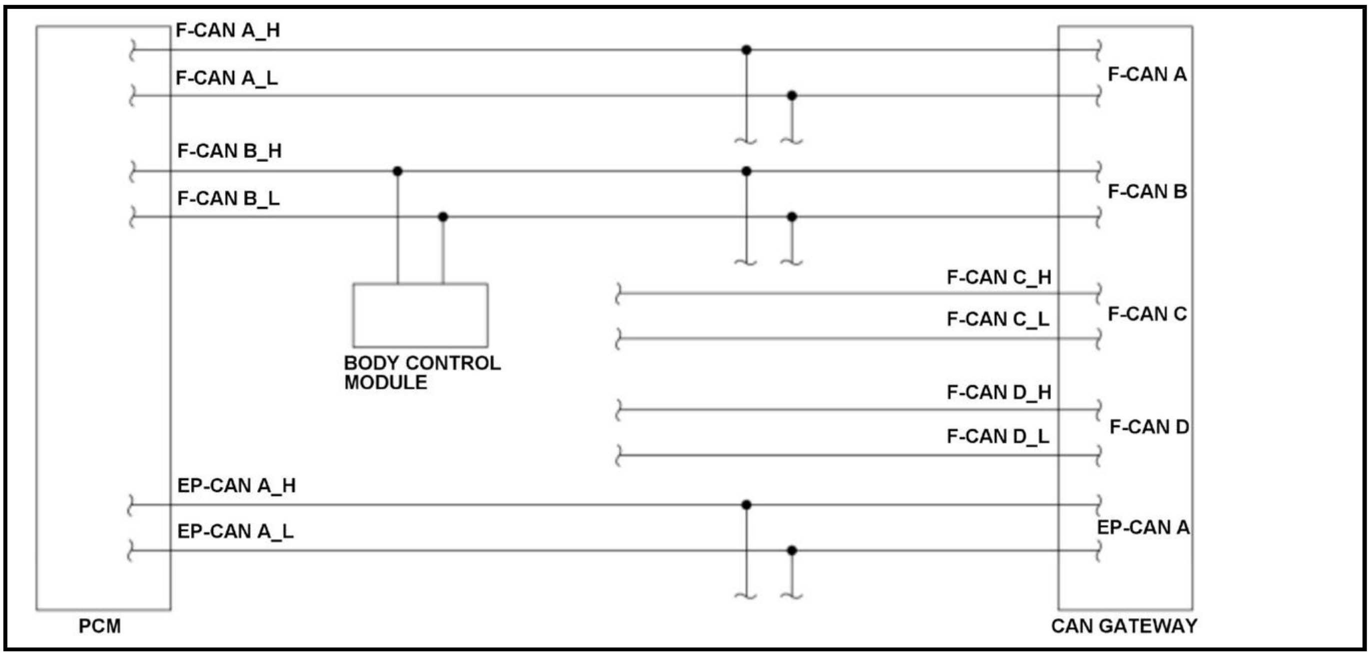
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U129E (PGM-FI SYSTEM)

DTC U129E: F-CAN Malfunction (Powertrain Control Module (PCM)-Power Control Unit (PCU))

General Description



F-CAN A_H
F-CAN A_L
F-CAN A
F-CAN B_H
F-CAN B_L
F-CAN B
F-CAN C_H
F-CAN C_L
F-CAN C
BODY CONTROL MODULE
F-CAN D_H
F-CAN D_L
F-CAN D
EP-CAN A_H
EP-CAN A_L
EP-CAN A
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the body control module via the F-CAN lines and this condition continues for a specified time or when the information sent from the body control module is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the body control module via the F-CAN lines for at least 1.5 seconds.
- The information sent from the body control module is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- Body control module failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

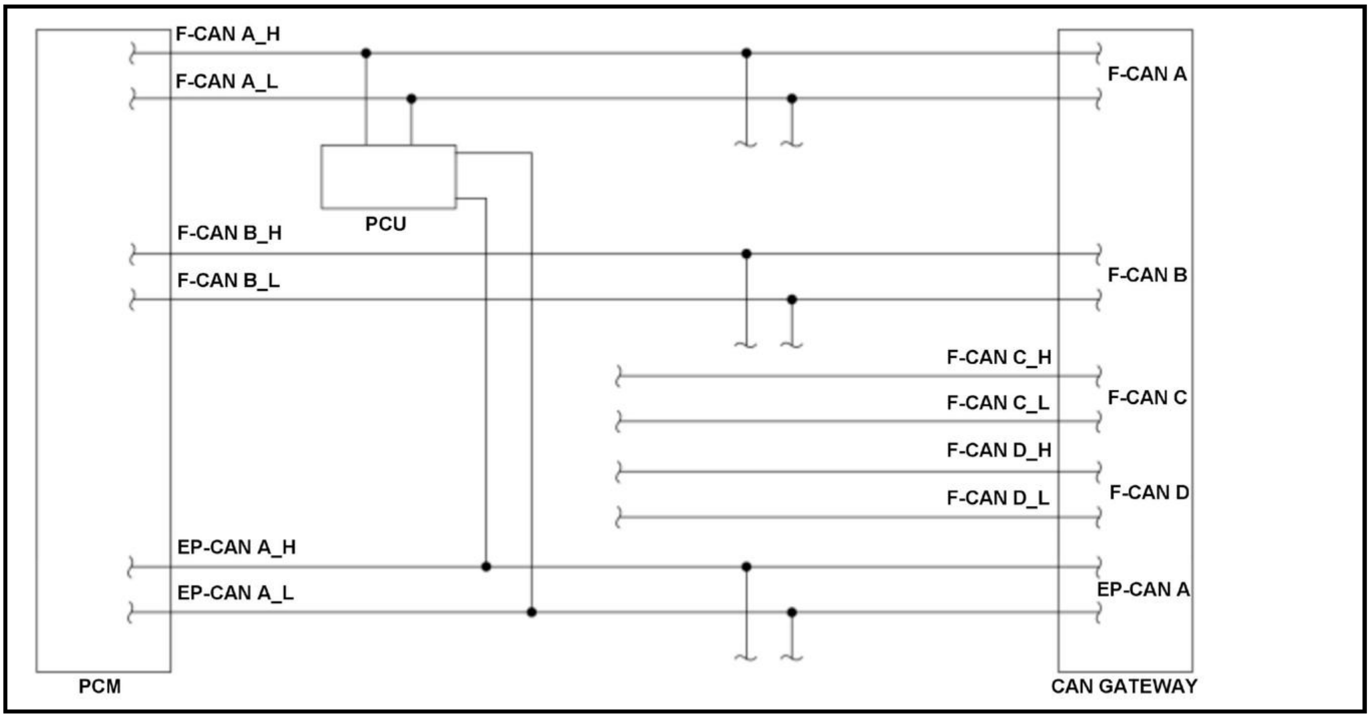
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U12A5 (PGM-FI SYSTEM)

DTC U12A5: EP-CAN Malfunction (Powertrain Control Module (PCM)-Motor Control Module)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the power control unit (PCU) via the EP-CAN lines and this condition continues for a specified time or when the information sent from the PCU is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the PCU via the EP-CAN lines for at least 200 milliseconds.
- The information sent from the PCU is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short to ground
- EP-CAN circuit EP-CAN A_L line short to ground
- PCU failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

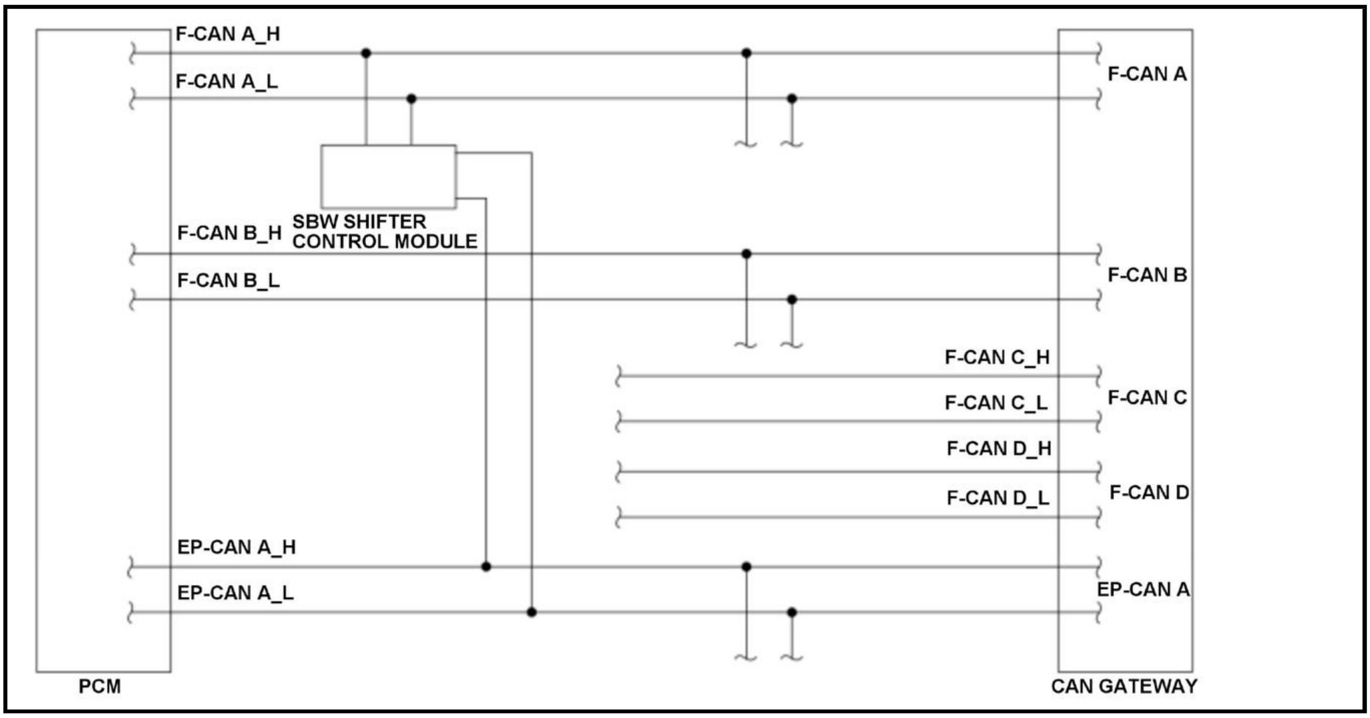
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U12AA (PGM-FI SYSTEM)

DTC U12AA: EP-CAN Malfunction (Powertrain Control Module (PCM)-SBW Shifter)

General Description



F-CAN A_H
F-CAN A_L
F-CAN A
SBW SHIFTER CONTROL MODULE
F-CAN B_H
F-CAN B_L
F-CAN B
F-CAN C_H
F-CAN C_L
F-CAN C
F-CAN D_H
F-CAN D_L
F-CAN D
EP-CAN A_H
EP-CAN A_L
EP-CAN A
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the powertrain control module (PCM) cannot receive the signals from the shift by wire (SBW) shifter control module via the EP-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The PCM cannot receive any signals from the SBW shifter control module via the EP-CAN lines for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short to ground

- EP-CAN circuit EP-CAN A_L line short to ground
- SBW shifter control module failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

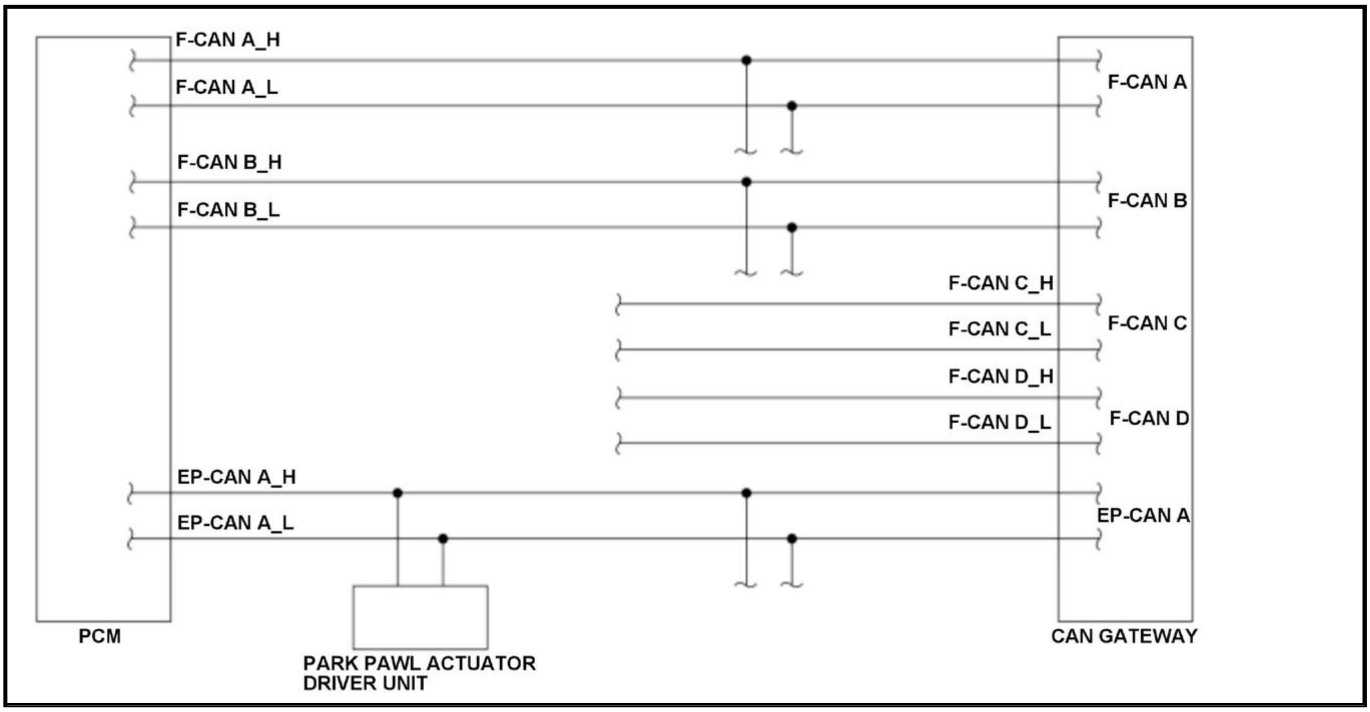
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U12B4 (PGM-FI SYSTEM)

DTC U12B4: EP-CAN Malfunction (Powertrain Control Module (PCM)-Park Pawl Actuator Driver Unit))

General Description



F-CAN A_H
F-CAN A_L
F-CAN B_H
F-CAN B_L
F-CAN C_H
F-CAN C_L
F-CAN D_H
F-CAN D_L
EP-CAN A_H
EP-CAN A_L
F-CAN A
F-CAN B
F-CAN C
F-CAN D
EP-CAN A
PCM
PARK PAWL ACTUATOR DRIVER UNIT
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the park pawl actuator driver unit via the EP-CAN lines and this condition continues for a specified time or when the information sent from the park pawl actuator driver unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the park pawl actuator driver unit via the EP-CAN lines for at least 1.5 seconds.
- The information sent from the park pawl actuator driver unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short to ground
- EP-CAN circuit EP-CAN A_L line short to ground
- Park pawl actuator driver unit failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

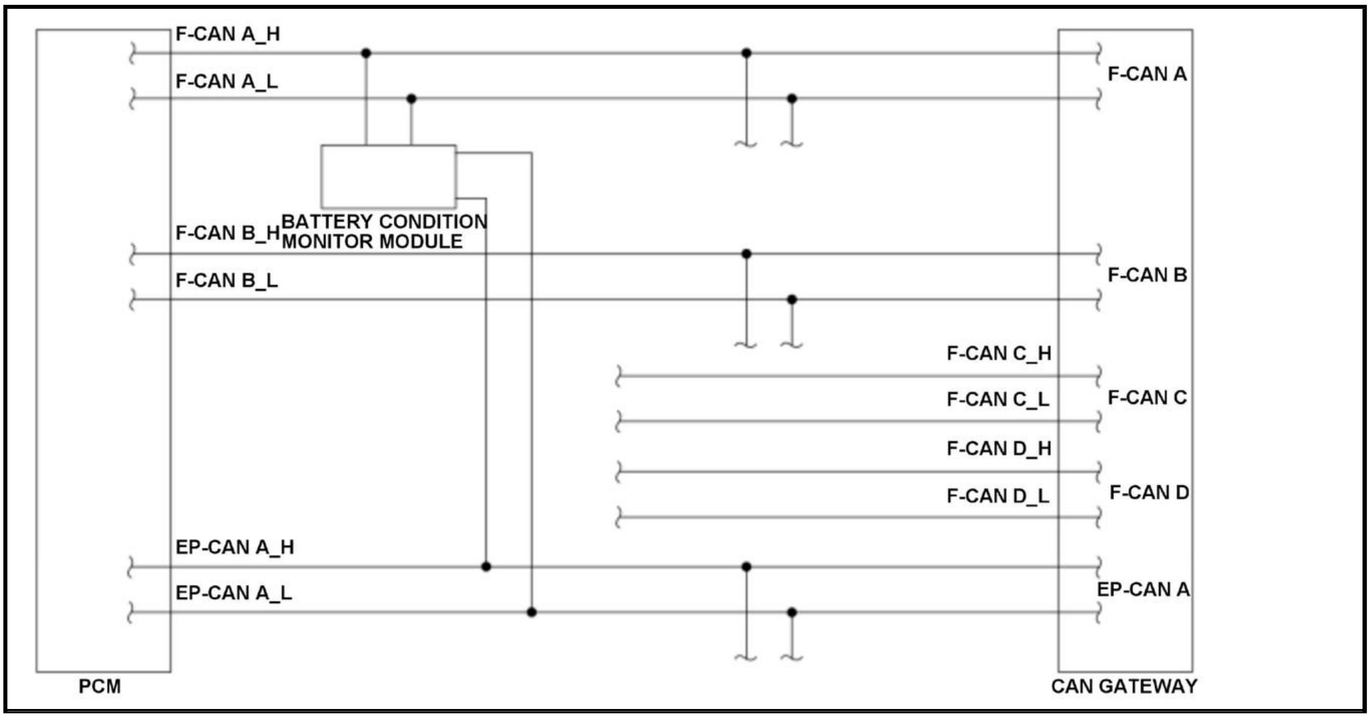
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U1603 (PGM-FI SYSTEM)

DTC U1603: F-CAN Malfunction (Powertrain Control Module (PCM)-Battery Condition Monitor Module)

General Description



F-CAN A_H
F-CAN A_L
F-CAN A
BATTERY CONDITION MONITOR MODULE
F-CAN B_H
F-CAN B_L
F-CAN B
F-CAN C_H
F-CAN C_L
F-CAN C
F-CAN D_H
F-CAN D_L
F-CAN D
EP-CAN A_H
EP-CAN A_L
EP-CAN A
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the battery condition monitor module via the F-CAN lines and this condition continues for a specified time or when the information sent from the battery condition monitor module is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the battery condition monitor module via the F-CAN lines for at least 1.5 seconds.
- The information sent from the battery condition monitor module is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- Battery condition monitor module failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, the freeze data, and the on-board snapshot are stored in the PCM memory. The MIL does not come on.

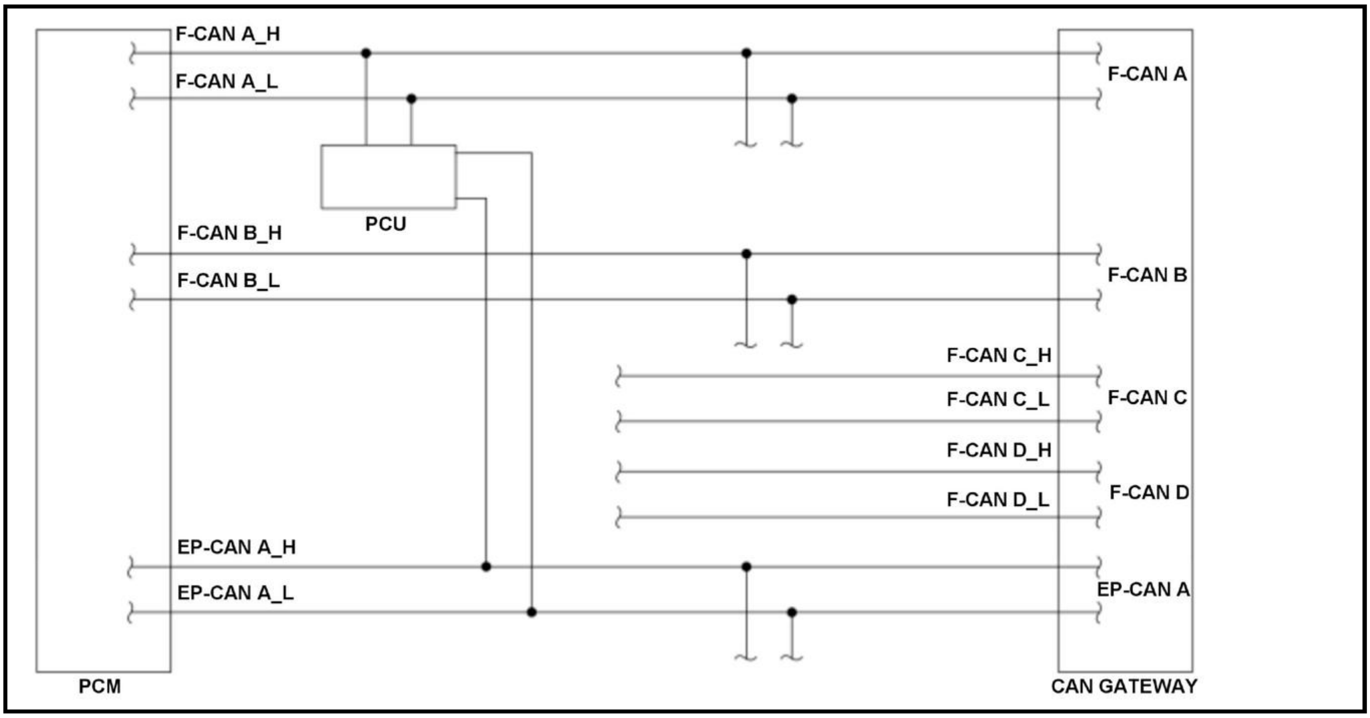
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U1604 (PGM-FI SYSTEM)

DTC U1604: F-CAN Malfunction (Powertrain Control Module (PCM)-Motor Control Module)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the power control unit (PCU) via the F-CAN lines and this condition continues for a specified time or when the information sent from the PCU is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the PCU via the F-CAN lines for at least 1.5 seconds.
- The information sent from the PCU is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- PCU failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, the freeze data, and the on-board snapshot are stored in the PCM memory. The MIL does not come on.

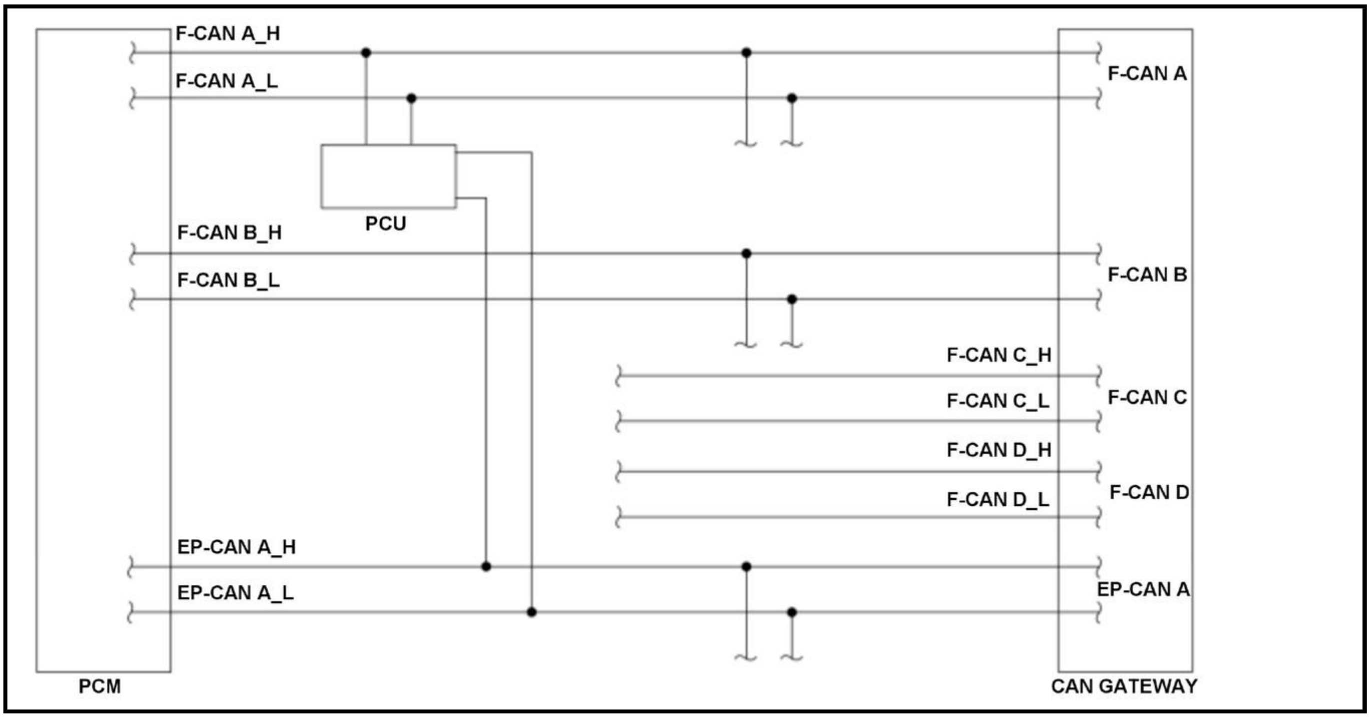
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U1605 (PGM-FI SYSTEM)

DTC U1605: F-CAN Malfunction (Powertrain Control Module (PCM)-Motor Control Module)

General Description



F-CAN A_H
F-CAN A_L
PCU
F-CAN B_H
F-CAN B_L
F-CAN C_H
F-CAN C_L
F-CAN D_H
F-CAN D_L
EP-CAN A_H
EP-CAN A_L
PCM
F-CAN A
F-CAN B
F-CAN C
F-CAN D
EP-CAN A
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the power control unit (PCU) via the F-CAN lines and this condition continues for a specified time or when the information sent from the PCU is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the PCU via the F-CAN lines for at least 1.5 seconds.
- The information sent from the PCU is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- PCU failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, the freeze data, and the on-board snapshot are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC TROUBLESHOOTING

DTC P0010 (1.5 L ENGINE)

DTC P0010 : VTC Oil Control Solenoid Valve A Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0010 VTC Oil Control Solenoid Valve A Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Select the VTC TEST in the INSPECTION MENU with the HDS, then select the IN-VTC.

   VTC TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0010 VTC Oil Control Solenoid Valve A Malfunction	B	B

   Is DTC P0010 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at VTC oil control solenoid valve A and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. VTC oil control solenoid valve A internal resistance check

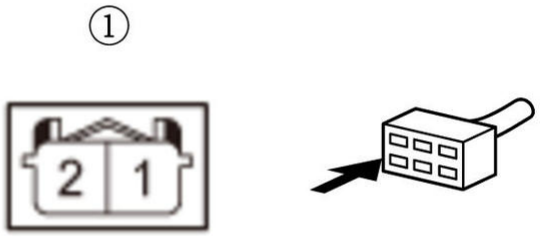
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

VTC oil control solenoid valve A 2P connector

   -3. At the solenoid valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve A 2P connector: disconnected
Test point 1	VTC oil control solenoid valve A 2P connector (male terminals) No. 1 (solenoid valve side): ①
Test point 2	VTC oil control solenoid valve A 2P connector (male terminals) No. 2 (solenoid valve side): ①



Is there 6.77-8.27 Ω at room temperature?

YES

Go to step 3.

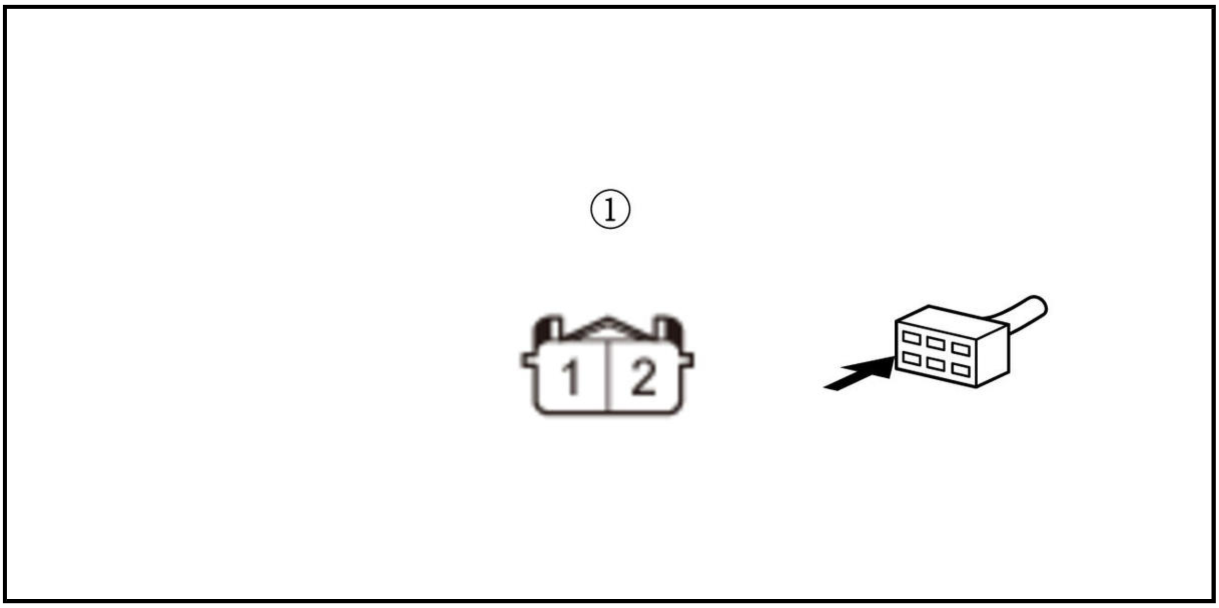
NO

Replace VTC oil control solenoid valve A .

3. Open wire check (PG line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve A 2P connector: disconnected
Test point 1	VTC oil control solenoid valve A 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The PG wire is OK. Go to step 4.

NO

Repair an open in the PG wire between VTC oil control solenoid valve A and G101.

4. Shorted wire check (VTC (IN) line)

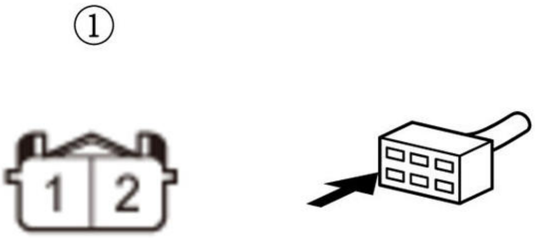
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve A 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	VTC oil control solenoid valve A 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the VTC (IN) wire between the PCM (E64) and VTC oil control solenoid valve A.

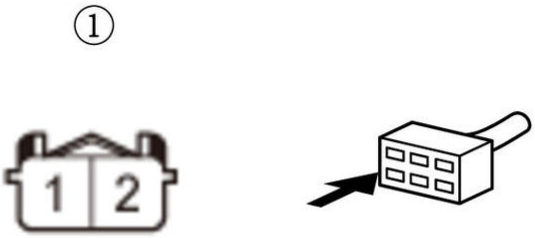
NO

Go to step 5.

5. Open wire check (VTC (IN) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve A 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	VTC oil control solenoid valve A 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 64**



Is there continuity?

YES

The VTC (IN) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VTC (IN) wire between the PCM (E64) and VTC oil control solenoid valve A.

DTC P0010 (2.4 L ENGINE) (2017 2018 2019)

DTC P0010 : VTC Oil Control Solenoid Valve Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0010 VTC Oil Control Solenoid Valve Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-4. Select the VTC TEST in the INSPECTION MENU with the HDS.

VTC TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0010 VTC Oil Control Solenoid Valve Malfunction	B	B

Is DTC P0010 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the VTC oil control solenoid valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. VTC oil control solenoid valve internal resistance check

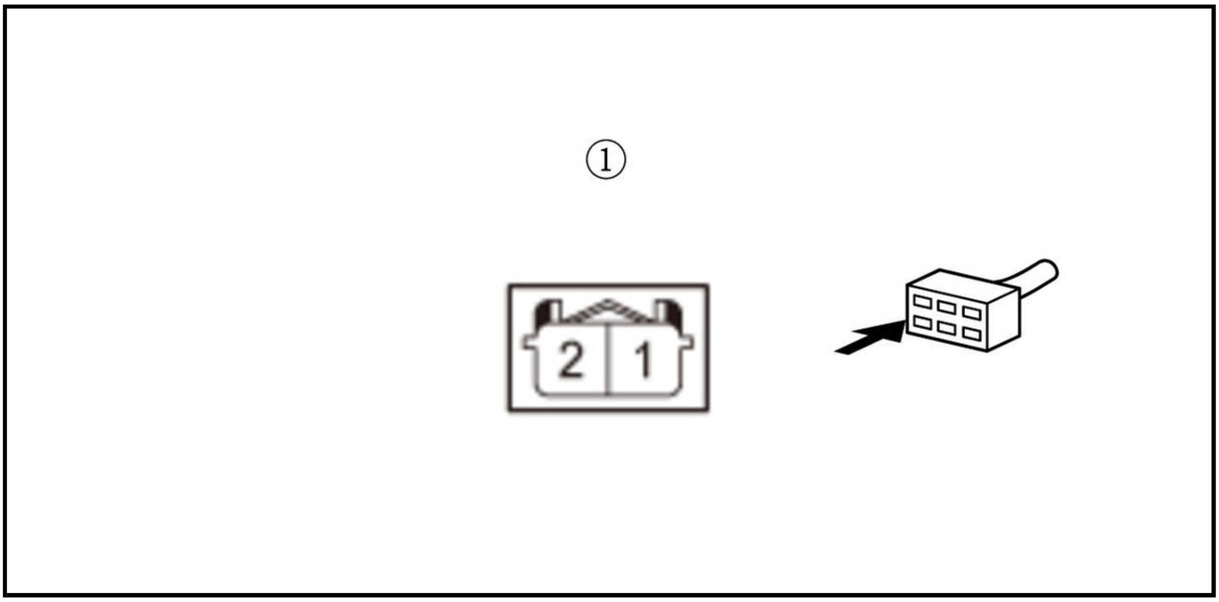
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VTC oil control solenoid valve 2P connector

-3. At the VTC oil control solenoid valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve 2P connector: disconnected
Test point 1	VTC oil control solenoid valve 2P connector (male terminals) No. 1 (VTC oil control solenoid valve side): ①
Test point 2	VTC oil control solenoid valve 2P connector (male terminals) No. 2 (VTC oil control solenoid valve side): ①



Is there 6.75 -8.25 Ω at room temperature?

YES

Go to step 3.

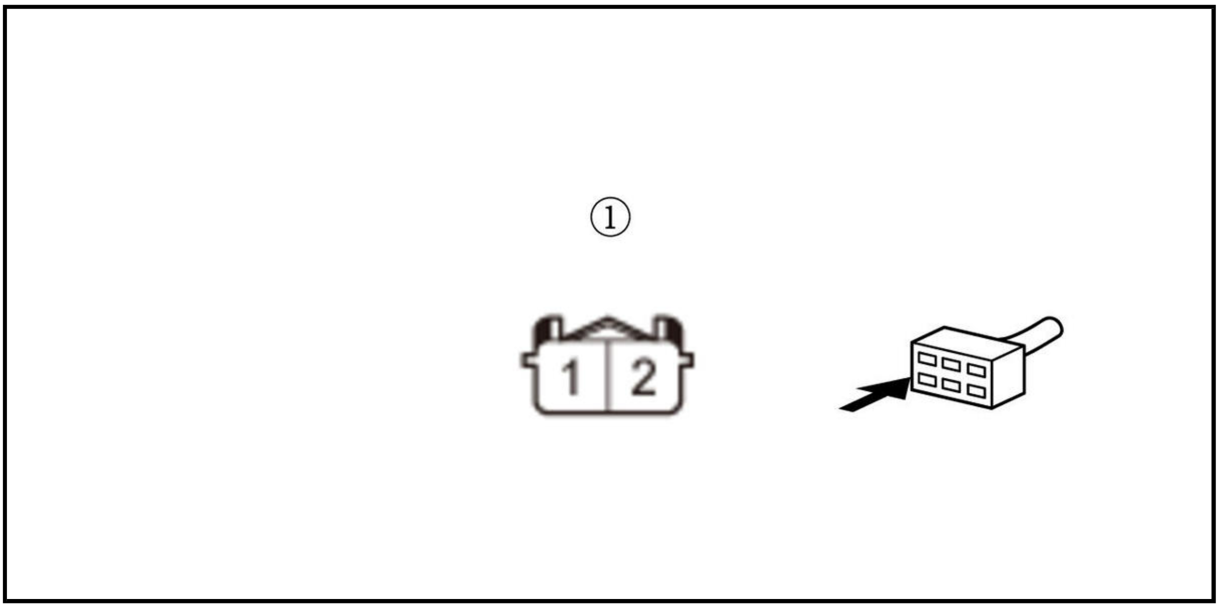
NO

Replace the VTC oil control solenoid valve .

3. Open wire check (PG line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve 2P connector: disconnected
Test point 1	VTC oil control solenoid valve 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The PG line is OK. Go to step 4.

NO

Repair an open in the PG wire between the VTC oil control solenoid valve and G101.

4. Shorted wire check (VTC line)

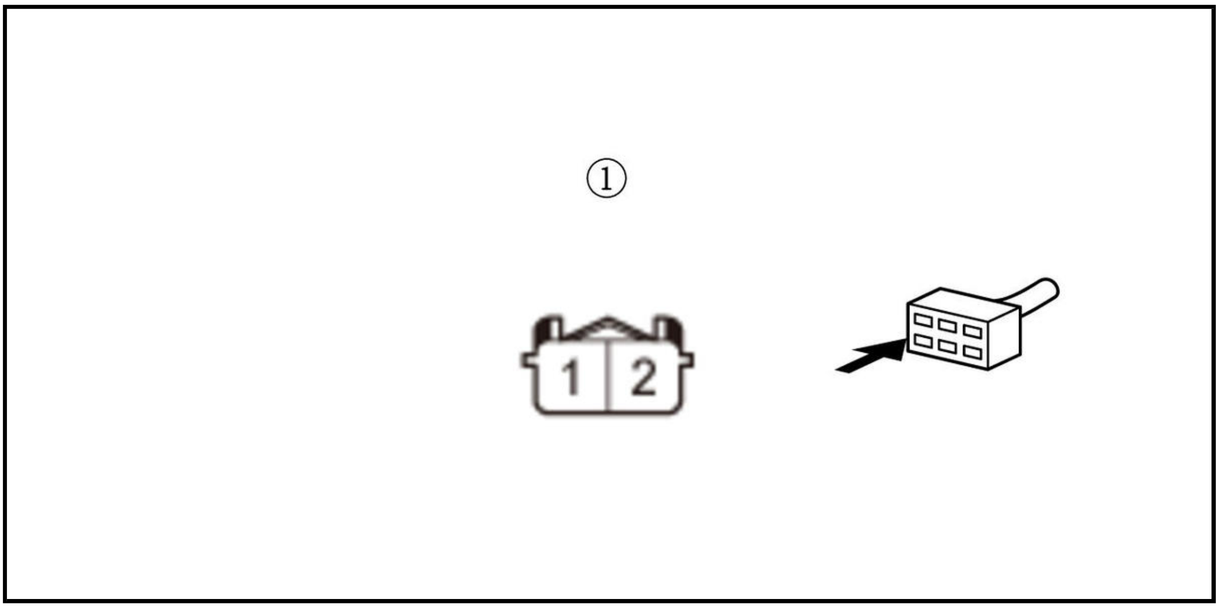
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector C (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve 2P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	VTC oil control solenoid valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the VTC wire between the PCM (C6) and the VTC oil control solenoid valve.

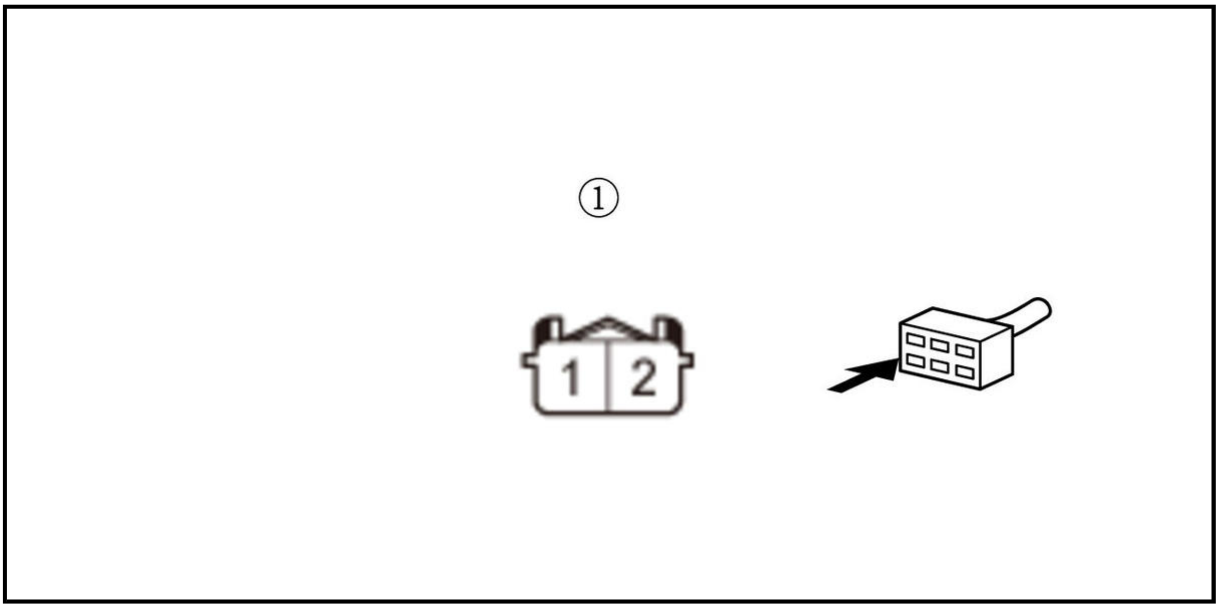
NO

The VTC wire is not shorted. Go to step 5.

5. Open wire check (VTC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve 2P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	VTC oil control solenoid valve 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 6**



Is there continuity?

YES

The VTC wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VTC wire between the VTC oil control solenoid valve and the PCM (C6).

DTC P0011 (1.5 L ENGINE)

DTC P0011 : VTC A System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0010 and/or P0341 are stored at the same time as DTC P0011, troubleshoot those DTCs first, then recheck for DTC P0011.

DTC Description	Confirmed DTC	Pending DTC
P0011 VTC A System Malfunction	B	B

DTC (PGM-FI)

1. Oil pressure check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Watch the low oil pressure indicator in the gauge with the engine running.

   Is the low oil pressure indicator on?

   YES

   Check the engine oil level. If the level is OK, **check the engine oil pressure** .

   NO

   Go to step 2.

2. Problem verification

   -1. Select the VTC TEST in the INSPECTION MENU with the HDS, then select the IN-VTC.

   VTC TEST

   Is the result OK?

   YES

   Go to step 3.

   NO

Go to step 5.

3. VTC system check (HDS data list check)

   -1. Test-drive the vehicle at a steady speed between 19-37 mph (30-60 km/h) for 10 minutes.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
VTC STATUS	ON	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 4.

   NO

   Go to step 3, and recheck.

4. VTC system check (OBD STATUS check)

   -1. Test-drive the vehicle at a steady speed between 19-37 mph (30-60 km/h) for 10 minutes.

   -2. Monitor the OBD STATUS for DTC P0011 with the HDS.

DTC Description	OBD STATUS
P0011 VTC A System Malfunction	B

   Does the HDS indicate FAILED?

   YES

   Go to step 5.

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at VTC oil control solenoid valve A and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 2 and recheck.

5. VTC oil control solenoid valve A check

   -1. **Test VTC oil control solenoid valve A** .

   Is the solenoid valve OK?

   YES

   Check the VTC system oil passages, and clean them if needed.

   NO

   Replace VTC oil control solenoid valve A .

DTC P0011 (2.4 L ENGINE) (2017 2018 2019)

DTC P0011 : VTC System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0010 and/or P0341 are stored at the same time as DTC P0011, troubleshoot those DTCs first, then recheck for DTC P0011.

DTC Description	Confirmed DTC	Pending DTC
P0011 VTC System Malfunction	B	B

DTC (PGM-FI)

1. Oil pressure check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Watch the low oil pressure indicator in the gauge with the engine running.

   Is the low oil pressure indicator on?

   YES

   Check the engine oil level. If the level is OK, **check the engine oil pressure** .

   NO

   Go to step 2.

2. Problem verification

   -1. Select the VTC TEST in the INSPECTION MENU with the HDS.

   VTC TEST

   Is the result OK?

   YES

   The failure is not duplicated. Go to step 3.

   NO

   Go to step 6.

3. VTC system check (HDS data list check)

   -1. Test-drive at a steady speed between 19-37 mph (30-60 km/h) for 10 minutes.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
VTC STATUS	ON	B	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Go to step 3, and recheck.

4. VTC system check (OBD STATUS check)

-1. Test-drive at a steady speed between 19-37 mph (30-60 km/h) for 10 minutes.

-2. Monitor the OBD STATUS for DTC P0011 with the HDS.

DTC Description	OBD STATUS
P0011 VTC System Malfunction	B

Does the HDS indicate FAILED?

YES

Go to step 5.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the VTC oil control solenoid valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 2 and recheck.

5. VTC strainer check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the VTC strainer** .

-3. Check the VTC strainer for clogging.

Is the strainer OK?

YES

Go to step 6.

NO

Clean the VTC strainer, **replace the engine oil filter** and **engine oil** .

6. VTC oil control solenoid valve check

-1. **Test the VTC oil control solenoid valve** .

Is the valve OK?

YES

Go to step 7.

NO

Replace the VTC oil control solenoid valve .

7. VTC actuator check

   -1. Inspect the VTC actuator .

   Is the VTC actuator OK?

   YES

   Check the VTC system oil passages, and clean them if needed.

   NO

   Replace the VTC actuator .

DTC P0013 (1.5 L ENGINE)

DTC P0013 : VTC Oil Control Solenoid Valve B Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0013 VTC Oil Control Solenoid Valve B Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Select the VTC TEST in the INSPECTION MENU with the HDS, then select the EX-VTC.

   VTC TEST - EX-VTC

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0013 VTC Oil Control Solenoid Valve B Malfunction	B	B

   Is DTC P0013 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at VTC oil control solenoid valve B and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. VTC oil control solenoid valve B internal resistance check

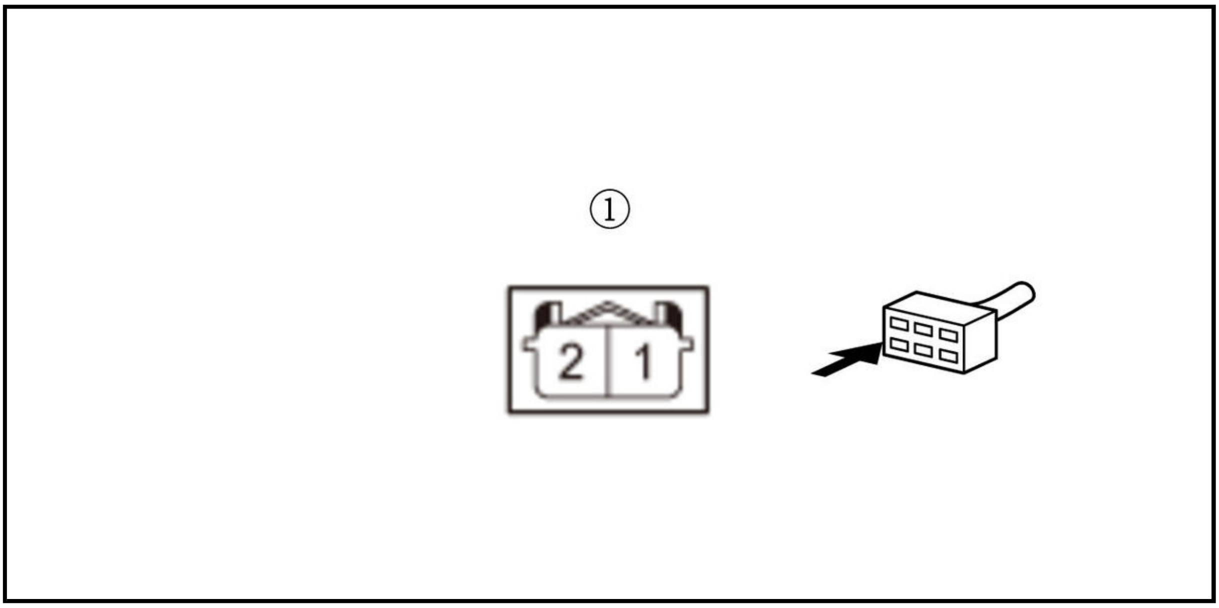
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VTC oil control solenoid valve B 2P connector

-3. At the solenoid valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve B 2P connector: disconnected
Test point 1	VTC oil control solenoid valve B 2P connector (male terminals) No. 1 (solenoid valve side): ①
Test point 2	VTC oil control solenoid valve B 2P connector (male terminals) No. 2 (solenoid valve side): ①



Is there 6.77-8.27 Ω at room temperature?

YES

Go to step 3.

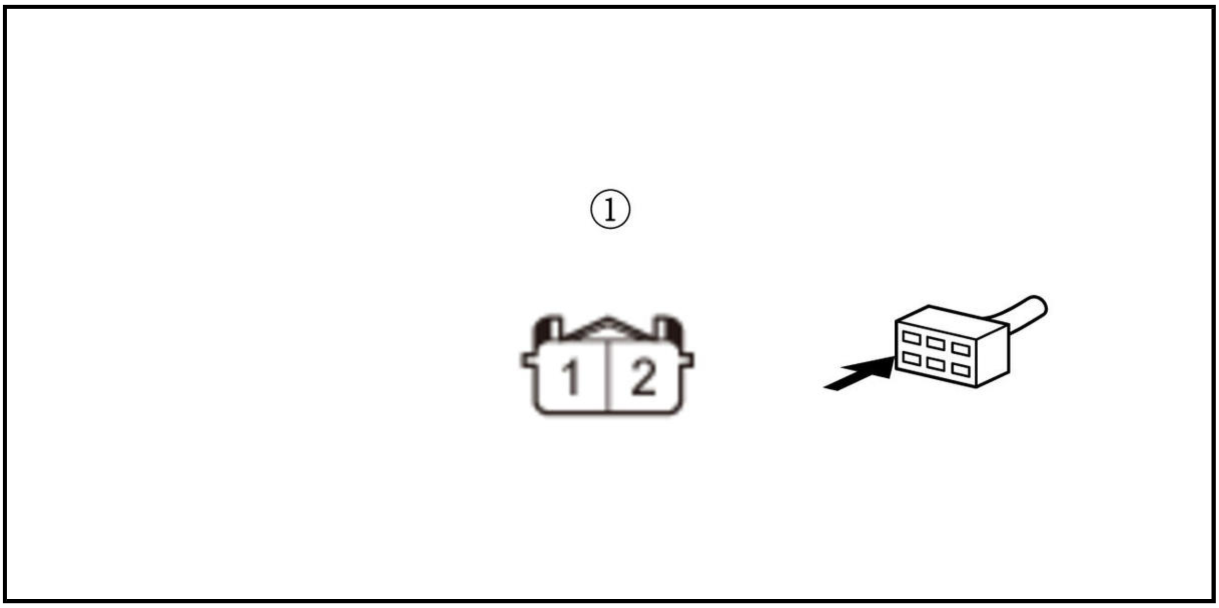
NO

Replace VTC oil control solenoid valve B .

3. Open wire check (PG line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve B 2P connector: disconnected
Test point 1	VTC oil control solenoid valve B 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Repair an open in the PG wire between VTC oil control solenoid valve B and G101.

4. Shorted wire check (VTC (EX) line)

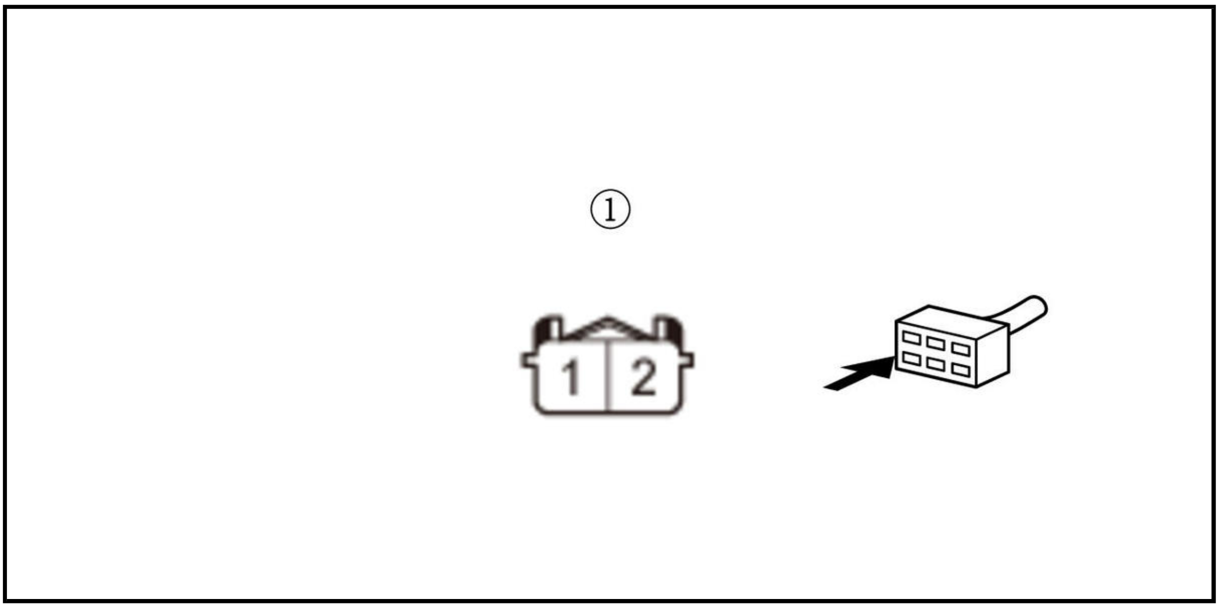
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve B 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	VTC oil control solenoid valve B 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in VTC (EX) wire between the PCM (E46) and VTC oil control solenoid valve B.

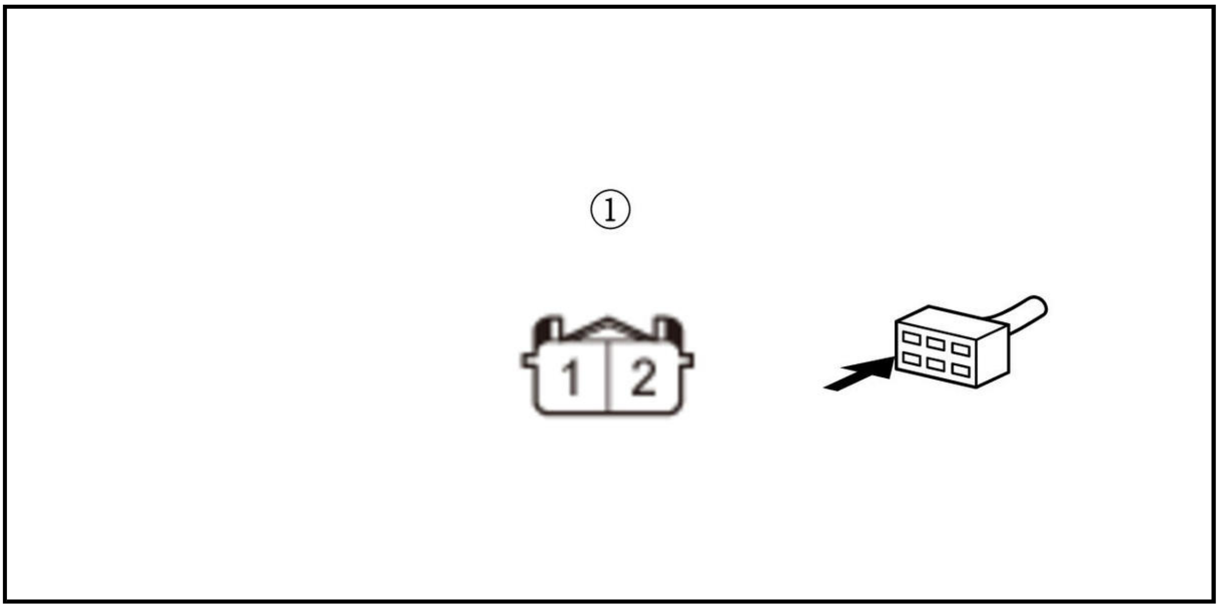
NO

Go to step 5.

5. Open wire check (VTC (EX) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VTC oil control solenoid valve B 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	VTC oil control solenoid valve B 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 46**



Is there continuity?

YES

The VTC (EX) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VTC (EX) wire between the PCM (E46) and VTC oil control solenoid valve B.

DTC P0014 (1.5 L ENGINE)

DTC P0014 : VTC B System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0013 and/or P0366 are stored at the same time as DTC P0014, troubleshoot those DTCs first, then recheck for DTC P0014.

DTC Description	Confirmed DTC	Pending DTC
P0014 VTC B System Malfunction	B	B

DTC (PGM-FI)

1. Oil pressure check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Watch the low oil pressure indicator in the gauge with the engine running.

   Is the low oil pressure indicator on?

   YES

   Check the engine oil level. If the level is OK, **check the engine oil pressure** .

   NO

   Go to step 2.

2. Problem verification

   -1. Select the VTC TEST in the INSPECTION MENU with the HDS, then select the EX-VTC.

   VTC TEST - EX-VTC

   Is the result OK?

   YES

   Go to step 3.

   NO

Go to step 5.

3. VTC system check (HDS data list check)

   -1. Test-drive the vehicle at a steady speed between 19-37 mph (30-60 km/h) for 10 minutes.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EX VTC STATUS	ON	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 4.

   NO

   Go to step 3, and recheck.

4. VTC system check (OBD STATUS check)

   -1. Test-drive the vehicle at a steady speed between 19-37 mph (30-60 km/h) for 10 minutes.

   -2. Monitor the OBD STATUS for DTC P0014 with the HDS.

DTC Description	OBD STATUS
P0014 VTC B System Malfunction	B

   Does the HDS indicate FAILED?

   YES

   Go to step 5.

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at VTC oil control solenoid valve B and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 2 and recheck.

5. VTC oil control solenoid valve B check

   -1. **Test the VTC oil control solenoid valve B** .

   Is the solenoid valve OK?

   YES

   Check the VTC system oil passages, and clean them if needed.

   NO

   Replace VTC oil control solenoid valve B .

DTC P0034 (1.5 L ENGINE)

DTC P0034 : Turbocharger Bypass Control Solenoid Valve Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0034 Turbocharger Bypass Control Solenoid Valve Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Do the ABV TEST in the INSPECTION MENU with the HDS.

   ABV TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0034 Turbocharger Bypass Control Solenoid Valve Circuit Low Voltage	B	B

   Is DTC P0034 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger bypass control solenoid valve and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Turbocharger bypass control solenoid valve internal circuit check

   -1. Turn the vehicle to the OFF (LOCK) mode.

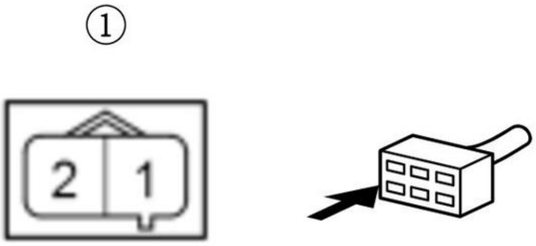
   -2. Disconnect the following connector.

Turbocharger bypass control solenoid valve 2P connector

   -3. At the solenoid valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger bypass control solenoid valve 2P connector: disconnected
Test point 1	Turbocharger bypass control solenoid valve 2P connector (male terminals) No. 1 (solenoid valve side): ①

Test point 2	Turbocharger bypass control solenoid valve 2P connector (male terminals) No. 2 (solenoid valve side): ①



Is there about 30-34 Ω at room temperature?

YES

Go to step 3.

NO

Replace the turbocharger bypass control solenoid valve .

3. Fuse check

-1. Check the following fuse.

Fuse	No. D21 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the IG1 ACG/IG1 (ACG)/IG1 (ABV) wire between the turbocharger bypass control solenoid valve and the No. D21 (10 A) fuse. Also replace the No. D21 (10 A) fuse.

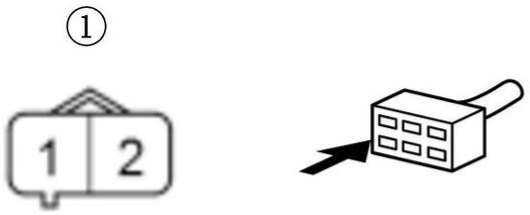
4. Open wire check (IG1 ACG/IG1 (ACG)/IG1 (ABV) line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger bypass control solenoid valve 2P connector: disconnected

Test point 1	Turbocharger bypass control solenoid valve 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

NO

Repair an open in the IG1 ACG/IG1 (ACG)/IG1 (ABV) wire between the turbocharger bypass control solenoid valve and the No. D21 (10 A) fuse in the under-dash fuse/relay box. If needed, **replace the under-dash fuse/relay box** .

5. Short wire check (ABV line)

-1. Turn the vehicle to the OFF (LOCK) mode.

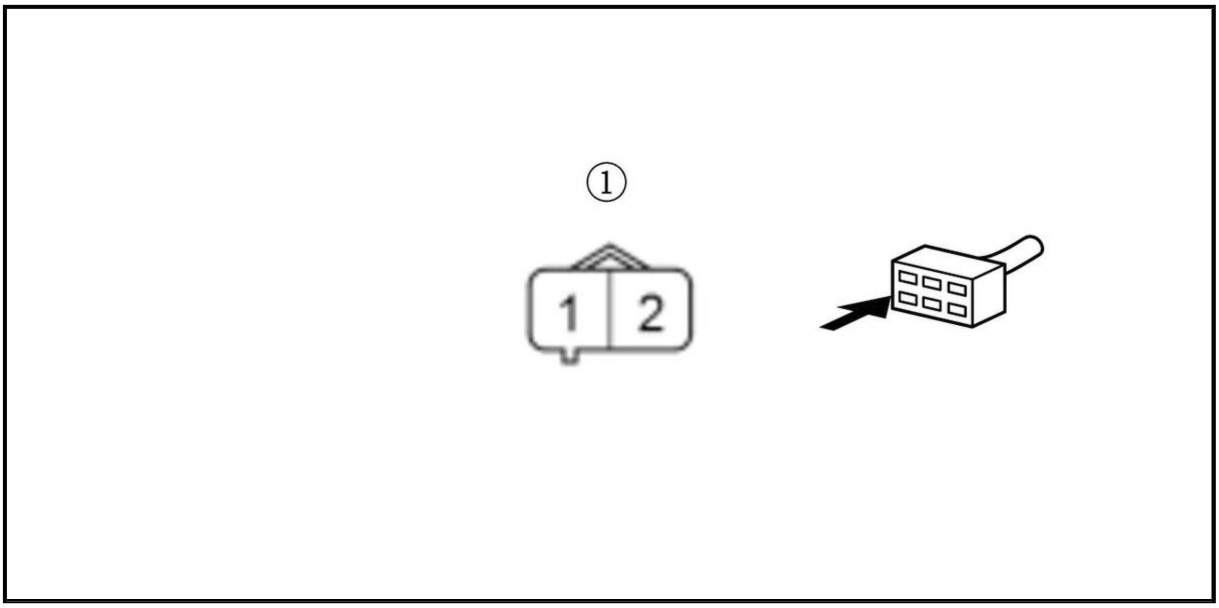
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger bypass control solenoid valve 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger bypass control solenoid valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the ABV wire between the PCM (E79) and the turbocharger bypass control solenoid valve.

NO

The ABV wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0035 (1.5 L ENGINE)

DTC P0035 : Turbocharger Bypass Control Solenoid Valve Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0035 Turbocharger Bypass Control Solenoid Valve Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Do the ABV TEST in the INSPECTION MENU with the HDS.

ABV TEST

Monitor the OBD STATUS for DTC P0035 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0035 Turbocharger Bypass Control Solenoid Valve Circuit High Voltage	B

Does the HDS indicate FAILED?

YES

Go to step 2.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger bypass control solenoid valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 1-5 and recheck.

2. Open wire check (ABV line)

-1. Turn the vehicle to the OFF (LOCK) mode.

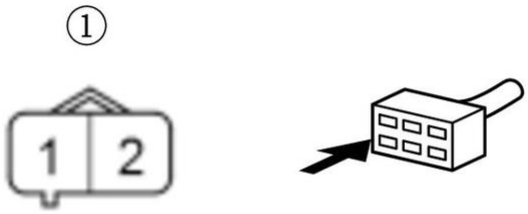
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

Turbocharger bypass control solenoid valve 2P connector
PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger bypass control solenoid valve 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger bypass control solenoid valve 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 79**



Is there continuity?

YES

The ABV wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ABV wire between the PCM (E79) and the turbocharger bypass control solenoid valve.

DTC P003A, P0046 (1.5 L ENGINE)

DTC P003A : Turbocharger Wastegate Control Actuator Position Exceeded Learning Limit **DTC P0046** : Turbocharger Wastegate Control Actuator Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P003A Turbocharger Wastegate Control Actuator Position Exceeded Learning Limit	B	B
P0046 Turbocharger Wastegate Control Actuator Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

-5. Select the Electric Waste Gate in the INSPECTION MENU with the HDS.

Electric Waste Gate

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P003A Turbocharger Wastegate Control Actuator Position Exceeded Learning Limit	B	B
P0046 Turbocharger Wastegate Control Actuator Circuit Range/Performance Problem	B	B

Is DTC P003A or P0046 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger wastegate control actuator and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Turbocharger check

-1. Check for the foreign materials at the turbocharger wastegate control actuator link part and the damage on the turbocharger cover.

Is there foreign materials at the turbocharger wastegate control actuator link part or the damage on the turbocharger cover?

YES

Repair the turbocharger wastegate control actuator or the turbocharger cover, then go to step 1.

NO

Go to step 3.

3. Turbocharger wastegate control actuator check

-1. Select the Electric Waste Gate in the INSPECTION MENU with the HDS.

Electric Waste Gate

Visually inspect the operation of the turbocharger wastegate control actuator.

Does the turbocharger wastegate control actuator operate?

YES

Go to step 4.

NO

Replace the turbocharger .

4. Turbocharger wastegate control actuator position sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

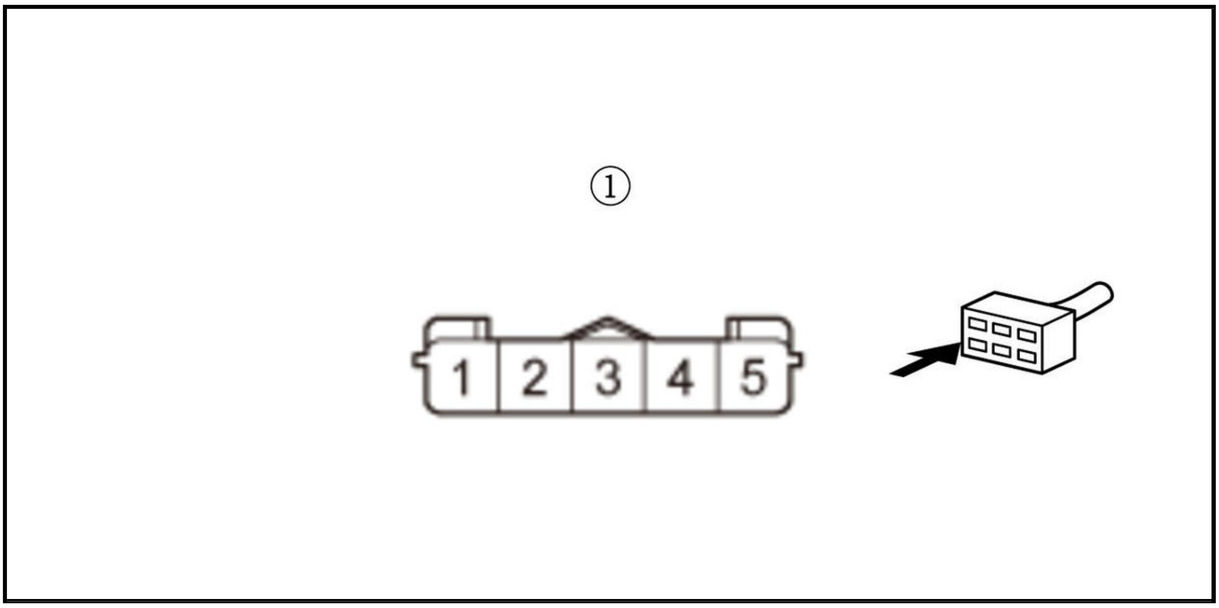
-2. Disconnect the following connector.

Turbocharger 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger 5P connector: disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 2: ①
Test point 2	Turbocharger 5P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the turbocharger .

NO

The turbocharger wastegate control actuator position sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0045 (1.5 L ENGINE)

DTC P0045 : Turbocharger Wastegate Control Actuator Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0045 Turbocharger Wastegate Control Actuator Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Select the Electric Waste Gate in the INSPECTION MENU with the HDS.

Electric Waste Gate

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0045 Turbocharger Wastegate Control Actuator Circuit Malfunction	B	B

Is DTC P0045 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger wastegate control actuator and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (WGMTR1 (+) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

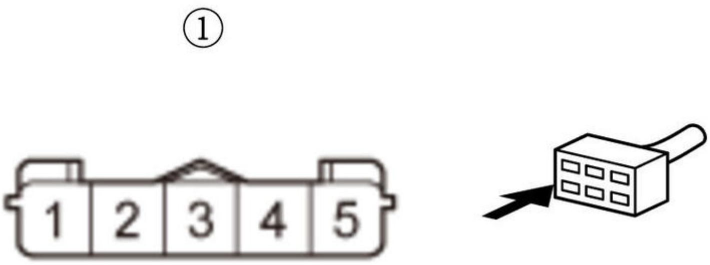
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

Turbocharger 5P connector
PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the WGMTR1 (+) wire between the PCM (E26) and the turbocharger.

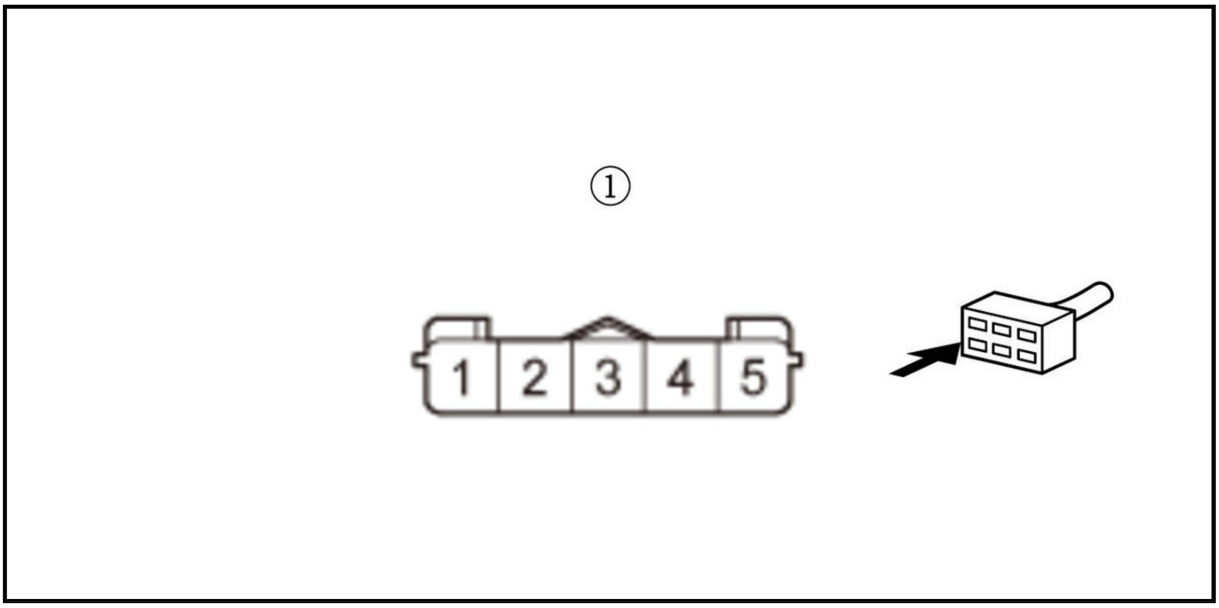
NO

Go to step 3.

3. Shorted wire check (WGMTR2 (-) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the WGMTR2 (-) wire between the PCM (E25) and the turbocharger.

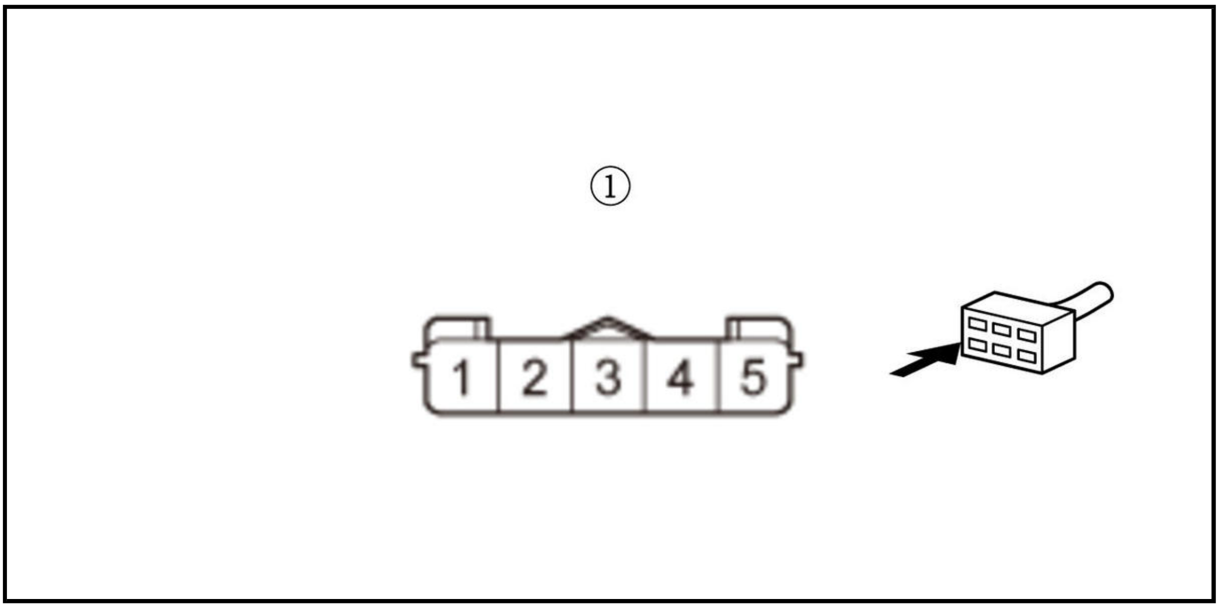
NO

Go to step 4.

4. Open wire check (WGMTR1 (+) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 26**



Is there continuity?

YES

Go to step 5.

NO

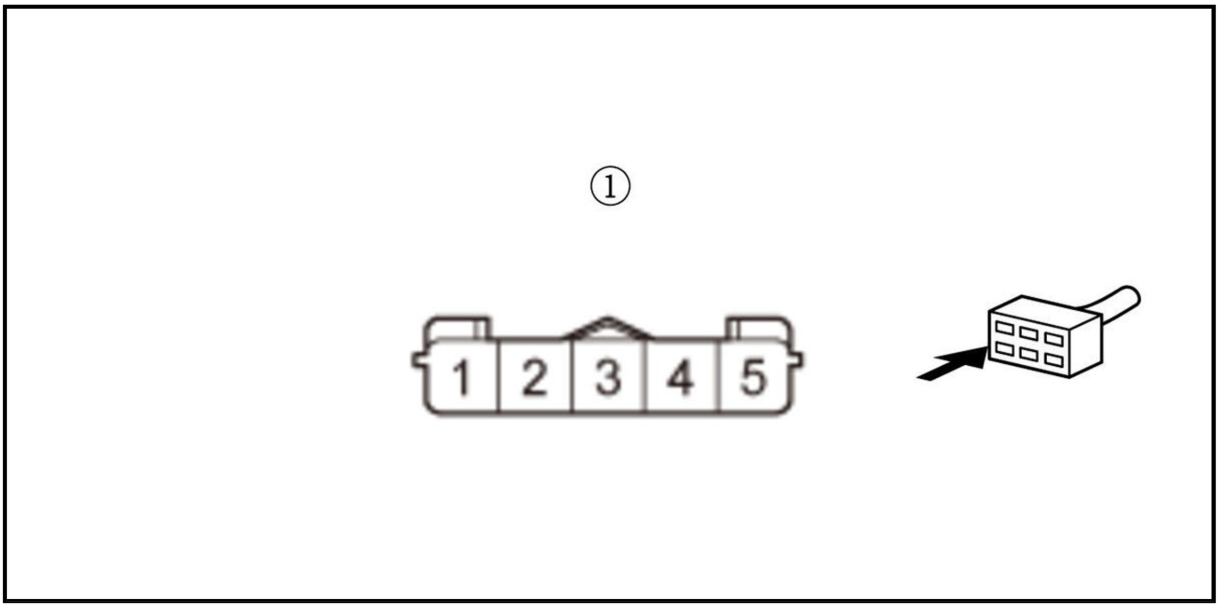
Repair an open in the WGMTR1 (+) wire between the PCM (E26) and the turbocharger.

5. Open wire check (WGMTR2 (-) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 1: ①
Test point 2	PCM connector E (80P) No. 25



Is there continuity?

YES

Go to step 6.

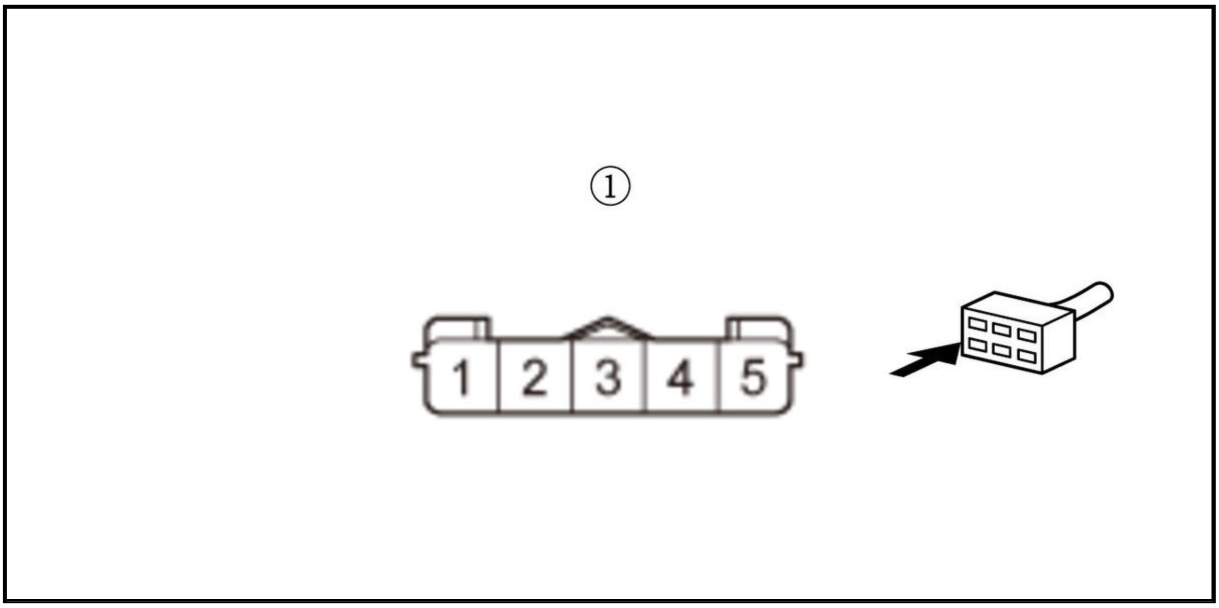
NO

Repair an open in the WGMTR2 (-) wire between the PCM (E25) and the turbocharger.

6. Shorted wire check (WGMTR1 (+) line to WGMTR2 (-) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Turbocharger 5P connector: disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 1: ①
Test point 2	Turbocharger 5P connector (female terminals) No. 5: ①



Is there continuity?

YES

Repair a short in the WGMTR1 (+) wire to the WGMTR2 (-) wire between the PCM (E25, E26) and the turbocharger.

NO

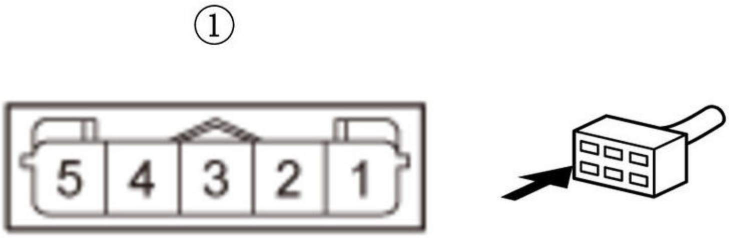
Go to step 7.

7. Turbocharger wastegate control actuator internal circuit check (short in wires)

-1. At the turbocharger wastegate control actuator side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Turbocharger 5P connector: disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 1 (actuator side): ①

Test point 2	Turbocharger 5P connector (female terminals) No. 5 (actuator side): ①



Is there about 1.2 Ω-1.0 kΩ?

YES

Go to step 8.

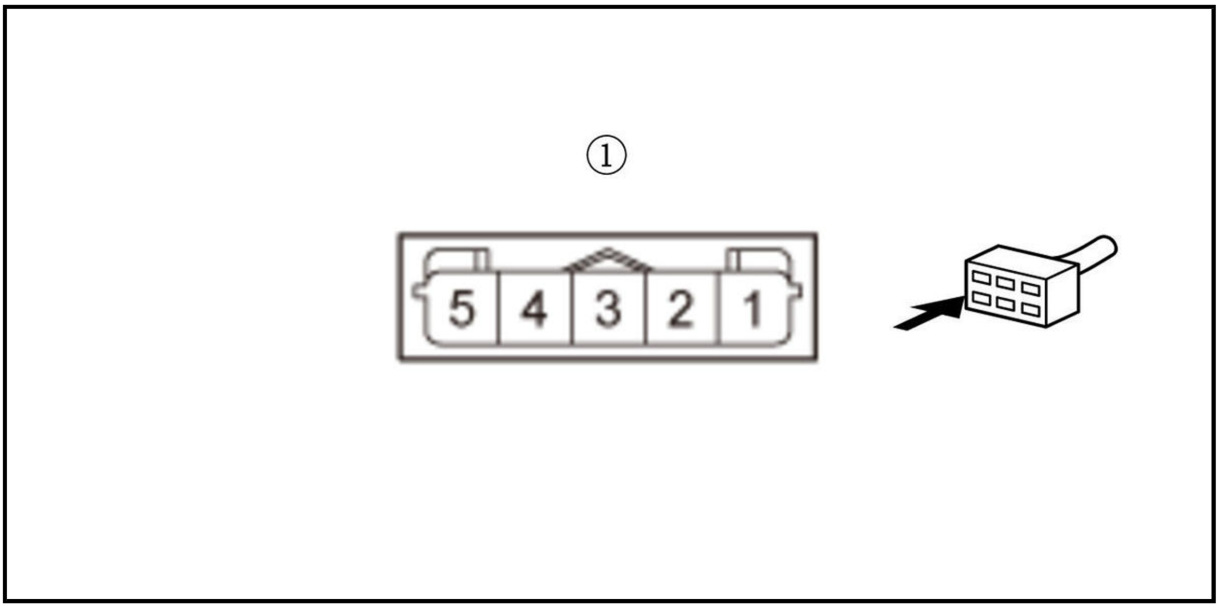
NO

Replace the turbocharger .

8. Turbocharger wastegate control actuator internal circuit check (short to ground)

-1. At the turbocharger side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Turbocharger 5P connector: disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 1 (actuator side): ①
B	Turbocharger 5P connector (female terminals) No. 5 (actuator side): ①
Test point 2	Body ground



Is there continuity?

YES

Replace the turbocharger .

NO

The turbocharger wastegate control actuator internal circuit is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0069 (1.5 L ENGINE)

DTC P0069 : BARO Sensor Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0069 BARO Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Test-drive the vehicle under these conditions:

- Engine speed above 1, 700 rpm
- REL TP SENSOR above 42.2 deg
- Drive 6 seconds or more

Signal	**Current conditions**	
	Values	**Unit**
ECT Sensor 1	B	B
Engine Speed	B	B
REL TP Sensor	B	B

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	**Confirmed DTC**	**Pending DTC**
P0069 BARO Sensor Circuit Range/Performance Problem	B	B

Is DTC P0069 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0069 (2.4 L ENGINE) (2017 2018 2019)

DTC P0069 : BARO Sensor Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	**Confirmed DTC**	**Pending DTC**
P0069 BARO Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Test-drive the vehicle under these conditions:

- Engine speed above 1, 000 rpm and REL TP SENSOR above 12 deg (or engine speed above 3, 000 rpm and REL TP SENSOR above 25 deg)
- Drive 2.5 seconds or more

Signal	**Current conditions**	
	Values	**Unit**
ECT Sensor 1	B	B
Engine Speed	B	B
REL TP Sensor	B	B

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0069 BARO Sensor Circuit Range/Performance Problem	B	B

Is DTC P0069 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P006A (1.5 L ENGINE)

DTC P006A : MAF Sensor Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2073, P2074, P2228, and/or P2229 are stored at the same time as DTC P006A, troubleshoot those DTCs first, then recheck for DTC P006A.

DTC Description	Confirmed DTC	Pending DTC
P006A MAF Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Parts condition check:

   Check for poor connections or damage to these parts:

   - PCV valve
   - PCV hose
   - Intake air duct
   - Air cleaner
   - Purge (PCS) line
   - All parts through the turbocharger joint to the throttle body

   Are the parts OK?

   YES

   Go to step 2.

   NO

   Repair or replace the damaged part (s).

2. Intake air duct visual check

   -1. Check for damage or looseness of the intake air duct in the air cleaner.

   Is it OK?

YES

Go to step 3.

NO

Reconnect or replace the intake air duct in the air cleaner.

3. Air cleaner element visual check

-1. Check for a dirty air cleaner element.

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 4.

4. MAF sensor signal check (without engine running)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	About 0.2	g/s	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

NO

Replace MAF sensor/IAT sensor 1 .

5. MAF sensor signal check (with engine running)

-1. Start the engine.

-2. Vary the engine speed between 2, 000 rpm and 3, 000 rpm.

-3. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
MAF Sensor	B	B

Does the MAF SENSOR reading change?

YES

Go to step 6.

NO

Replace the MAF sensor/IAT sensor 1 .

6. MAF sensor check

-1. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- ENGINE SPEED
- VEHICLE SPEED
- MAP SENSOR
- TP SENSOR

On-board Snapshot

Signal	**Current conditions**	
	Values	**Unit**
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
MAP SENSOR	B	B
TP SENSOR	B	B

-3. Monitor the OBD STATUS for DTC P006A with the HDS.

DTC Description	**OBD STATUS**
P006A MAF Sensor Circuit Range/Performance Problem	B

Does the HDS indicate FAILED?

YES

Replace the MAF sensor/IAT sensor 1 .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 6-2 and recheck.

DTC P006A (2.4 L ENGINE) (2017 2018 2019)

DTC P006A : MAF Sensor Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2073, P2074, P2228, and/or P2229 are stored at the same time as DTC P006A, troubleshoot those DTCs first, then recheck for DTC P006A.

DTC Description	**Confirmed DTC**	**Pending DTC**
P006A MAF Sensor Circuit Range/Performance Problem	B	B

1. Parts condition check:

   Check for poor connections or damage to these parts:

   - PCV valve
   - PCV hose
   - Intake air duct
   - Air cleaner
   - Purge (PCS) line
   - All parts through the turbocharger joint to the throttle body

   Are the parts OK?

   YES

   Go to step 2.

   NO

   Repair or replace the damaged part (s).

2. Intake air duct visual check

   -1. Check for damage or looseness of the intake air duct in the air cleaner.

   Is it OK?

   YES

   Go to step 3.

   NO

   Reconnect or replace the intake air duct in the air cleaner.

3. Air cleaner element visual check

   -1. Check for a dirty air cleaner element.

   Is it dirty?

   YES

   Replace the air cleaner element .

   NO

   Go to step 4.

4. MAF sensor signal check (without engine running)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	About 0.2	g/s	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

NO

Replace MAF sensor/IAT sensor 1 .

5. MAF sensor signal check (with engine running)

-1. Start the engine.

-2. Vary the engine speed between 2, 000 rpm and 3, 000 rpm.

-3. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
MAF Sensor	B	B

Does the MAF SENSOR reading change?

YES

Go to step 6.

NO

Replace the MAF sensor/IAT sensor 1 .

6. MAF sensor check

-1. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- ENGINE SPEED
- VEHICLE SPEED
- MAP SENSOR
- TP SENSOR

On-board Snapshot

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
MAP SENSOR	B	B
TP SENSOR	B	B

-3. Monitor the OBD STATUS for DTC P006A with the HDS.

DTC Description	OBD STATUS
P006A MAF Sensor Circuit Range/Performance Problem	B

Does the HDS indicate FAILED?

YES

Replace the MAF sensor/IAT sensor 1 .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 6-2 and recheck.

DTC P006E (1.5 L ENGINE)

DTC P006E : Turbocharger Power Supply Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P006E Turbocharger Power Supply Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P006E Turbocharger Power Supply Circuit Malfunction	B	B

   Is DTC P006E indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B
P1659 ETCS Control Relay OFF Malfunction	B	B

Is DTC P1658 and/or P1659 indicated?

YES

Go to the indicated DTCs troubleshooting.

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A5 (7.5 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (+B VBACT/FI SUB RLY OUT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

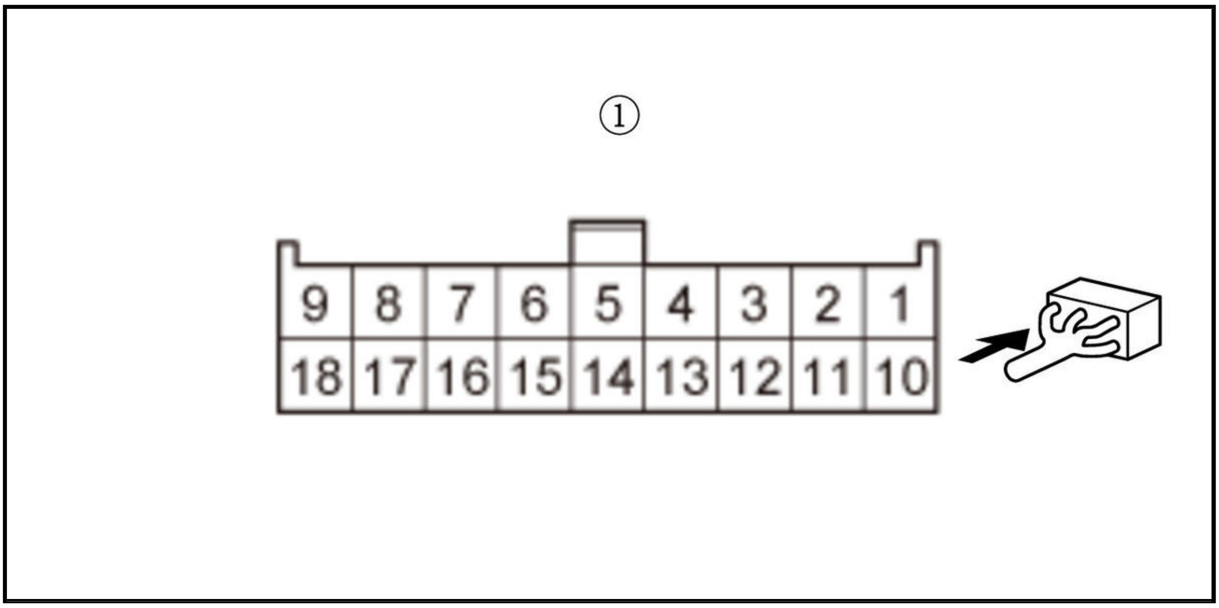
-2. Disconnect the following connectors.

PCM connector A (50P)
Relay circuit board connector C (18P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board connector C (18P): disconnected
	PCM connector A (50P): disconnected

Test point 1	Relay circuit board connector C (18P) (female terminals) No. 1: ①
Test point 2	**PCM connector A (50P) No. 3**



Is there continuity?

YES

The +B VBACT/FI SUB RLY OUT wire is OK. **Remove and test the relay circuit board** . If the relay circuit board is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the +B VBACT/FI SUB RLY OUT wire between the PCM (A3) and the relay circuit board.

5. Shorted wire check (+B VBACT line)

-1. Remove the blown No. A5 (7.5 A) fuse from the under-hood fuse/relay box.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the +B VBACT wire between the PCM (A3) and the No. A5 (7.5 A) fuse in the under-hood fuse/relay box. Also replace No. A5 (7.5 A) fuse.

NO

Replace the No. A5 (7.5 A) fuse in the under-hood fuse/relay box and recheck. If the fuse blown again, **replace the under-hood fuse/relay box** .

DTC P0087 (1.5 L ENGINE)

DTC P0087 : Fuel Rail Pressure Too Low

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel, then clear the DTC with the HDS.
- If a fuel leak occurs, this DTC will be stored. Repair the fuel leak before troubleshooting.
- If any of the DTCs listed below are stored at the same time as P0087, troubleshoot those DTCs first, then recheck for P0087.

  P0192, P0193: Fuel rail pressure sensor

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0300, P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

  P219C, P219D, P219E, P219F: No. 1-No. 4 cylinder A/F variation

  P2623: High pressure fuel pump

DTC Description	Confirmed DTC	Pending DTC
P0087 Fuel Rail Pressure Too Low	B	B

DTC (PGM-FI)

1. Problem verification (idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Select the DI Fuel Pressure Test in the INSPECTION MENU with the HDS.

   DI FUEL PRESSURE TEST

   Is the result OK?

   YES

   Go to step 2.

   NO

   Go to step 3.

2. Problem verification (test-drive):

   Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- ENGINE SPEED
- VEHICLE SPEED
- MAP SENSOR
- TP SENSOR
- APP SENSOR
- ECT SENSOR 1
- FUEL PRESSURE CONVERTED FROM PF SENSOR
- FUEL PRESSURE DIRECT INJECTION SYSTEM
- IAT SENSOR (1)

On-board Snapshot

Signal	**Current conditions**	
	Values	**Unit**
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
MAP SENSOR	B	B
TP SENSOR	B	B
APP SENSOR	B	B
ECT SENSOR 1	B	B
FUEL PRESSURE CONVERTED FROM PF SENSOR	B	B

Signal	**Current conditions**	
	Values	**Unit**
FUEL PRESSURE DIRECT INJECTION SYSTEM	B	B
IAT SENSOR (1)	B	B

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	**Confirmed DTC**	**Pending DTC**
P0087 Fuel Rail Pressure Too Low	B	B

Is DTC P0087 indicated?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time. **Test the PGM-FI main relay 2** . If the relay is OK, check for a poor connection or loose terminals at the fuel rail pressure sensor, the high pressure fuel pump, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Spill valve operation check

-1. Start the engine, then let it idle.

-2. Check for noise or vibration from the spill valve on the high pressure fuel pump.

When the high pressure fuel pump runs, you will hear some noise from the spill valve.

Is there any noise or vibration?

YES

Go to step 4.

NO

Replace the high pressure fuel pump .

4. Fuel rail pressure sensor check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the PGM-FI main relay 2** .

-3. Start the engine, and let it idle until it stalls.

-4. After the engine stalls, crank the engine for several times.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 1, 000	kPa	B	B

NOTE: It is normal if the value of several hundred kPa is indicated.

Do the current condition (s) match the threshold?

YES

Go to step 5.

NO

Replace the fuel rail (fuel rail pressure sensor) .

5. Fuel rail pressure sensor check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Install the PGM-FI main relay 2** .

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Shift the transmission to D position/mode while pressing the brake pedal firmly, then press the accelerator pedal.**NOTE:** Do not shift the transmission or remove your foot off the brake pedal, while raising the engine speed.

-6. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	B	B
FUEL PRESSURE DIRECT INJECTION SYSTEM	B	B

Are both values almost the same?

YES

Go to step 6.

NO

Replace the fuel rail (fuel rail pressure sensor) .

6. Fuel pressure check (low pressure side)

   -1. **Check the fuel pressure** .

   Is the fuel pressure OK?

   YES

   Go to step 7.

   NO

   Check the fuel pump, the fuel pressure regulator, the fuel filter , and **the fuel lines** .

7. High pressure fuel pump visual check

   -1. **Remove the high pressure fuel pump** .

   -2. **Visually check the cam that drives a high pressure fuel pump and the roller of the high pressure fuel pump for wear or damage** .

   Are the parts OK?

   YES

   Replace the high pressure fuel pump .

   NO

   Check for damage of the cam and the roller , and **replace the intake camshaft** and/or **the high pressure fuel pump** if needed.

DTC P0087 (2.4 L ENGINE) (2017 2018 2019)

DTC P0087 : Fuel Rail Pressure Too Low

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel, then clear the DTC with the HDS.
- If a fuel leak occurs, this DTC will be stored. Repair the fuel leak before troubleshooting.
- If any of the DTCs listed below are stored at the same time as P0087, troubleshoot those DTCs first, then recheck for P0087.

  P0192, P0193: Fuel rail pressure sensor

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0300, P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

P219A: Air-Fuel Ratio Variation of Cylinder

P2623: High pressure fuel pump

DTC Description	Confirmed DTC	Pending DTC
P0087 Fuel Rail Pressure Too Low	B	B

DTC (PGM-FI)

1. Problem verification (idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Select the DI Fuel Pressure Test in the INSPECTION MENU with the HDS.

   DI FUEL PRESSURE TEST

   Is the result OK?

   YES

   Go to step 2.

   NO

   Go to step 3.

2. Problem verification (test-drive):

   Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

   - ENGINE SPEED
   - VEHICLE SPEED
   - MAP SENSOR
   - TP SENSOR
   - APP SENSOR
   - ECT SENSOR 1
   - FUEL PRESSURE CONVERTED FROM PF SENSOR
   - FUEL PRESSURE DIRECT INJECTION SYSTEM
   - IAT SENSOR (1)

   On-board Snapshot

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
MAP SENSOR	B	B
TP SENSOR	B	B

Signal	Current conditions	
	Values	Unit
APP SENSOR	B	B
ECT SENSOR 1	B	B
FUEL PRESSURE CONVERTED FROM PF SENSOR	B	B

Signal	Current conditions	
	Values	Unit
FUEL PRESSURE DIRECT INJECTION SYSTEM	B	B
IAT SENSOR (1)	B	B

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0087 Fuel Rail Pressure Too Low	B	B

Is DTC P0087 indicated?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time. **Test the PGM-FI main relay 2** . If the relay is OK, check for a poor connection or loose terminals at the fuel rail pressure sensor, the high pressure fuel pump, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Spill valve operation check

-1. Start the engine, then let it idle.

-2. Check for noise or vibration from the spill valve on the high pressure fuel pump.

When the high pressure fuel pump runs, you will hear some noise from the spill valve.

Is there any noise or vibration?

YES

Go to step 4.

NO

Replace the high pressure fuel pump .

4. Fuel rail pressure sensor check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the PGM-FI main relay 2** .

-3. Start the engine, and let it idle until it stalls.

-4. After the engine stalls, crank the engine for several times.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 1, 000	kPa	B	B

NOTE: It is normal if the value of several hundred kPa is indicated.

Do the current condition (s) match the threshold?

YES

Go to step 5.

NO

Replace the fuel rail (fuel rail pressure sensor) .

5. Fuel rail pressure sensor check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Install the PGM-FI main relay 2** .

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Shift the transmission to D position/mode while pressing the brake pedal firmly, then press the accelerator pedal.**NOTE:** Do not shift the transmission or remove your foot off the brake pedal, while raising the engine speed.

-6. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	B	B
FUEL PRESSURE DIRECT INJECTION SYSTEM	B	B

Are both values almost the same?

YES

Go to step 6.

NO

Replace the fuel rail (fuel rail pressure sensor) .

6. Fuel pressure check (low pressure side)

-1. **Check the fuel pressure** .

Is the fuel pressure OK?

YES

Go to step 7.

NO

Check the fuel pump, the fuel pressure regulator, the fuel filter , and the fuel lines .

7. High pressure fuel pump visual check

   -1. Remove the high pressure fuel pump .

   -2. Visually check the cam that drives a high pressure fuel pump and the roller of the high pressure fuel pump for wear or damage .

   Are the parts OK?

   YES

   Replace the high pressure fuel pump .

   NO

   Check for damage of the cam and the roller , and replace the intake camshaft and/or the high pressure fuel pump if needed.

DTC P0088 (1.5 L ENGINE)

DTC P0088 : Fuel Rail Pressure Too High

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If any of the DTCs listed below are stored at the same time as P0088, troubleshoot those DTCs first, then recheck for P0088.

  P0192, P0193: Fuel rail pressure sensor

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

  P219C, P219D, P219E, P219F: No. 1-No. 4 cylinder A/F variation

  P2623: High pressure fuel pump

DTC Description	Confirmed DTC	Pending DTC
P0088 Fuel Rail Pressure Too High	B	B

DTC (PGM-FI)

1. Problem verification (idling)

   -1. Record on-board snapshots with the HDS.

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode.

   -5. Start the engine.

   -6. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-7. Select the DI Fuel Pressure Test in the INSPECTION MENU with the HDS.

DI FUEL PRESSURE TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0088 Fuel Rail Pressure Too High	B	B

Is DTC P0088 indicated?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification (test-drive):

Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- ENGINE SPEED
- VEHICLE SPEED
- MAP SENSOR
- TP SENSOR
- APP SENSOR
- ECT SENSOR 1
- FUEL PRESSURE CONVERTED FROM PF SENSOR
- FUEL PRESSURE DIRECT INJECTION SYSTEM
- IAT SENSOR (1)

On-board Snapshot

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
MAP SENSOR	B	B
TP SENSOR	B	B
APP SENSOR	B	B
ECT SENSOR 1	B	B
FUEL PRESSURE CONVERTED FROM PF SENSOR	B	B
FUEL PRESSURE DIRECT INJECTION SYSTEM	B	B
IAT SENSOR (1)	B	B

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0088 Fuel Rail Pressure Too High	B	B

DTC (PGM-FI)

Is DTC P0088 indicated?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for a poor connection or loose terminals at the fuel rail pressure sensor, the high pressure fuel pump, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Fuel rail pressure sensor check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the PGM-FI main relay 2** .

   -3. Start the engine, and let it idle until it stalls.

   -4. After the engine stalls, press the accelerator pedal to the floor and crank the engine several times.

   -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 1, 000	kPa	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Replace the fuel rail (fuel rail pressure sensor) .

4. Fuel rail pressure sensor check 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Install the PGM-FI main relay 2** .

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Shift the transmission to D position/mode while pressing the brake pedal firmly, then press the accelerator pedal.**NOTE:** Do not shift the transmission or remove your foot off the brake pedal, while raising the engine speed.

   -6. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	B	B
FUEL PRESSURE DIRECT INJECTION SYSTEM	B	B

Signal	Current conditions	
	Values	Unit
RELIEF VALVE	B	B

Are both values almost the same, and does the RELIEF VALVE indicate Normal?

YES

Go to step 5.

NO (the values are not the same)

Replace the fuel rail (fuel rail pressure sensor) .

NO (Abnormal is indicated)

Replace the high pressure fuel pump .

5. Fuel pressure check (low pressure side)

-1. **Check the fuel pressure** .

Is the fuel pressure OK?

YES

Replace the high pressure fuel pump .

NO

Check the fuel supply system (low pressure side).

DTC P0088 (2.4 L ENGINE) (2017 2018 2019)

DTC P0088 : Fuel Rail Pressure Too High

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are stored at the same time as P0088, troubleshoot those DTCs first, then recheck for P0088.

  P0192, P0193: Fuel rail pressure sensor

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

  P219A: Air-Fuel Ratio Variation of Cylinder

  P2623: High pressure fuel pump

DTC Description	Confirmed DTC	Pending DTC
P0088 Fuel Rail Pressure Too High	B	B

DTC (PGM-FI)

1. Problem verification (idling)

-1. Record on-board snapshots with the HDS.

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Start the engine.

-6. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-7. Select the DI Fuel Pressure Test in the INSPECTION MENU with the HDS.

DI FUEL PRESSURE TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0088 Fuel Rail Pressure Too High	B	B

Is DTC P0088 indicated?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification (test-drive):

   Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

   - ENGINE SPEED
   - VEHICLE SPEED
   - MAP SENSOR
   - TP SENSOR
   - APP SENSOR
   - ECT SENSOR 1
   - FUEL PRESSURE CONVERTED FROM PF SENSOR
   - FUEL PRESSURE DIRECT INJECTION SYSTEM
   - IAT SENSOR (1)

   On-board Snapshot

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

TP SENSOR	B	B
APP SENSOR	B	B
ECT SENSOR 1	B	B
FUEL PRESSURE CONVERTED FROM PF SENSOR	B	B
FUEL PRESSURE DIRECT INJECTION SYSTEM	B	B

Signal	Current conditions	
	Values	Unit
IAT SENSOR (1)	B	B

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0088 Fuel Rail Pressure Too High	B	B

Is DTC P0088 indicated?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for a poor connection or loose terminals at the fuel rail pressure sensor, the high pressure fuel pump, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Fuel rail pressure sensor check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the PGM-FI main relay 2** .

-3. Start the engine, and let it idle until it stalls.

-4. After the engine stalls, press the accelerator pedal to the floor and crank the engine several times.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 1, 000	kPa	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Replace the fuel rail (fuel rail pressure sensor) .

4. Fuel rail pressure sensor check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Install the PGM-FI main relay 2** .

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Shift the transmission to D position/mode while pressing the brake pedal firmly, then press the accelerator pedal.**NOTE:** Do not shift the transmission or remove your foot off the brake pedal, while raising the engine speed.

-6. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
FUEL PRESSURE CONVERTED FROM PF SENSOR	B	B
FUEL PRESSURE DIRECT INJECTION SYSTEM	B	B
RELIEF VALVE	B	B

Are both values almost the same, and does the RELIEF VALVE indicate Normal?

YES

Go to step 5.

NO (the values are not the same)

Replace the fuel rail (fuel rail pressure sensor) .

NO (Abnormal is indicated)

Replace the high pressure fuel pump .

5. Fuel pressure check (low pressure side)

-1. **Check the fuel pressure** .

Is the fuel pressure OK?

YES

Replace the high pressure fuel pump .

NO

Check the fuel supply system (low pressure side).

DTC P0096 (1.5 L ENGINE)

DTC P0096 : IAT Sensor 2 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0096 IAT Sensor 2 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

Check for poor connections or loose terminals of these connectors.

- ECT sensor 1
- ECT sensor 2
- MAF sensor/IAT sensor 1
- IAT sensor 2

Are the connections and terminals OK?

YES

Go to step 2.

NO

Repair the connections or terminals.

2. IAT sensor 2 performance check (low temperature)

-1. **Remove the IAT sensor 2** .

-2. Allow IAT sensor 2 to cool to the ambient temperature.

-3. Note the ambient temperature.

-4. Connect the IAT sensor 2 to its 2P connector, but do not install it.

-5. Turn the vehicle to the ON mode.

-6. Quickly note the value of IAT Sensor (2) in the DATA LIST with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
IAT Sensor (2)	B	B

-7. Compare the value of IAT Sensor (2) to the ambient temperature.

Does the value of IAT Sensor (2) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace the IAT sensor 2 .

NO

Go to step 3.

3. IAT sensor 2 performance check (high temperature)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

IAT sensor 2 2P connector

-3. Using a heat gun, blow hot air on IAT sensor 2 for a few seconds. Do not apply the heat longer than a few seconds or you will damage the sensor.

-4. Connect the IAT sensor 2 to its 2P connector, but do not install it.

-5. Turn the vehicle to the ON mode.

-6. Check IAT Sensor (2) in the DATA LIST with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
IAT Sensor (2)	B	B

Does IAT Sensor (2) change 76 deg. F (42 deg. C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at IAT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Replace the IAT sensor 2 .

DTC P0097 (1.5 L ENGINE)

DTC P0097 : IAT Sensor 2 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0097 IAT Sensor 2 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2)	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at IAT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (IAT sensor 2, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

IAT sensor 2 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
IAT Sensor (2)	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the IAT sensor 2 .

3. Shorted wire check (ITA2 (INTA) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

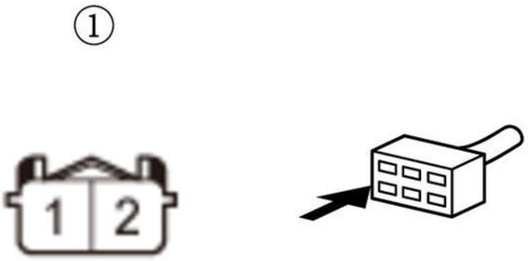
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IAT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the ITA2 (INTA) wire between the PCM (E55) and IAT sensor 2.

NO

The ITA2 (INTA) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0098 (1.5 L ENGINE)

DTC P0098 : IAT Sensor 2 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0098 IAT Sensor 2 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2)	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at IAT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (IAT sensor 2, others)

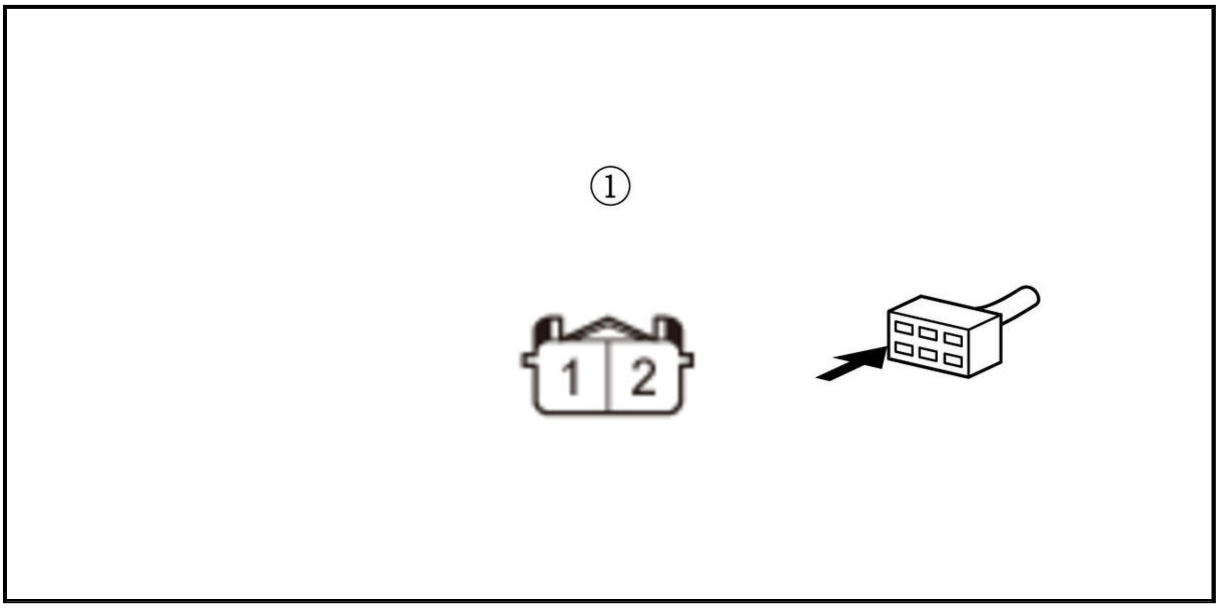
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

IAT sensor 2 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	IAT sensor 2 2P connector (female terminals) No. 1: ①
Terminal B	IAT sensor 2 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2)	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the IAT sensor 2 .

3. Determine possible failure area (ITA2 (INTA) line, others)

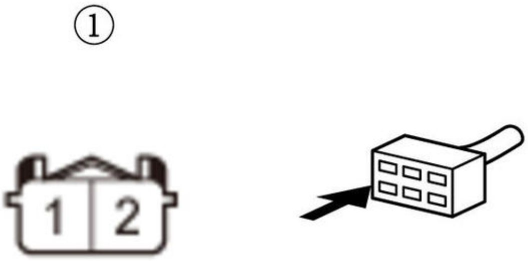
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the IAT sensor 2 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	IAT sensor 2 2P connector: disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

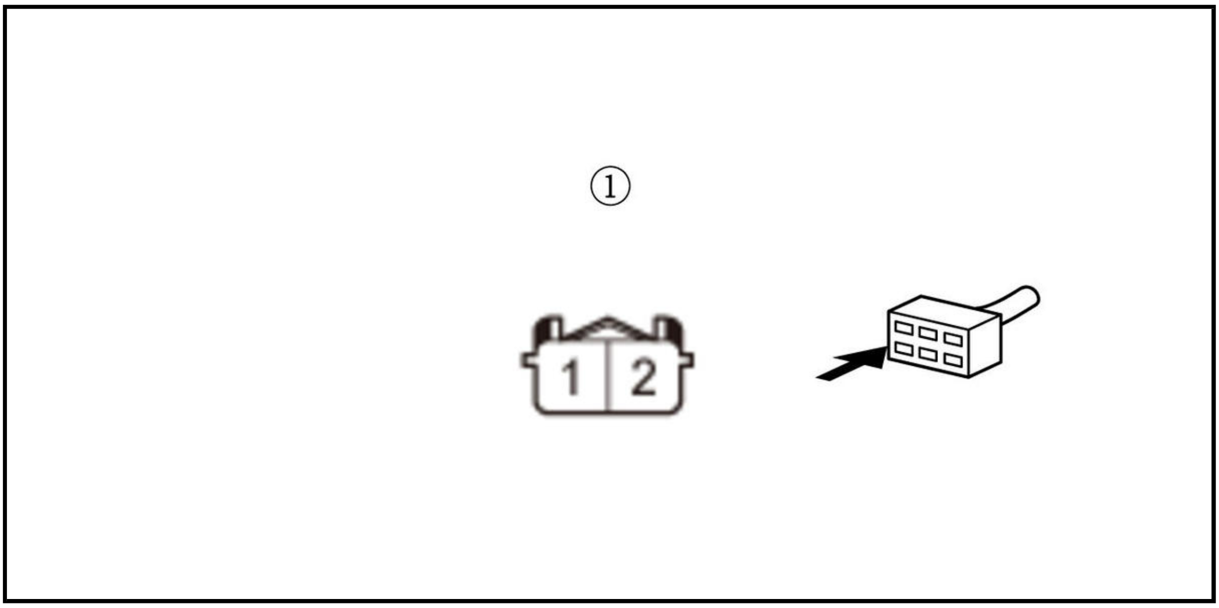
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IAT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and IAT sensor 2.

5. Open wire check (ITA2 (INTA) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

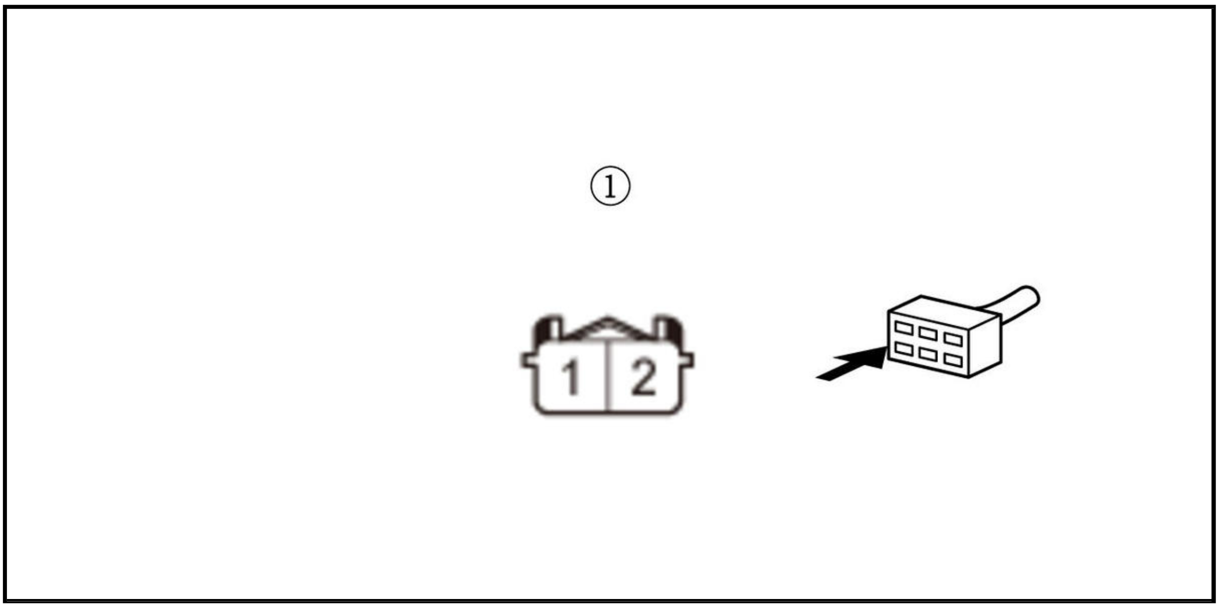
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IAT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 55**



Is there continuity?

YES

The ITA2 (INTA) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ITA2 (INTA) wire between the PCM (E55) and IAT sensor 2.

DTC P00CF (1.5 L ENGINE)

DTC P00CF : Turbocharger Boost Sensor/BARO Sensor Incorrect Correlation

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P00CF is indicated alone, do the troubleshooting for P0236 using the on-board snapshot for P00CF.
- If any of the DTCs listed below are indicated at the same time as DTC P00CF, troubleshoot those DTCs first, then recheck for P00CF.

  P0069: BARO sensor

  P0236: Turbocharger boost sensor

DTC Description	Confirmed DTC	Pending DTC
P00CF Turbocharger Boost Sensor Incorrect Correlation	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0069 BARO Sensor Circuit Range/Performance Problem	B	B

DTC Description	Confirmed DTC	Pending DTC
P00CF Turbocharger Boost Sensor/BARO Sensor Incorrect Correlation	B	B
P0236 Turbocharger Boost Sensor Circuit Range/Performance Problem	B	B

Are DTC P0069 or P0236 and P00CF indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC P0069** and **DTC P0236** .

DTC P00FE (1.5 L ENGINE) (2020 2021)

DTC P00FE : EVAP Vent Line Blockage

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P00FE EVAP Vent Line Blockage	B	B

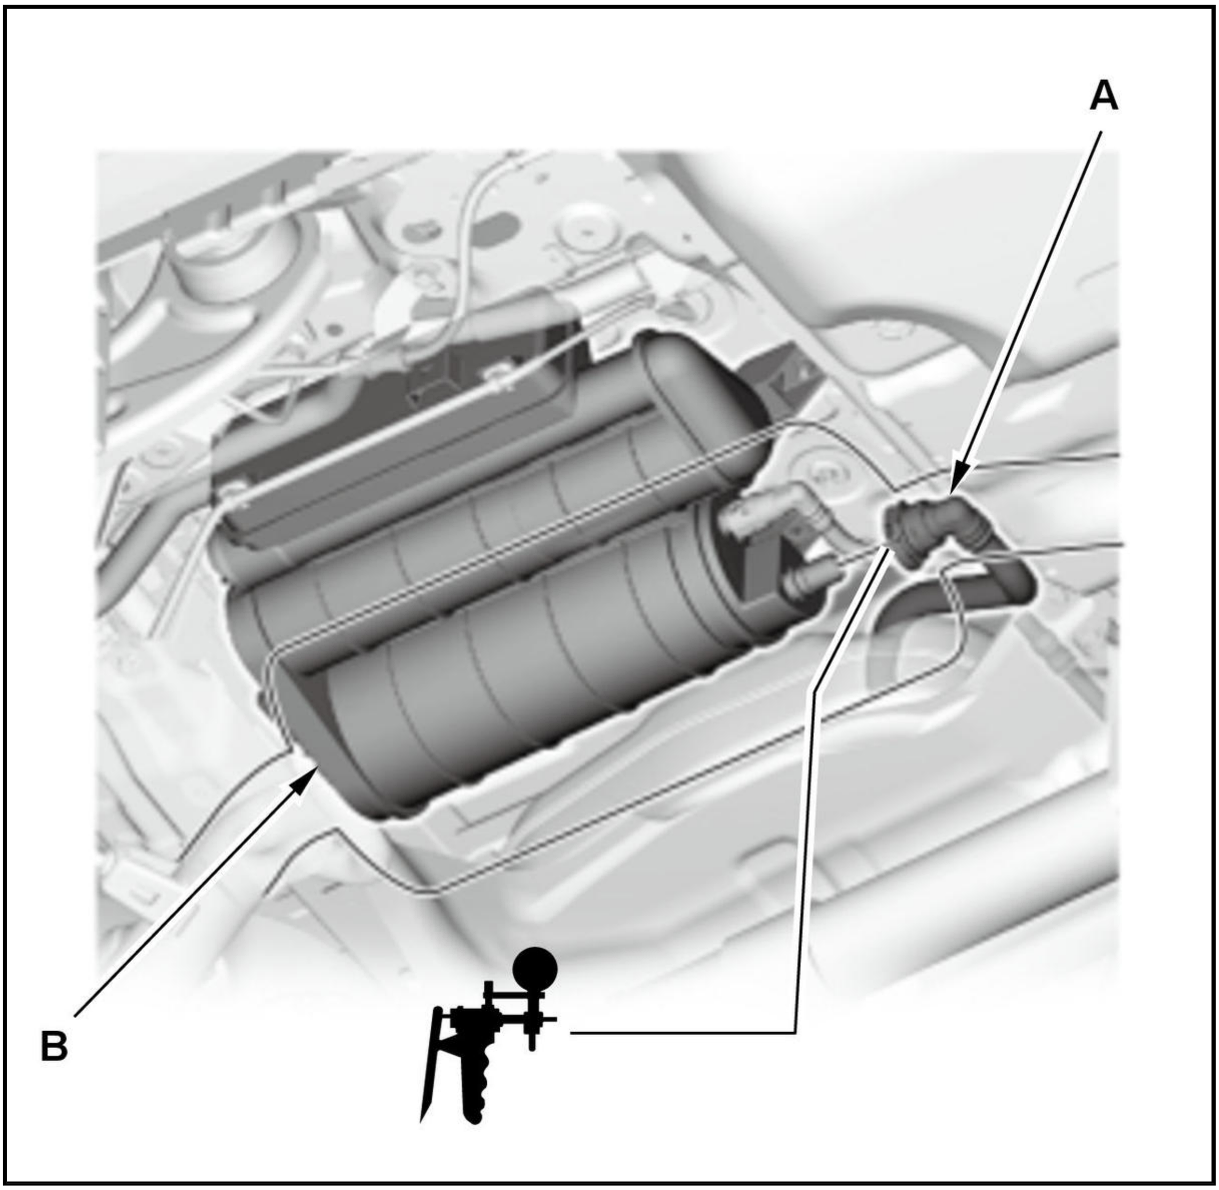
DTC (PGM-FI)

1. Fuel tank vapor control valve/fuel vent tube check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Insert the emergency fuel funnel into the fuel filler neck** .

   -3. Disconnect the fuel vent tube (A) from the EVAP canister (B), and connect a vacuum pump/gauge, 0-30 inHg, to the fuel vent tube as shown.



-4. Apply vacuum to the fuel vent tube.

Does it hold the vacuum?

YES

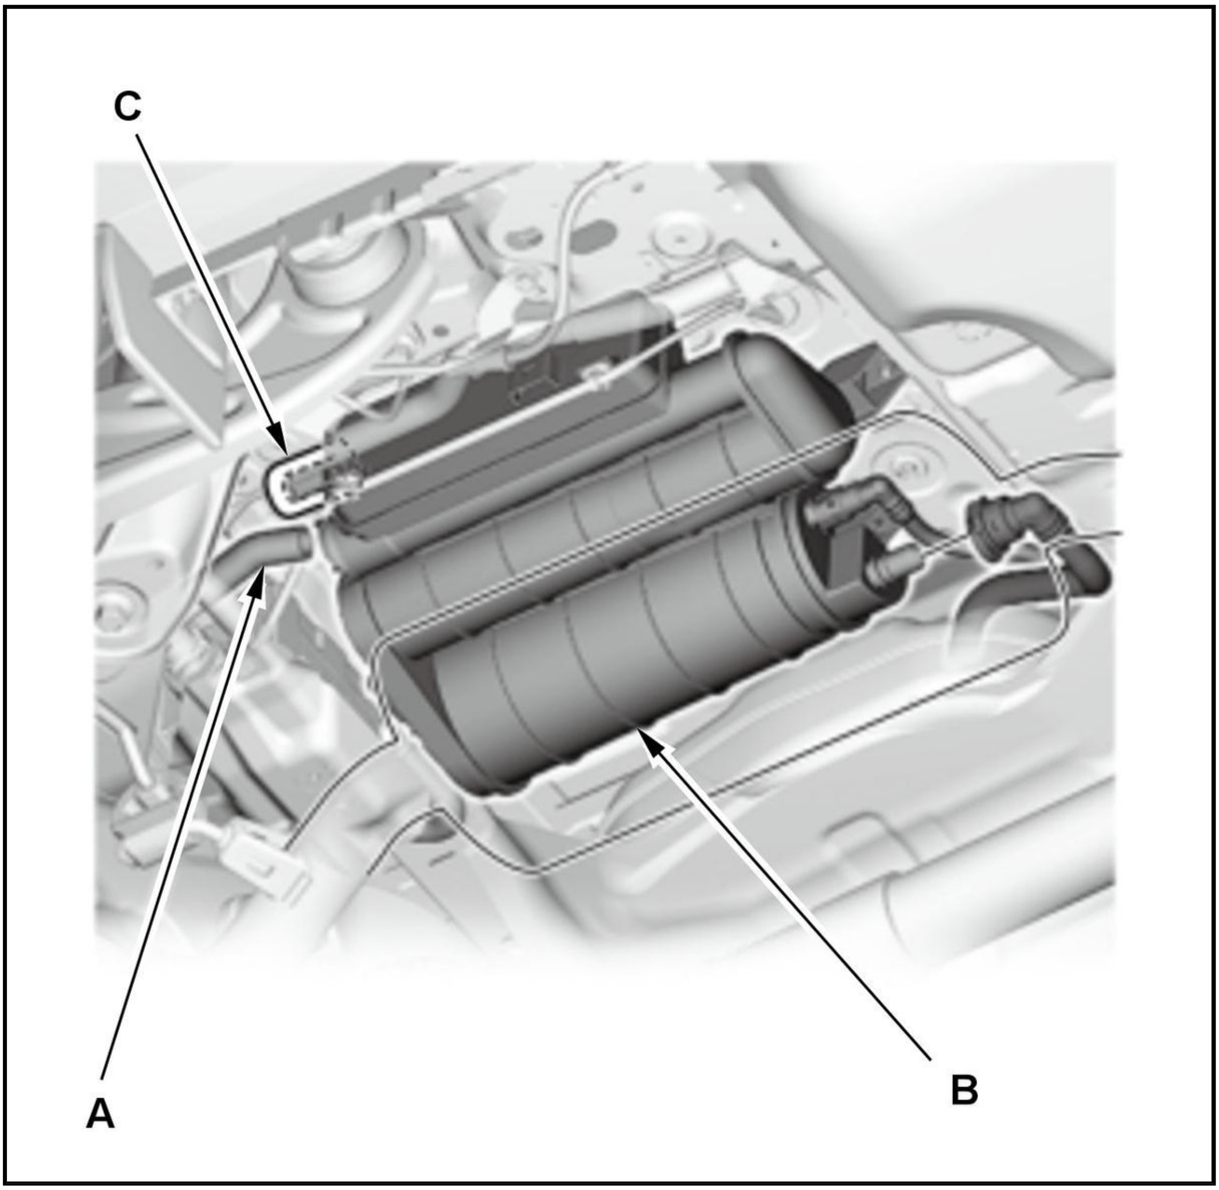
Replace the fuel tank .

NO

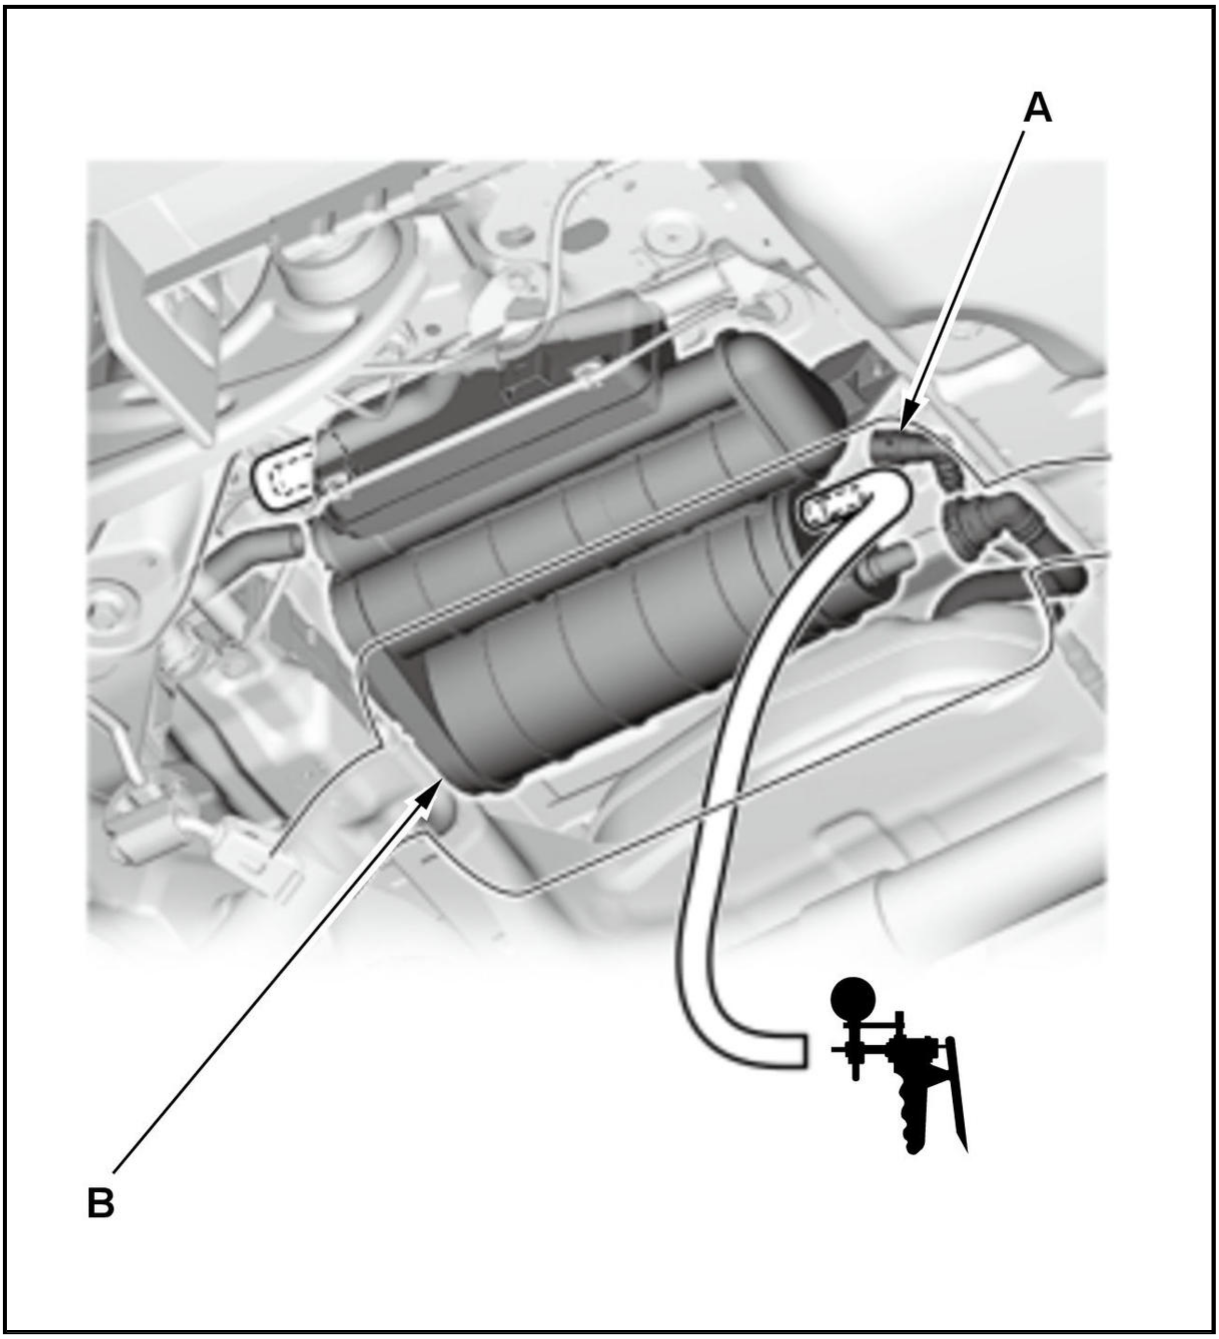
Go to step 2.

2. EVAP canister check 1

-1. Disconnect drain hose A from the EVAP canister (B), then plug the drain tube port (C).



-2. Disconnect the EVAP canister purge hose (A) from the EVAP canister (B), then connect the vacuum pump/gauge, 0-30 inHg, to the EVAP canister as shown.



-3. Apply vacuum to the EVAP canister.

Does it hold the vacuum?

YES

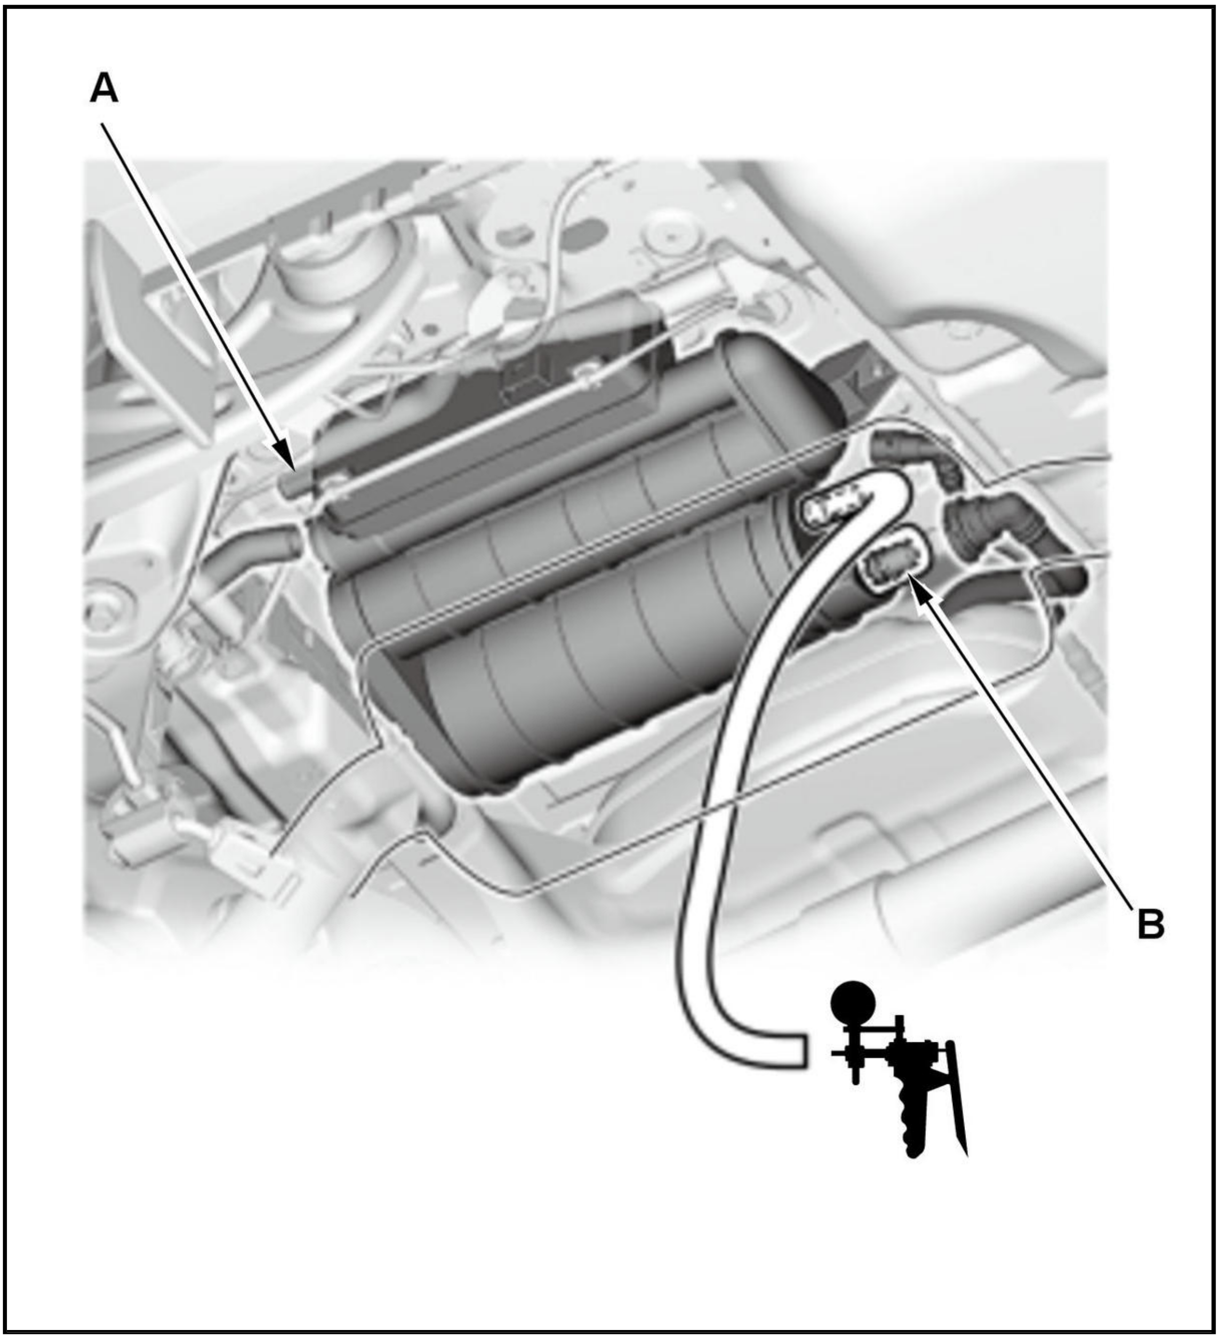
Replace the EVAP canister .

NO

Go to step 3.

3. EVAP canister check 2

-1. Remove the plug from the drain tube port (A) and plug the fuel vent tube port (B), then connect the vacuum pump/gauge, 0-30 inHg, to the EVAP canister as shown.



-2. Apply vacuum to the EVAP canister.

Does it hold the vacuum?

YES

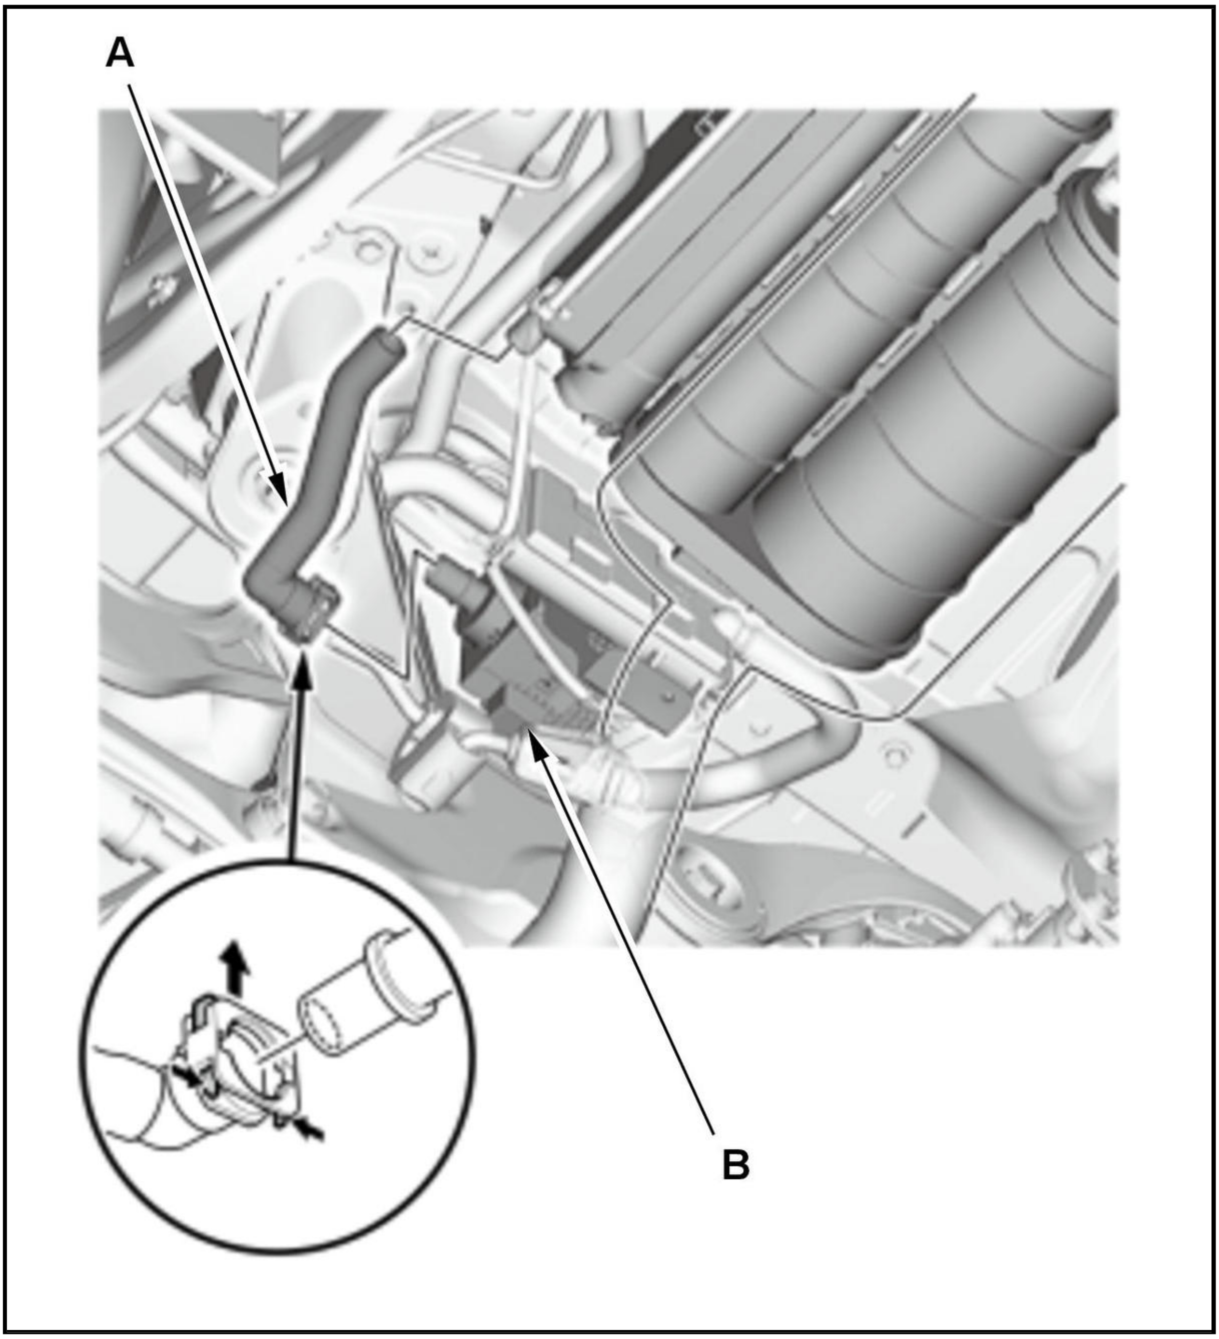
Replace the EVAP canister .

NO

Go to step 4.

4. Drain hose A visual check

-1. Disconnect drain hose A from the EVAP leak check module (B).



-2. Visually check drain hose A for deformation, foreign object clogged, or restrictions.

Is the hose OK?

YES

Replace the EVAP leak check module .

NO

Replace drain hose A .

DTC P0100 (1.5 L ENGINE)

DTC P0100 : MAF Sensor Circuit Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0100 MAF Sensor Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Wait 2 seconds or more.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0100 MAF Sensor Circuit Malfunction	B	B

   Is DTC P0100 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (FGP line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

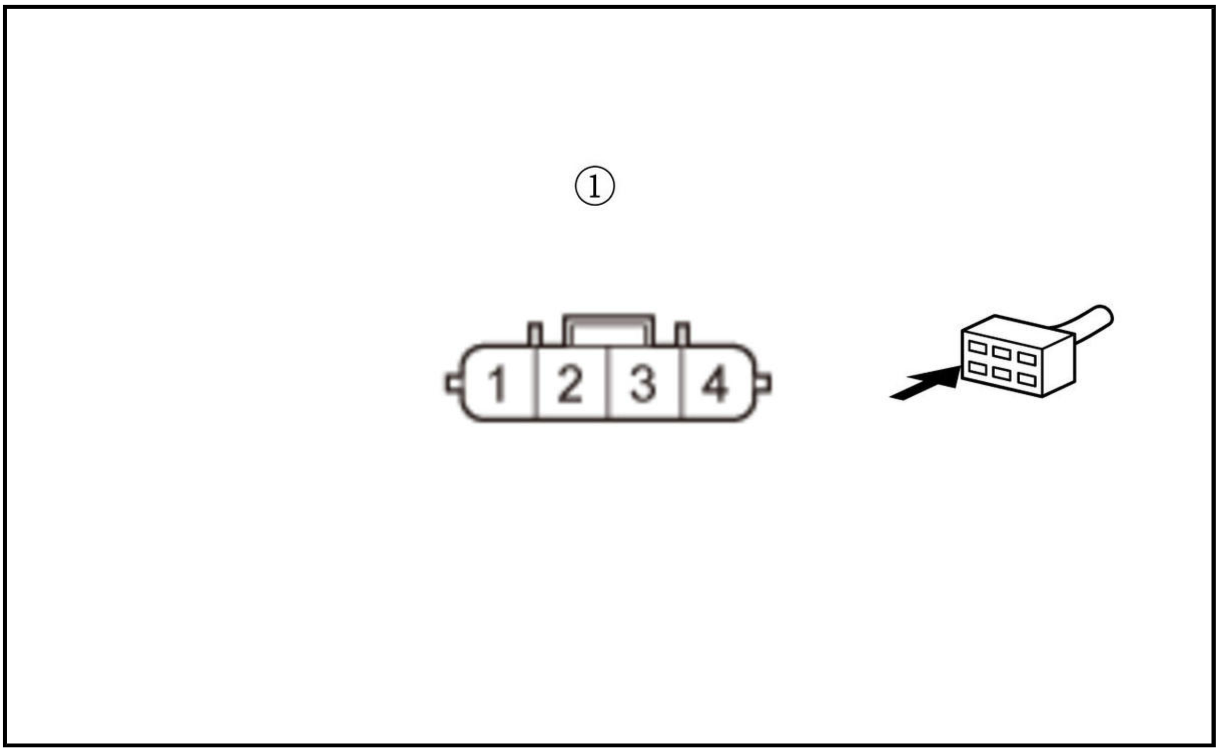
   -2. Disconnect the following connector.

MAF sensor/IAT sensor 1 4P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 2: ①
Test point 2	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 6.

NO

Go to step 3.

3. Shorted wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

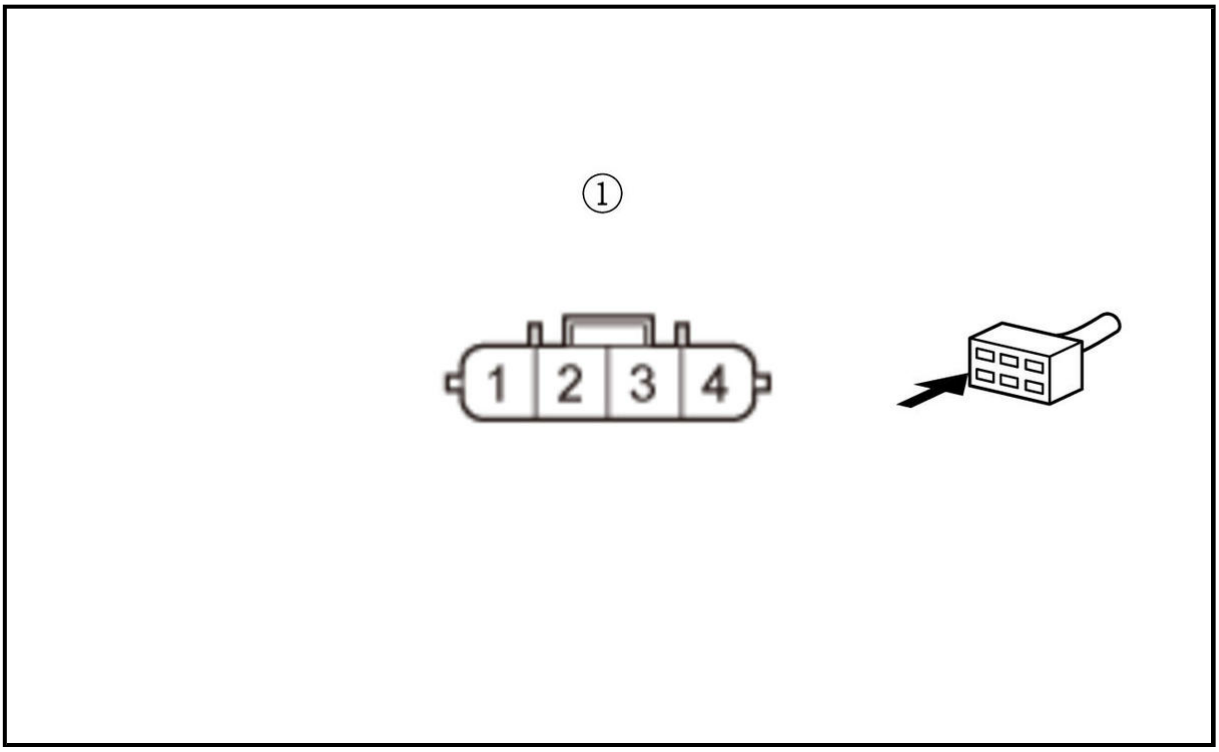
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the VCC2 wire between the PCM (E77) and the MAF sensor/IAT sensor 1.

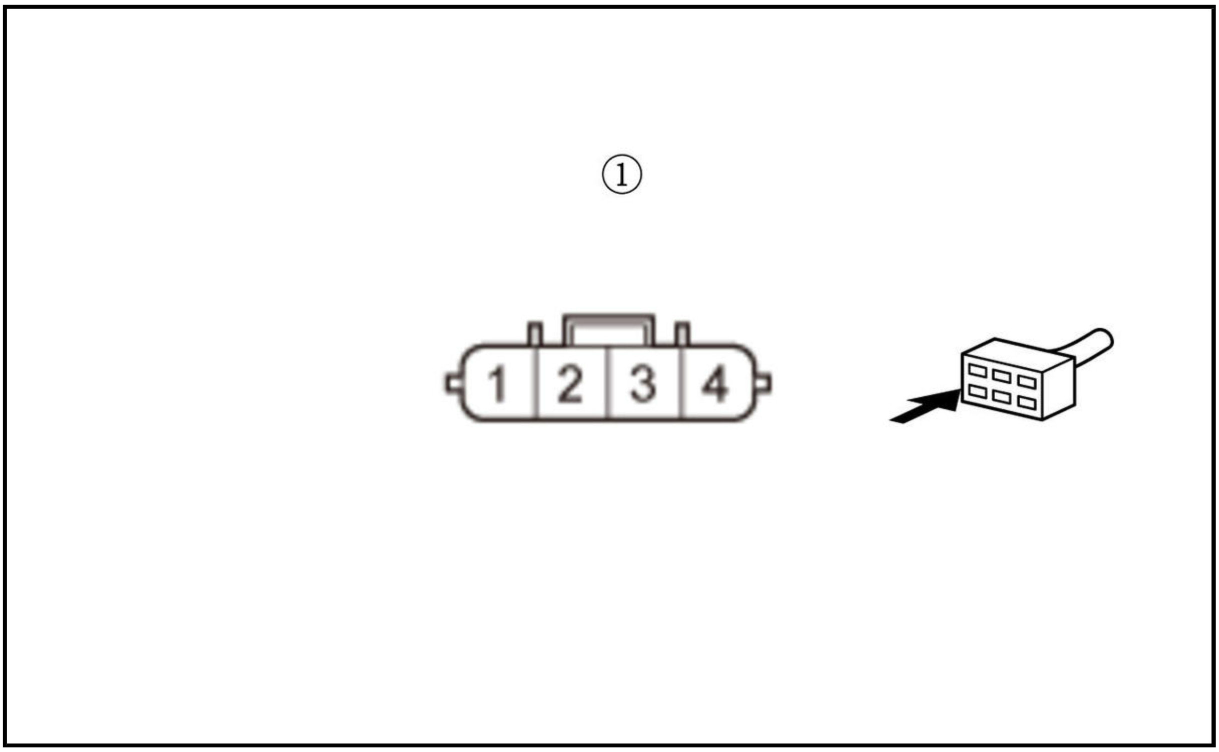
NO

The VCC2 wire is not shorted. Go to step 4.

4. Open wire check (VCC2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there continuity?

YES

The VCC2 wire is OK. Go to step 5.

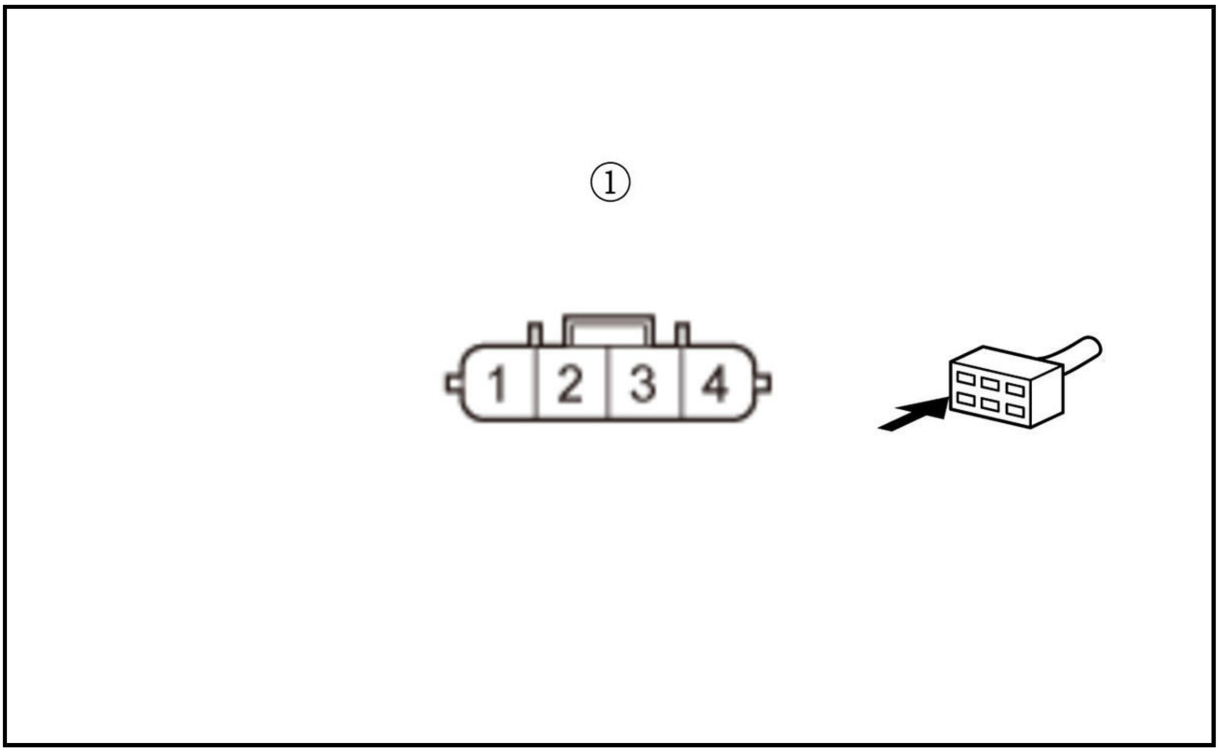
NO

Repair an open in the VCC2 wire between the PCM (E77) and the MAF sensor/IAT sensor 1.

5. Open wire check (SG2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and the MAF sensor/IAT sensor 1.

6. Shorted wire check (FGP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

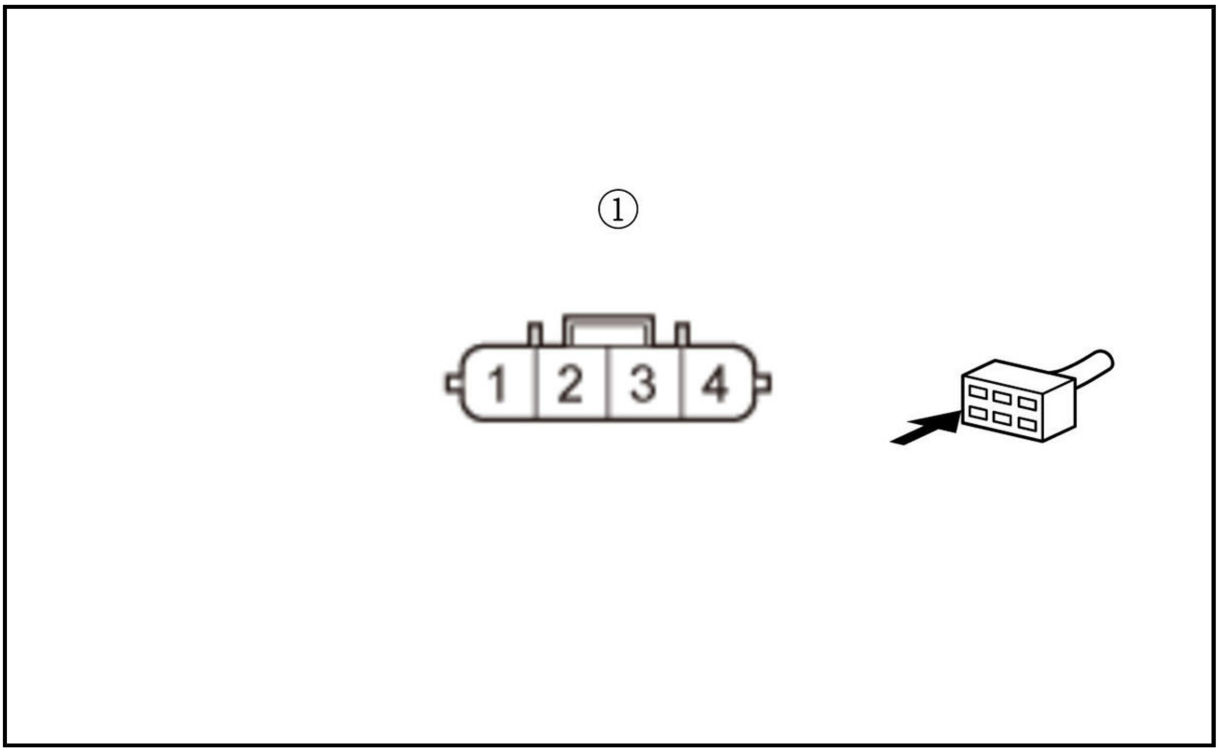
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the FGP wire between the PCM (E61) and the MAF sensor/IAT sensor 1.

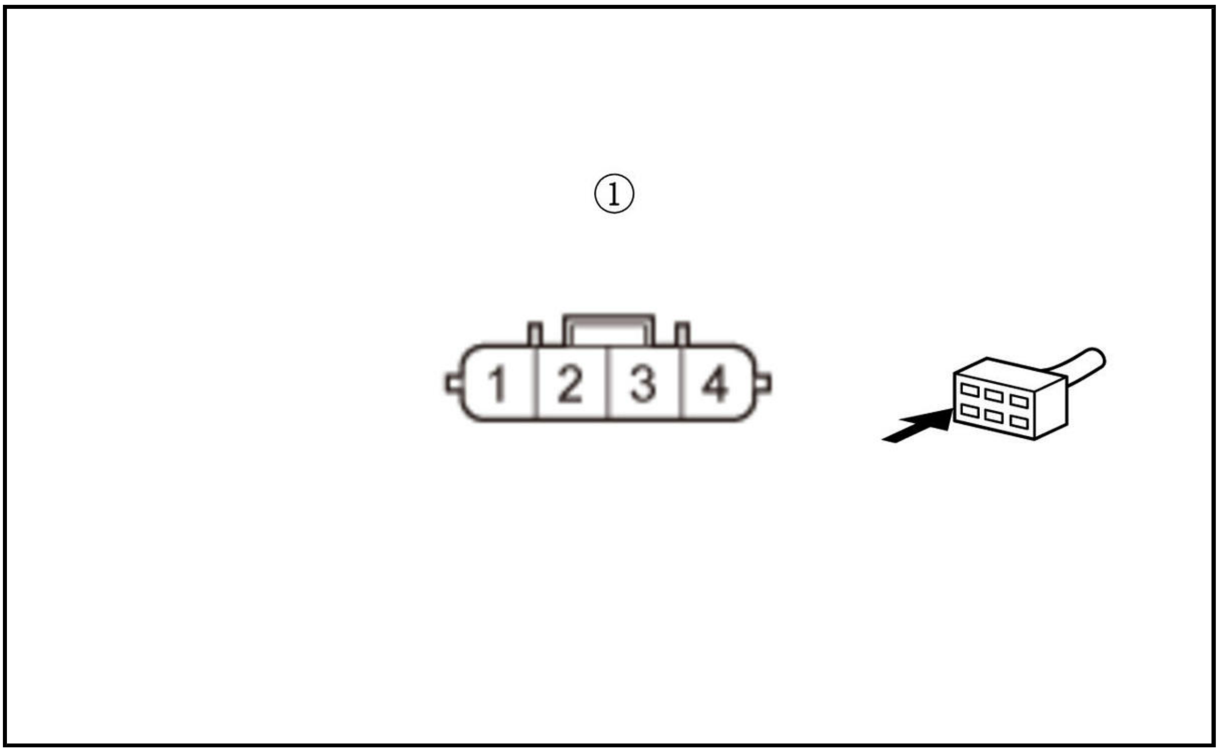
NO

The FGP wire is not shorted to ground. Go to step 7.

7. Open wire check (FGP line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 1: ①
Test point 2	PCM connector E (80P) No. 61



Is there continuity?

YES

The FGP wire is not open. Go to step 8.

NO

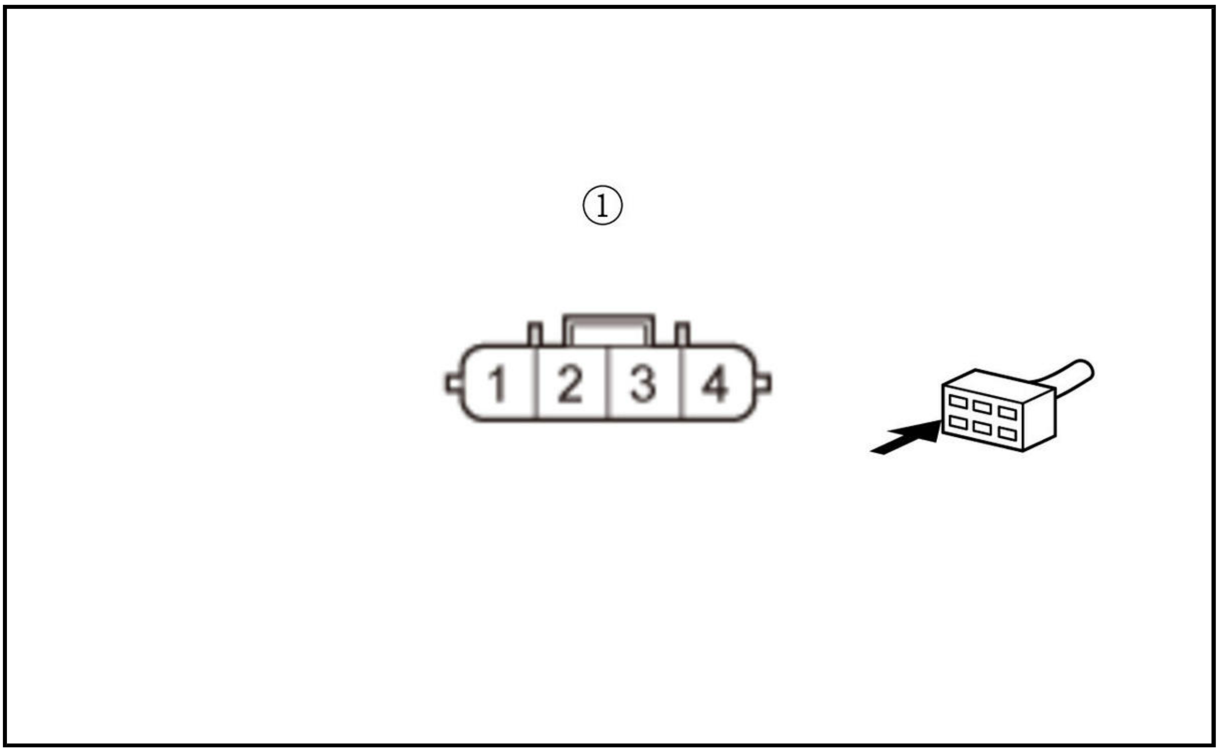
Repair an open in the FGP wire between the PCM (E61) and the MAF sensor/IAT sensor 1.

8. Shorted wire check (FGP line to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there any voltage?

YES

Repair a short to power in the FGP wire between the PCM (E61) and the MAF sensor/IAT sensor 1.

NO

The FGP wire is OK. Go to step 9.

9. MAF sensor/IAT sensor 1 check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good MAF sensor/IAT sensor 1** .

-3. Reconnect all connectors.

-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Clear the DTC with the HDS.

-7. Wait 2 seconds or more.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0100 MAF Sensor Circuit Malfunction	B	B

Is DTC P0100 indicated?

YES

The MAF sensor/IAT sensor 1 is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original MAF sensor/IAT sensor 1 .

DTC P0101 (1.5 L ENGINE)

DTC P0101 : MAF Sensor Circuit Range/Performance Problem (Out of Range)

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If DTC P2073, P2074, P2228, and/or P2229 are stored at the same time as DTC P0101, troubleshoot those DTCs first, then recheck for DTC P0101.

DTC Description	Confirmed DTC	Pending DTC
P0101 MAF Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Parts condition check:

   Check for poor connections or damage to these parts:

   - PCV valve
   - PCV hose
   - Intake air duct
   - Air cleaner
   - Purge (PCS) line
   - All parts through the turbocharger joint to the throttle body

   Are the parts OK?

   YES

   Go to step 2.

   NO

   Repair or replace the damaged part (s).

2. Intake air duct visual check

   -1. Check for damage or looseness of the intake air duct in the air cleaner.

   Is it OK?

   YES

   Go to step 3.

   NO

   Reconnect or replace the intake air duct in the air cleaner.

3. Air cleaner element visual check

   -1. Check for a dirty air cleaner element.

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 4.

4. MAF sensor signal check (without engine running)

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	520-10000	Hz	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

NO

Replace the MAF sensor/IAT sensor 1 .

5. MAF sensor signal check (with engine running)

-1. Start the engine and let it idle.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	520-10000	Hz	B	B

Do the current condition (s) match the threshold?

YES

Go to step 6.

NO

Replace the MAF sensor/IAT sensor 1 .

6. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle at least 5 seconds.

-5. Drive the vehicle at 37 mph (60 km/h) at least 5 seconds.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0101 MAF Sensor Circuit Range/Performance Problem	B	B

Is DTC P0101 indicated?

YES

The failure is duplicated. **Replace the MAF sensor/IAT sensor 1** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0101 (2.4 L ENGINE) (2018 2019)

DTC P0101 : MAF Sensor Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0101 MAF Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode, and wait 2 seconds.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	Less than 0.59	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	More than 4.89	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 8.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Open wire check (IG1 ACG/IG1 (MAIN)/IG1 (AFM) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

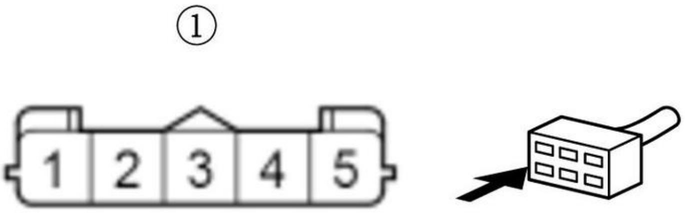
-2. Disconnect the following connector.

MAF sensor/IAT sensor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 ACG/IG1 (MAIN)/IG1 (AFM) wire is OK. Go to step 4.

NO

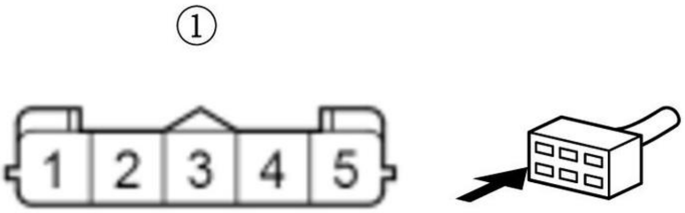
Repair an open in the IG1 ACG/IG1 (MAIN)/IG1 (AFM) wire between the MAF sensor/IAT sensor and the No. D21 (10 A) fuse in the under-dash fuse/relay box.

4. Determine possible failure area (VGP line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 170-210 kΩ?

YES

Go to step 7.

NO

Go to step 5.

5. Shorted wire check (VGP line)

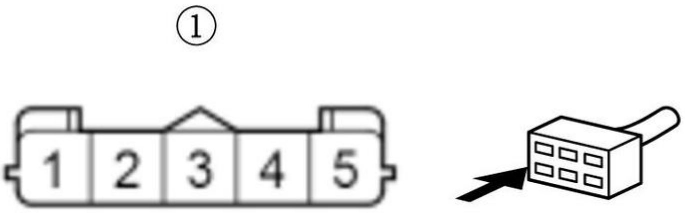
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the VGP wire between the PCM (B32) and the MAF sensor/IAT sensor.

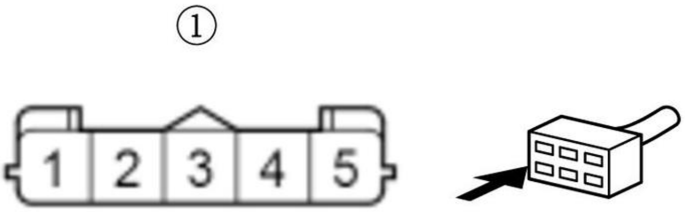
NO

The VGP wire is not shorted. Go to step 6.

6. Open wire check (VGP line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 5: ①
Test point 2	**PCM connector B (51P) No. 32**



Is there continuity?

YES

The VGP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VGP wire between the PCM (B32) and the MAF sensor/IAT sensor.

7. MAF sensor/IAT sensor check

-1. Substitute a known-good MAF sensor/IAT sensor.

-2. Reconnect all connectors.

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Start the engine.

-6. Hold the engine speed at 2, 000 rpm without load (in P or N).

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0101 MAF Sensor Circuit Range/Performance Problem	B	B

Is DTC P0101 indicated?

YES

The MAF sensor/IAT sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original MAF sensor/IAT sensor .

8. Open wire check (VGM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

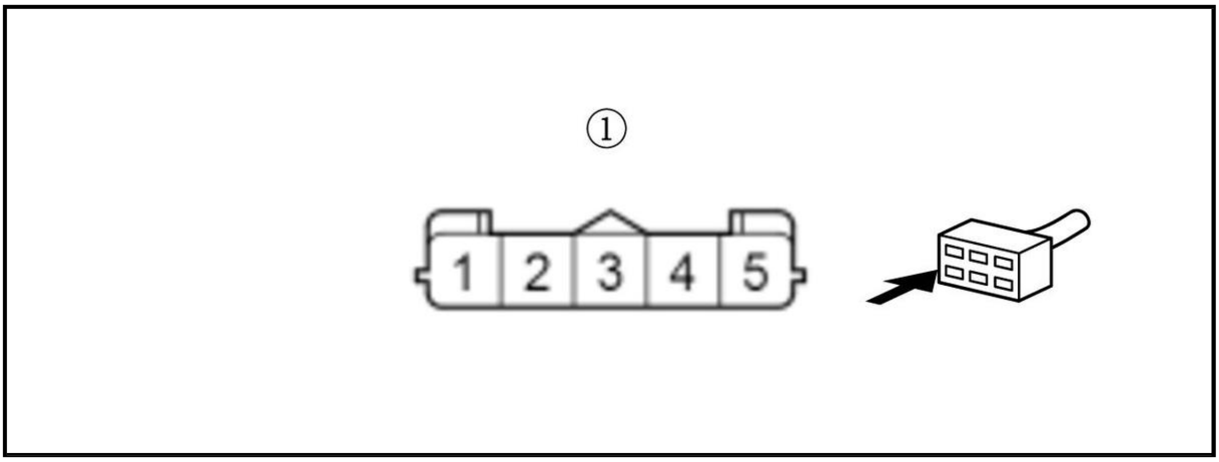
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

MAF sensor/IAT sensor 5P connector
PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 4: ①
Test point 2	**PCM connector B (51P) No. 33**



Is there continuity?

YES

The VGM wire is OK. Go to step 9.

NO

Repair an open in the VGM wire between the PCM (B33) and the MAF sensor/IAT sensor.

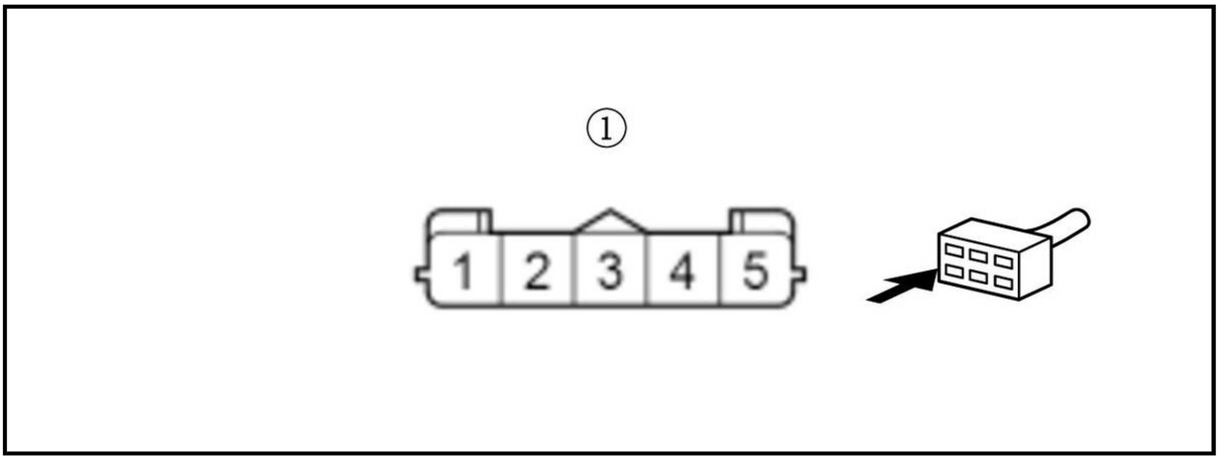
9. PCM internal circuit check

-1. Reconnect the following connector.

PCM connector B (51P)

-2. Connect terminals A and B with a jumper wire.

Terminal A	MAF sensor/IAT sensor 5P connector (female terminals) No. 4: ①
Terminal B	MAF sensor/IAT sensor 5P connector (female terminals) No. 5: ①



-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0101 MAF Sensor Circuit Range/Performance Problem	B	B

Is DTC P0101 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

The PCM internal circuit is OK. Replace the MAF sensor/IAT sensor .

DTC P0102 (2.4 L ENGINE) (2017 2018 2019)

DTC P0102 : MAF Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0102 MAF Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode, and wait 2 seconds.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	Less than 0.1	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Open wire check (IG1 ACG/IG1 (MAIN)/IG1 (AFM) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

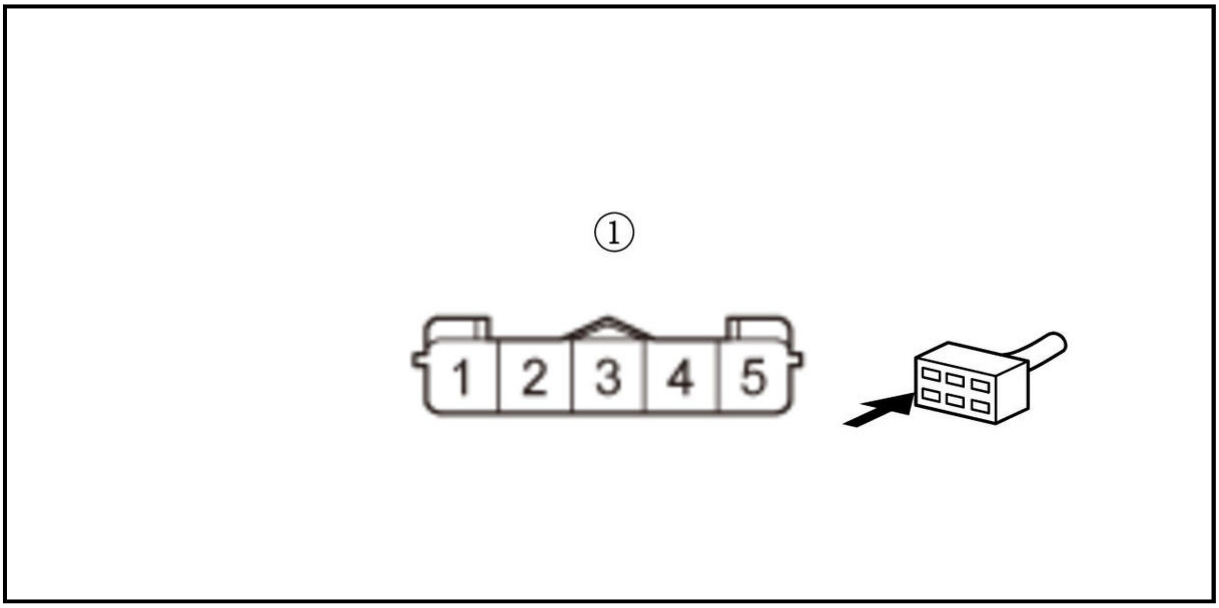
MAF sensor/IAT sensor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 5P connector: disconnected

Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 ACG/IG1 (MAIN)/IG1 (AFM) wire is OK. Go to step 3.

NO

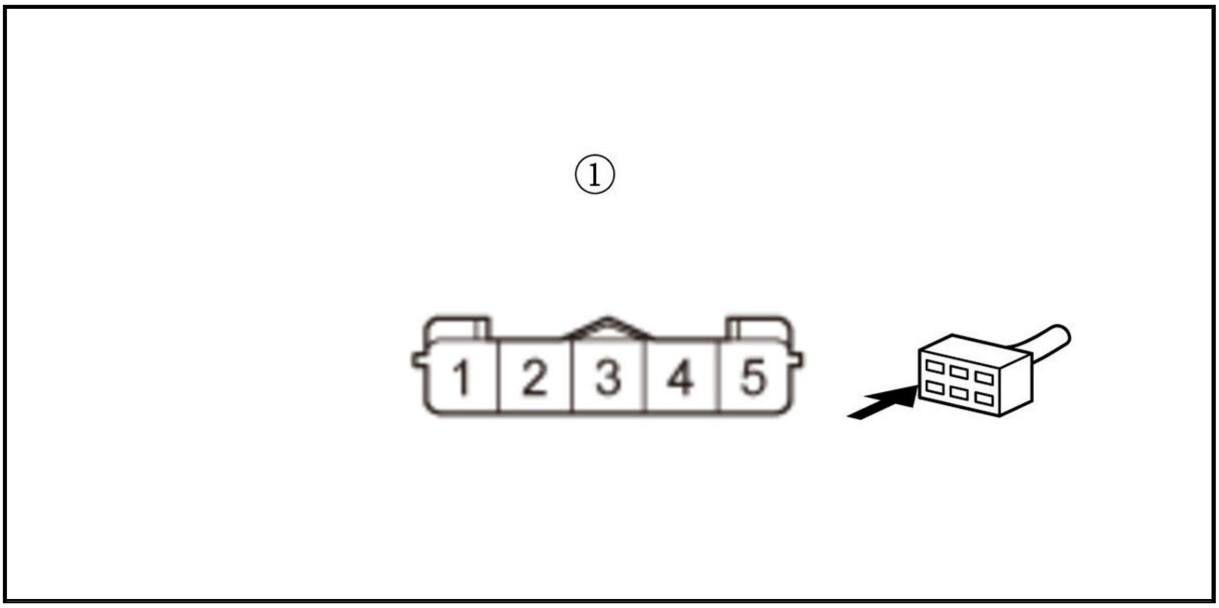
Repair an open in the IG1 ACG/IG1 (MAIN)/IG1 (AFM) wire between the MAF sensor/IAT sensor and the No. D21 (10 A) fuse in the under-dash fuse/relay box.

3. Determine possible failure area (VGP line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 170-210 kΩ?

YES

Go to step 6.

NO

Go to step 4.

4. Shorted wire check (VGP line)

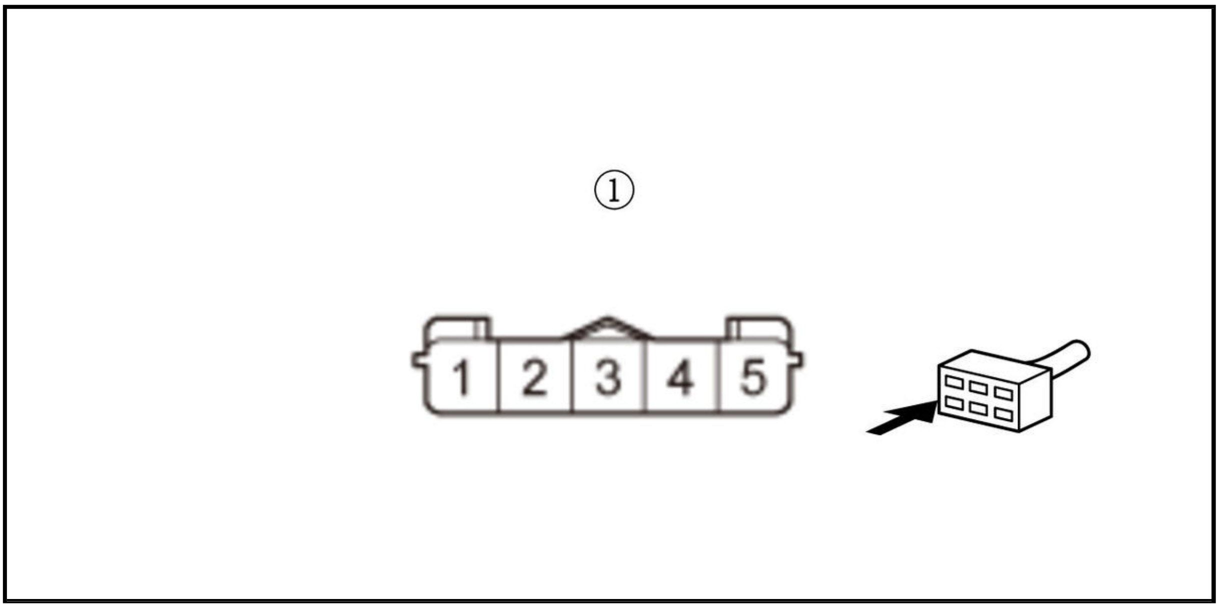
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the VGP wire between the PCM (B32) and the MAF sensor/IAT sensor.

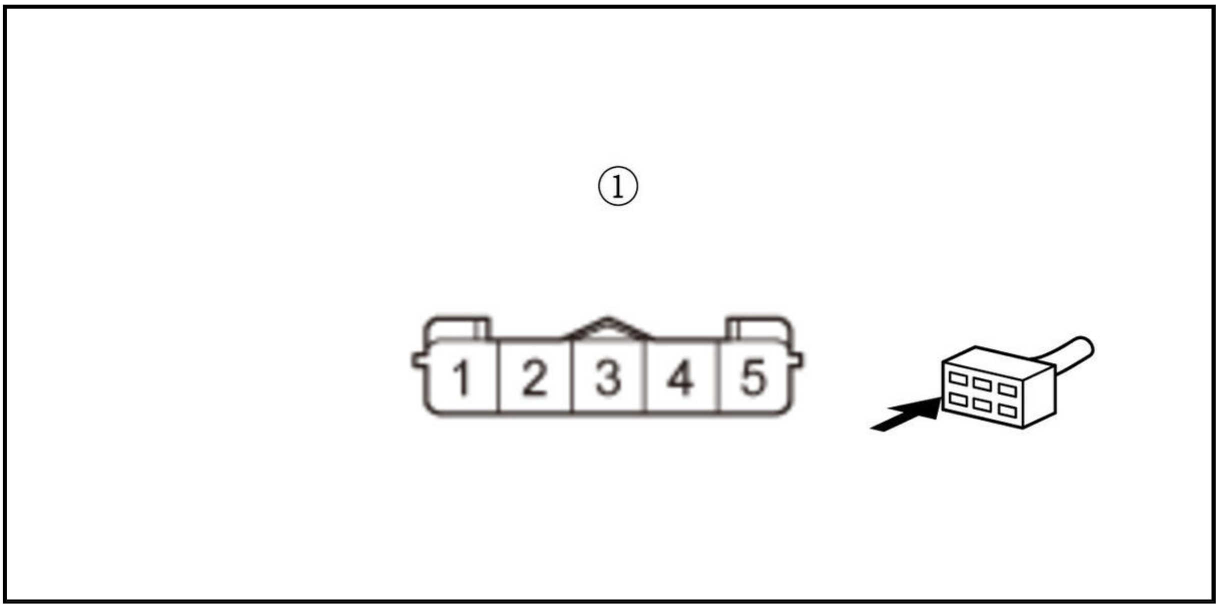
NO

The VGP wire is not shorted. Go to step 5.

5. Open wire check (VGP line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 5: ①
Test point 2	**PCM connector B (51P) No. 32**



Is there continuity?

YES

The VGP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VGP wire between the PCM (B32) and the MAF sensor/IAT sensor.

6. MAF sensor/IAT sensor check

-1. Substitute a known-good MAF sensor/IAT sensor.

-2. Reconnect all connectors.

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Start the engine.

-6. Hold the engine speed at 2, 000 rpm without load (in P or N).

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0102 MAF Sensor Circuit Low Voltage	B	B

Is DTC P0102 indicated?

YES

The MAF sensor/IAT sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Replace the original MAF sensor/IAT sensor .

DTC P0103 (2.4 L ENGINE) (2017 2018 2019)

DTC P0103 : MAF Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0103 MAF Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode, and wait 2 seconds.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	More than 4.89	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (VGM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

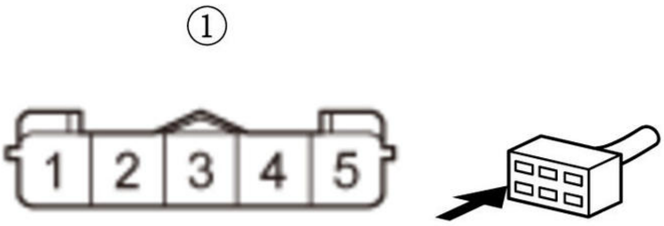
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

MAF sensor/IAT sensor 5P connector
PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 4: ①
Test point 2	**PCM connector B (51P) No. 33**



Is there continuity?

YES

The VGM wire is OK. Go to step 3.

NO

Repair an open in the VGM wire between the PCM (B33) and the MAF sensor/IAT sensor.

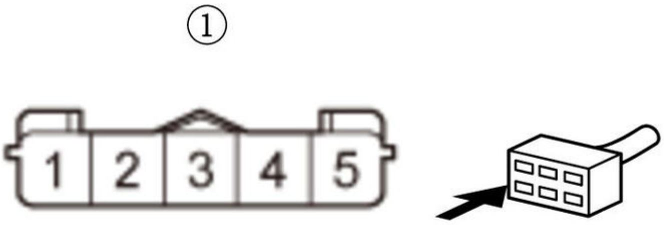
3. PCM internal circuit check

-1. Reconnect the following connector.

PCM connector B (51P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

The PCM internal circuit is OK. **Replace the MAF sensor/IAT sensor** .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P0105 (2.4 L ENGINE) (2018 2019)

DTC P0105 : MAP Sensor Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0105 MAP Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
MAP SENSOR	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
MAP SENSOR	More than 3.39	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 7.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (PB line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAP sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
MAP SENSOR	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 6.

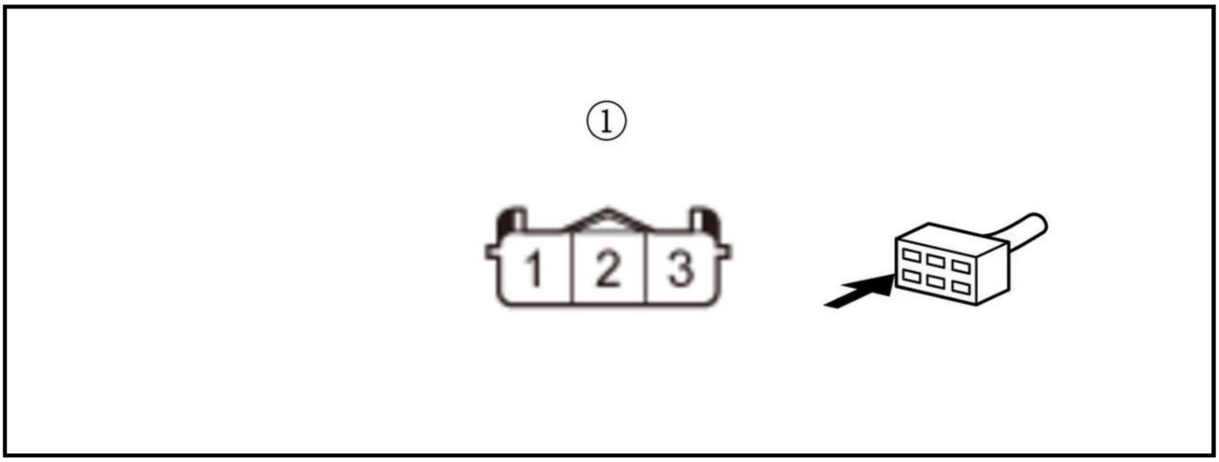
NO

Go to step 4.

4. Determine possible failure area (MAP sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the MAP sensor .

NO

Go to step 5.

5. Open wire check (VCC1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

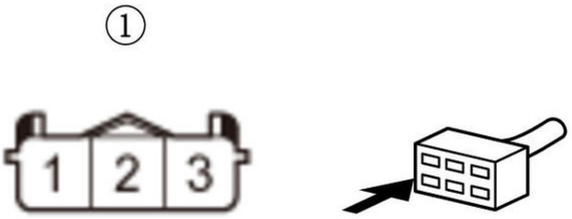
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector C (51P) No. 41**



Is there continuity?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC1 wire between the PCM (C41) and the MAP sensor.

6. Shorted wire check (PB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

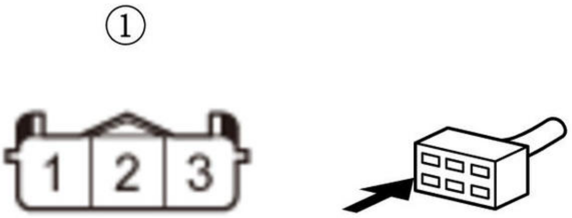
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PB wire between the PCM (C45) and the MAP sensor.

NO

The PB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

7. Determine possible failure area (MAP sensor, others)

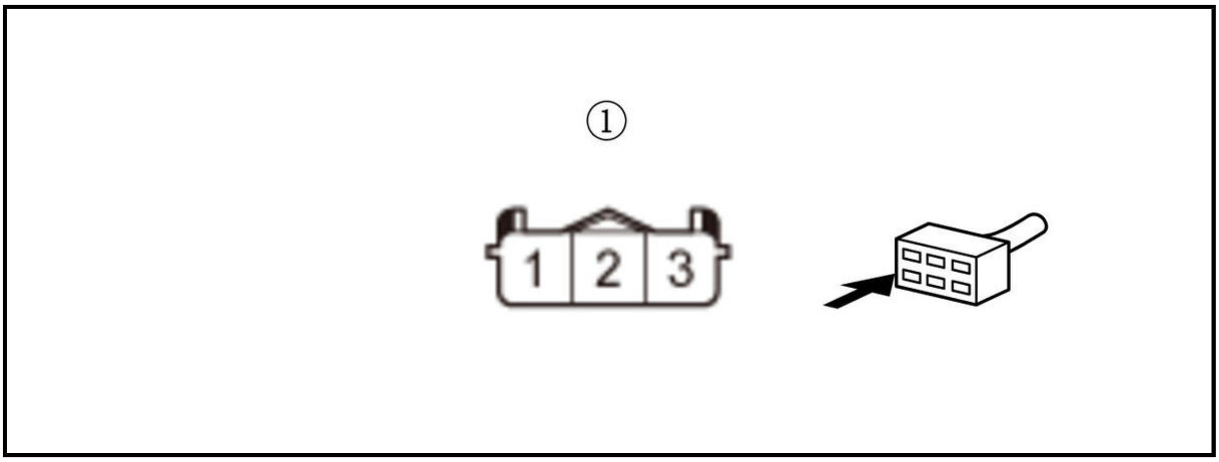
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAP sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	MAP sensor 3P connector (female terminals) No. 1: ①
Terminal B	MAP sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
MAP SENSOR	More than 3.39	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 8.

NO

Replace the MAP sensor .

8. Determine possible failure area (SG1 line, others)

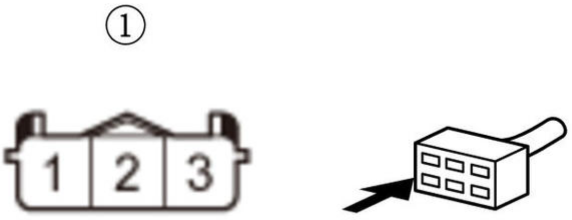
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the MAP sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 10.

NO

Go to step 9.

9. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

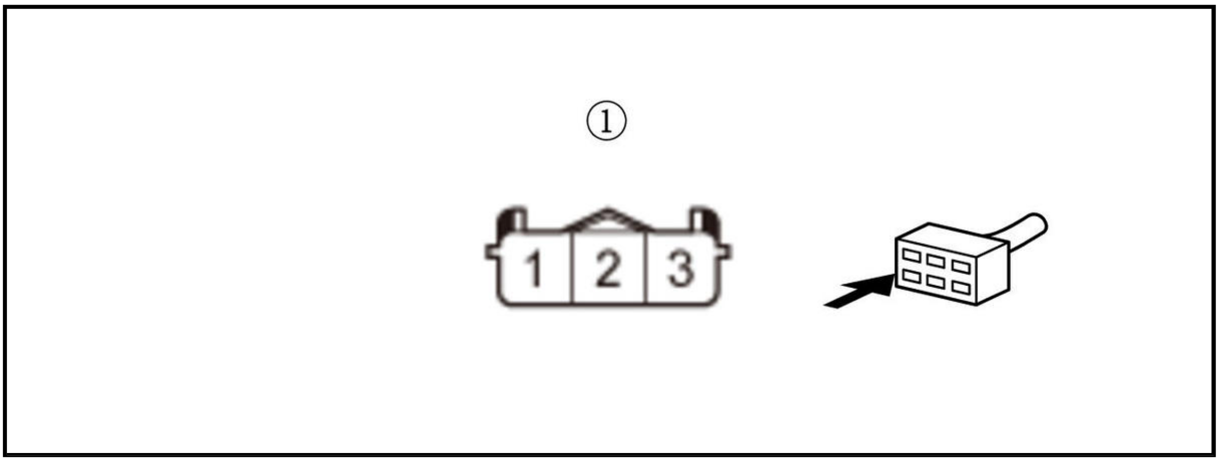
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 42**



Is there continuity?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (C42) and the MAP sensor.

10. Open wire check (PB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

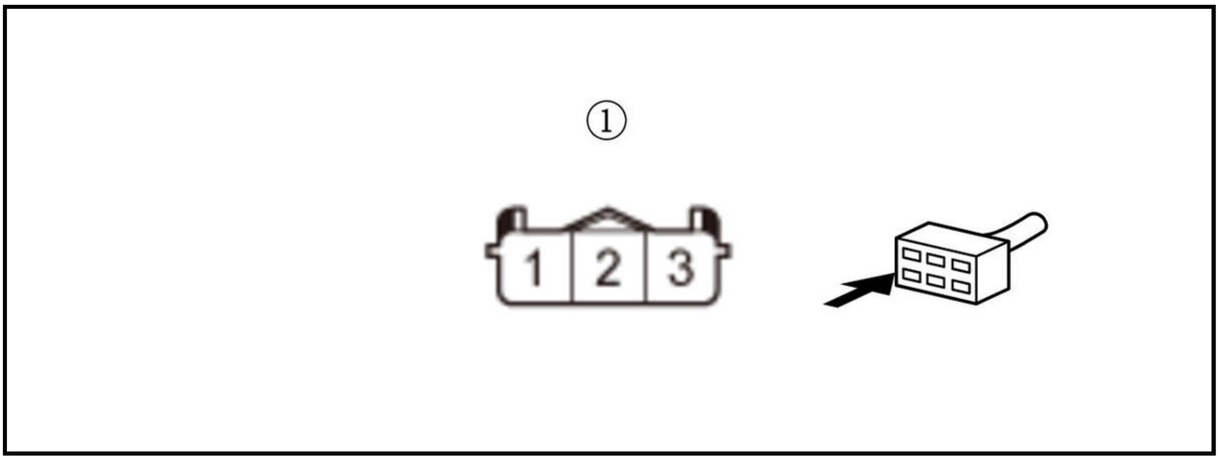
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector C (51P) No. 45**



Is there continuity?

YES

The PB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the PB wire between the PCM (C45) and the MAP sensor.

DTC P0107 (1.5 L ENGINE)

DTC P0107 : MAP Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0107 MAP Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP SENSOR	Less than 0.23	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (PB line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

MAP sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP SENSOR	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

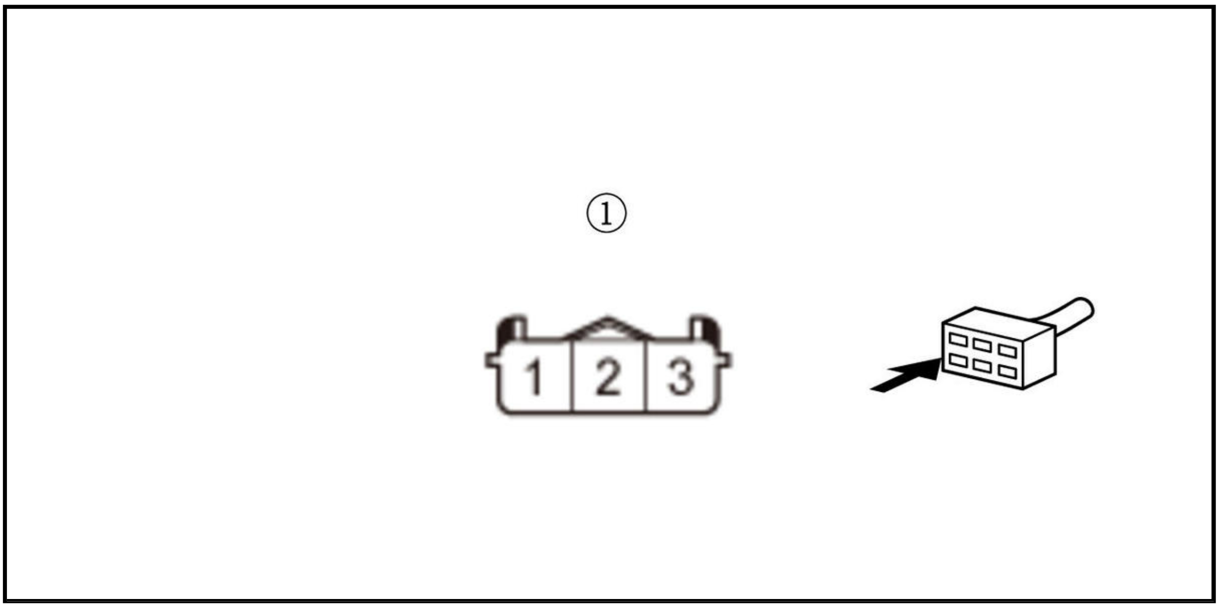
NO

Go to step 3.

3. Determine possible failure area (MAP sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the MAP sensor .

NO

Go to step 4.

4. Open wire check (VCC1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

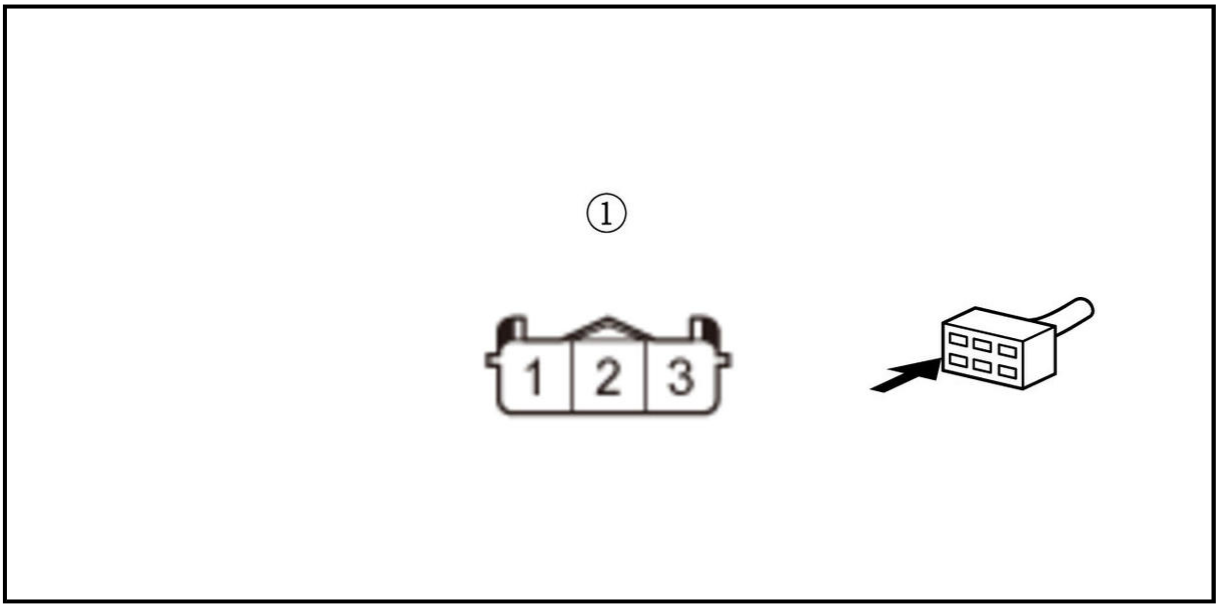
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 70**



Is there continuity?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC1 wire between the PCM (E70) and the MAP sensor.

5. Shorted wire check (PB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

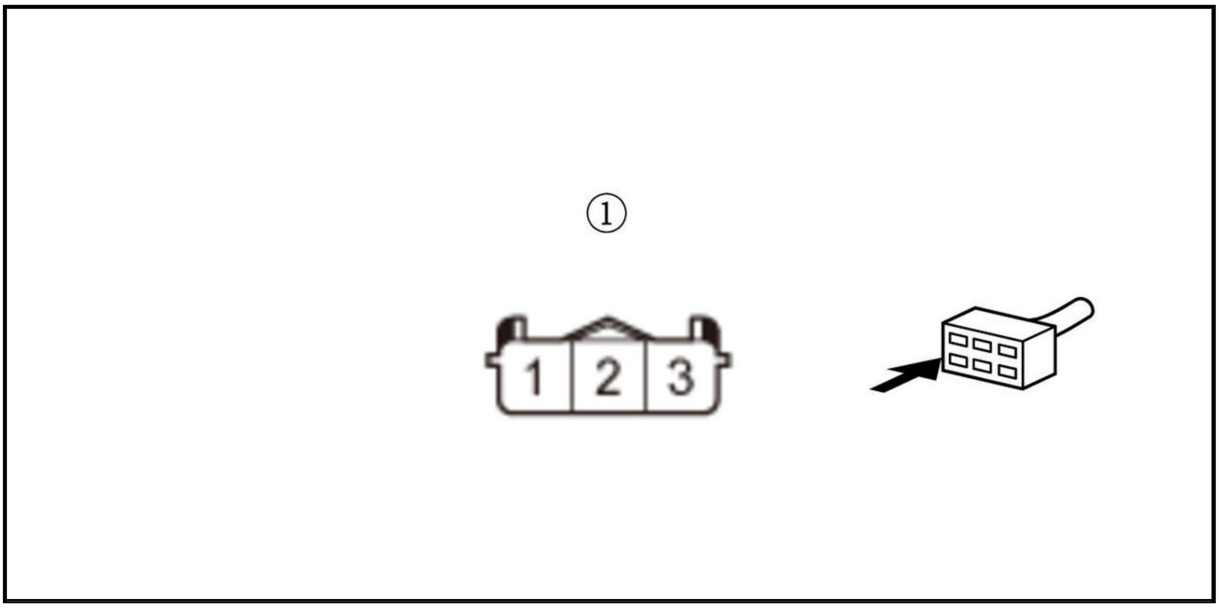
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PB wire between the PCM (E56) and the MAP sensor.

NO

The PB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0107 (2.4 L ENGINE) (2017 2018 2019)

DTC P0107 : MAP Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0107 MAP Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP SENSOR	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (PB line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAP sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
MAP SENSOR	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

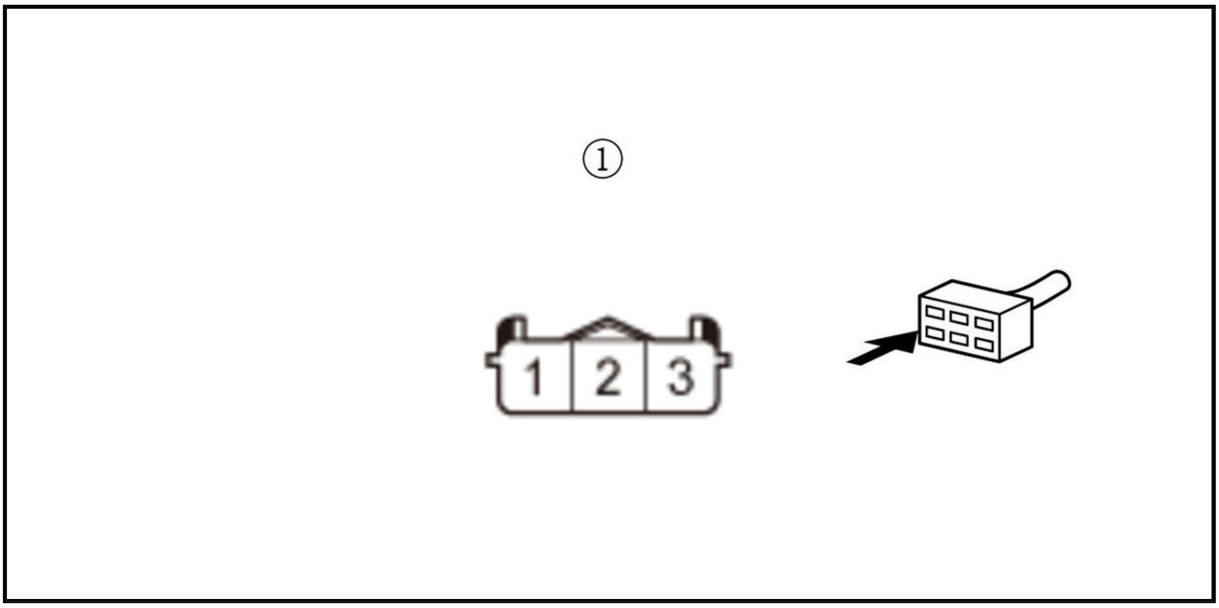
NO

Go to step 3.

3. Determine possible failure area (MAP sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the MAP sensor .

NO

Go to step 4.

4. Open wire check (VCC1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

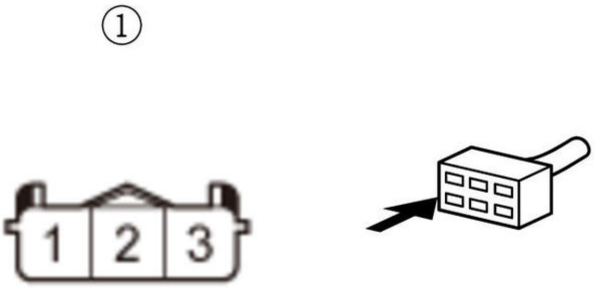
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector C (51P) No. 41**



Is there continuity?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VCC1 wire between the PCM (C41) and the MAP sensor.

5. Shorted wire check (PB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

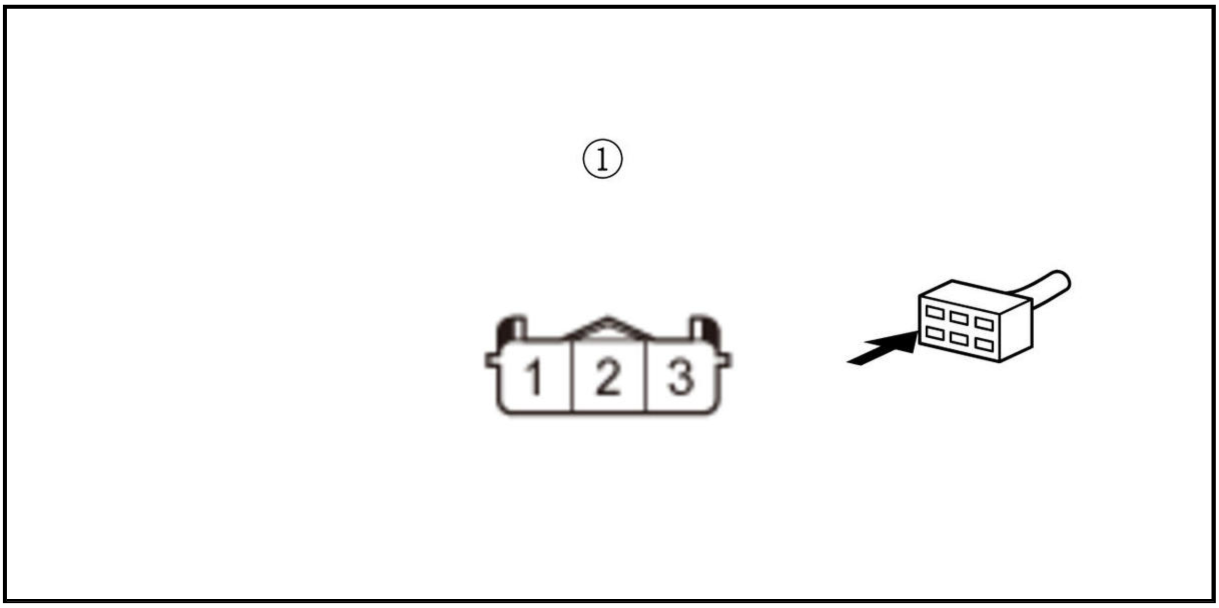
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PB wire between the PCM (C45) and the MAP sensor.

NO

The PB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P0108 (1.5 L ENGINE)

DTC P0108 : MAP Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0108 MAP Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the MAP SENSOR in the DATA LIST with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
MAP SENSOR	More than 4.49	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (MAP sensor, others)

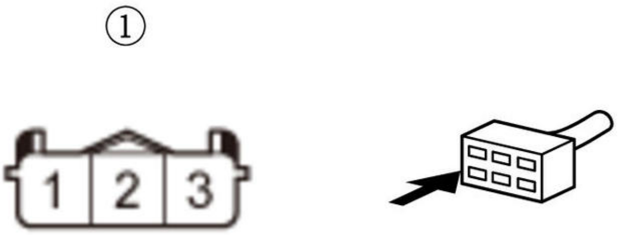
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAP sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	MAP sensor 3P connector (female terminals) No. 1: ①
Terminal B	MAP sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP SENSOR	More than 4.49	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the MAP sensor .

3. Determine possible failure area (SG1 line, others)

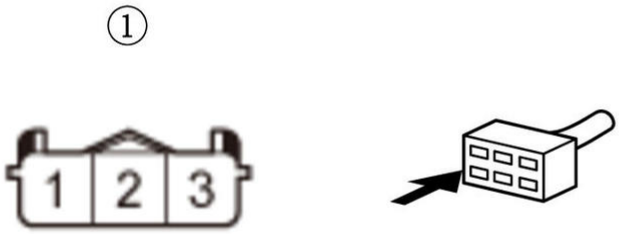
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the jumper wire from the MAP sensor 3P connector.

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

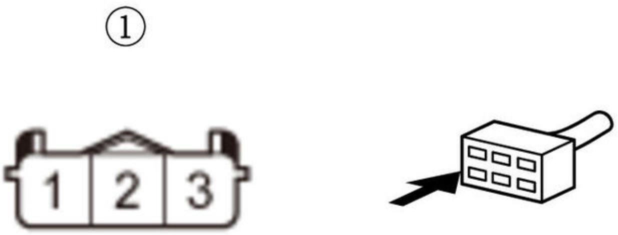
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 71**



Is there continuity?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (E71) and the MAP sensor.

5. Open wire check (PB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

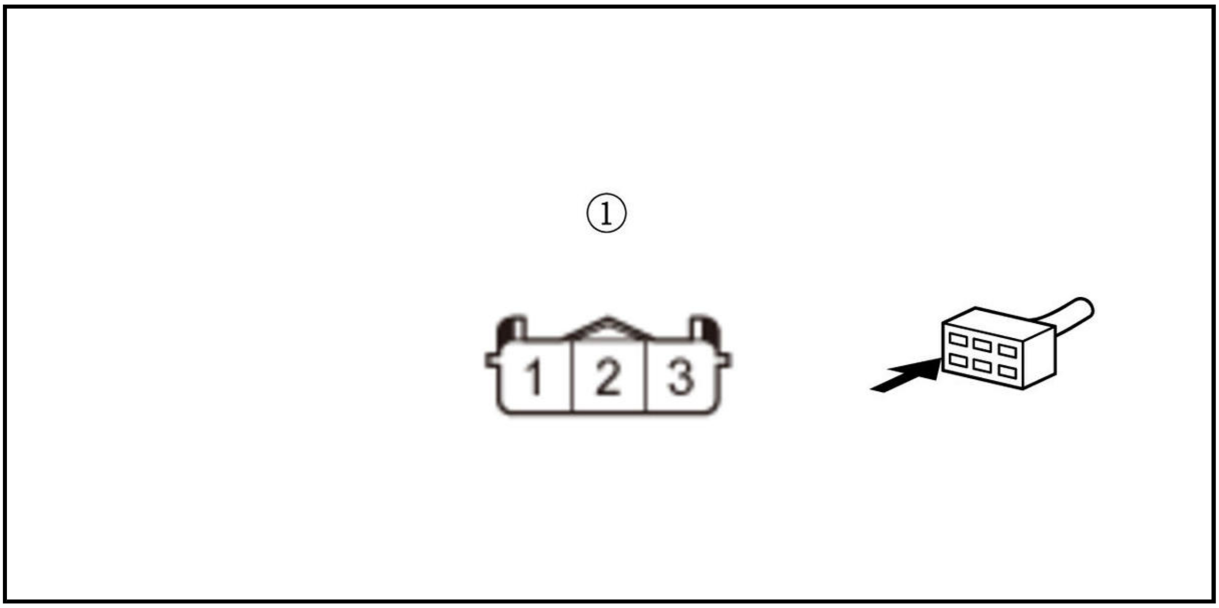
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 56**



Is there continuity?

YES

The PB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the PB wire between the PCM (E56) and the MAP sensor.

DTC P0108 (2.4 L ENGINE) (2017 2018 2019)

DTC P0108 : MAP Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0108 MAP Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the MAP SENSOR in the DATA LIST with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP SENSOR	More than 4.49	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (MAP sensor, others)

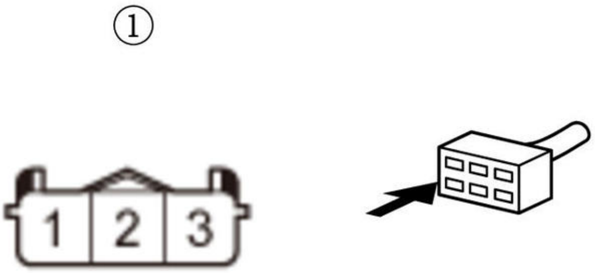
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAP sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	MAP sensor 3P connector (female terminals) No. 1: ①
Terminal B	MAP sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP SENSOR	More than 4.49	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the MAP sensor .

3. Determine possible failure area (SG1 line, others)

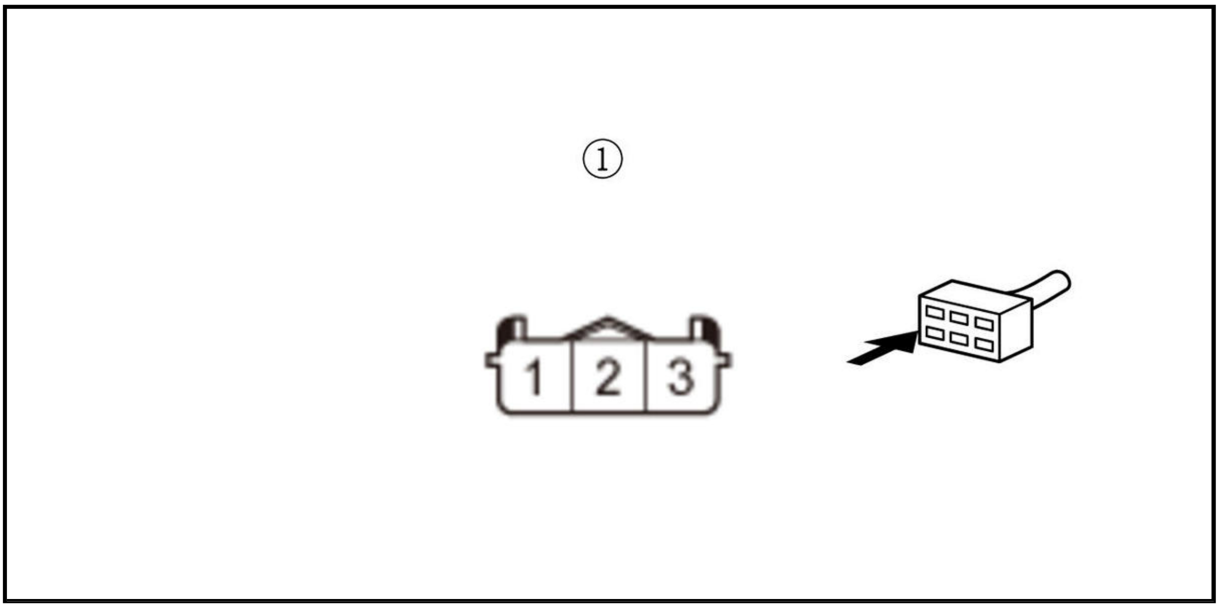
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the MAP sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

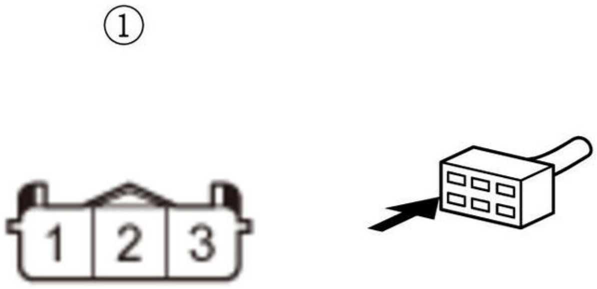
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 42**



Is there continuity?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (C42) and the MAP sensor.

5. Open wire check (PB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

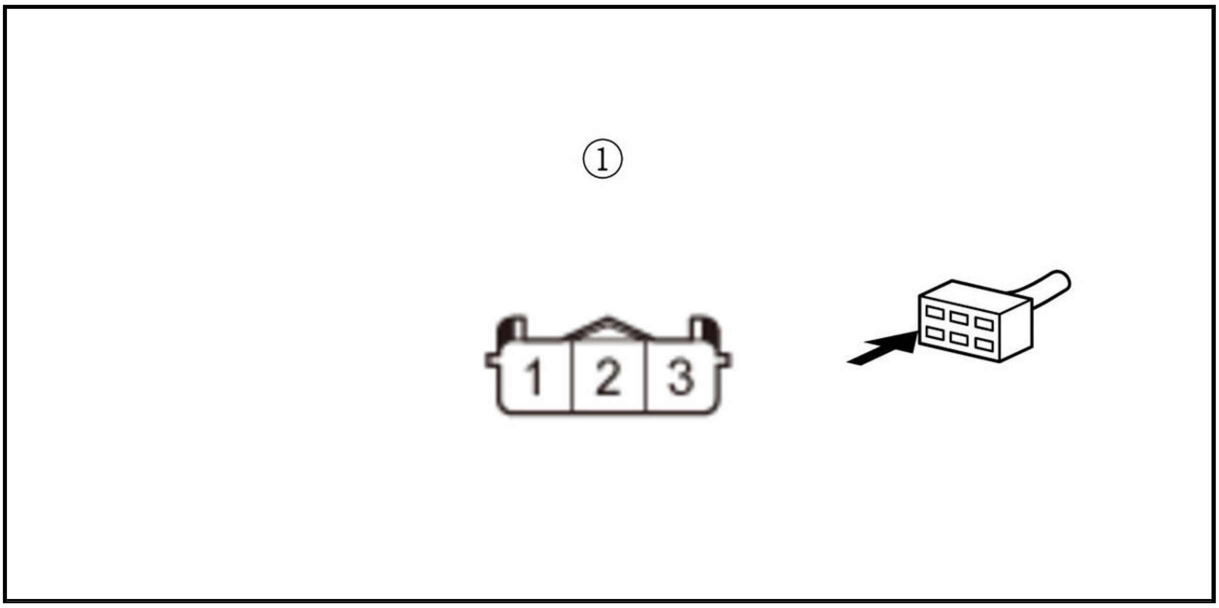
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector C (51P) No. 45**



Is there continuity?

YES

The PB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the PB wire between the PCM (C45) and the MAP sensor.

DTC P0111, P011B (1.5 L ENGINE)

DTC P0111 : IAT Sensor 1 Circuit Range/Performance Problem **DTC P011B** : IAT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0111 IAT Sensor 1 Circuit Range/Performance Problem	B	B
P011B IAT Sensor 1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals at these locations:

   - MAF sensor/IAT sensor 1
   - ECT sensor 1
   - ECT sensor 2

   Are the connections and terminals OK?

   YES

   Go to step 2.

   NO

   Repair the connections or terminals.

2. IAT sensor performance check (low temperature)

-1. Disconnect the following connector.

MAF sensor/IAT sensor 1 4P connector

-2. **Remove the MAF sensor/IAT sensor 1** .

-3. Allow MAF sensor/IAT sensor 1 to cool to the ambient temperature.

-4. Note the ambient temperature.

-5. Connect the MAF sensor/IAT sensor 1 to its 4P connector, but do not install it.

-6. Turn the vehicle to the ON mode.

-7. Quickly note the value of the IAT Sensor (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1)	B	B

-8. Compare the value of the IAT Sensor (1) to the ambient temperature.

Does the value of the IAT Sensor (1) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace the MAF sensor/IAT sensor 1 .

NO

Go to step 3.

3. IAT sensor performance check (high temperature)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAF sensor/IAT sensor 1 4P connector

-3. Using a heat gun, blow hot air on MAF sensor/IAT sensor 1 for a few seconds. Do not apply the heat longer than a few seconds or you will damage the sensor.

-4. Connect the MAF sensor/IAT sensor 1 to its 4P connector, but do not install it.

-5. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1)	B	B

Does the IAT Sensor (1) change 76 deg. F (42 deg. C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce** the failure under the same conditions with the on-board snapshot .

NO

Replace the MAF sensor/IAT sensor 1 .

DTC P0111, P011B (2.4 L ENGINE) (2017 2018 2019)

DTC P0111 : IAT Sensor Circuit Range/Performance Problem **DTC P011B** : IAT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0111 IAT Sensor Circuit Range/Performance Problem	B	B
P011B IAT Sensor 1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals at these locations:

   - MAF sensor/IAT sensor
   - ECT sensor 1
   - ECT sensor 2

   Are the connections and terminals OK?

   YES

   Go to step 2.

   NO

   Repair the connections or terminals.

2. IAT sensor performance check (low temperature)

   -1. Disconnect the following connector.

MAF sensor/IAT sensor 5P connector

   -2. Remove the MAF sensor/IAT sensor .

   -3. Allow MAF sensor/IAT sensor to cool to the ambient temperature.

   -4. Note the ambient temperature.

   -5. Connect the MAF sensor/IAT sensor to its 5P connector, but do not install it.

   -6. Turn the vehicle to the ON mode.

   -7. Quickly note the value of the IAT Sensor (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1)	B	B

-8. Compare the value of the IAT Sensor (1) to the ambient temperature.

Does the value of the IAT Sensor (1) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace the MAF sensor/IAT sensor .

NO

Go to step 3.

3. IAT sensor performance check (high temperature)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAF sensor/IAT sensor 5P connector

-3. Using a heat gun, blow hot air on MAF sensor/IAT sensor for a few seconds. Do not apply the heat longer than a few seconds or you will damage the sensor.

-4. Connect the MAF sensor/IAT sensor to its 5P connector, but do not install it.

-5. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1)	B	B

Does the IAT Sensor (1) change 76 deg. F (42 deg. C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

NO

Replace the MAF sensor/IAT sensor .

DTC P0112 (1.5 L ENGINE)

DTC P0112 : IAT Sensor 1 Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0112 IAT Sensor 1 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT SENSOR (1)	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (IAT sensor 1, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAF sensor/IAT sensor 1 4P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT SENSOR (1)	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the MAF sensor/IAT sensor 1 .

3. Shorted wire check (ITA1 (TA) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

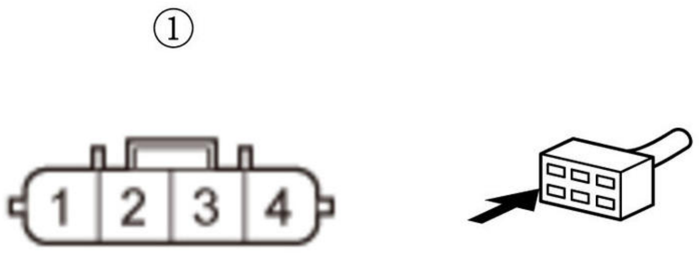
-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected

Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the ITA1 (TA) wire between the PCM (E53) and MAF sensor/IAT sensor 1.

NO

The ITA1 (TA) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0112 (2.4 L ENGINE) (2017 2018 2019)

DTC P0112 : IAT Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0112 IAT Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT SENSOR (1)	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (IAT sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAF sensor/IAT sensor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
IAT SENSOR (1)	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the MAF sensor/IAT sensor .

3. Shorted wire check (TA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

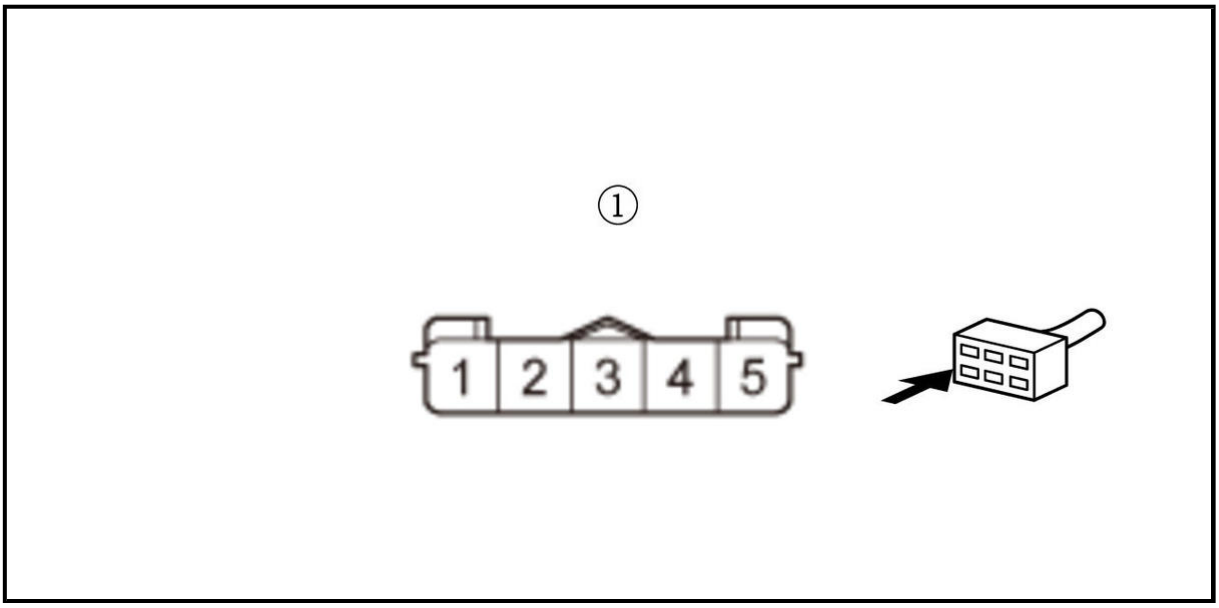
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TA wire between the PCM (B51) and the MAF sensor/IAT sensor.

NO

The TA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P0113 (1.5 L ENGINE)

DTC P0113 : IAT Sensor 1 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0113 IAT Sensor 1 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT SENSOR (1)	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (IAT sensor 1, others)

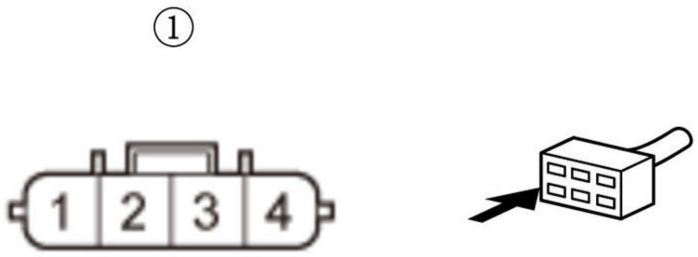
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAF sensor/IAT sensor 1 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 2: ①
Terminal B	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT SENSOR (1)	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the MAF sensor/IAT sensor 1 .

3. Determine possible failure area (ITA1 (TA) line, others)

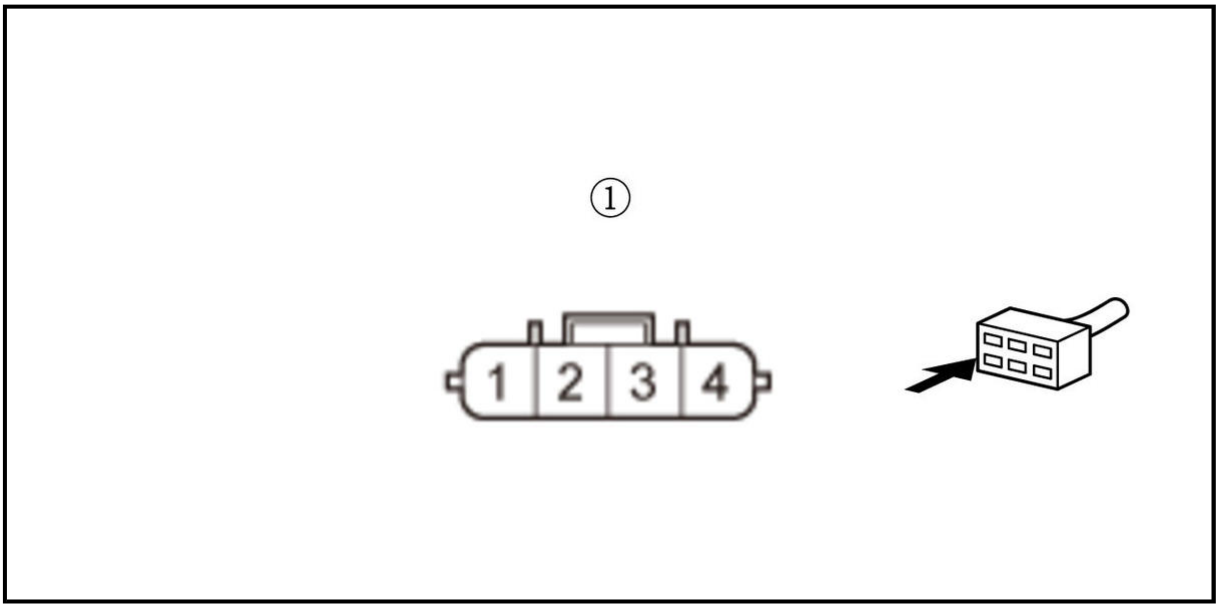
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from MAF sensor/IAT sensor 1 4P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

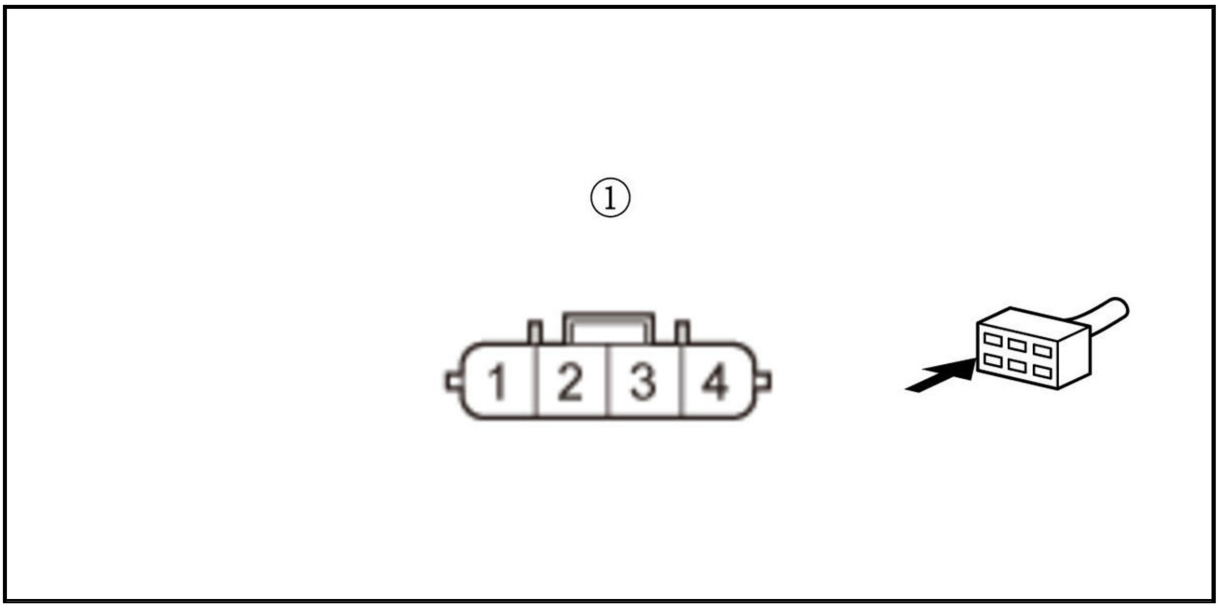
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and MAF sensor/IAT sensor 1.

5. Open wire check (ITA1 (TA) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

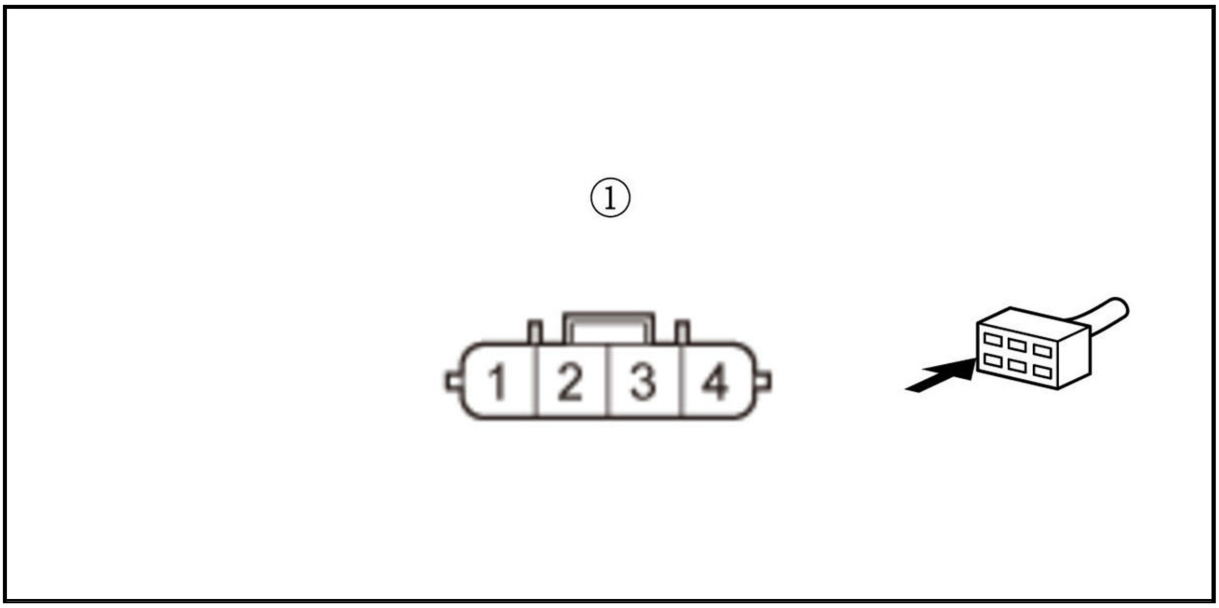
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 4P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	MAF sensor/IAT sensor 1 4P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 53**



Is there continuity?

YES

The ITA1 (TA) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ITA1 (TA) wire between the PCM (E53) and MAF sensor/IAT sensor 1.

DTC P0113 (2.4 L ENGINE) (2017 2018 2019)

DTC P0113 : IAT Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0113 IAT Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT SENSOR (1)	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (IAT sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

MAF sensor/IAT sensor 5P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	MAF sensor/IAT sensor 5P connector (female terminals) No. 1: ①
Terminal B	MAF sensor/IAT sensor 5P connector (female terminals) No. 2: ①

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT SENSOR (1)	More than 4.92	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 3.

   NO

   Replace the MAF sensor/IAT sensor .

3. Determine possible failure area (TA line, others)

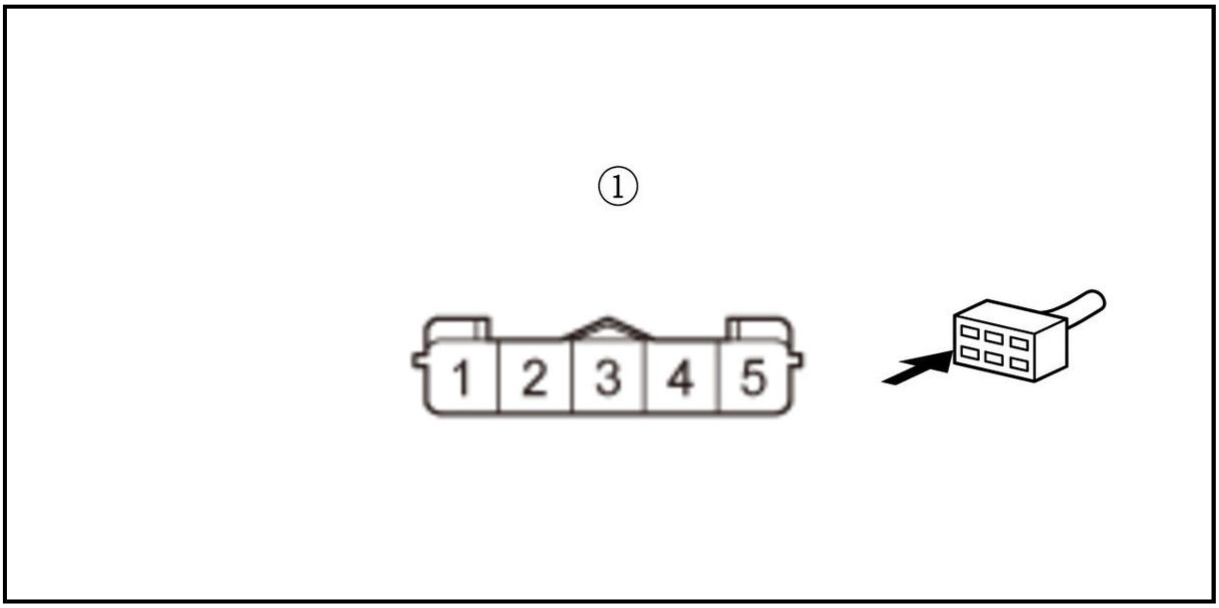
   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the MAF sensor/IAT sensor 5P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

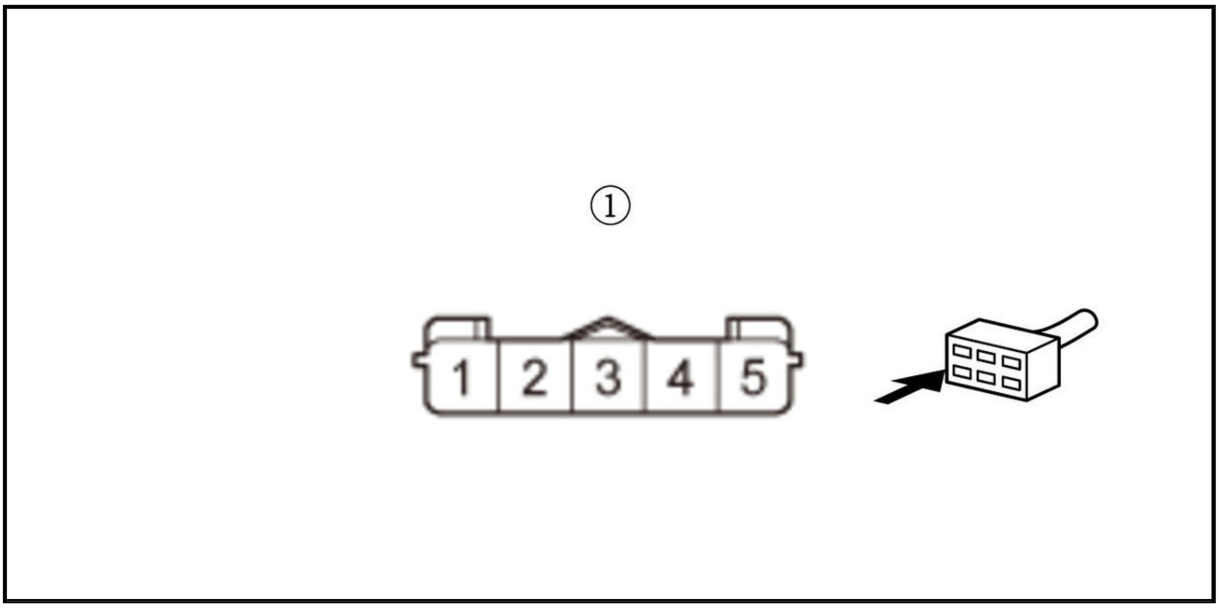
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 2: ①
Test point 2	**PCM connector C (51P) No. 31**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (C31) and the MAF sensor/IAT sensor.

5. Open wire check (TA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

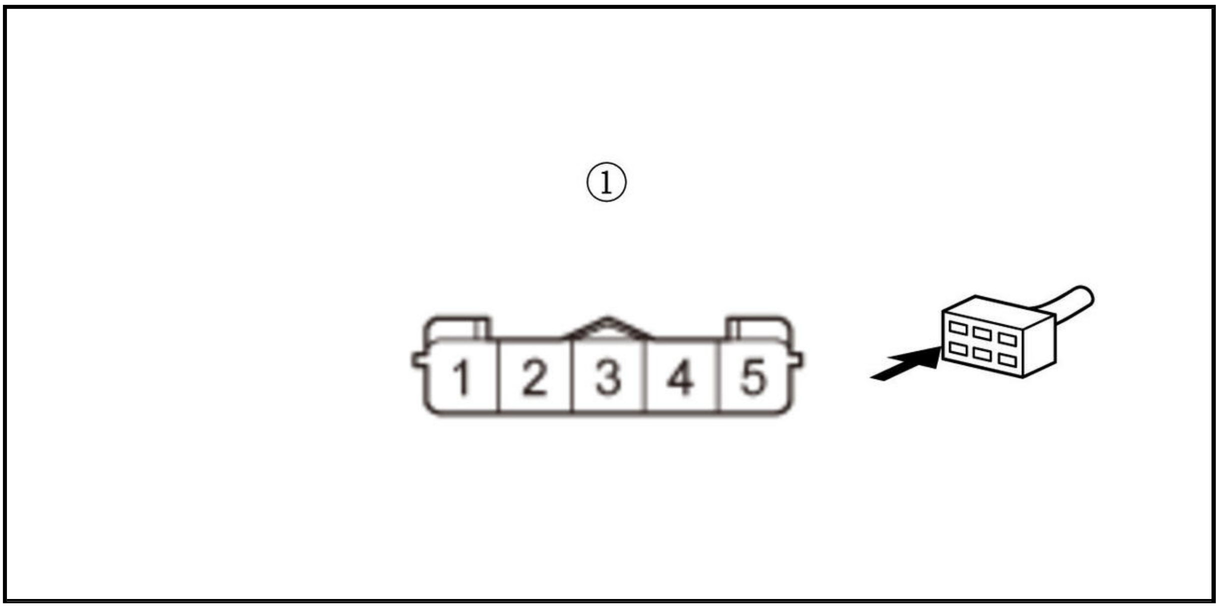
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 5P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	MAF sensor/IAT sensor 5P connector (female terminals) No. 1: ①
Test point 2	**PCM connector B (51P) No. 51**



Is there continuity?

YES

The TA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the TA wire between the PCM (B51) and the MAF sensor/IAT sensor.

DTC P0115 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0115 : ECT Sensor 1 Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0115 ECT Sensor 1 Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 0.14	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	More than 4.99	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 5.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (ECT sensor 1, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 0.14	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Replace ECT sensor 1 .

4. Shorted wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

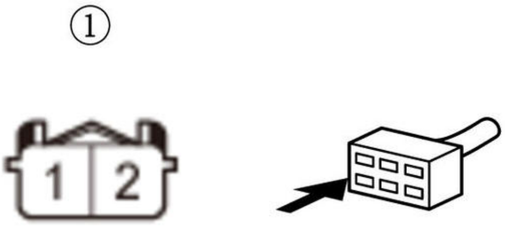
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TW wire between the PCM (E52) and ECT sensor 1.

NO

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (ECT sensor 1, others)

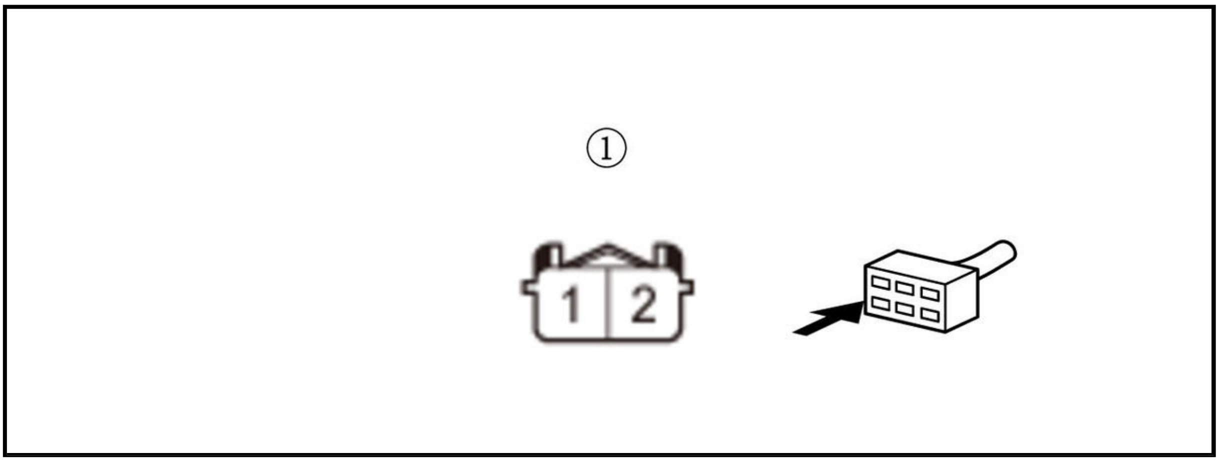
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 1 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 1 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 1	More than 4.99	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 6.

NO

Replace ECT sensor 1 .

6. Determine possible failure area (TW line, others)

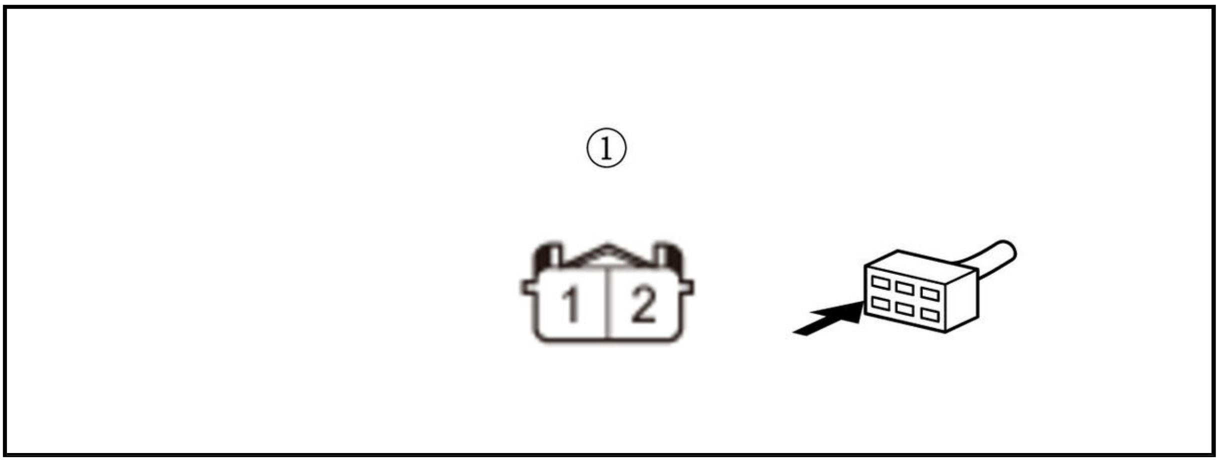
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the ECT sensor 1 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 1 2P connector: disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

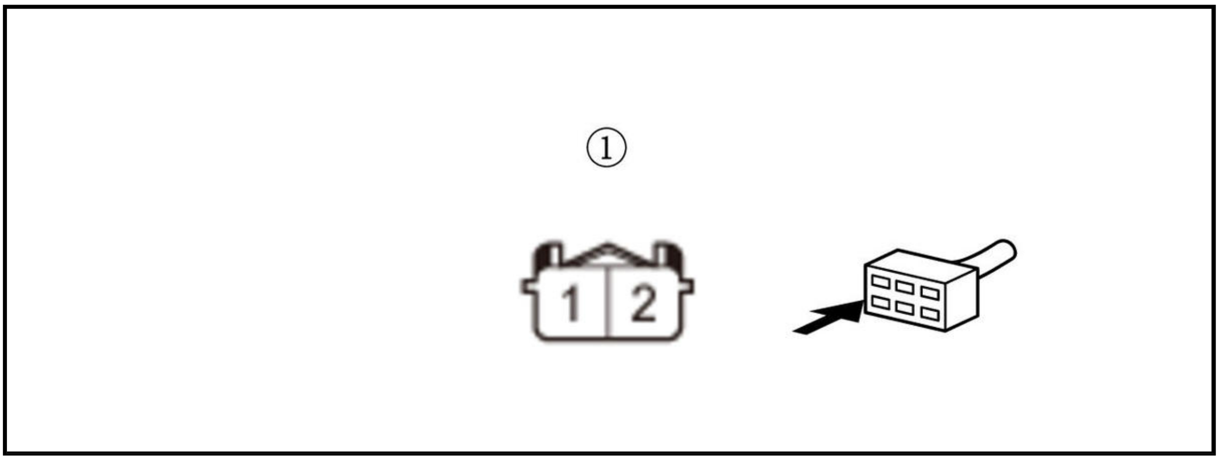
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and ECT sensor 1.

8. Open wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

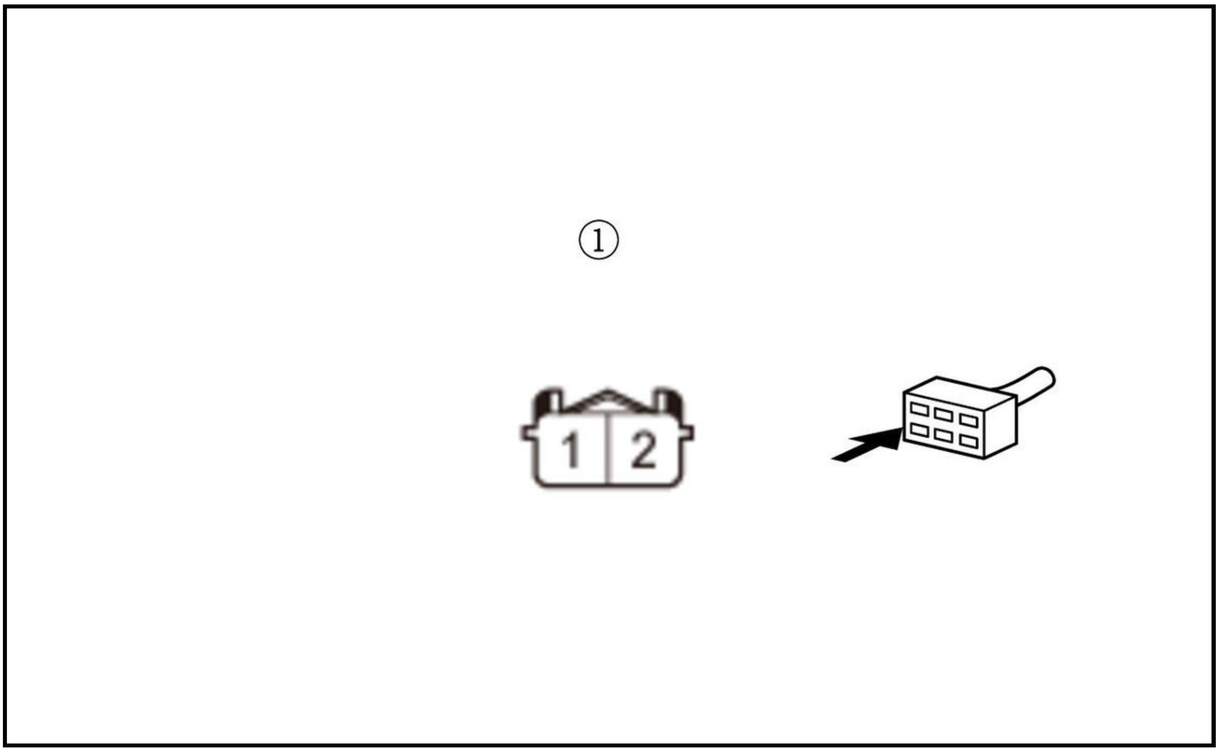
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 52**



Is there continuity?

YES

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TW wire between the PCM (E52) and ECT sensor 1.

DTC P0115 (2.4 L ENGINE) (2018 2019)

DTC P0115 : ECT Sensor 1 Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0115 ECT Sensor 1 Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 0.14	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Go to step 2.

2. Problem verification 2

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	More than 4.92	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 5.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (ECT sensor 1, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 0.14	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Replace ECT sensor 1 .

4. Shorted wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

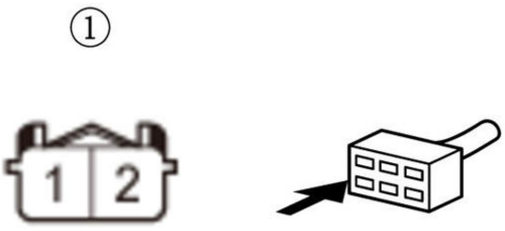
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TW wire between the PCM (B50) and ECT sensor 1.

NO

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (ECT sensor 1, others)

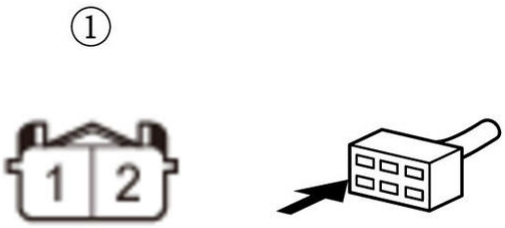
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 1 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 1 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 6.

NO

Replace ECT sensor 1 .

6. Determine possible failure area (TW line, others)

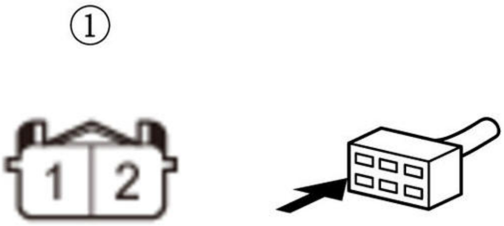
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the ECT sensor 1 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 1 2P connector: disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

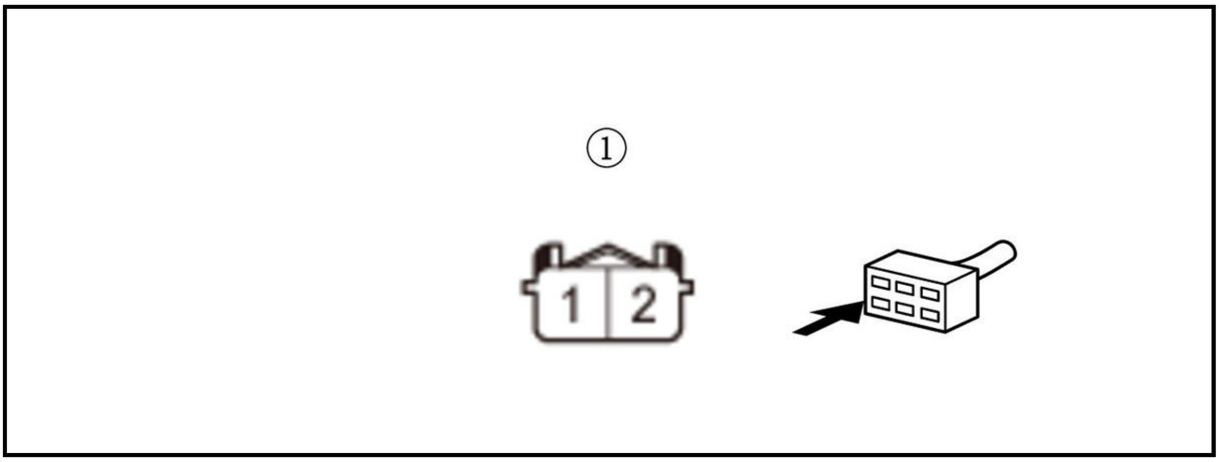
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 31**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (C31) and ECT sensor 1.

8. Open wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

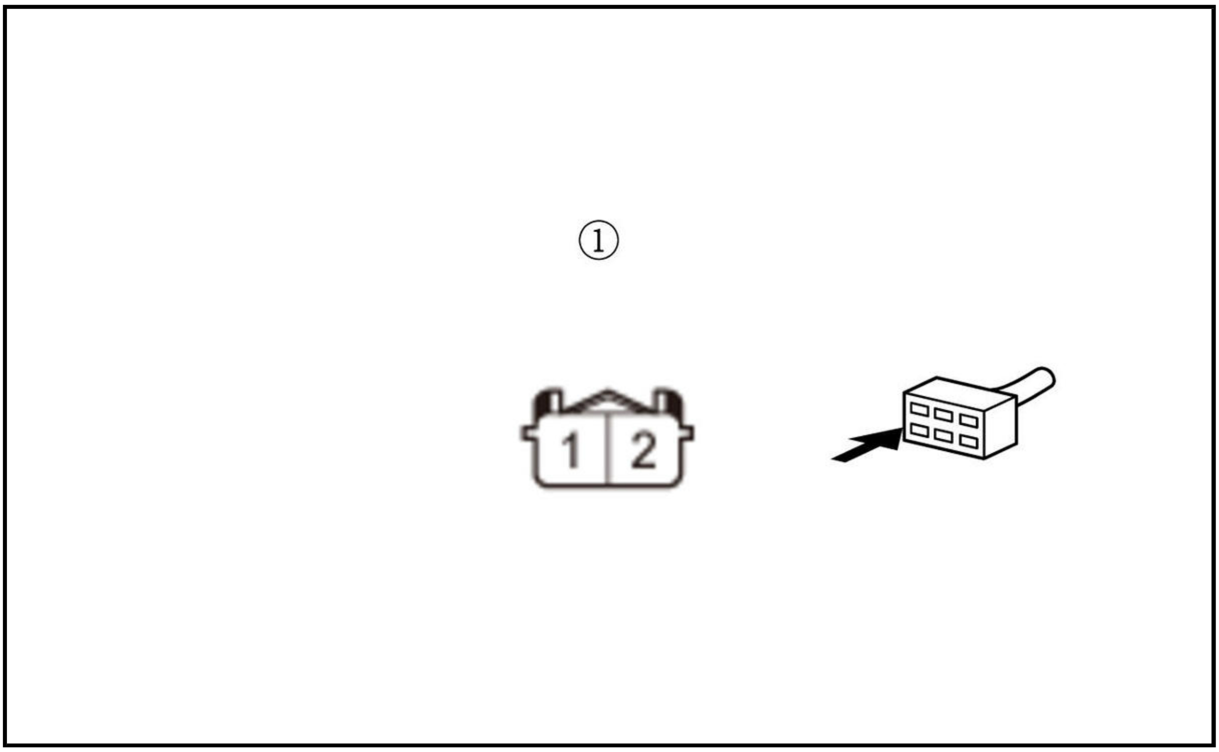
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector B (51P) No. 50**



Is there continuity?

YES

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TW wire between the PCM (B50) and ECT sensor 1.

DTC P0116 (1.5 L ENGINE)

DTC P0116 : ECT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0116 ECT Sensor 1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. ECT sensor 1 check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	More than 80	deg. C	B	B
ECT SENSOR 1	More than 176	deg. F		

Do the current condition (s) match the threshold?

YES

Note the value of ECT SENSOR 1, then go to step 3.

NO

Note the value of ECT SENSOR 1, then go to step 2.

2. Problem verification (low temperature)

-1. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	**Unit**
ECT SENSOR 1	B	B

-2. Start the engine.

-3. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-4. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	**Unit**
ECT SENSOR 1	B	B

Does ECT SENSOR 1 change 18 deg. F (10 deg. C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. **Replace the ECT sensor 1** .

3. Problem verification (high temperature)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Open the hood, and let the engine cool for 3 hours.

-3. Turn the vehicle to the ON mode.

-4. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	**Unit**
ECT SENSOR 1	B	B

Does ECT SENSOR 1 change 18 deg. F (10 deg. C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. **Replace the ECT sensor 1** .

DTC P0116 (2.4 L ENGINE) (2017 2018 2019)

DTC P0116 : ECT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0116 ECT Sensor 1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. ECT sensor 1 check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	More than 80	deg. C	B	B
ECT SENSOR 1	More than 176	deg. F		

Do the current condition (s) match the threshold?

YES

Note the value of ECT SENSOR 1, then go to step 3.

NO

Note the value of ECT SENSOR 1, then go to step 2.

2. Problem verification (low temperature)

-1. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-2. Start the engine.

-3. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-4. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

Does ECT SENSOR 1 change 18 deg. F (10 deg. C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. **Replace the ECT sensor 1** .

3. Problem verification (high temperature)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Open the hood, and let the engine cool for 3 hours.

-3. Turn the vehicle to the ON mode.

-4. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

Does ECT SENSOR 1 change 18 deg. F (10 deg. C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. **Replace the ECT sensor 1** .

DTC P0117 (1.5 L ENGINE)

DTC P0117 : ECT Sensor 1 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0117 ECT Sensor 1 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (ECT sensor 1, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the ECT sensor 1 .

3. Shorted wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

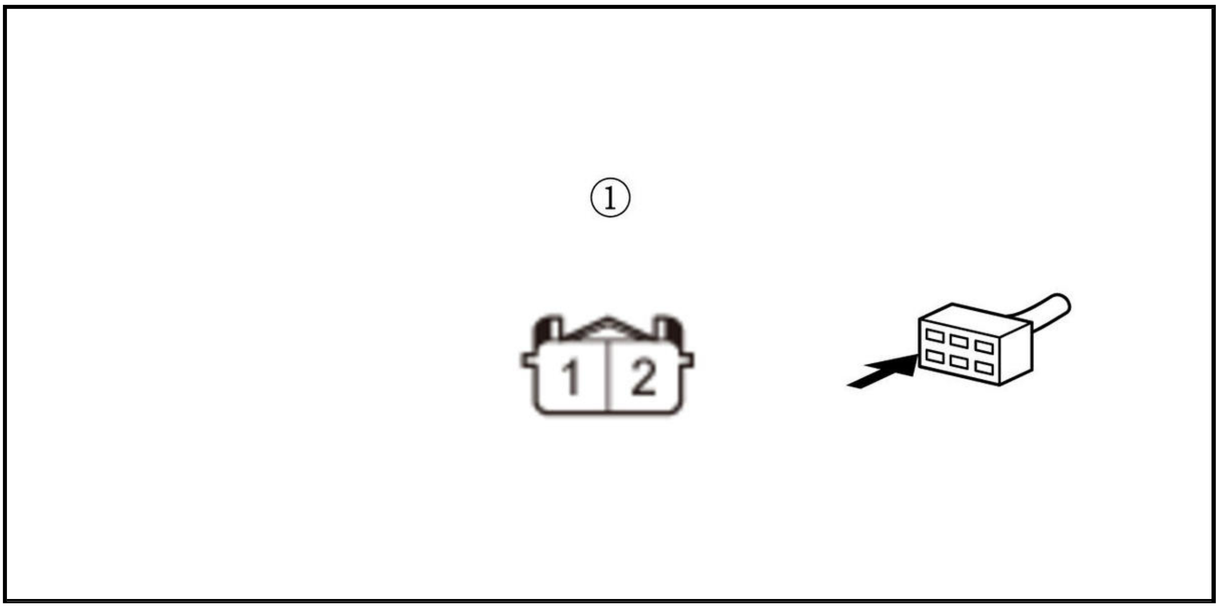
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TW wire between the PCM (E52) and ECT sensor 1.

NO

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0117 (2.4 L ENGINE) (2017 2018 2019)

DTC P0117 : ECT Sensor 1 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0117 ECT Sensor 1 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. ECT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 1	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 1 .

3. Shorted wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

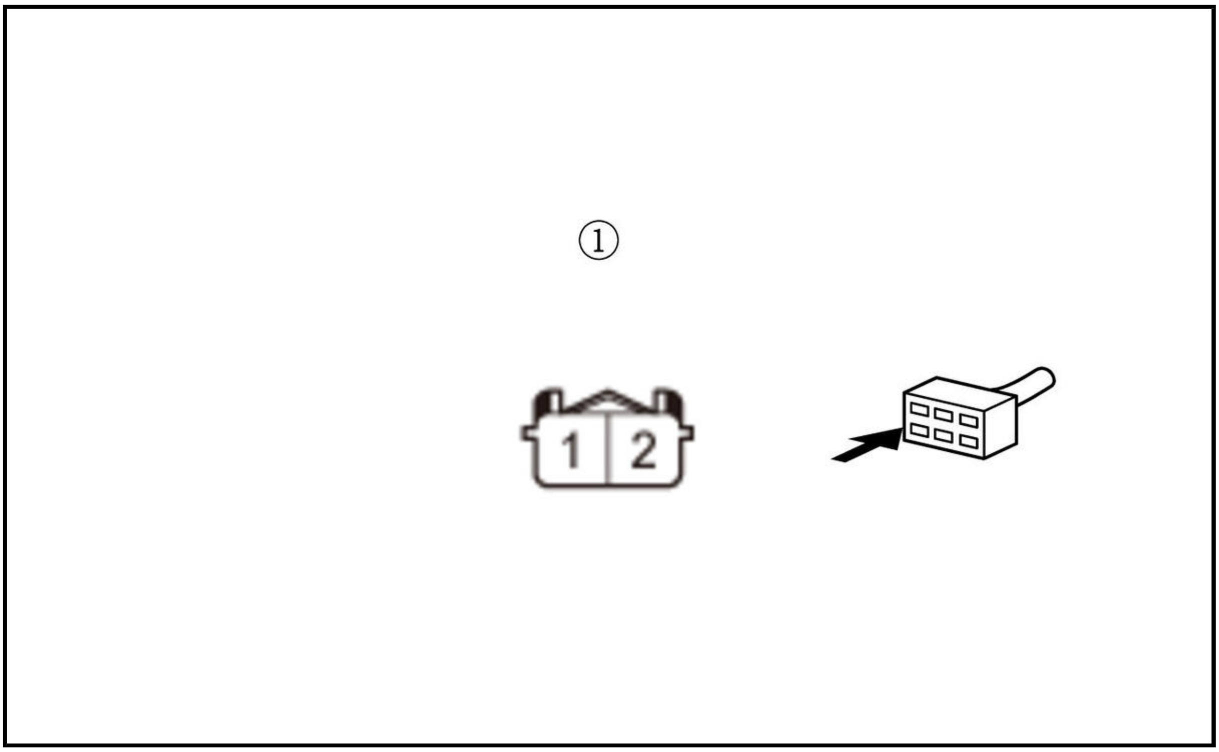
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TW wire between the PCM (B50) and ECT sensor 1.

NO

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P0118 (1.5 L ENGINE)

DTC P0118 : ECT Sensor 1 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0118 ECT Sensor 1 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (ECT sensor 1, others)

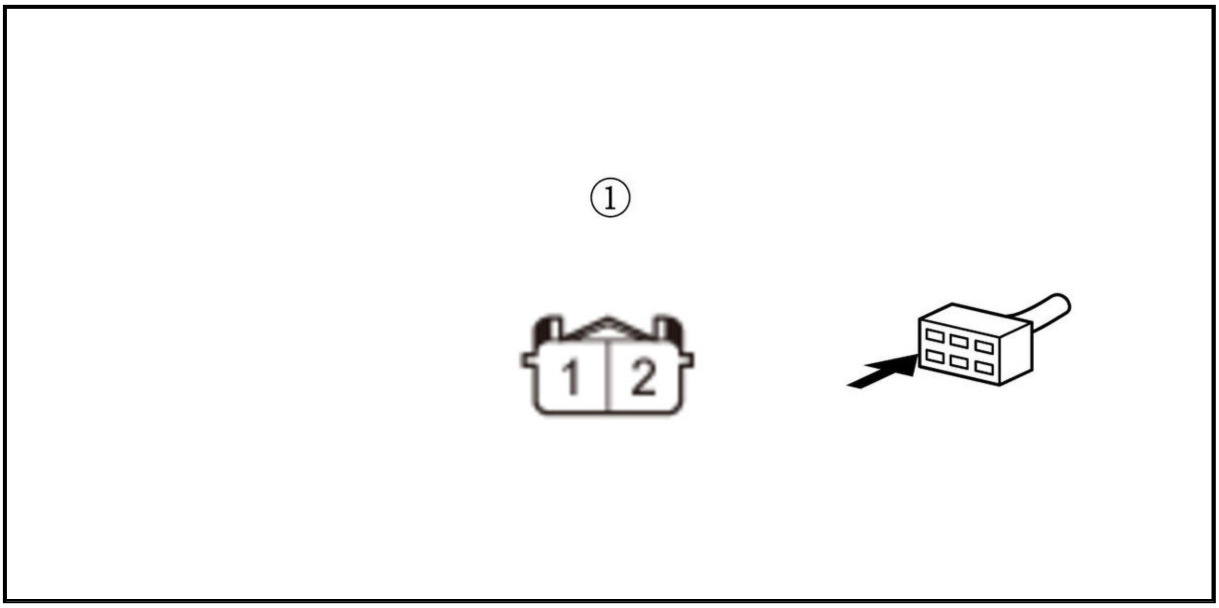
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 1 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 1 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the ECT sensor 1 .

3. Determine possible failure area (TW line, others)

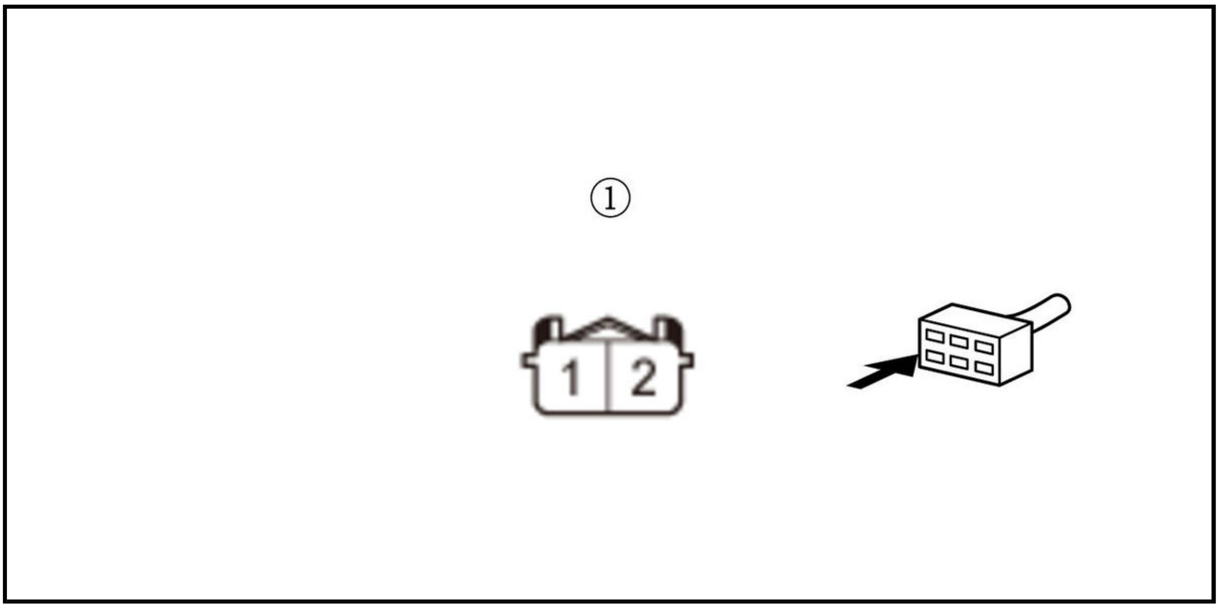
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the ECT sensor 1 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 1 2P connector: disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

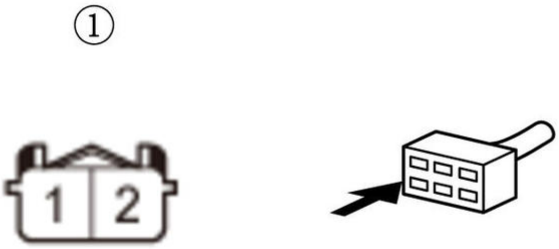
-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 1: ①

Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and ECT sensor 1.

5. Open wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

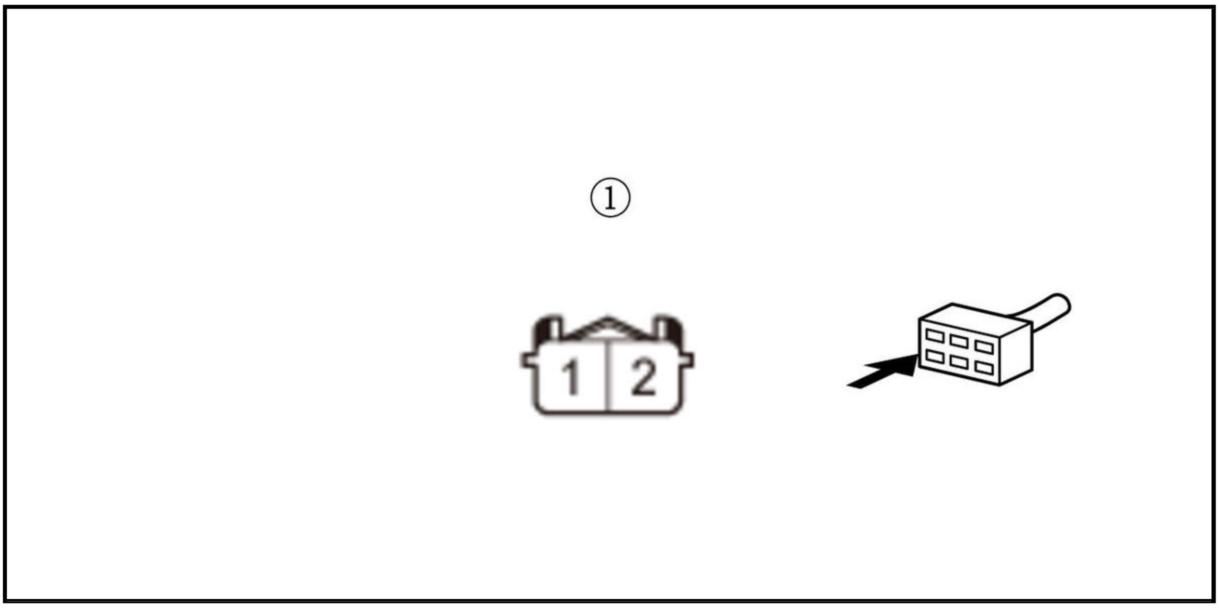
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 52**



Is there continuity?

YES

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TW wire between the PCM (E52) and ECT sensor 1.

DTC P0118 (2.4 L ENGINE) (2017 2018 2019)

DTC P0118 : ECT Sensor 1 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0118 ECT Sensor 1 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. ECT sensor 1 check

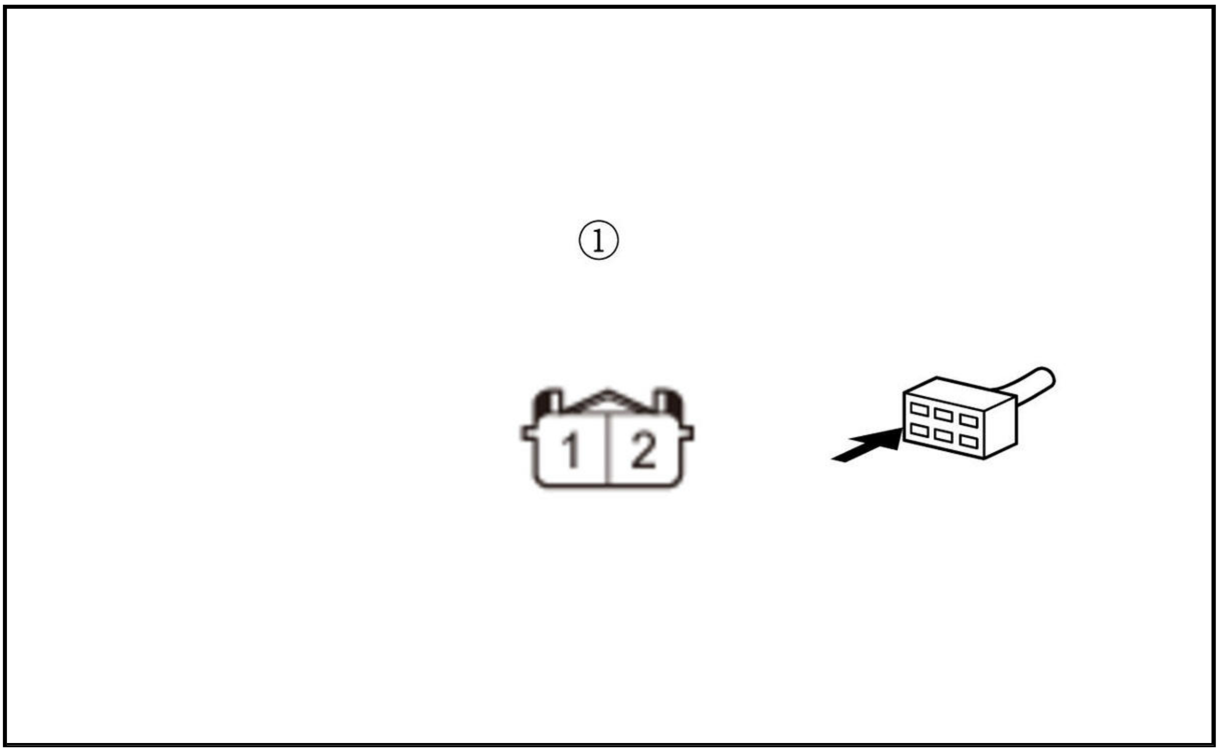
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 1 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 1 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 1	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 1 .

3. Determine possible failure area (TW line, others)

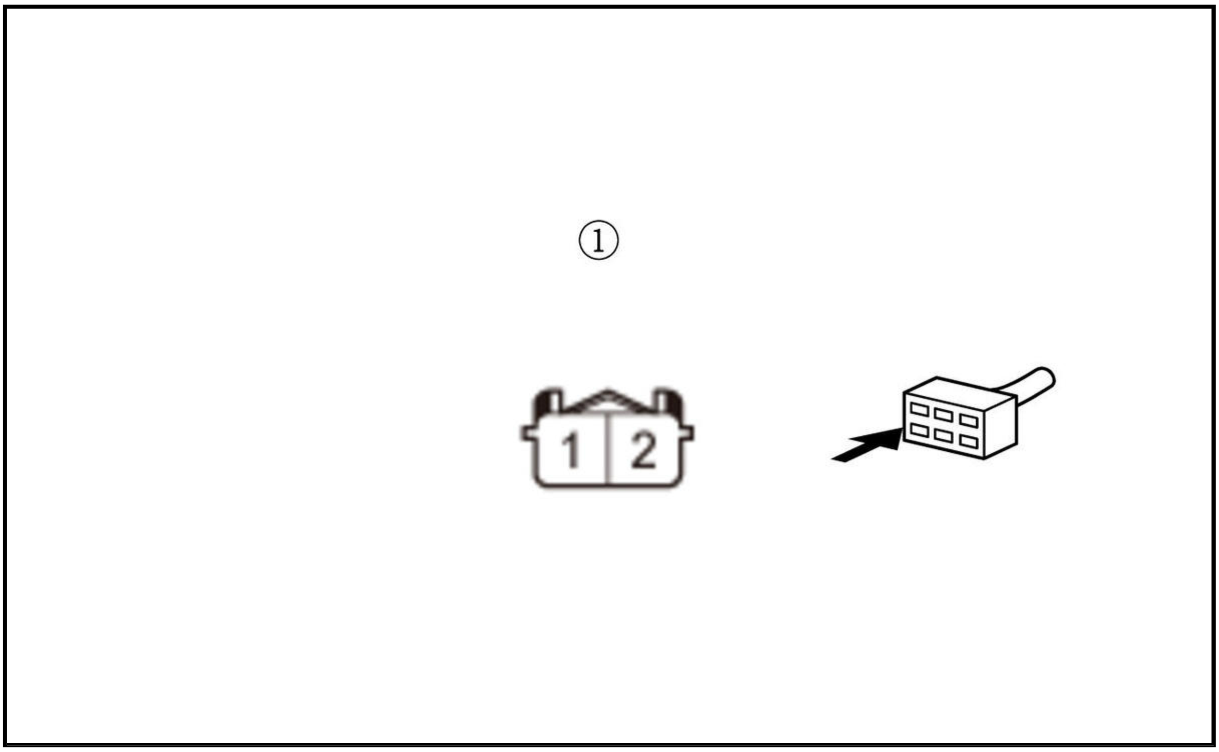
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the jumper wire from the ECT sensor 1 2P connector.

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 1 2P connector: disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG2 line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

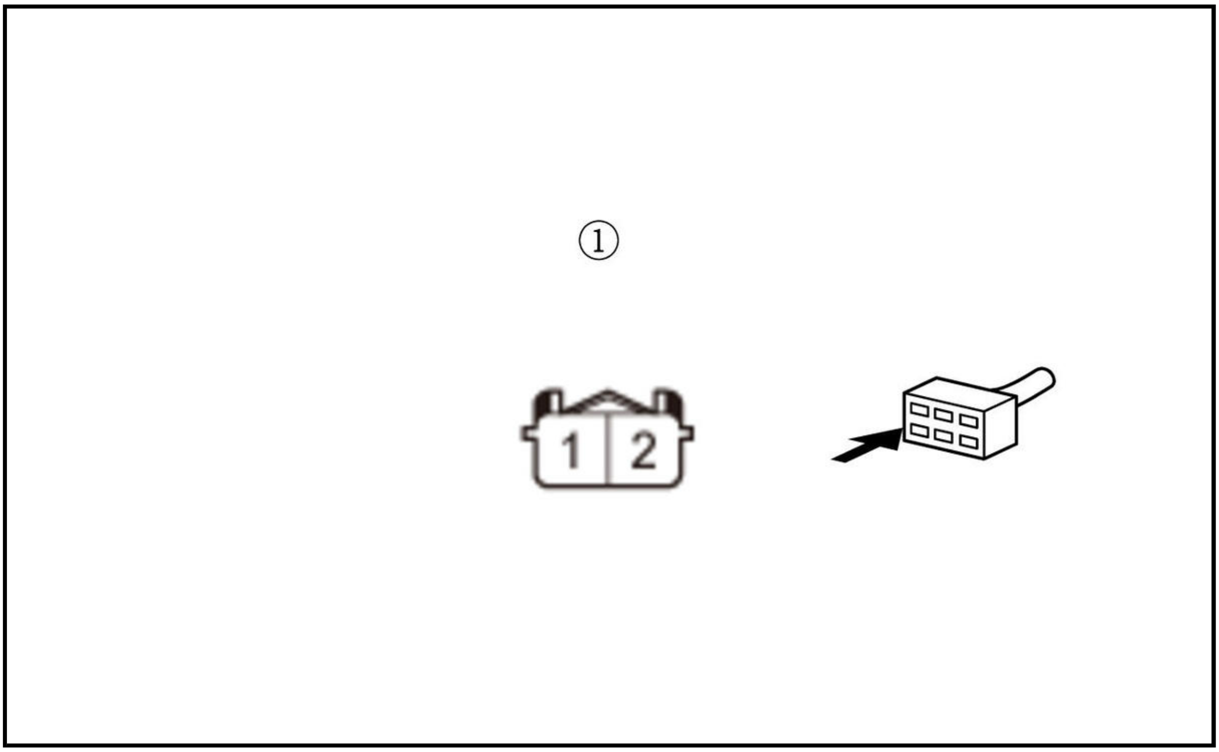
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector C (51P)

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 31**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (C31) and ECT sensor 1.

5. Open wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

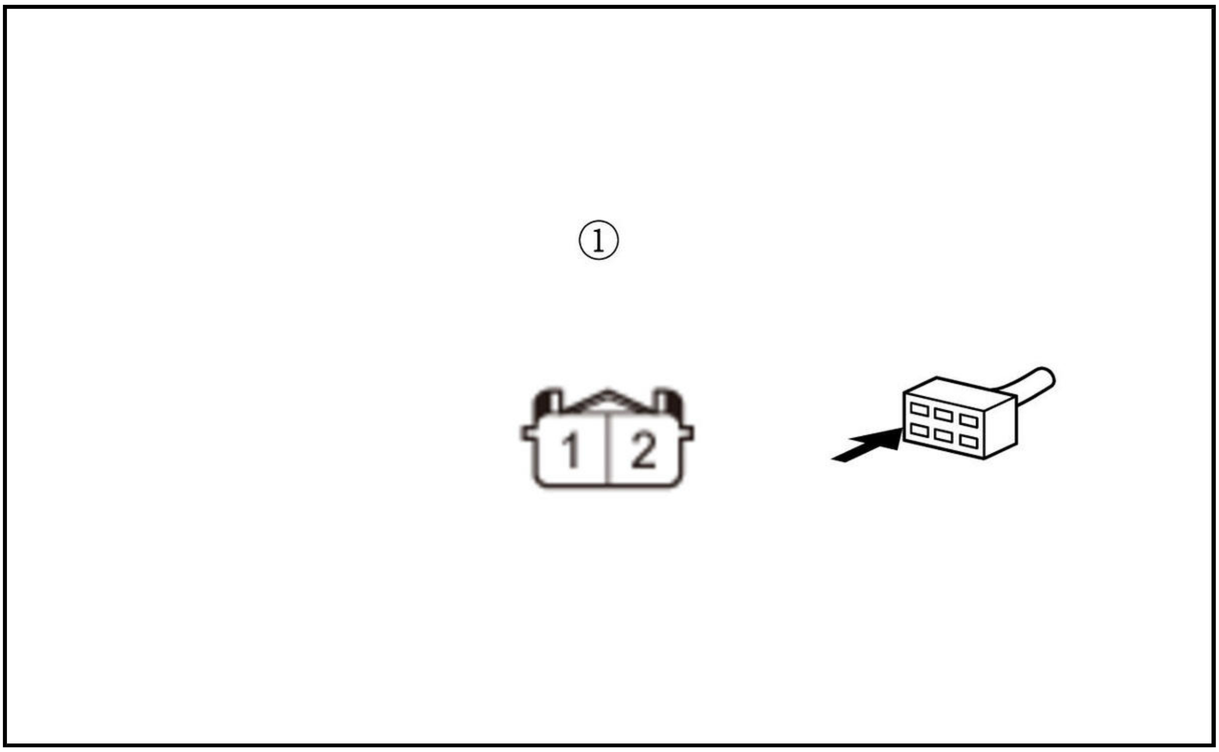
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector B (51P) No. 50**



Is there continuity?

YES

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the TW wire between the PCM (B50) and ECT sensor 1.

DTC P011A (1.5 L ENGINE)

DTC P011A : ECT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P011A ECT Sensor1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals of these connectors.

   - ECT sensor 1
   - ECT sensor 2
   - MAF sensor/IAT sensor 1

   Are the connection and terminals OK?

   YES

   Replace ECT sensor 1 .

   NO

Repair the connections or terminals, then recheck.

DTC P011A (2.4 L ENGINE) (2017 2018 2019)

DTC P011A : ECT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P011A ECT Sensor1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals of these connectors.

   - ECT sensor 1
   - ECT sensor 2
   - MAF sensor/IAT sensor 1

   Are the connection and terminals OK?

   YES

   Replace ECT sensor 1 .

   NO

   Repair the connections or terminals, then recheck.

DTC P0121 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0121 : TP Sensor A Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR A	Less than 0.38	V	B	B

   Do the current condition (s) match the threshold?

   YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR A	More than 4.5	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 7.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (THL1 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

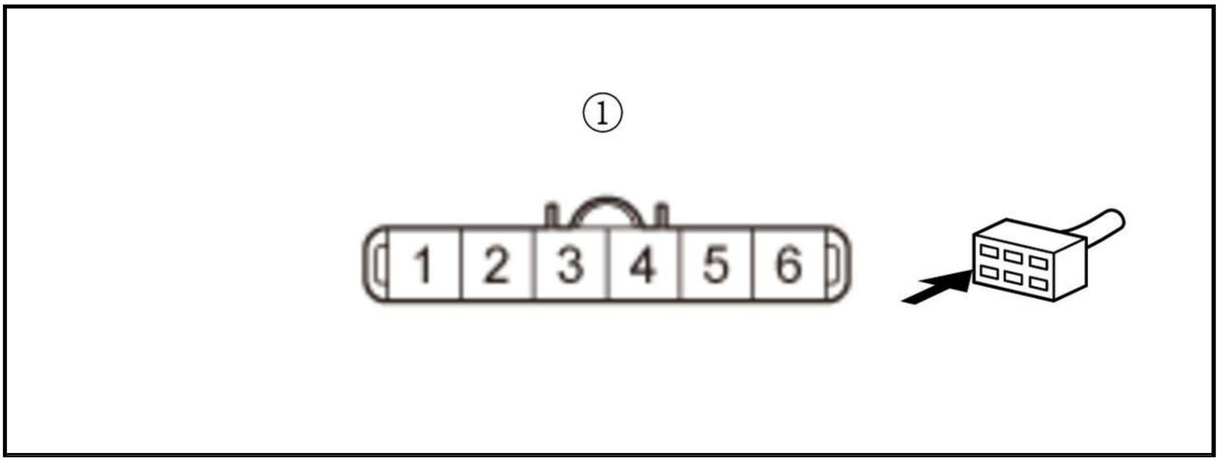
-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected

B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the THL1 wire between the PCM (E50) and the throttle body.

NO

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

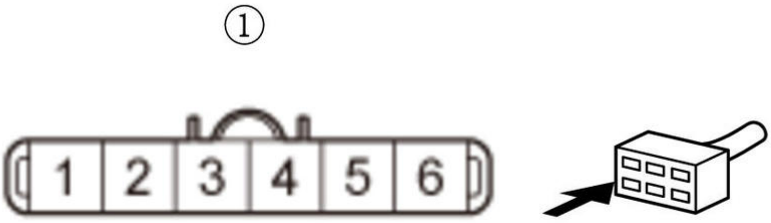
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 6.

6. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

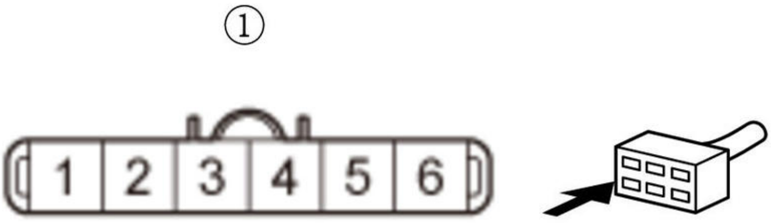
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 75**



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 wire between the PCM (E75) and the throttle body.

7. Determine possible failure area (SG3 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 10.

NO

Go to step 8.

8. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

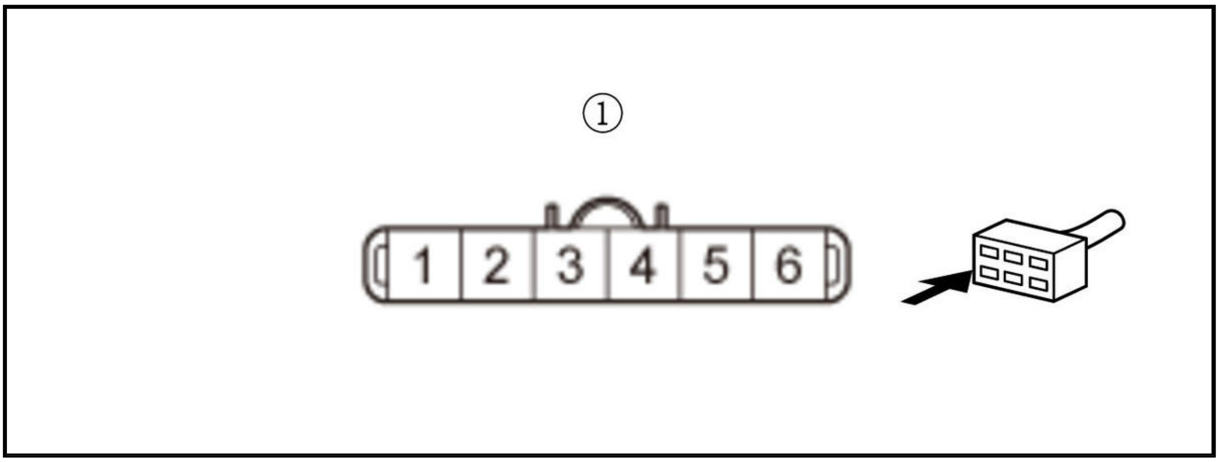
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 9.

9. Open wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

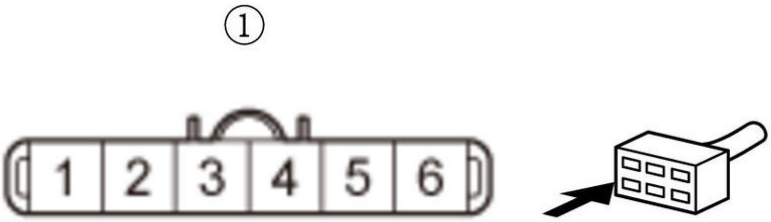
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	PCM connector E (80P) No. 50



Is there continuity?

YES

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the THL1 wire between the PCM (E50) and the throttle body.

10. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

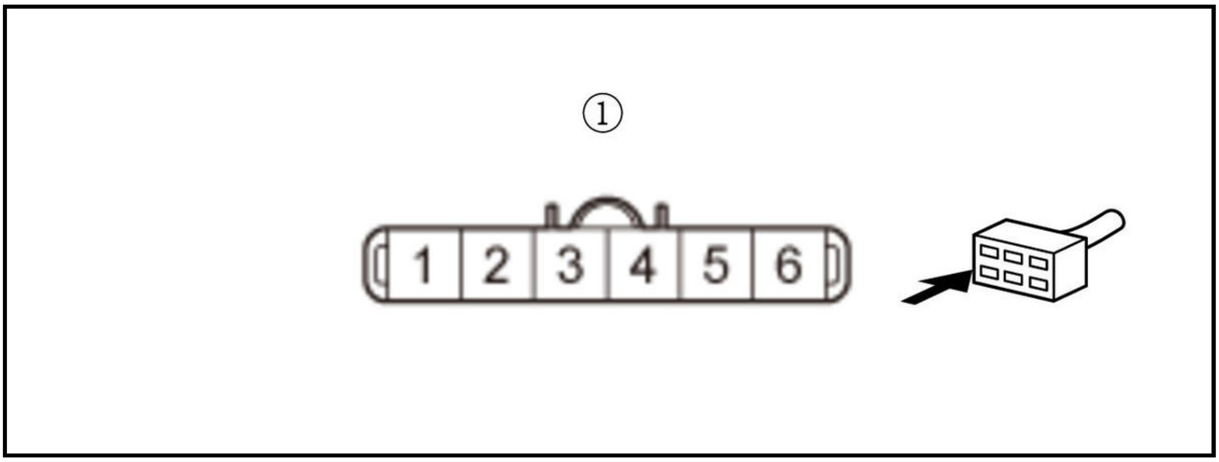
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	PCM connector E (80P) No. 76



Is there continuity?

YES

The SG3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the SG3 wire between the PCM (E76) and the throttle body.

DTC P0121 (2.4 L ENGINE) (2018 2019)

DTC P0121 : TP Sensor A Out of Range

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR A	Less than 0.39	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR A	More than 4.5	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 7.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (THL1 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

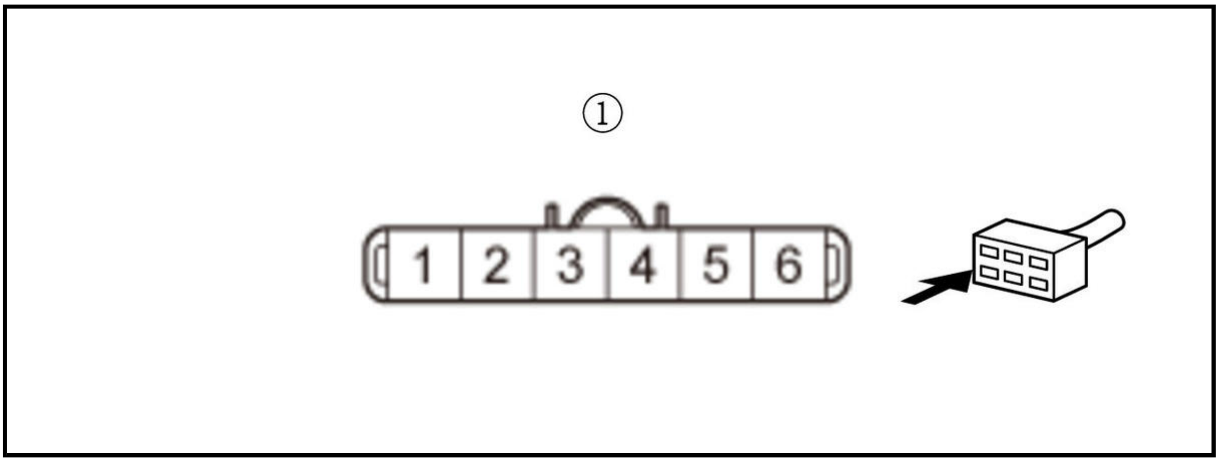
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the THL1 wire between the PCM (B46) and the throttle body.

NO

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

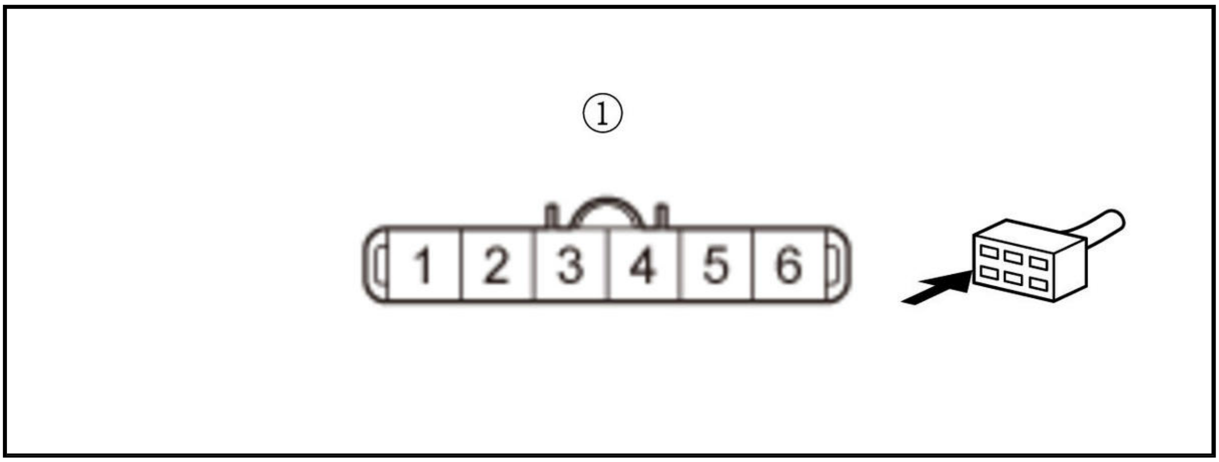
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 6.

6. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

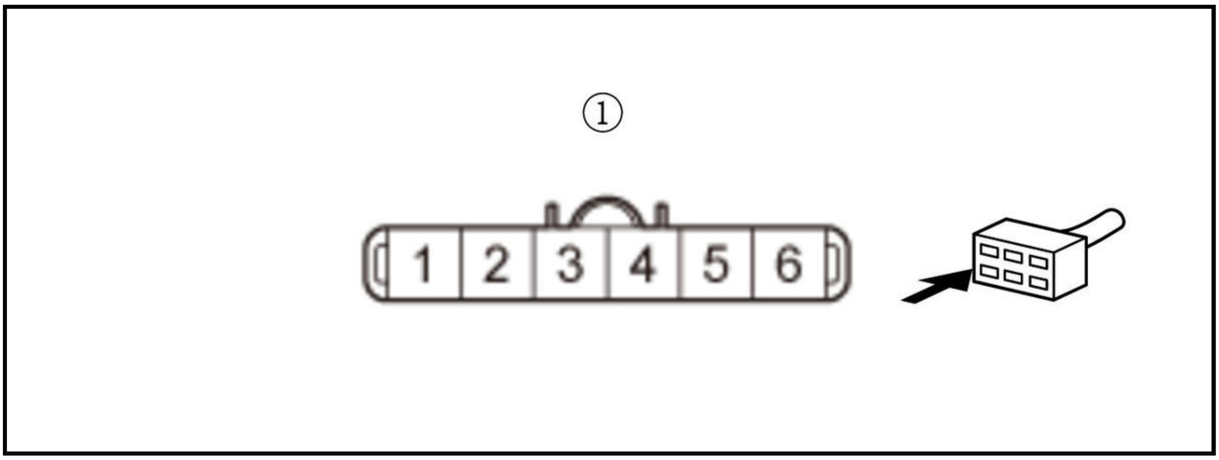
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector B (51P) No. 48**



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 wire between the PCM (B48) and the throttle body.

7. Determine possible failure area (SG3 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 10.

NO

Go to step 8.

8. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

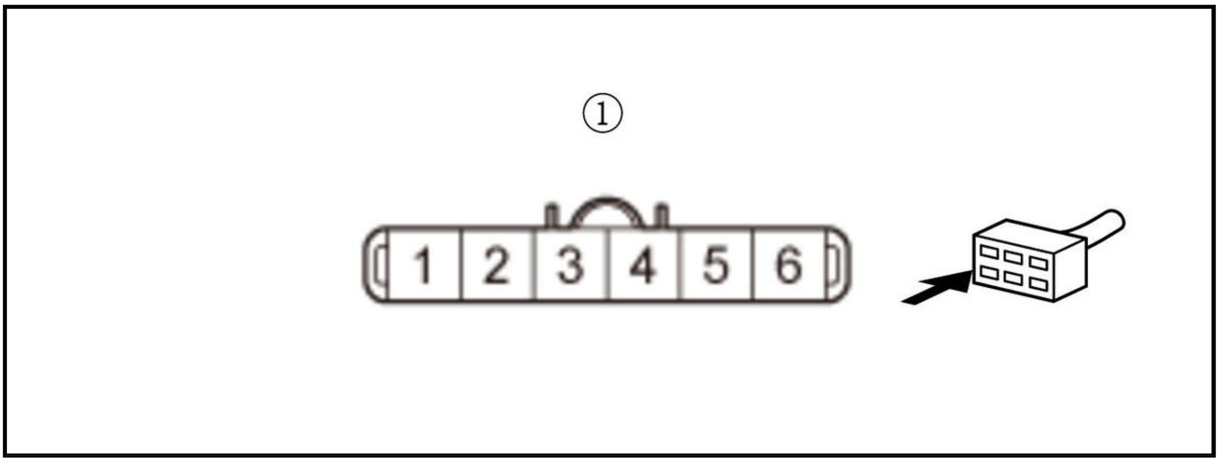
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 9.

9. Open wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

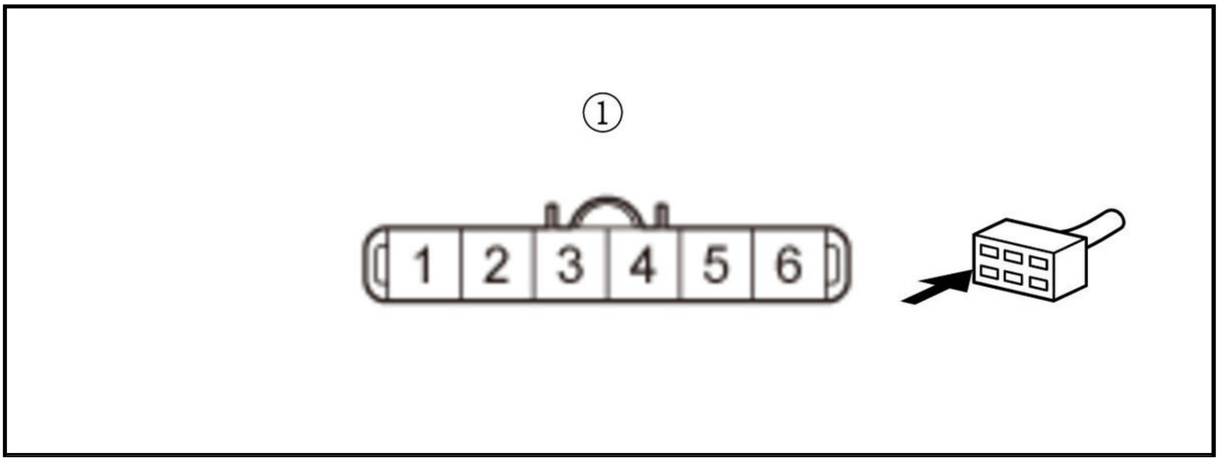
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	**PCM connector B (51P) No. 46**



Is there continuity?

YES

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the THL1 wire between the PCM (B46) and the throttle body.

10. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

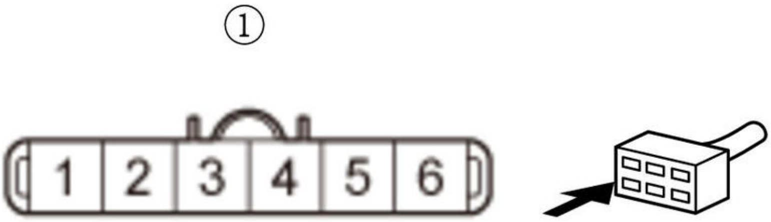
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector B (51P) No. 49**



Is there continuity?

YES

The SG3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG3 wire between the PCM (B49) and the throttle body.

DTC P0122 (1.5 L ENGINE)

DTC P0122 : TP Sensor A Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0122 TP Sensor A Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
TP SENSOR A	Less than 0.3	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (THL1 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	**Confirmed DTC**	**Pending DTC**
P0122 TP Sensor A Circuit Low Voltage	B	B
P0222 TP Sensor B Circuit Low Voltage	B	B

Are DTC P0122 and P0222 indicated at the same time?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

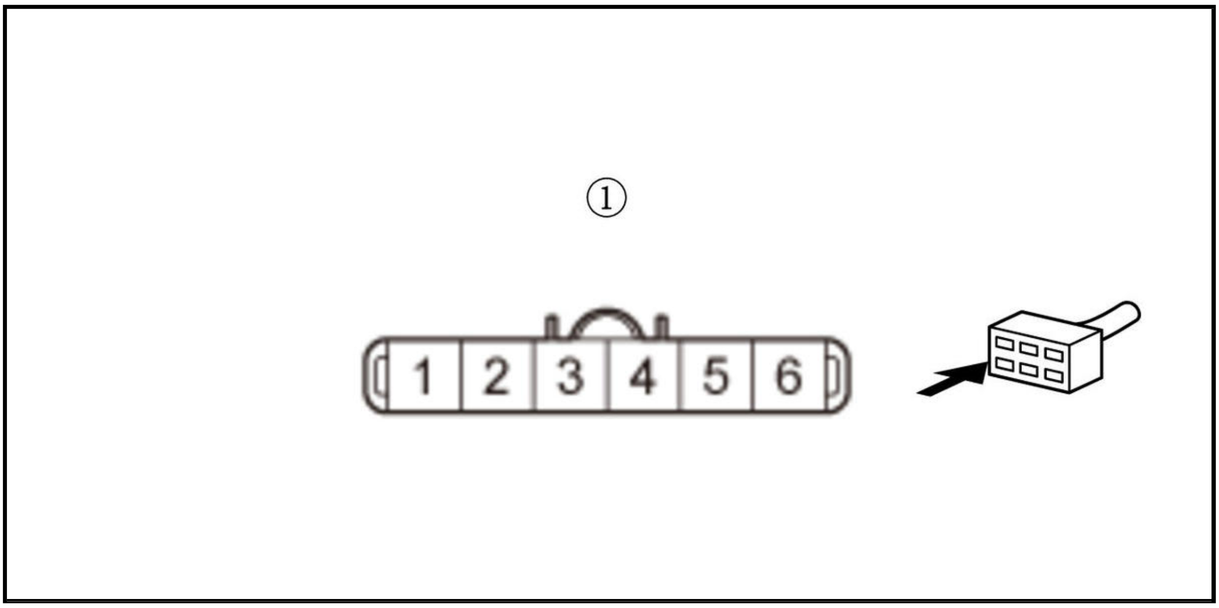
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)	
Throttle body 6P connector	

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the THL1 wire between the PCM (E50) and the throttle body.

NO

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Determine possible failure area (VCC3 line, throttle body)

-1. Turn the vehicle to the OFF (LOCK) mode.

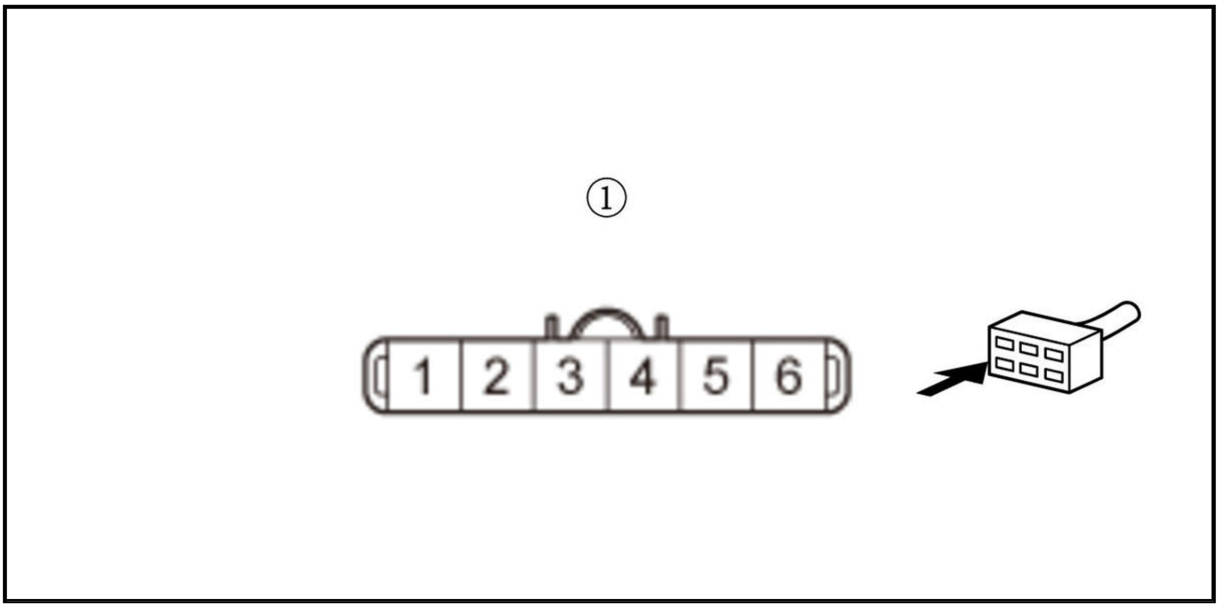
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 5.

5. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

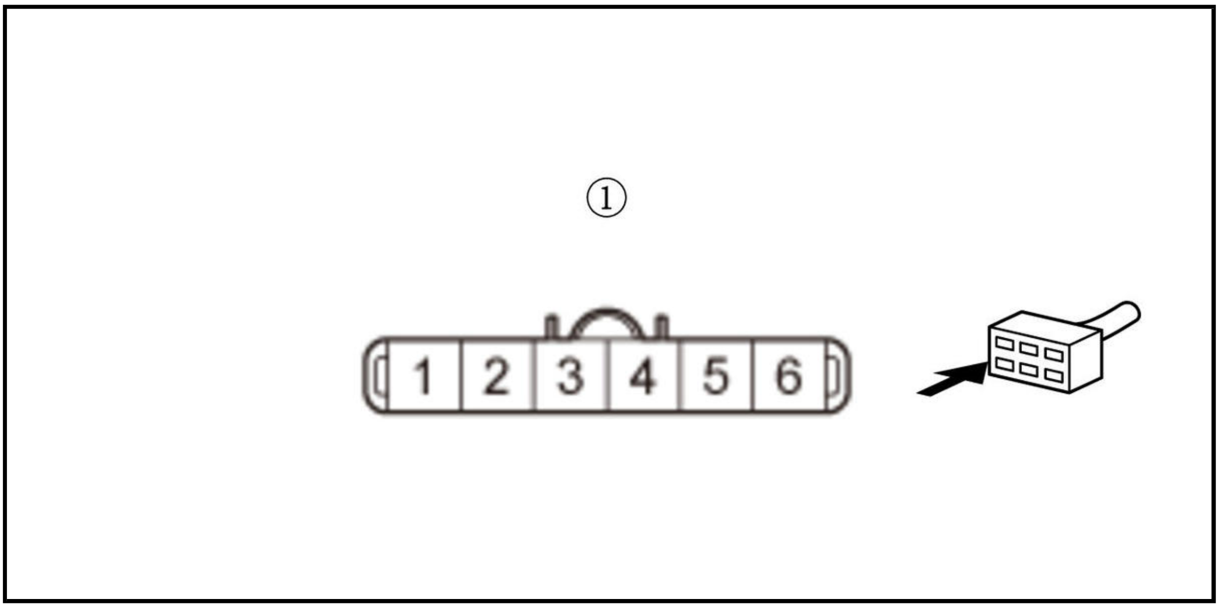
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 75**



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 wire between the PCM (E75) and the throttle body.

DTC P0122 (2.4 L ENGINE) (2017 2018 2019)

DTC P0122 : TP Sensor A Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0122 TP Sensor A Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR A	Less than 0.3	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM.**If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (THL1 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0122 TP Sensor A Circuit Low Voltage	B	B
P0222 TP Sensor B Circuit Low Voltage	B	B

Are DTC P0122 and P0222 indicated at the same time?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

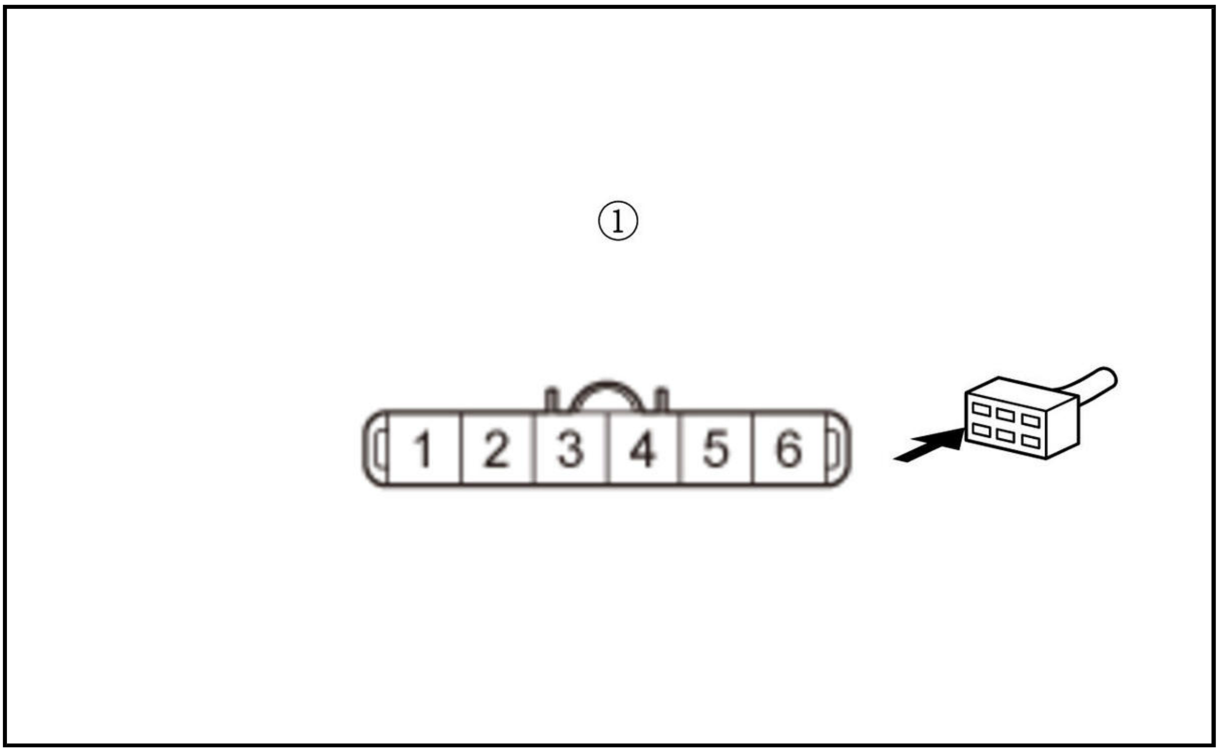
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the THL1 wire between the PCM (B46) and the throttle body.

NO

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

4. Determine possible failure area (VCC3 line, throttle body)

-1. Turn the vehicle to the OFF (LOCK) mode.

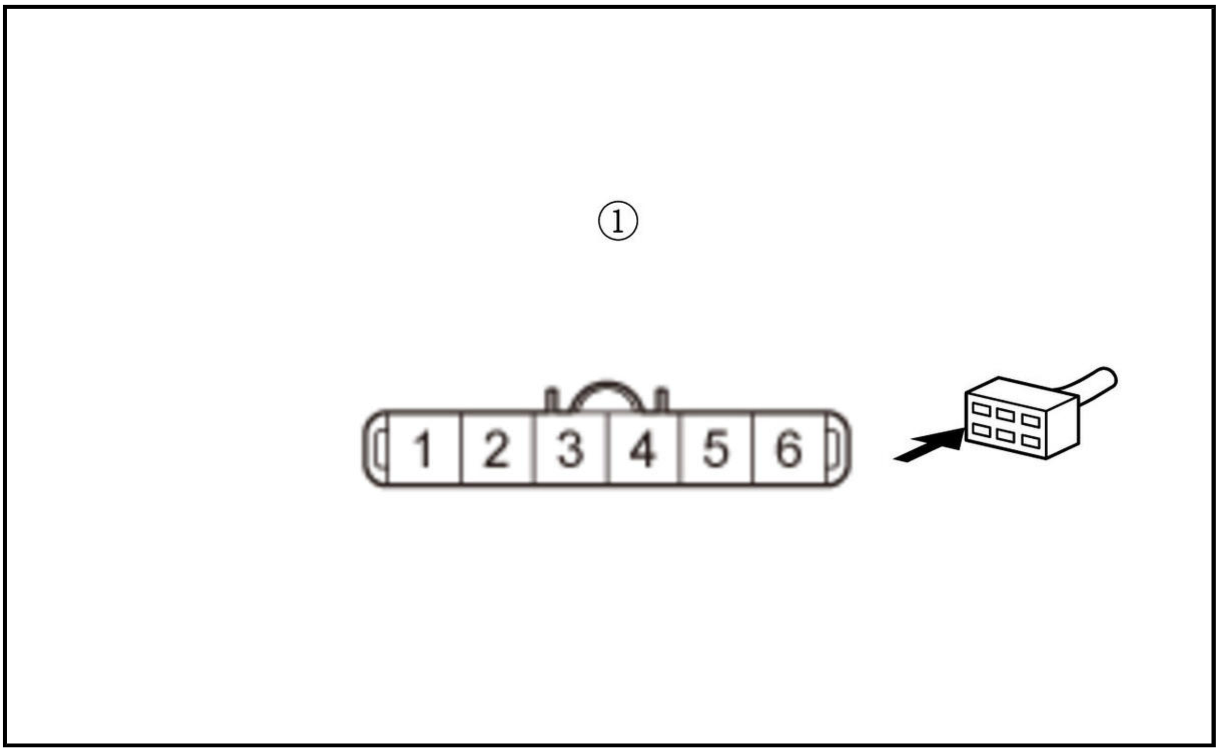
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 5.

5. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

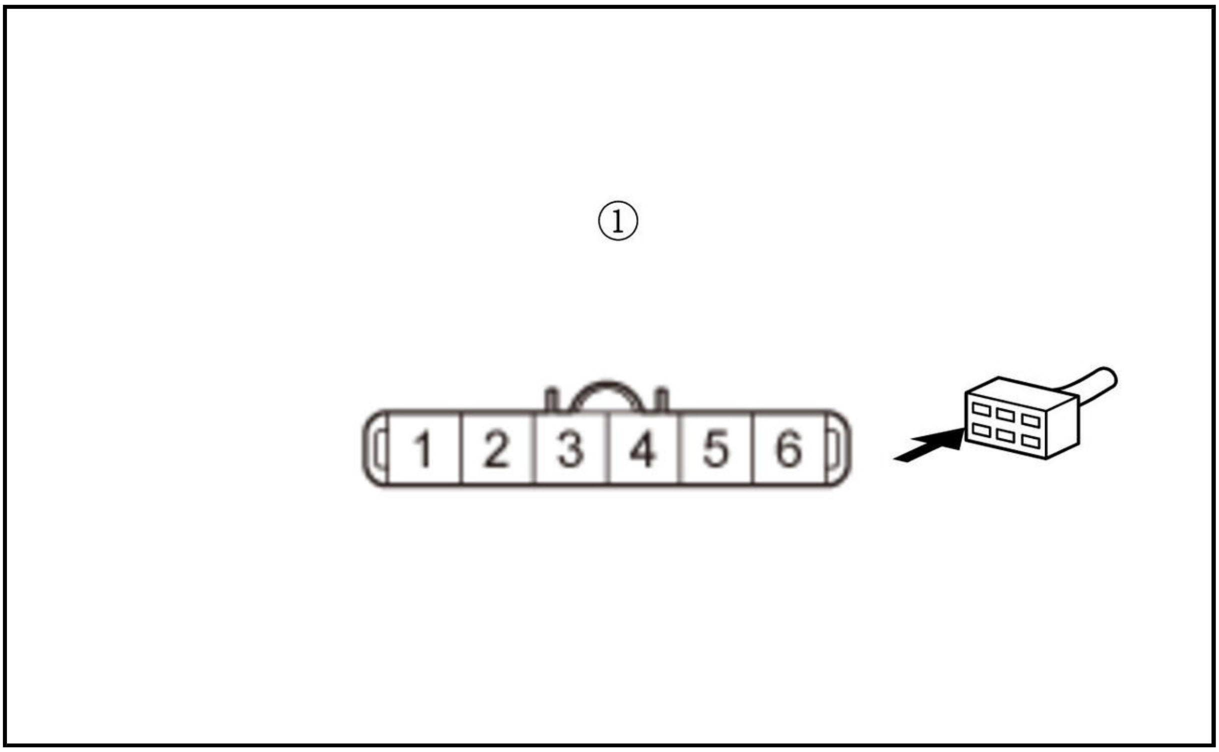
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector B (51P) No. 48**



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 wire between the PCM (B48) and the throttle body.

DTC P0123 (1.5 L ENGINE)

DTC P0123 : TP Sensor A Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0123 TP Sensor A Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR A	More than 4.8	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (SG3 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0123 TP Sensor A Circuit High Voltage	B	B
P0223 TP Sensor B Circuit High Voltage	B	B

Are DTC P0123 and P0223 indicated at the same time?

YES

Go to step 5.

NO

Go to step 3.

3. Determine possible failure area (THL1 line, throttle body)

-1. Turn the vehicle to the OFF (LOCK) mode.

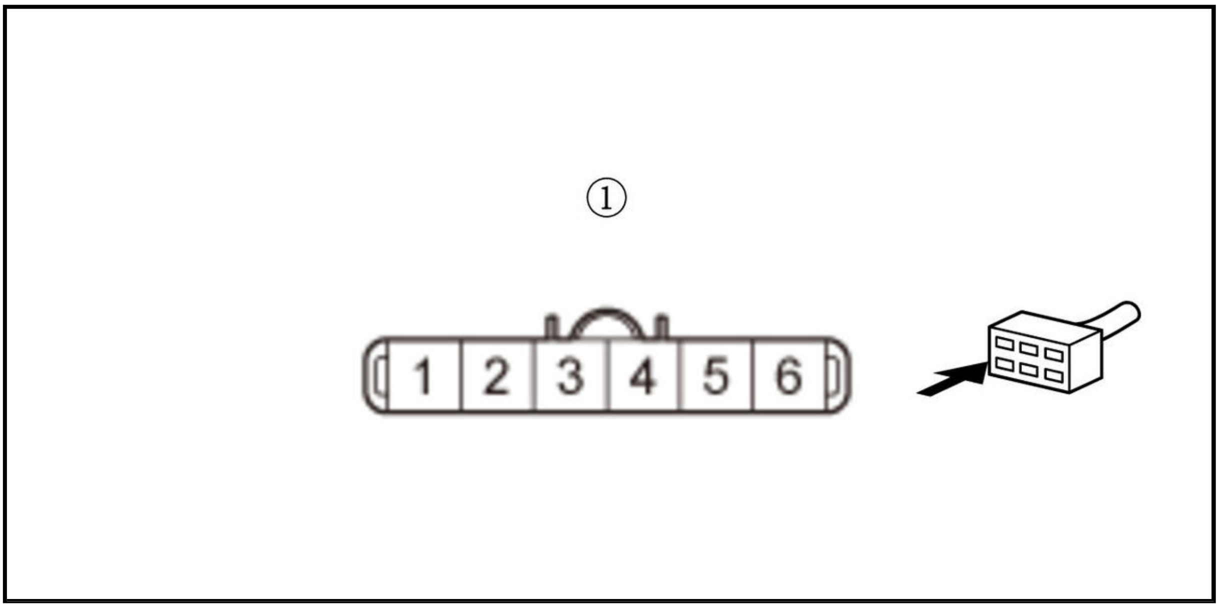
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 4.

4. Open wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

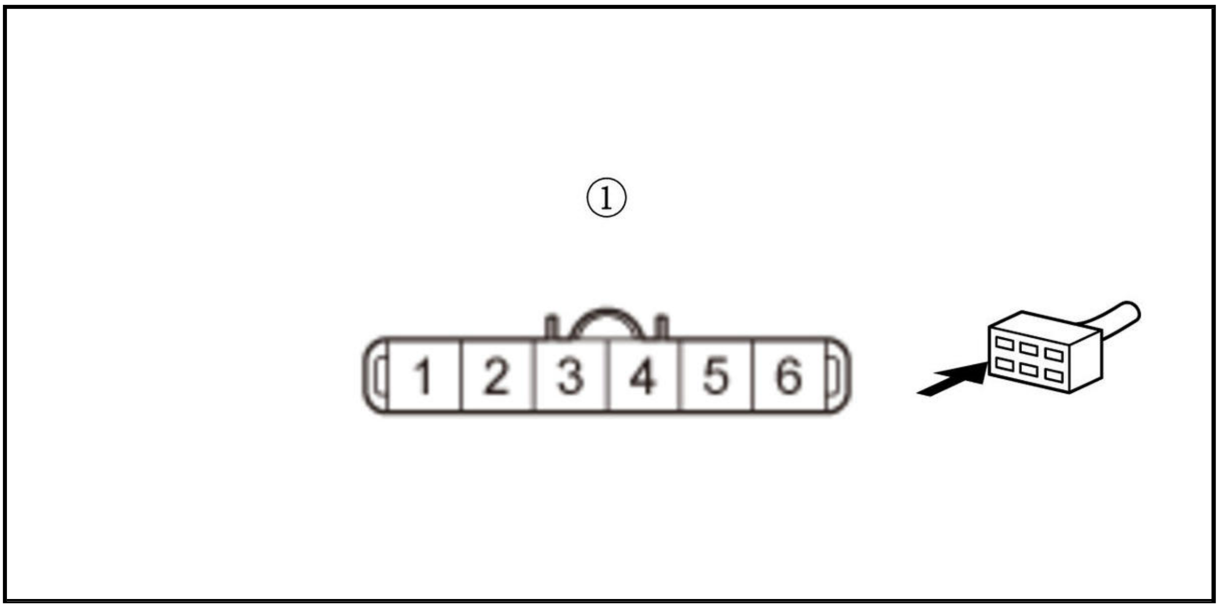
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	PCM connector E (80P) No. 50



Is there continuity?

YES

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the THL1 wire between the PCM (E50) and the throttle body.

5. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

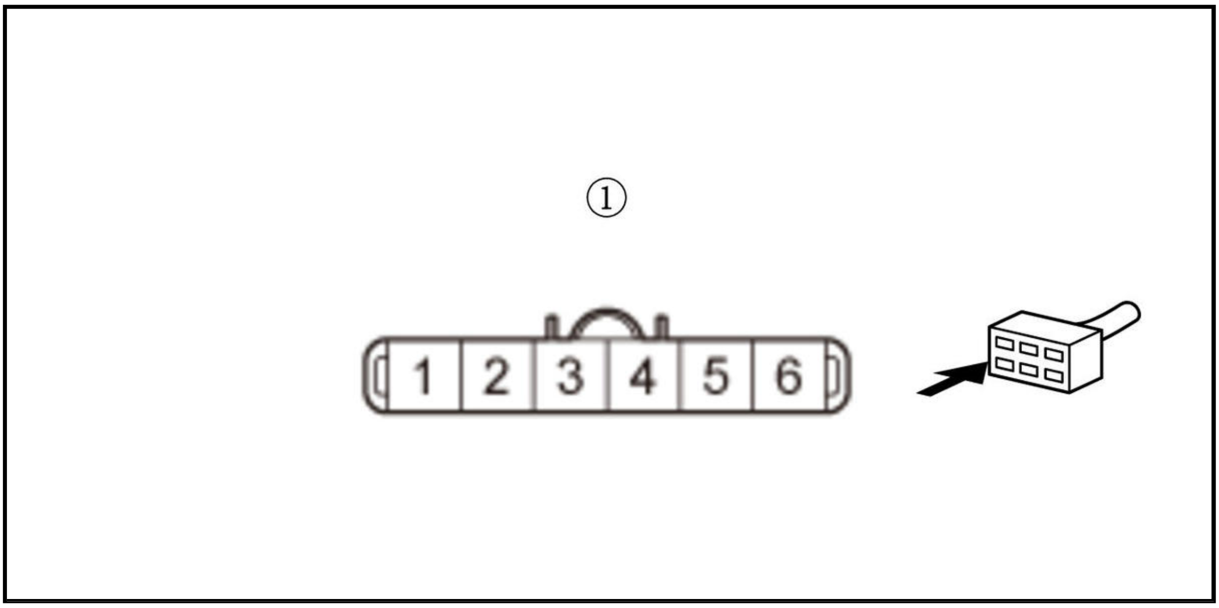
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 76**



Is there continuity?

YES

The SG3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG3 wire between the PCM (E76) and the throttle body.

DTC P0123 (2.4 L ENGINE) (2017 2018 2019)

DTC P0123 : TP Sensor A Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0123 TP Sensor A Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR A	More than 4.8	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (SG3 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0123 TP Sensor A Circuit High Voltage	B	B
P0223 TP Sensor B Circuit High Voltage	B	B

Are DTC P0123 and P0223 indicated at the same time?

YES

Go to step 5.

NO

Go to step 3.

3. Determine possible failure area (THL1 line, throttle body)

-1. Turn the vehicle to the OFF (LOCK) mode.

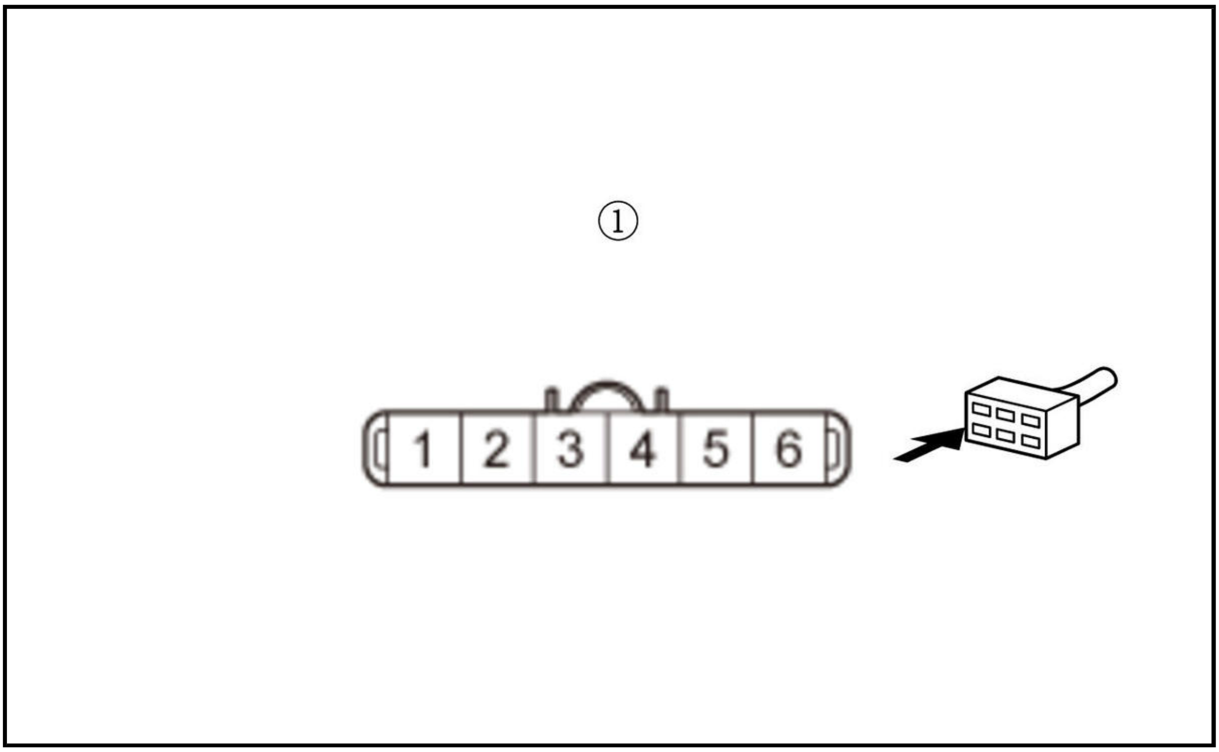
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 4.

4. Open wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

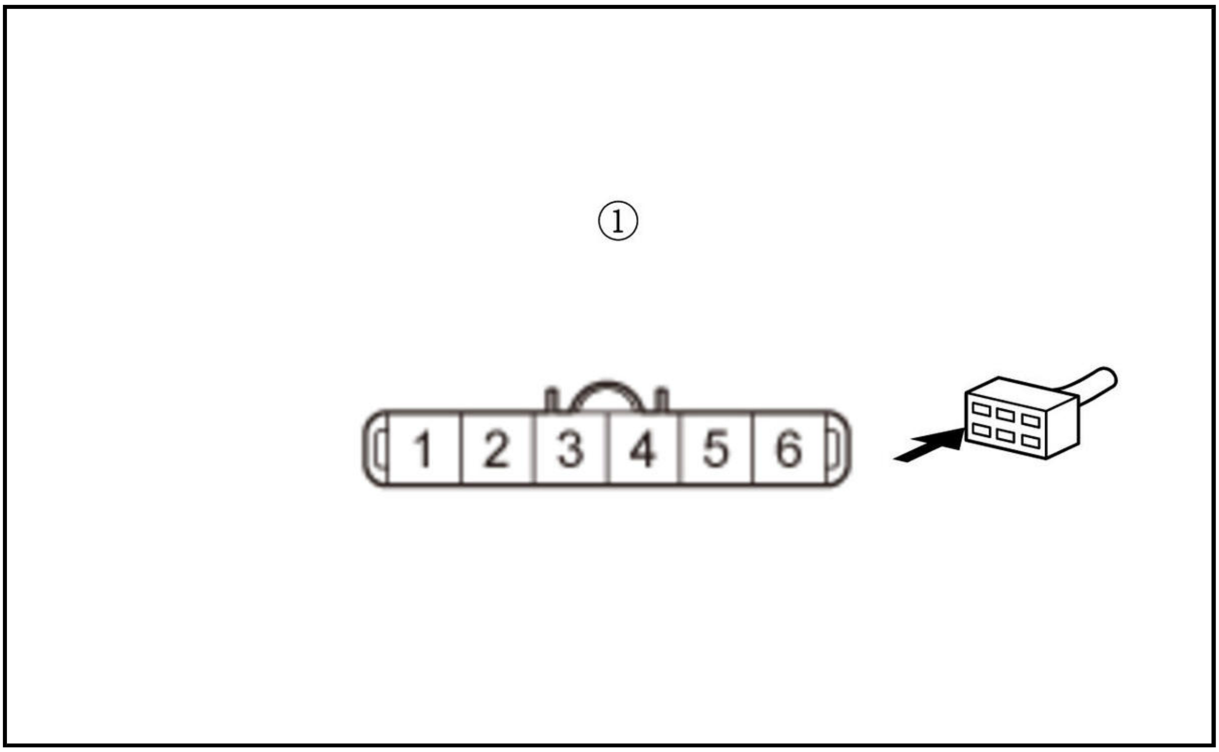
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	**PCM connector B (51P) No. 46**



Is there continuity?

YES

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the THL1 wire between the PCM (B46) and the throttle body.

5. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

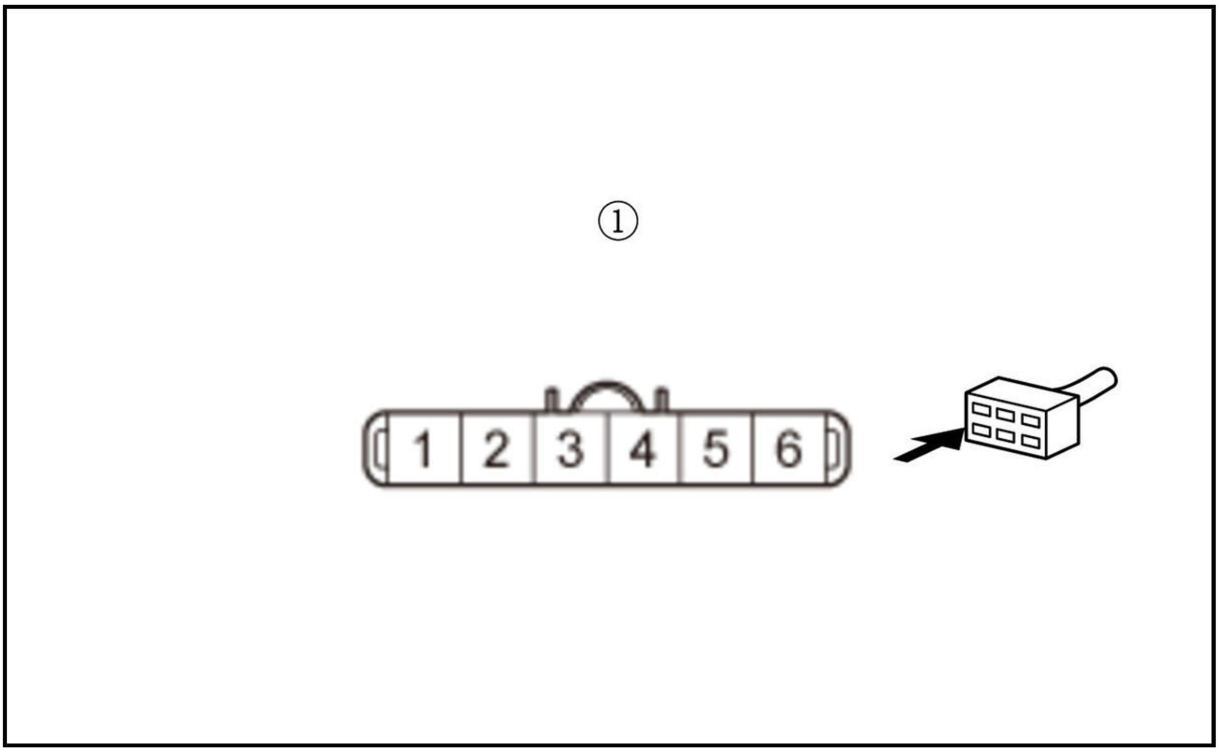
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector B (51P) No. 49**



Is there continuity?

YES

The SG3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SG3 wire between the PCM (B49) and the throttle body.

DTC P0125 (1.5 L ENGINE)

DTC P0125 : ECT Sensor 1 Malfunction/Slow Response

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0125 ECT Sensor 1 Malfunction/Slow Response	B	B

DTC (PGM-FI)

1. ECT sensor 1 check

-1. Start the engine, and let it idle for 5 minutes or more.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than -18	deg. C	B	B
	Less than 0	deg. F		

Do the current condition (s) match the threshold?

YES

Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If they are OK, replace the ECT sensor 1 .

NO

Go to step 2.

2. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to 104 deg. F (40 deg. C) or less.

-3. Start the engine, and let it idle until ECT SENSOR 1 goes up to about 158 deg. F (70 deg. C).

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 2	About 70	deg. C	B	B
	About 158	deg. F		

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

3. Thermostat check

-1. Check the thermostat .

Is the thermostat OK?

YES

Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If the connections and terminals are OK, replace the ECT sensor 1 .

NO

Replace the thermostat .

DTC P0125 (2.4 L ENGINE) (2017 2018 2019)

DTC P0125 : ECT Sensor 1 Malfunction/Slow Response

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0125 ECT Sensor 1 Malfunction/Slow Response	B	B

DTC (PGM-FI)

1. ECT sensor 1 check

   -1. Start the engine, and let it idle for 5 minutes or more.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 10	deg. F	B	B
	Less than -12	deg. C		

   Do the current condition (s) match the threshold?

   YES

   Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If they are OK, **replace ECT sensor 1** .

   NO

   Go to step 2.

2. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Allow the engine to cool to 104 deg. F (40 deg. C) or less.

   -3. Start the engine, and let it idle until ECT SENSOR 1 goes up to about 158 deg. F (70 deg. C).

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	About 158	deg. F	B	B
	About 70	deg. C		

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Thermostat check

   -1. Check the thermostat .

   Is the thermostat OK?

   YES

   Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If the connections and terminals are OK, replace ECT sensor 1 .

   NO

   Replace the thermostat .

DTC P0128 (1.5 L ENGINE)

DTC P0128 : Cooling System Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0128 Cooling System Malfunction	B	B

DTC (PGM-FI)

1. Radiator fan control command check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the blower switch off.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FAN HIGH CTRL	OFF	B	B	B
FAN LOW CTRL	OFF	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Wait until the FAN HIGH CTRL and the FAN LOW CTRL are OFF, then go to step 2.

2. Radiator fan operation check

   -1. Check the radiator fan operation.

   Does the radiator fan keep running?

   YES

Go to step 3.

NO

Go to step 4.

3. Radiator fan circuit and radiator fan relay check

-1. Check the radiator fan circuit and the radiator fan relay.

Is it OK?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair the radiator fan circuit, and the radiator fan relay.

4. Problem verification

-1. Let the engine cool until the coolant temperature is 104 deg. F (40 deg. C) or less.

-2. Note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	**Unit**
ECT SENSOR 1	B	B
ECT SENSOR 2	B	B

-3. Start the engine, and let it idle.

-4. Let the engine idle until ECT SENSOR 1 goes up 40 deg. F (22 deg. C) or more from the recorded start temperature.

Signal	Current conditions	
	Values	**Unit**
ECT SENSOR 1	B	B

-5. Check ECT SENSOR 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	**Unit**
ECT SENSOR 2	B	B

-6. Compare the recorded start value of ECT SENSOR 2 and the present value of ECT SENSOR 2.

Did the temperature rise 13 deg. F (7 deg. C) or more?

YES

Test the thermostat and replace it if needed .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to** reproduce the failure under the same conditions with the on-board snapshot .

DTC P0128 (2.4 L ENGINE) (2017 2018 2019)

DTC P0128 : Cooling System Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0128 Cooling System Malfunction	B	B

DTC (PGM-FI)

1. Radiator fan control command check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the blower switch off.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FAN HIGH CTRL	OFF	B	B	B
FAN LOW CTRL	OFF	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Wait until the FAN HIGH CTRL and the FAN LOW CTRL are OFF, then go to step 2.

2. Radiator fan operation check

   -1. Check the radiator fan operation.

   Does the radiator fan keep running?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Radiator fan circuit and radiator fan relay check

   -1. Check the radiator fan circuit and the radiator fan relay.

   Is it OK?

   YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Repair the radiator fan circuit, and the radiator fan relay.

4. Problem verification

-1. Let the engine cool until the coolant temperature is 104 deg. F (40 deg. C) or less.

-2. Note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ECT SENSOR 2	B	B

-3. Start the engine, and let it idle.

-4. Let the engine idle until ECT SENSOR 1 goes up 40 deg. F (22 deg. C) or more from the recorded start temperature.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-5. Check ECT SENSOR 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 2	B	B

-6. Compare the recorded start value of ECT SENSOR 2 and the present value of ECT SENSOR 2.

Did the temperature rise 13 deg. F (7 deg. C) or more?

YES

Test the thermostat and replace it if needed .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0130 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0130 : A/F Sensor (Sensor 1) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0130 A/F Sensor (Sensor 1) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Monitor the OBD STATUS for P0130 with the HDS.

DTC Description	OBD STATUS
P0130 A/F Sensor (Sensor 1) Out of Range	B

Does the HDS indicate FAILED?

YES

Replace the A/F sensor (Sensor 1) .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F Sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

DTC P0130 (2.4 L ENGINE) (2018 2019)

DTC P0130 : A/F Sensor (Sensor 1) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0130 A/F Sensor (Sensor 1) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Monitor the OBD STATUS for P0130 with the HDS.

DTC Description	OBD STATUS
P0130 A/F Sensor (Sensor 1) Out of Range	B

Does the HDS indicate FAILED?

YES

Replace the A/F sensor (Sensor 1) .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F Sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

DTC P0133 (1.5 L ENGINE)

DTC P0133 : A/F Sensor (Sensor 1) Malfunction/Slow Response

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0139 is stored at the same time as DTC P0133, troubleshoot DTC P0139 first, then recheck for DTC P0133.

DTC Description	Confirmed DTC	Pending DTC
P0133 A/F Sensor (Sensor 1) Malfunction/Slow Response	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. (70 deg. C)
- Transmission in D
- Engine speed between 1, 500-3, 000 rpm
- Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes, then drive at a steady speed of 25 mph (41 km/h) or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

-7. Monitor the OBD STATUS for DTC P0133 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0133 A/F Sensor (Sensor 1) Malfunction/Slow Response	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the A/F sensor (Sensor 1)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 on this step and recheck.

DTC P0133 (2.4 L ENGINE) (2017 2018 2019)

DTC P0133 : A/F Sensor (Sensor 1) Malfunction/Slow Response

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0139 is stored at the same time as DTC P0133, troubleshoot DTC P0139 first, then recheck for DTC P0133.

DTC Description	Confirmed DTC	Pending DTC
P0133 A/F Sensor (Sensor 1) Malfunction/Slow Response	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Test-drive under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Engine speed between 1, 250-3, 000 rpm
- Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes, then drive at a steady speed of 33 mph (52 km/h) or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

-6. Monitor the OBD STATUS for DTC P0133 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0133 A/F Sensor (Sensor 1) Malfunction/Slow Response	B

Does the HDS indicate FAILED?

YES

Replace the A/F sensor (Sensor 1) .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-3 on this step and recheck.

DTC P0134 (1.5 L ENGINE)

DTC P0134 : A/F Sensor (Sensor 1) Heater System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2251 is stored at the same time as DTC P0134, troubleshoot DTC P2251 first, then recheck for P0134.

DTC Description	Confirmed DTC	Pending DTC
P0134 A/F Sensor (Sensor 1) Heater System Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle without load (in P or N) for at least 1 minute.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0134 A/F Sensor (Sensor 1) Heater System Malfunction	B	B

Is DTC P0134 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the relay circuit board (PGM-FI subrelay), and the PCM. **If the on-board**

snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Open wire check (VS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

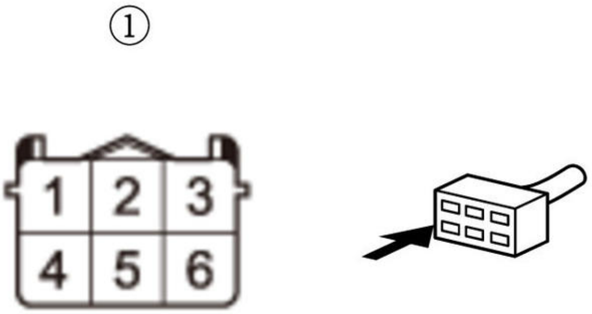
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

A/F sensor (Sensor 1) 6P connector
PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 6: ①
Test point 2	**PCM connector E (80P) No. 73**



Is there continuity?

YES

Go to step 3.

NO

Repair an open in the VS wire between the PCM (E73) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

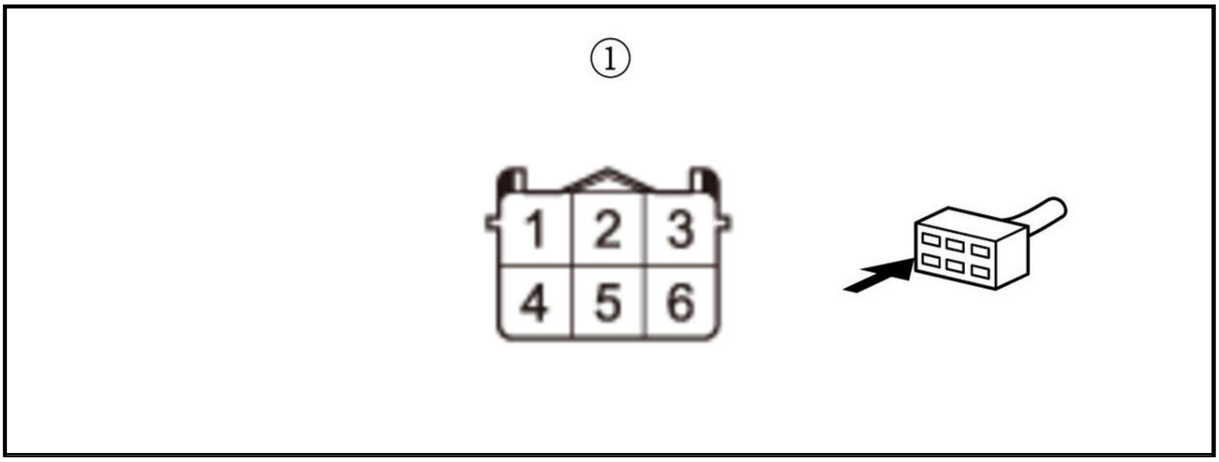
PCM connector E (80P)

-2. Exit the SCS mode with the HDS.

-3. Start the engine, and let it idle without load (in P or N) for at least 1 minute.

-4. Measure the voltage between test point 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the A/F sensor (Sensor 1) .

DTC P0134 (2.4 L ENGINE) (2017 2018 2019)

DTC P0134 : A/F Sensor (Sensor 1) Heater System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0135 is stored at the same time as DTC P0134, troubleshoot DTC P0135 first, then recheck for P0134.

DTC Description	Confirmed DTC	Pending DTC
P0134 A/F Sensor (Sensor 1) Heater System Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine, and let it idle without load (in P or N) for at least 1 minute.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0134 A/F Sensor (Sensor 1) Heater System Malfunction	B	B

Is DTC P0134 indicated?

YES

The failure is duplicated. **Replace the A/F sensor (Sensor 1)** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the relay circuit board (PGM-FI subrelay), and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0135 (1.5 L ENGINE)

DTC P0135 : A/F Sensor (Sensor 1) Heater Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0135 A/F Sensor (Sensor 1) Heater Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0135 A/F Sensor (Sensor 1) Heater Circuit Malfunction	B	B

   Is DTC P0135 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the relay circuit board (PGM-FI subrelay), and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B
P1659 ETCS Control Relay OFF Malfunction	B	B

Is DTC P1658 and/or P1659 indicated?

YES

Go to the indicated DTCs troubleshooting.

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A11 (7.5 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the IGPS (LAF) wire between the No. A11 (7.5 A) fuse in the under-hood fuse/relay box and the A/F sensor (Sensor 1). Also replace the No. A11 (7.5 A) fuse.

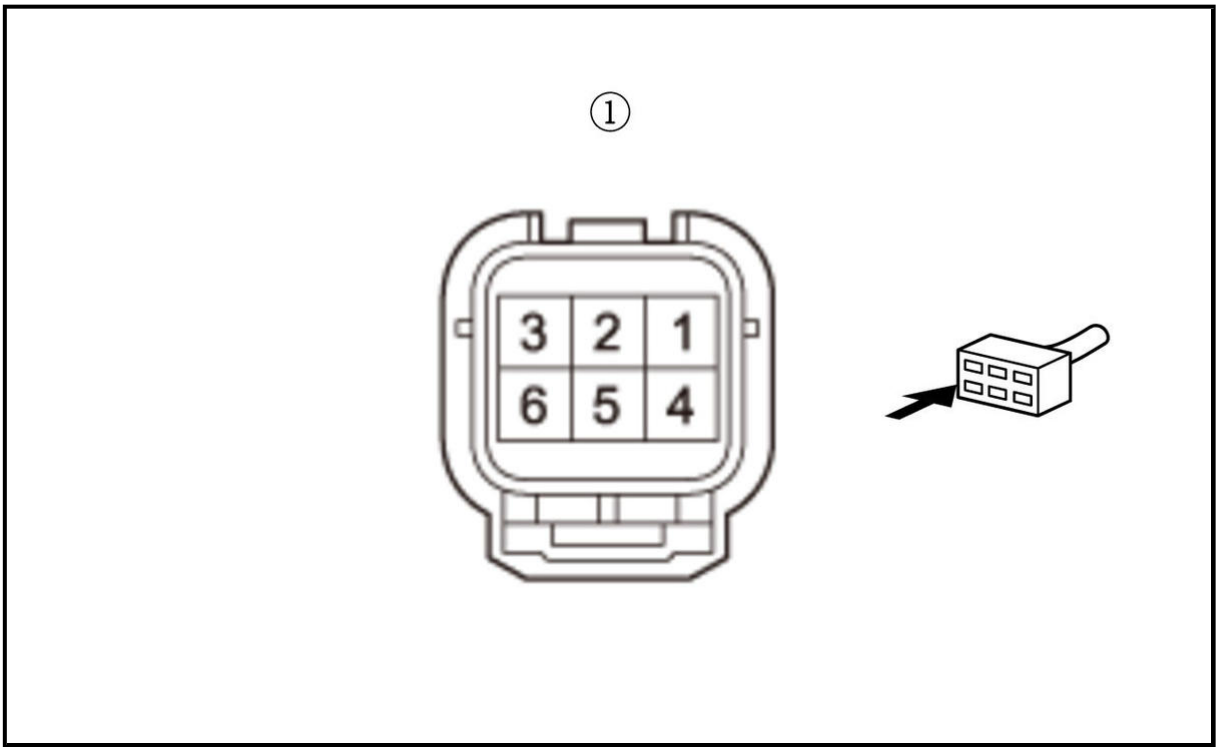
4. A/F sensor (Sensor 1) internal heater resistance check

-1. Disconnect the following connector.

A/F sensor (Sensor 1) 6P connector

-2. At the sensor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 2 (A/F sensor (Sensor 1) side): ①
Test point 2	A/F sensor (Sensor 1) 6P connector (male terminals) No. 3 (A/F sensor (Sensor 1) side): ①



Is there 2.8-4.5 Ω at room temperature?

YES

Go to step 5.

NO

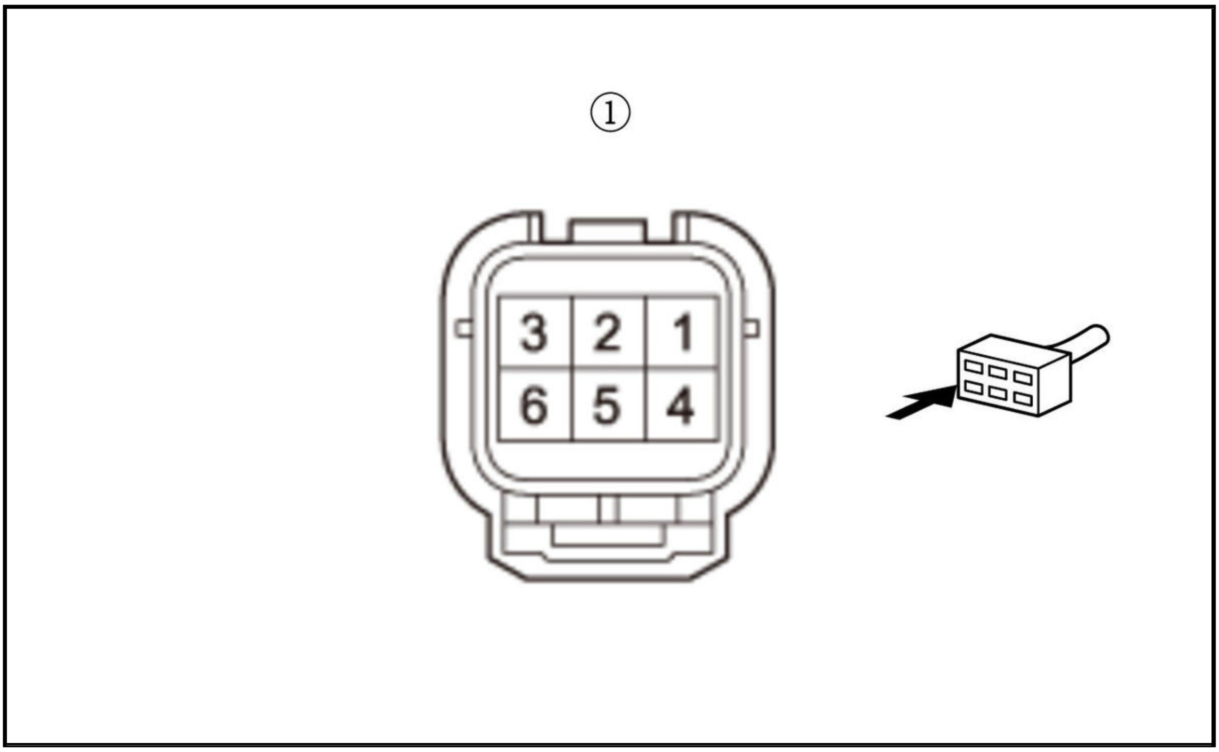
Replace the A/F sensor (Sensor 1) .

5. A/F sensor (Sensor 1) internal circuit check 1

-1. Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected

Connector	Test circuit	Terminal
A/F sensor (Sensor 1) (A/F sensor (Sensor 1) side)	AFHT N	(male terminals) No. 2: ①
	IGPS (LAF)	(male terminals) No. 3: ①
	VCENT	(male terminals) No. 4: ①
	IP	(male terminals) No. 5: ①
	VS	(male terminals) No. 6: ①



Is there continuity?

YES

Replace the A/F sensor (Sensor 1) .

NO

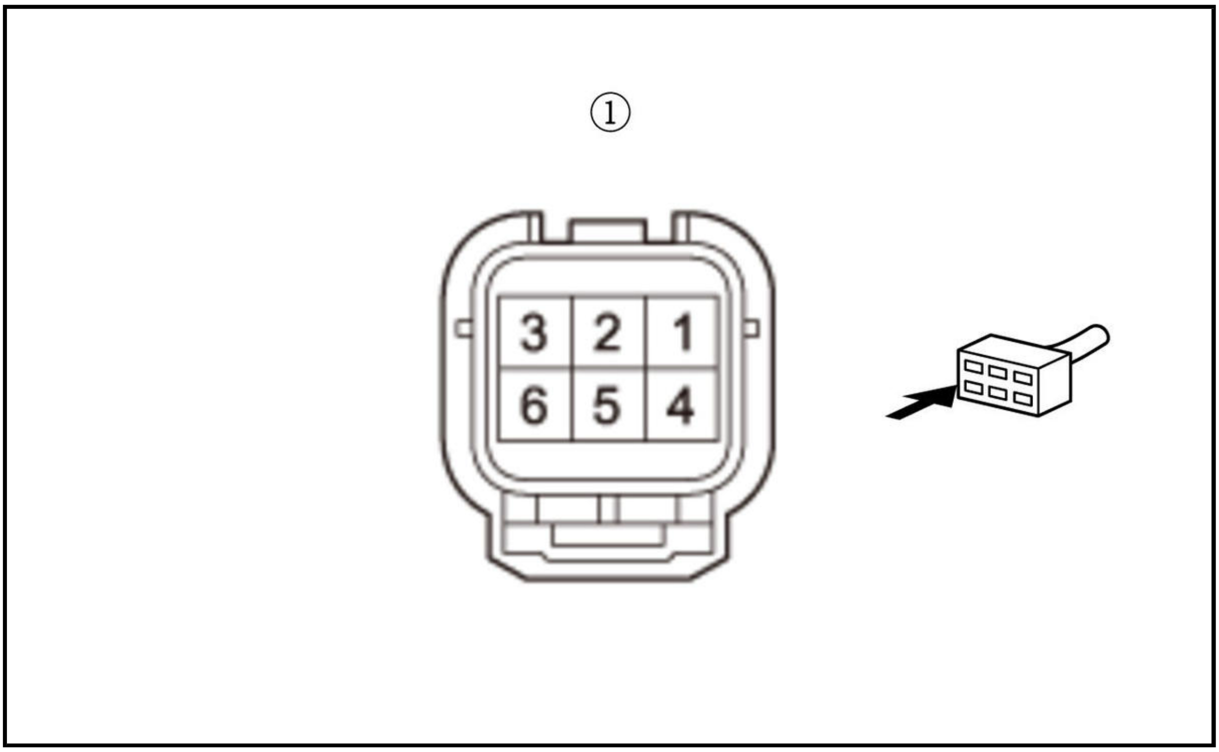
Go to step 6.

6. A/F sensor (Sensor 1) internal circuit check 2

-1. Check for continuity between the following test points and the A/F sensor (Sensor 1) 6P connector No. 3 individually.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected

Connector	Test circuit	Terminal
A/F sensor (Sensor 1) (A/F sensor (Sensor 1) side)	AFHT N	(male terminals) No. 2: ①
	VCENT	(male terminals) No. 4: ①
	IP	(male terminals) No. 5: ①
	VS	(male terminals) No. 6: ①



Is there continuity?

YES

Replace the A/F sensor (Sensor 1) .

NO

Go to step 7.

7. Shorted wire check (AFHT N line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 13**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the AFHT N wire between the PCM (E13) and the A/F sensor (Sensor 1).

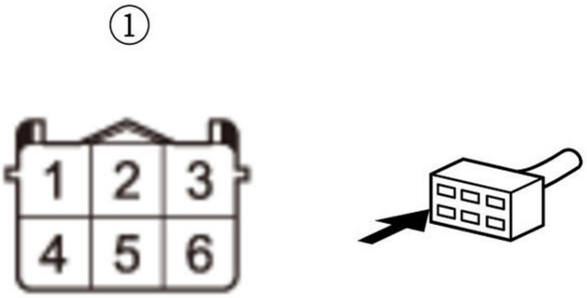
NO

Go to step 8.

8. Open wire check (AFHT N line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 13**



Is there continuity?

YES

Go to step 9.

NO

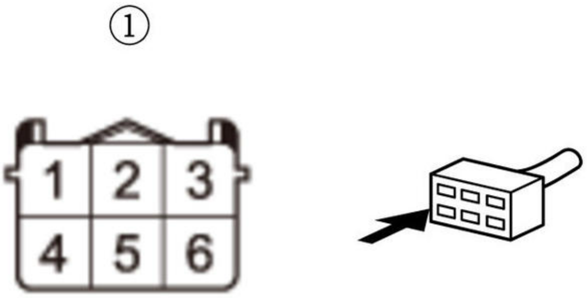
Repair an open in the AFHT N wire between the PCM (E13) and the A/F sensor (Sensor 1).

9. Open wire check (IGPS (LAF) line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGPS (LAF) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the IGPS (LAF) wire between the A/F sensor (Sensor 1) and the No. A11 (7.5 A) fuse in the under-hood fuse/relay box.

DTC P0135 (2.4 L ENGINE) (2017 2018 2019)

DTC P0135 : A/F Sensor (Sensor 1) Heater Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0135 A/F Sensor (Sensor 1) Heater Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0135 A/F Sensor (Sensor 1) Heater Circuit Malfunction	B	B

   Is DTC P0135 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the relay circuit board (PGM-FI subrelay circuit), and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B
P1659 ETCS Control Relay OFF Malfunction	B	B

   Is DTC P1658 and/or P1659 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 3.

3. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A11 (7.5 A)
Location	Under-hood fuse/relay box

   Is the fuse OK?

   YES

   Go to step 4.

   NO

   Repair a short in the IGPS (LAF) wire between the No. A11 (7.5 A) fuse in the under-hood fuse/relay box and the A/F sensor (Sensor 1). Also replace the No. A11 (7.5 A) fuse.

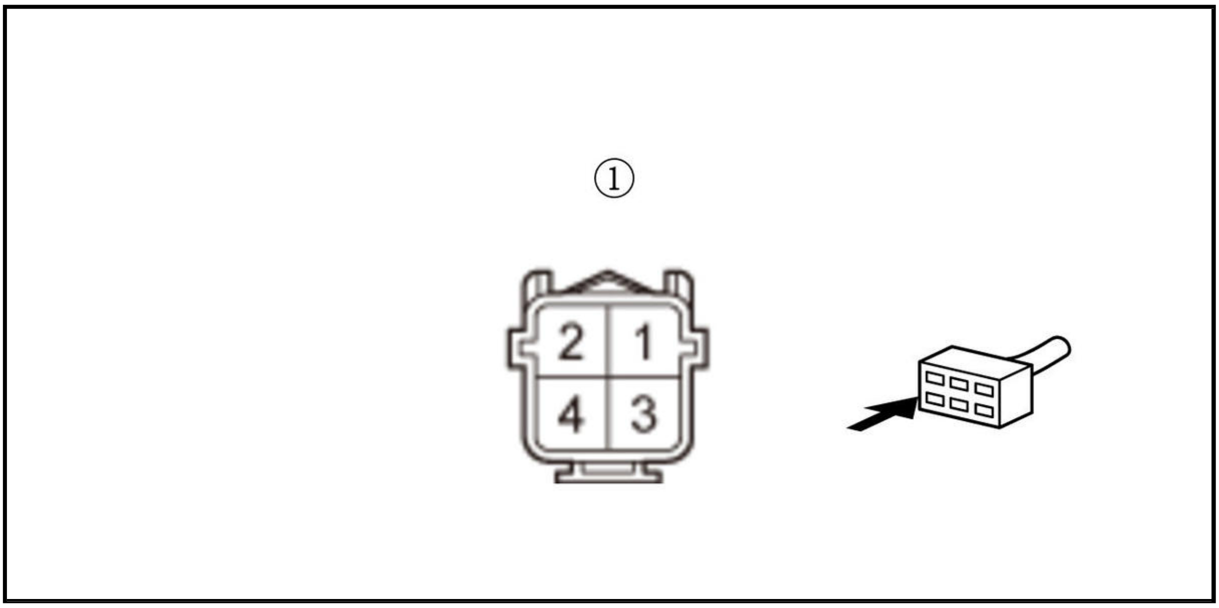
4. A/F sensor (Sensor 1) internal heater resistance check

   -1. Disconnect the following connector.

A/F sensor (Sensor 1) 4P connector

   -2. At the sensor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	A/F sensor (Sensor 1) 4P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 4P connector (male terminals) No. 3 (A/F sensor (Sensor 1) side): ①
Test point 2	A/F sensor (Sensor 1) 4P connector (male terminals) No. 4 (A/F sensor (Sensor 1) side): ①



Is there 2.2-2.7 Ω at room temperature?

YES

Go to step 5.

NO

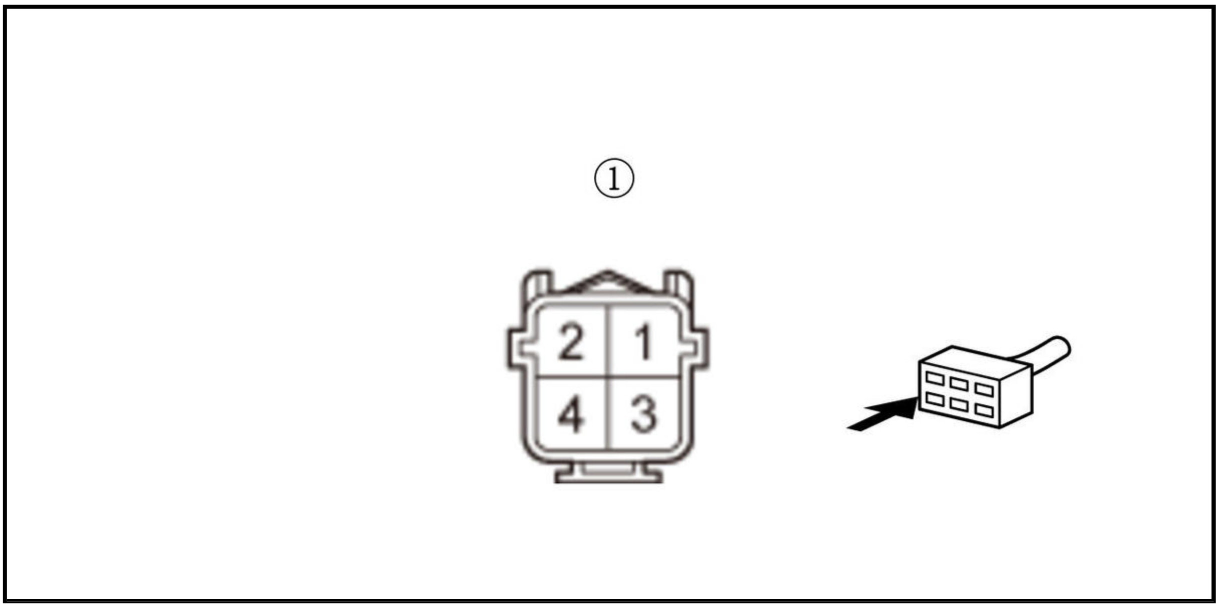
Replace the A/F sensor (Sensor 1) .

5. A/F sensor (Sensor 1) internal circuit check

-1. At the sensor side, check for continuity under the following conditions.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 4P connector: disconnected

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 4P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 4P connector (male terminals) No. 3 (A/F sensor (Sensor 1) side): ①
	A/F sensor (Sensor 1) 4P connector (male terminals) No. 4 (A/F sensor (Sensor 1) side): ①
Test point 2	A/F sensor (Sensor 1) 4P connector (male terminals) No. 1 (A/F sensor (Sensor 1) side): ①



Is there continuity?

YES

Replace the A/F sensor (Sensor 1) .

NO

Go to step 6.

6. Shorted wire check (AFHT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector C (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	A/F sensor (Sensor 1) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the AFHT wire between the PCM (C7) and the A/F sensor (Sensor 1).

NO

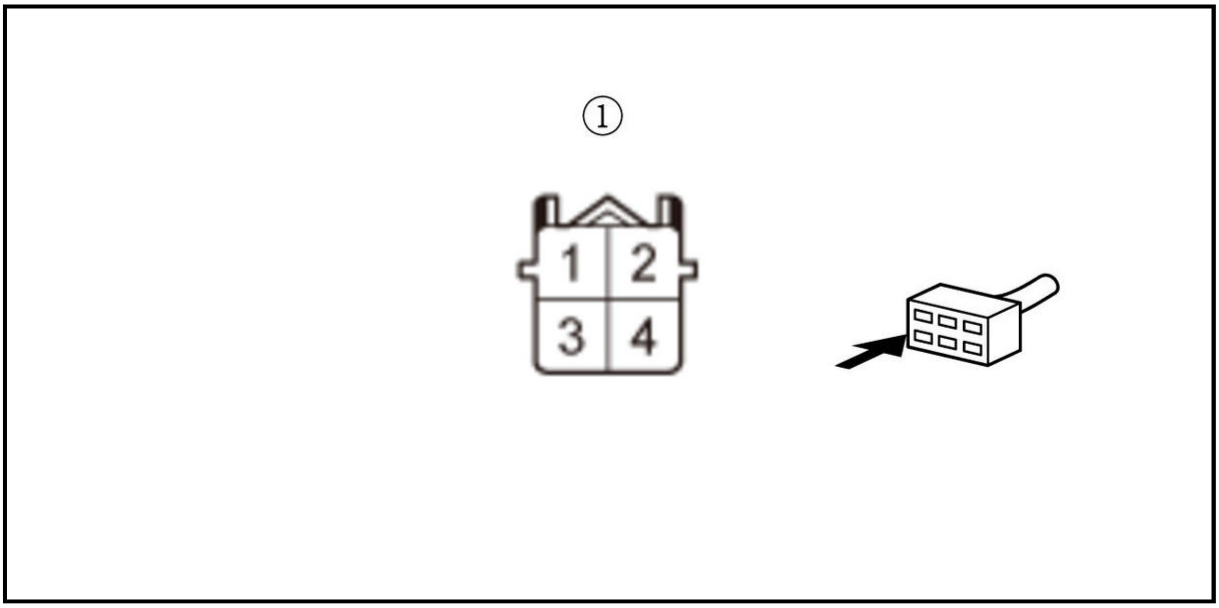
The AFHT wire is not shorted. Go to step 7.

7. Open wire check (AFHT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	A/F sensor (Sensor 1) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	A/F sensor (Sensor 1) 4P connector (female terminals) No. 3: ①
Test point 2	**PCM connector C (51P) No. 7**



Is there continuity?

YES

The AFHT wire is OK. Go to step 8.

NO

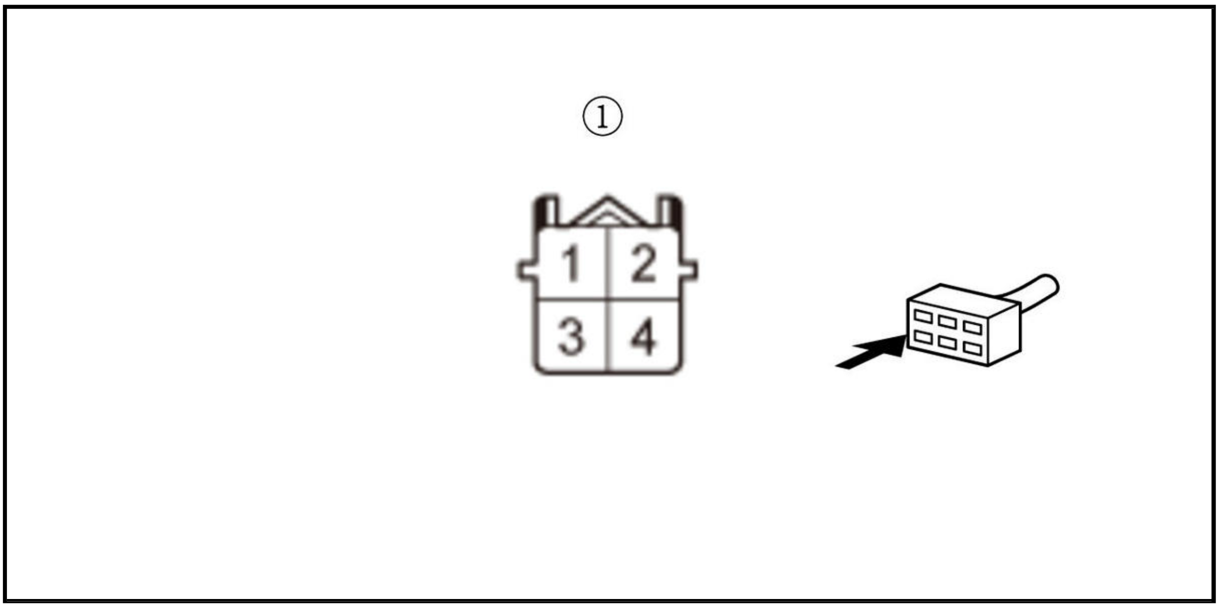
Repair an open in the AFHT wire between the PCM (C7) and the A/F sensor (Sensor 1).

8. Open wire check (IGPS (LAF)/LAF+ line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/F sensor (Sensor 1) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	A/F sensor (Sensor 1) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGPS (LAF)/LAF+ wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the IGPS (LAF)/LAF+ wire between the A/F sensor (Sensor 1) and the relay circuit board (PGM-FI subrelay circuit).

DTC P0137 (1.5 L ENGINE)

DTC P0137 : Secondary HO2S (Sensor 2) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0137 Secondary HO2S (Sensor 2) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Monitor the OBD STATUS for DTC P0137 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0137 Secondary HO2S (Sensor 2) Circuit Low Voltage	B

Does the HDS indicate FAILED?

YES

Go to step 2.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	Less than 0.17	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

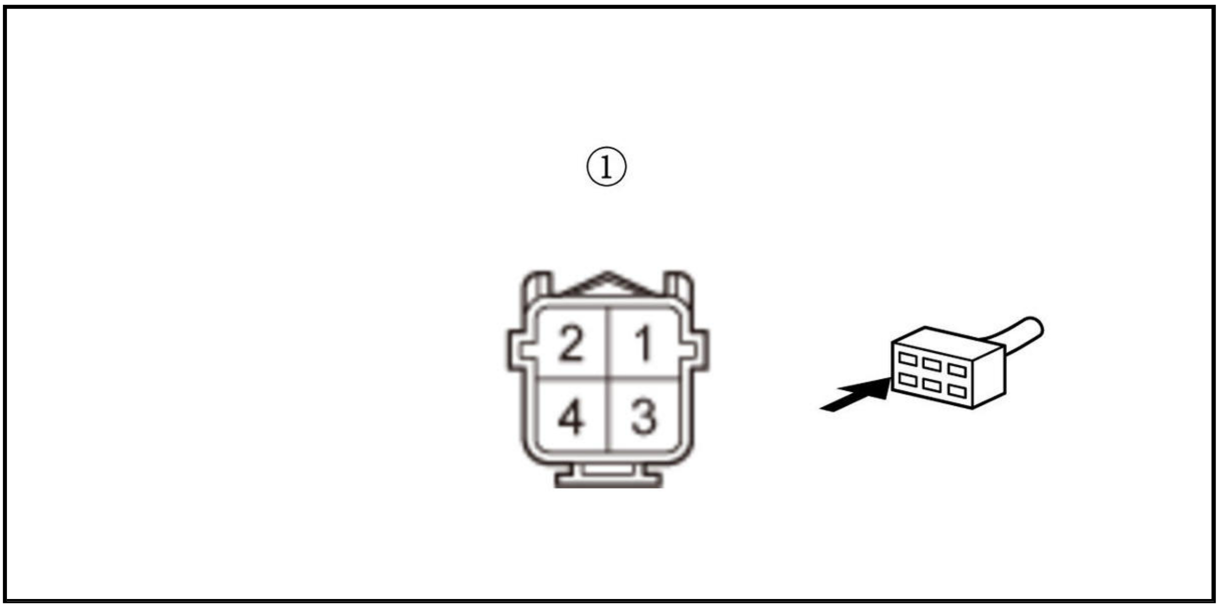
Replace the secondary HO2S (Sensor 2) .

3. Determine possible failure area (short in SO2 line, short in SO2SG/SO2 SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (SO2 line)

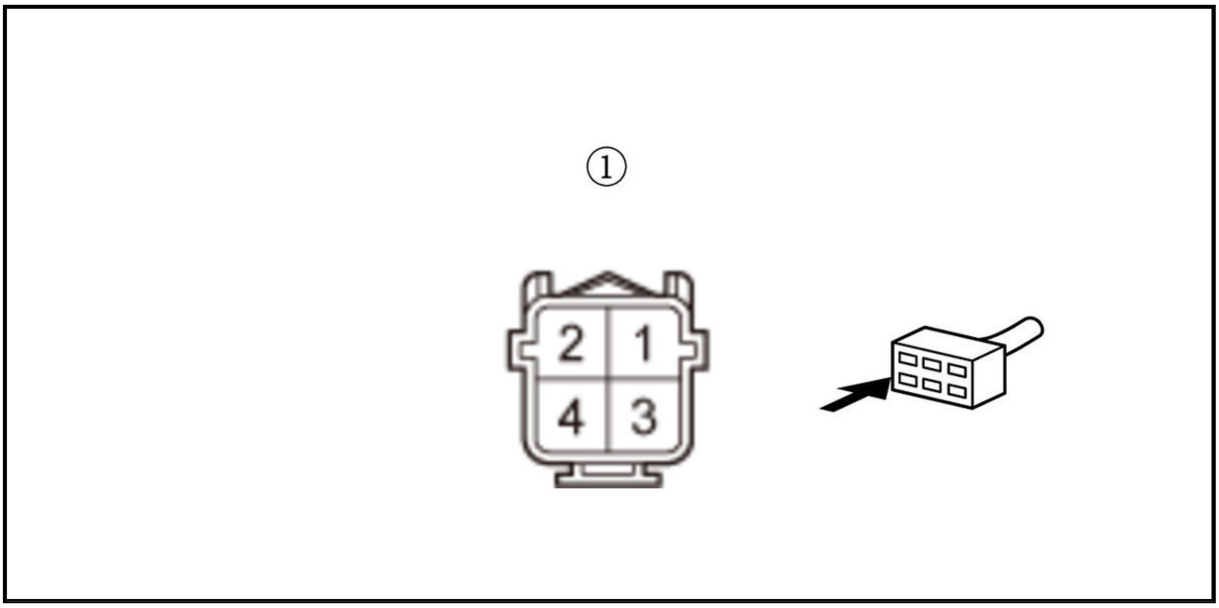
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the SO2 wire between the PCM (A47) and secondary HO2S (Sensor 2).

NO

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Shorted wire check (SO2SG/SO2 SG line)

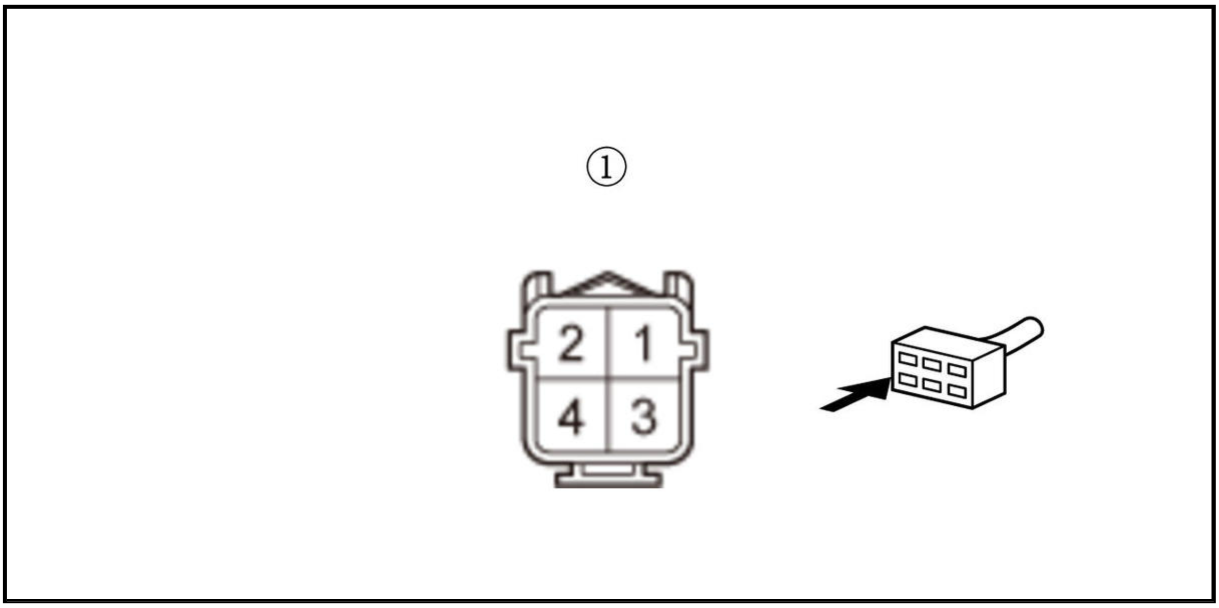
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the SO2SG/SO2 SG wire between the PCM (A48) and secondary HO2S (Sensor 2).

NO

The SO2SG/SO2 SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0137 (2.4 L ENGINE) (2017 2018 2019)

DTC P0137 : Secondary HO2S (Sensor 2) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0137 Secondary HO2S (Sensor 2) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

-5. Monitor the OBD STATUS for DTC P0137 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0137 Secondary HO2S (Sensor 2) Circuit Low Voltage	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

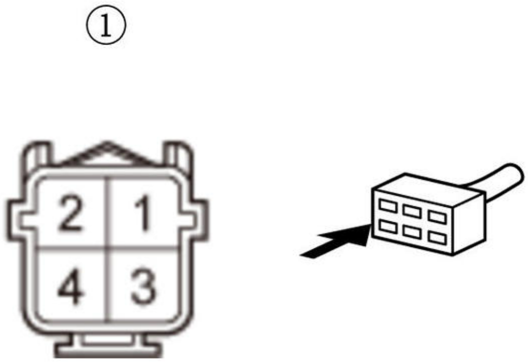
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	Less than 0.12	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace secondary HO2S (Sensor 2) .

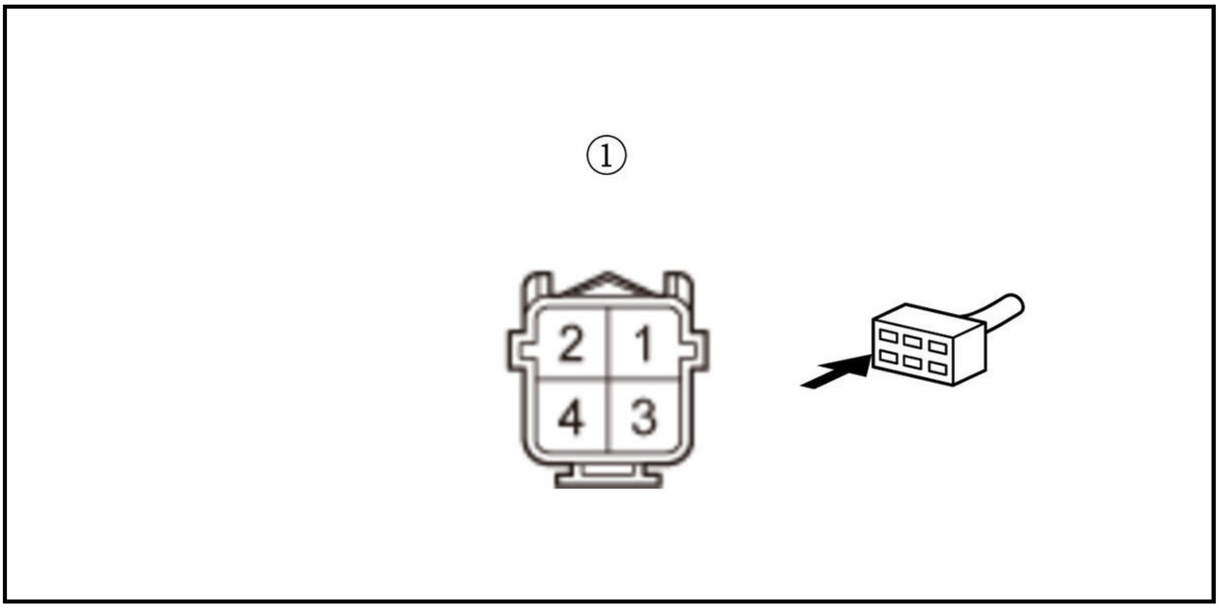
3. Determine possible failure area (short in SO2 line, short in SO2SG/SO2 SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected

Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (SO2 line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

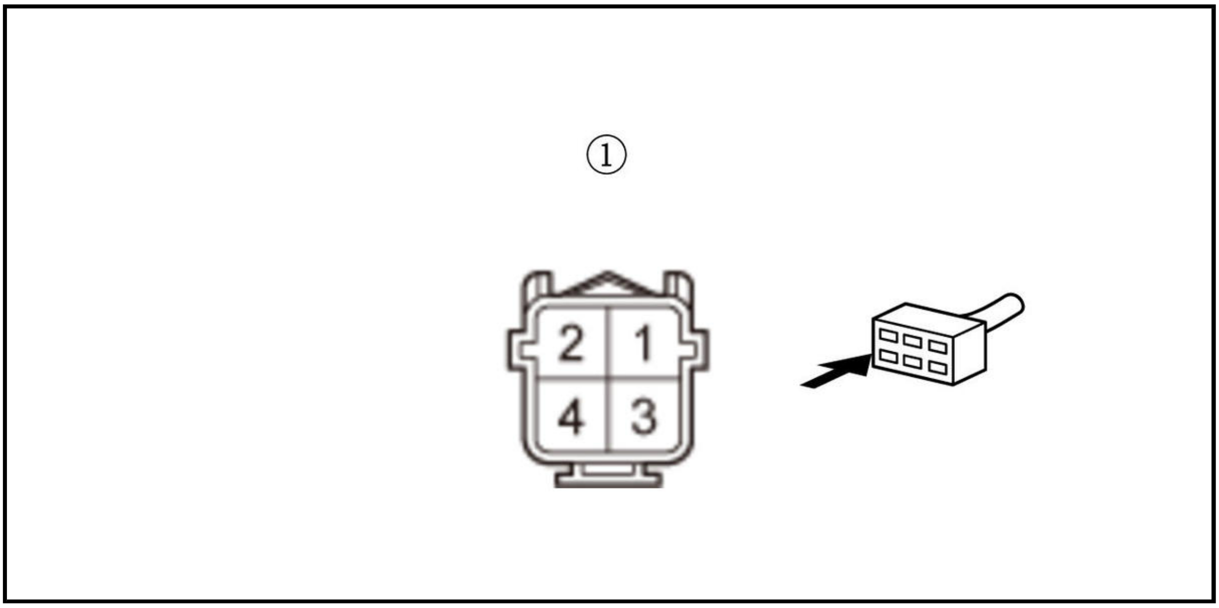
-2. Disconnect the following connector.

PCM connector C (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①

Test point 2	Body ground



Is there continuity?

YES

Repair a short in the SO2 wire between the PCM (C38) and secondary HO2S (Sensor 2).

NO

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Shorted wire check (SO2SG/SO2 SG line)

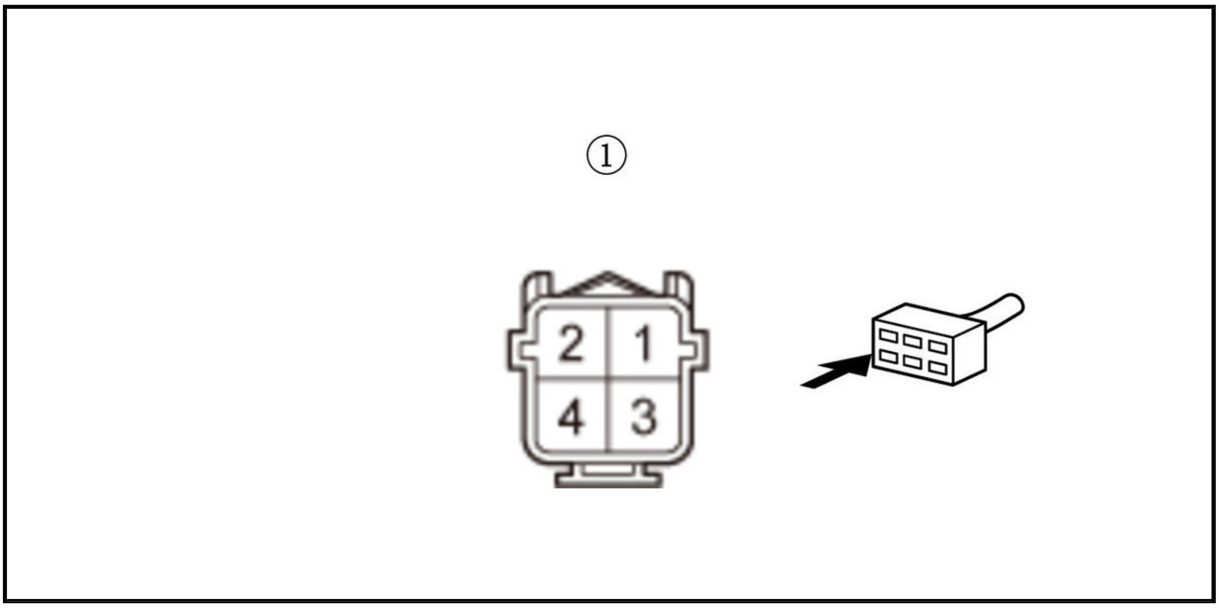
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector C (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the SO2SG/SO2 SG wire between the PCM (C39) and secondary HO2S (Sensor 2).

NO

The SO2SG/SO2 SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0138 (1.5 L ENGINE) (2017)

DTC P0138 : Secondary HO2S (Sensor 2) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0138 Secondary HO2S (Sensor 2) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	More than 1.27	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

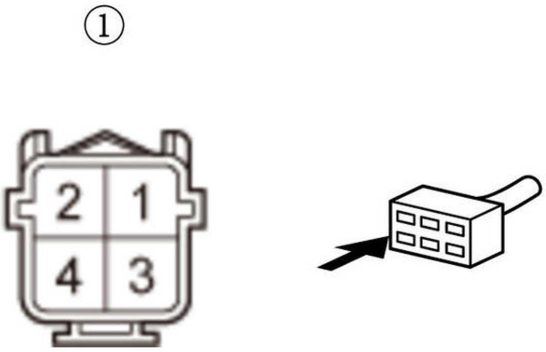
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 1.27	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the secondary HO2S (Sensor 2) .

3. Open wire check (SO2SG/SO2 SG line)

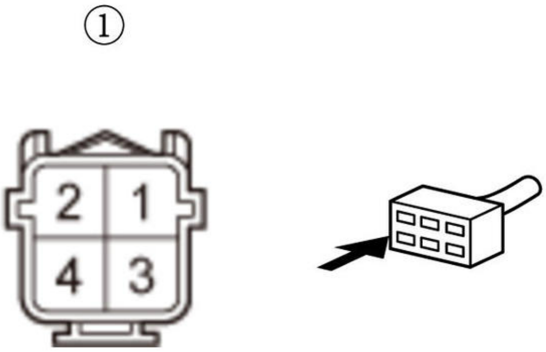
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①

Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 1.27	V	B	B

Do the current condition (s) match the threshold?

YES

The SO2SG/SO2 SG wire is OK. Go to step 4.

NO

Go to step 5.

4. Open wire check (SO2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Secondary HO2S (Sensor 2) 4P connector: disconnected
	Secondary HO2S (Sensor 2) 4P connector No. 1: jumped to body ground
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 47**
Test point 2	Body ground

Is there continuity?

YES

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SO2 wire between the PCM (A47) and secondary HO2S (Sensor 2).

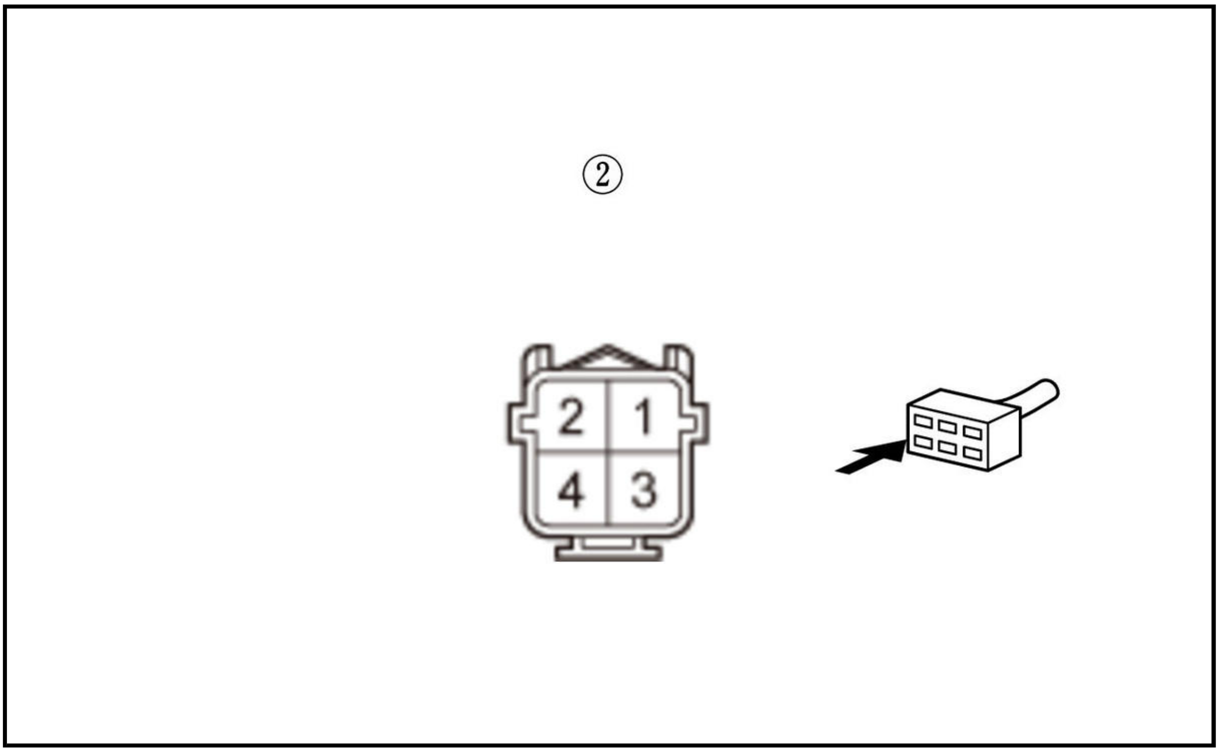
5. Open wire check (SO2SG/SO2 SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①
Terminal B	Body ground



-4. Jump the SCS line with the HDS, and wait more than 1 minute.

-5. Disconnect the following connector.

PCM connector A (50P)

-6. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	Secondary HO2S (Sensor 2) 4P connector No. 2: jumped to body ground
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 48**
Test point 2	Body ground

Is there continuity?

YES

The SO2SG/SO2 SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SO2SG/SO2 SG wire between the PCM (A48) and secondary HO2S (Sensor 2).

DTC P0138 (1.5 L ENGINE) (2018 2019)

DTC P0138 : Secondary HO2S (Sensor 2) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0138 Secondary HO2S (Sensor 2) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	More than 3.28	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

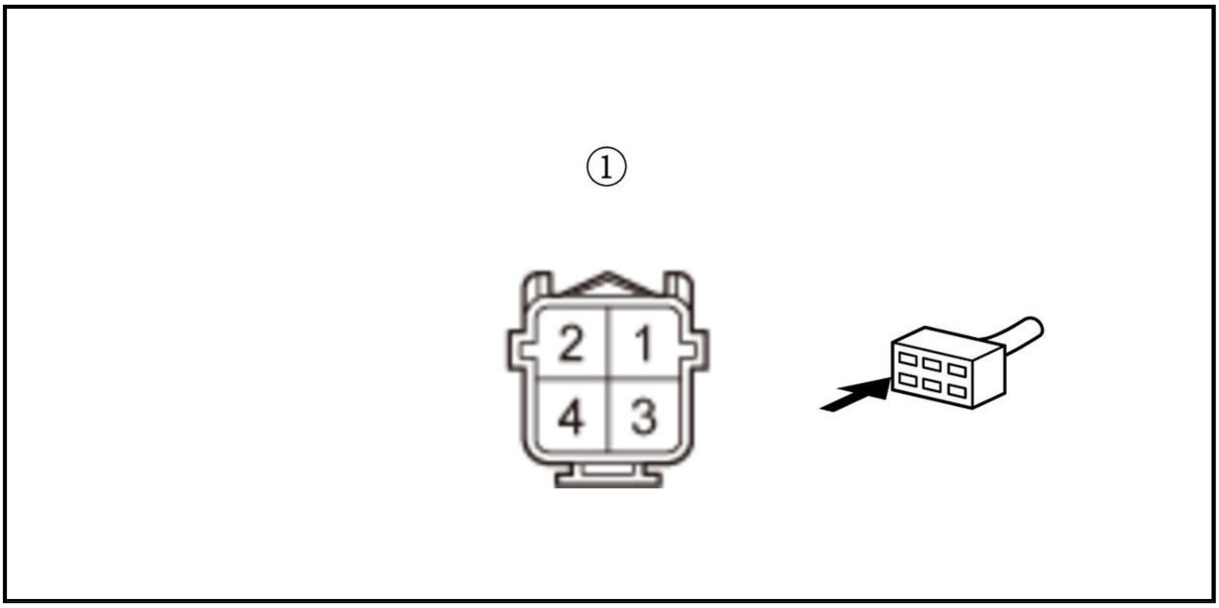
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 3.28	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the secondary HO2S (Sensor 2) .

3. Open wire check (SO2SG/SO2 SG line)

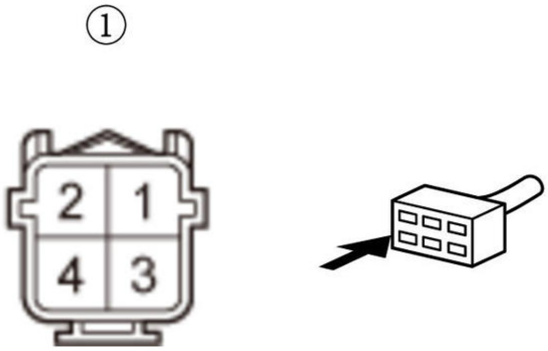
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①

Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 3.28	V	B	B

Do the current condition (s) match the threshold?

YES

The SO2SG/SO2 SG wire is OK. Go to step 4.

NO

Go to step 5.

4. Open wire check (SO2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Secondary HO2S (Sensor 2) 4P connector: disconnected

	Secondary HO2S (Sensor 2) 4P connector No. 1: jumped to body ground
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 47**
Test point 2	Body ground

Is there continuity?

YES

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SO2 wire between the PCM (A47) and secondary HO2S (Sensor 2).

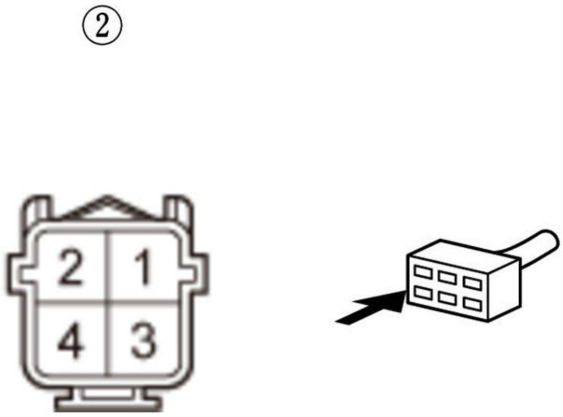
5. Open wire check (SO2SG/SO2 SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①
Terminal B	Body ground



-4. Jump the SCS line with the HDS, and wait more than 1 minute.

-5. Disconnect the following connector.

PCM connector A (50P)

-6. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	Secondary HO2S (Sensor 2) 4P connector No. 2: jumped to body ground
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 48**
Test point 2	Body ground

Is there continuity?

YES

The SO2SG/SO2 SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SO2SG/SO2 SG wire between the PCM (A48) and secondary HO2S (Sensor 2).

DTC P0138 (1.5 L ENGINE) (2020 2021)

DTC P0138 : Secondary HO2S (Sensor 2) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0138 Secondary HO2S (Sensor 2) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine, and let it idle without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	More than 3.27	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

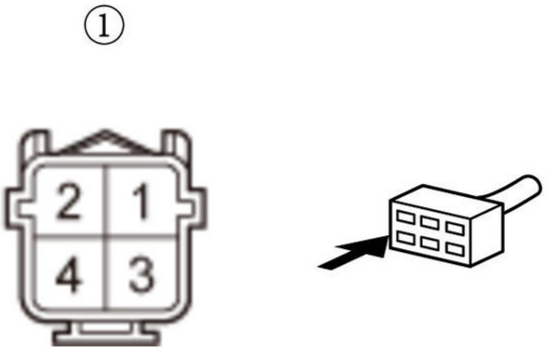
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 3.27	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the secondary HO2S (Sensor 2) .

3. Open wire check (SO2SG/SO2 SG line)

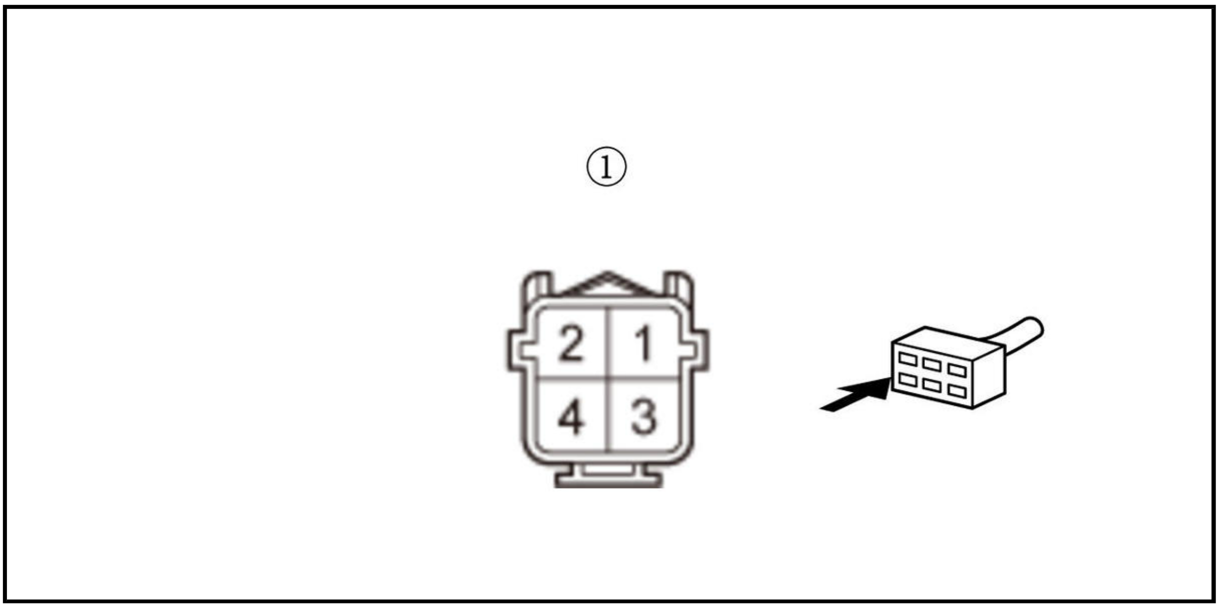
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①

Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 3.27	V	B	B

Do the current condition (s) match the threshold?

YES

The SO2SG/SO2 SG wire is not open. Go to step 4.

NO

Repair an open in the SO2SG/SO2 SG wire between the PCM (A48) and secondary HO2S (Sensor 2).

4. Open wire check (SO2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Secondary HO2S (Sensor 2) 4P connector: disconnected
	Secondary HO2S (Sensor 2) 4P connector No. 1: jumped to body ground
	PCM connector A (50P): disconnected
Test point 1	PCM connector A (50P) No. 47
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SO2 wire is OK. Go to step 5.

NO

Repair an open in the SO2 wire between the PCM (A47) and secondary HO2S (Sensor 2).

5. Shorted wire check (SO2SG/SO2 SG line to power)

-1. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 48**
Test point 2	Body ground

Is there about 5 V or more?

YES

Repair a short to power in the SO2SG/SO2 SG wire between the PCM (A48) and secondary HO2S (Sensor 2).

NO

The SO2SG/SO2 SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0138 (2.4 L ENGINE) (2017 2018 2019)

DTC P0138 : Secondary HO2S (Sensor 2) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0138 Secondary HO2S (Sensor 2) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	More than 1.27	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

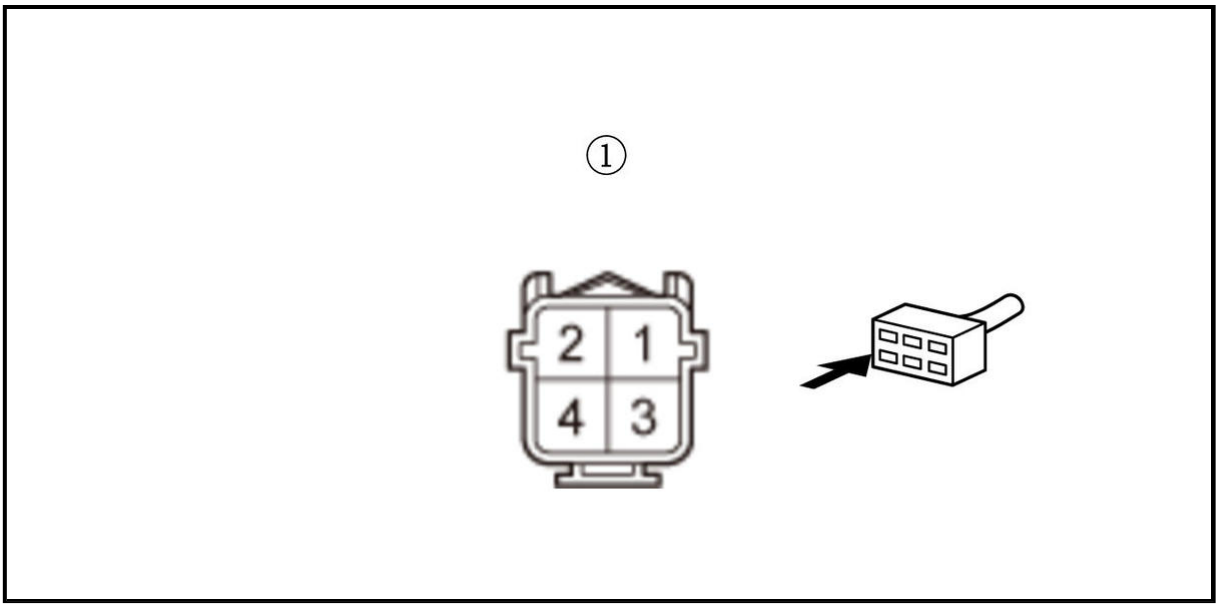
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	More than 1.27	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace secondary HO2S (Sensor 2) .

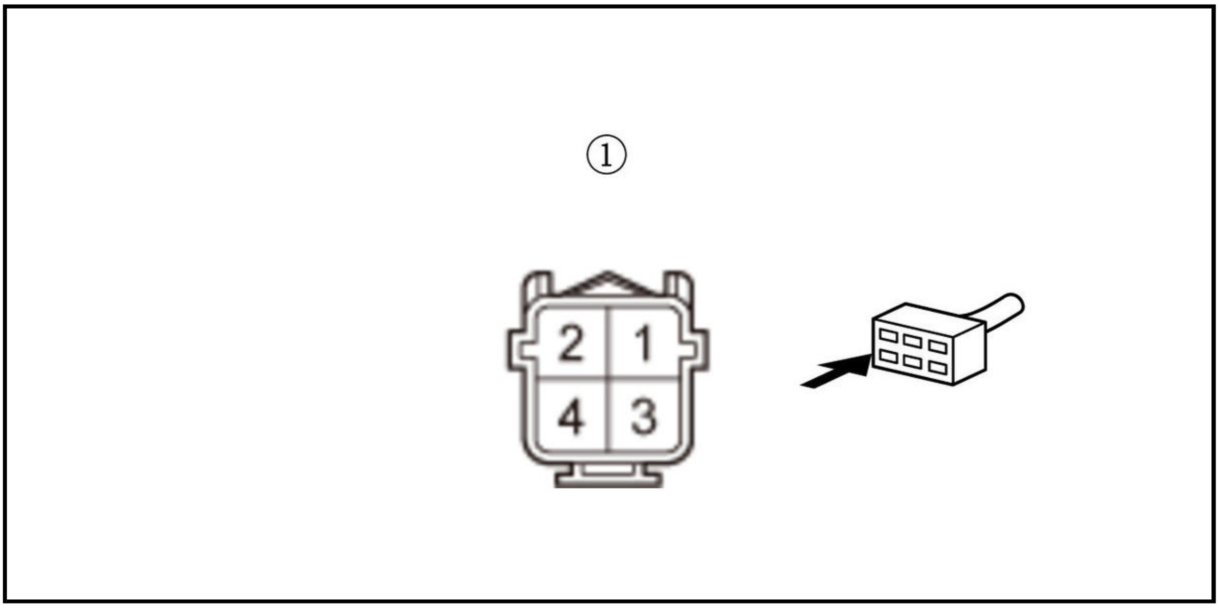
3. Determine possible failure area (open in SO2 line, open in SO2SG/SO2 SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	More than 1.27	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SO2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	Secondary HO2S (Sensor 2) 4P connector No. 1: jumped to body ground
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 38**
Test point 2	Body ground

Is there continuity?

YES

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SO2 wire between the PCM (C38) and secondary HO2S (Sensor 2).

5. Open wire check (SO2SG/SO2 SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

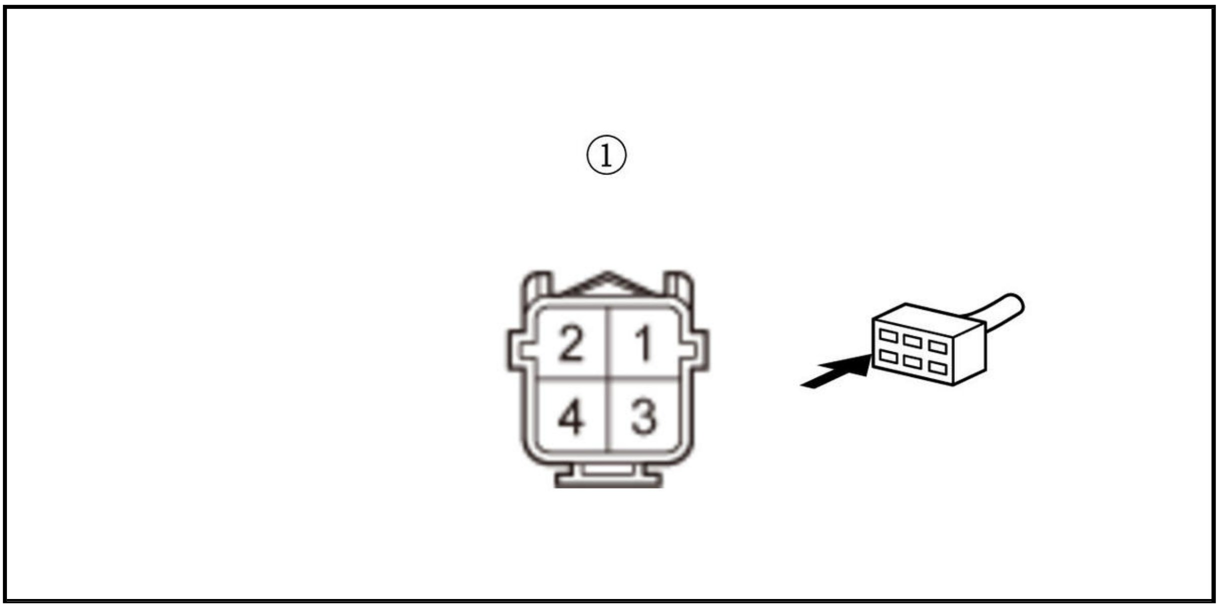
-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector C (51P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①
Terminal B	Body ground



-6. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 39**
Test point 2	Body ground

Is there continuity?

YES

The SO2SG/SO2 SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SO2SG/SO2 SG wire between the PCM (C39) and secondary HO2S (Sensor 2).

DTC P0139 (1.5 L ENGINE)

DTC P0139 : Secondary HO2S (Sensor 2) Slow Response

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If there are leaks from the exhaust system, this DTC will be set. Check for damage in the exhaust pipe and repair it if needed.

DTC Description	Confirmed DTC	Pending DTC
P0139 Secondary HO2S (Sensor 2) Slow Response	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Drive at a steady speed between 55-75 mph (90-120 km/h) for 1 minute, then decelerate (with the throttle fully closed) for 10 seconds

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
VEHICLE SPEED	B	B

-7. Monitor the OBD STATUS for DTC P0139 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0139 Secondary HO2S (Sensor 2) Slow Response	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the secondary HO2S (Sensor 2)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-5 and recheck.

DTC P0139 (2.4 L ENGINE) (2017 2018 2019)

DTC P0139 : Secondary HO2S (Sensor 2) Slow Response

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If there are leaks from the exhaust system, this DTC will be set. Check for damage in the exhaust pipe and repair it if needed.

DTC Description	Confirmed DTC	Pending DTC
P0139 Secondary HO2S (Sensor 2) Slow Response	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm) without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Test-drive under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Drive at a steady speed between 55-75 mph (90-120 km/h) for 1 minute, then decelerate (with the throttle fully closed) for 10 seconds

Signal	**Current conditions**	
	Values	**Unit**
ECT Sensor 1	B	B
VEHICLE SPEED	B	B

-6. Monitor the OBD STATUS for DTC P0139 in the DTCs MENU with the HDS.

DTC Description	**OBD STATUS**
P0139 Secondary HO2S (Sensor 2) Slow Response	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace secondary HO2S (Sensor 2)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 on this step and recheck.

DTC P0141 (1.5 L ENGINE)

DTC P0141 : Secondary HO2S (Sensor 2) Heater Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	**Confirmed DTC**	**Pending DTC**
P0141 Secondary HO2S (Sensor 2) Heater Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0141 Secondary HO2S (Sensor 2) Heater Circuit Malfunction	B	B

Is DTC P0141 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (IG1 ACG/IG1 (ACG)/IG1 (SO2) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D21 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 3.

NO

Repair a short in the IG1 ACG/IG1 (ACG)/IG1 (SO2) wire between secondary HO2S (Sensor 2) and the No. D21 (10 A) fuse. Also replace the No. D21 (10 A) fuse.

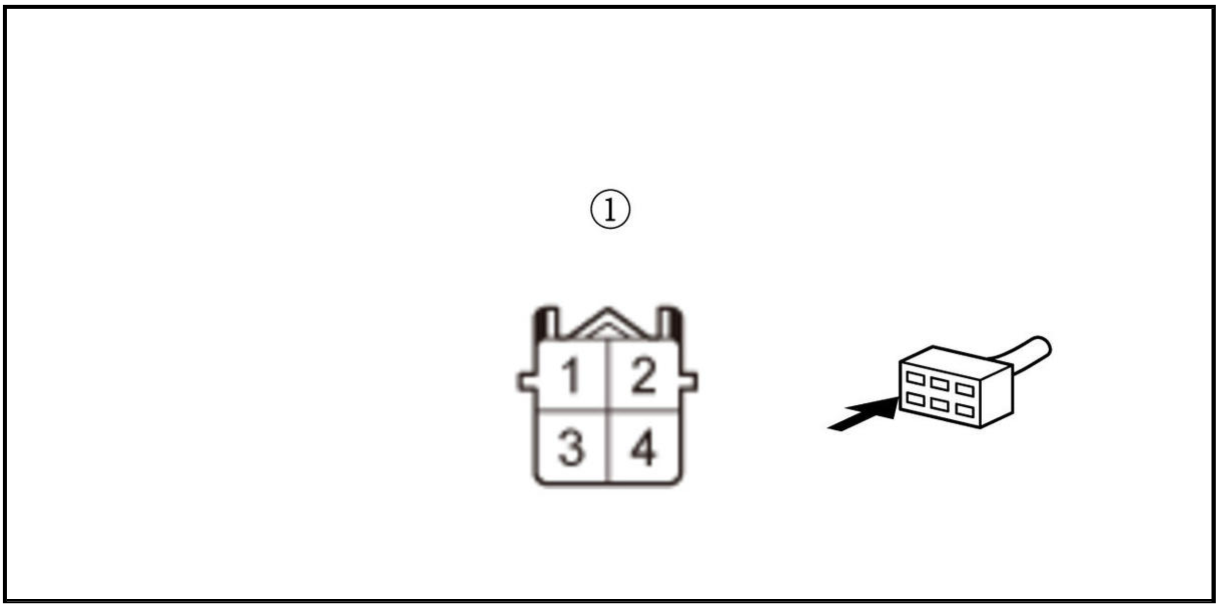
3. Secondary HO2S (Sensor 2) internal heater resistance check

-1. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-2. At the sensor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 3 (secondary HO2S (Sensor 2) side): ①
Test point 2	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 4 (secondary HO2S (Sensor 2) side): ①



Is there 4.2-6.6 Ω at room temperature?

YES

Go to step 4.

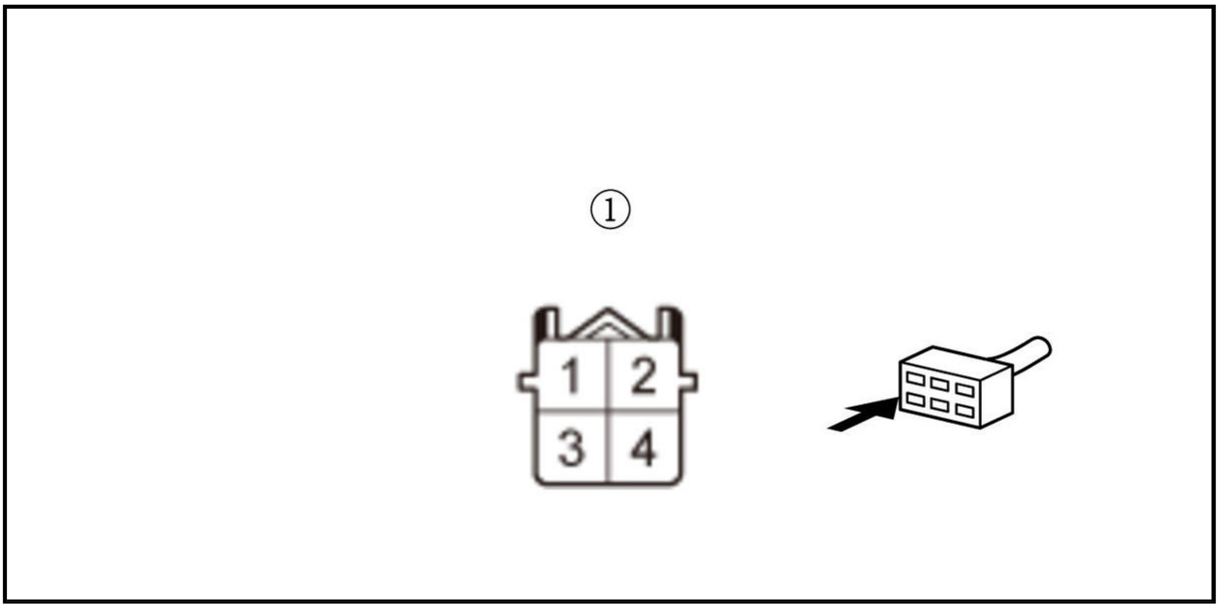
NO

Replace the secondary HO2S (Sensor 2) .

4. Secondary HO2S (Sensor 2) internal circuit check

-1. At the sensor side, check for continuity between test point 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 3 and No. 4 (secondary HO2S (Sensor 2) side): ①
Test point 2	Body ground



Is there continuity?

YES

Replace the secondary HO2S (Sensor 2) .

NO

Go to step 5.

5. Shorted wire check (SO2HT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 4**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the SO2HT wire between the PCM (A4) and secondary HO2S (Sensor 2).

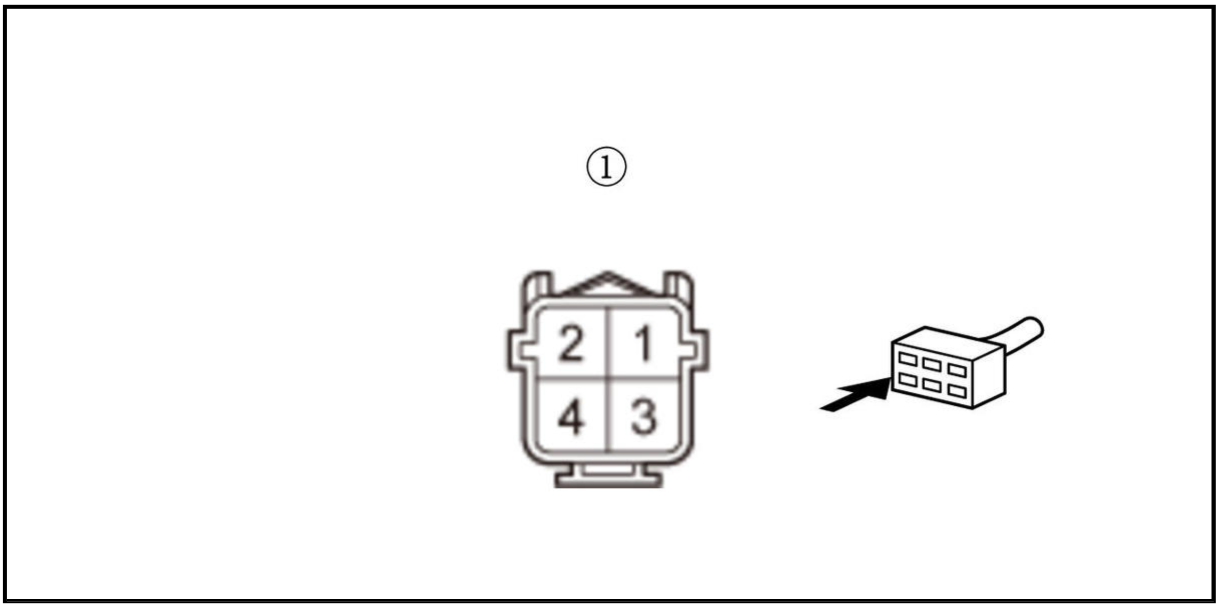
NO

Go to step 6.

6. Open wire check (SO2HT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 3: ①
Test point 2	**PCM connector A (50P) No. 4**



Is there continuity?

YES

Go to step 7.

NO

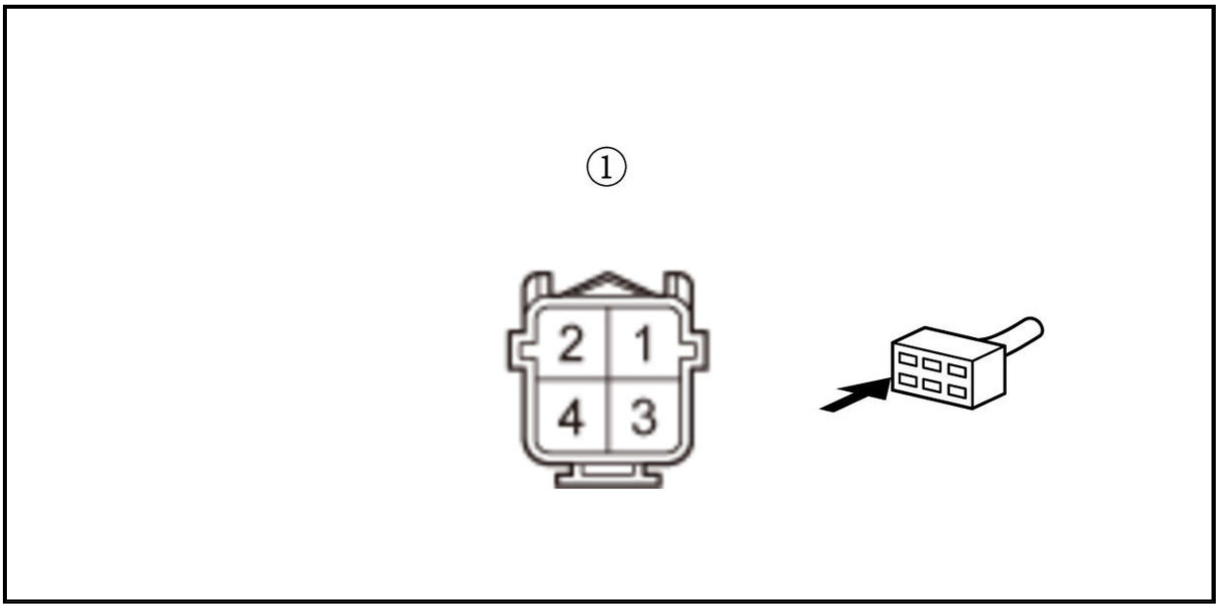
Repair an open in the SO2HT wire between the PCM (A4) and secondary HO2S (Sensor 2).

7. Open wire check (IG1 ACG/IG1 (ACG)/IG1 (SO2) line)

   -1. Turn the vehicle to the ON mode.

   -2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 ACG/IG1 (ACG)/IG1 (SO2) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the IG1 ACG/IG1 (ACG)/IG1 (SO2) wire between secondary HO2S (Sensor 2) and the No. D21 (10 A) fuse in the under-dash fuse/relay box.

DTC P0141 (2.4 L ENGINE) (2017 2018 2019)

DTC P0141 : Secondary HO2S (Sensor 2) Heater Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0141 Secondary HO2S (Sensor 2) Heater Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0141 Secondary HO2S (Sensor 2) Heater Circuit Malfunction	B	B

   Is DTC P0141 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (IG1 ACG line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. D21 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The IG1 ACG wire is not shorted. Go to step 3.

NO

Repair a short in the IG1 ACG wire between secondary HO2S (Sensor 2) and the No. D21 (10 A) fuse. Also replace the No. D21 (10 A) fuse.

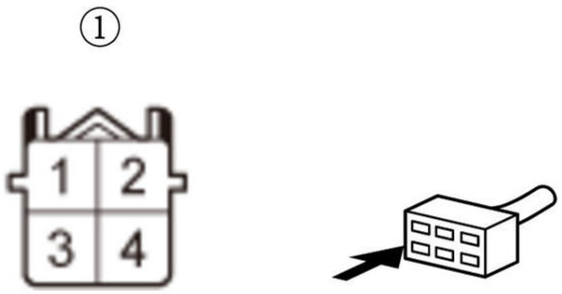
3. Secondary HO2S (Sensor 2) internal heater resistance check

-1. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-2. At the sensor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connectors: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 3 (secondary HO2S (Sensor 2) side): ①
Test point 2	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 4 (secondary HO2S (Sensor 2) side): ①



Is there 5.4-7.3 Ω at room temperature?

YES

Go to step 4.

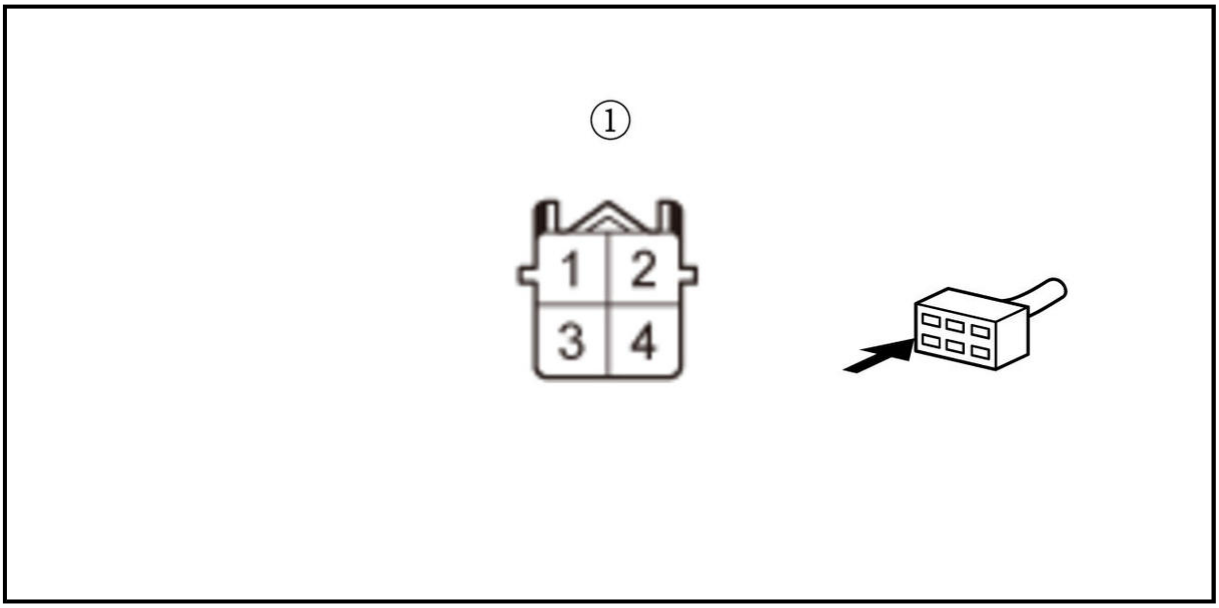
NO

Replace secondary HO2S (Sensor 2) .

4. Secondary HO2S (Sensor 2) internal circuit check

-1. At the sensor side, check for continuity between test point 1 and 2

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connectors: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 3 (secondary HO2S (Sensor 2) side): ①
	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 4 (secondary HO2S (Sensor 2) side): ①
Test point 2	Body ground



Is there continuity?

YES

Replace secondary HO2S (Sensor 2) .

NO

Go to step 5.

5. Shorted wire check (SO2 HT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector C (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 9**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the SO2 HT wire between the PCM (C9) and secondary HO2S (Sensor 2).

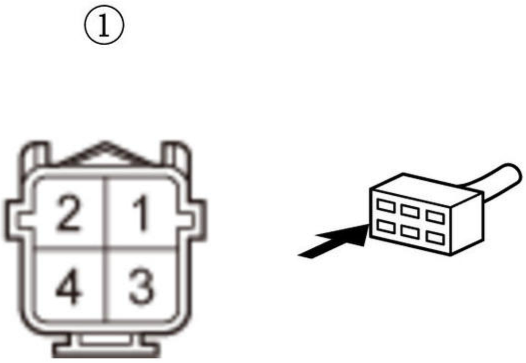
NO

The SO2 HT wire is not shorted. Go to step 6.

6. Open wire check (SO2 HT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 4: ①
Test point 2	**PCM connector C (51P) No. 9**



Is there continuity?

YES

The SO2 HT wire is OK. Go to step 7.

NO

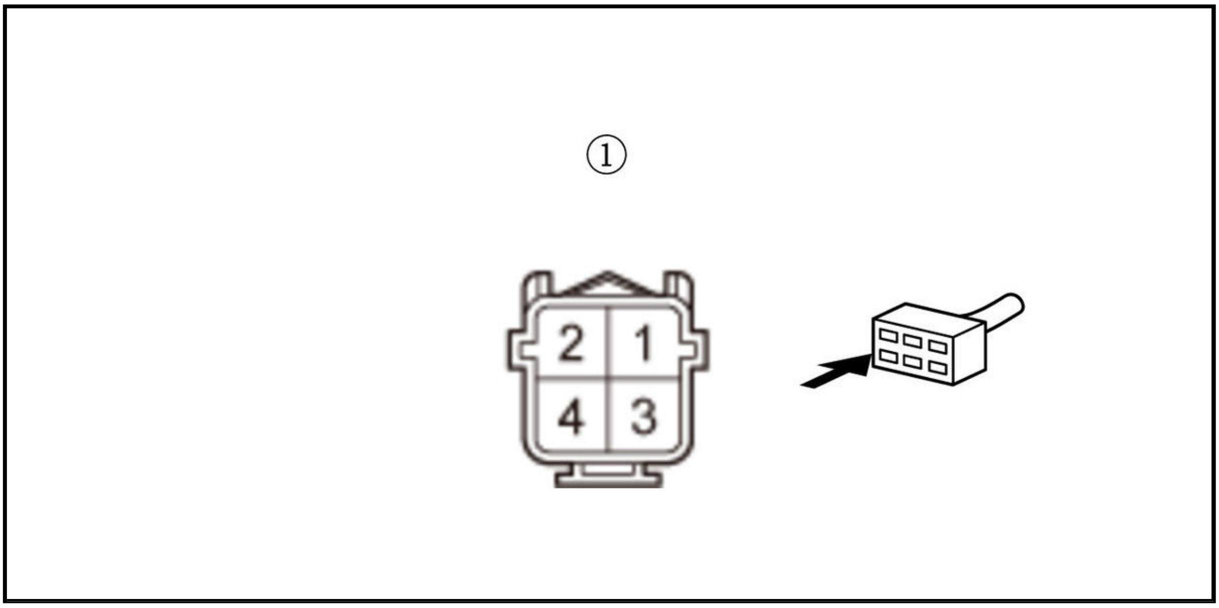
Repair an open in the SO2 HT wire between the PCM (C9) and secondary HO2S (Sensor 2).

7. Open wire check (IG1 ACG line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 ACG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the IG1 ACG wire between secondary HO2S (Sensor 2) and the No. D21 (10 A) fuse in the under-dash fuse/relay box.

DTC TROUBLESHOOTING

DTC P0328 (2.4 L ENGINE) (2017 2018 2019)

DTC P0328 : Knock Sensor Circuit High Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

   Is DTC P0328 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Determine possible failure area (knock sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

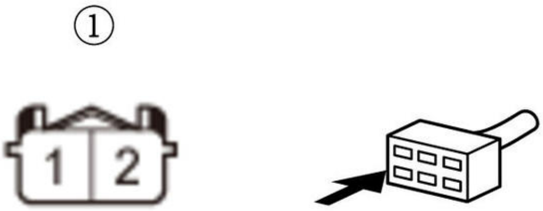
Knock sensor 2P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Knock sensor 2P connector: disconnected

Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	Knock sensor 2P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Replace the knock sensor .

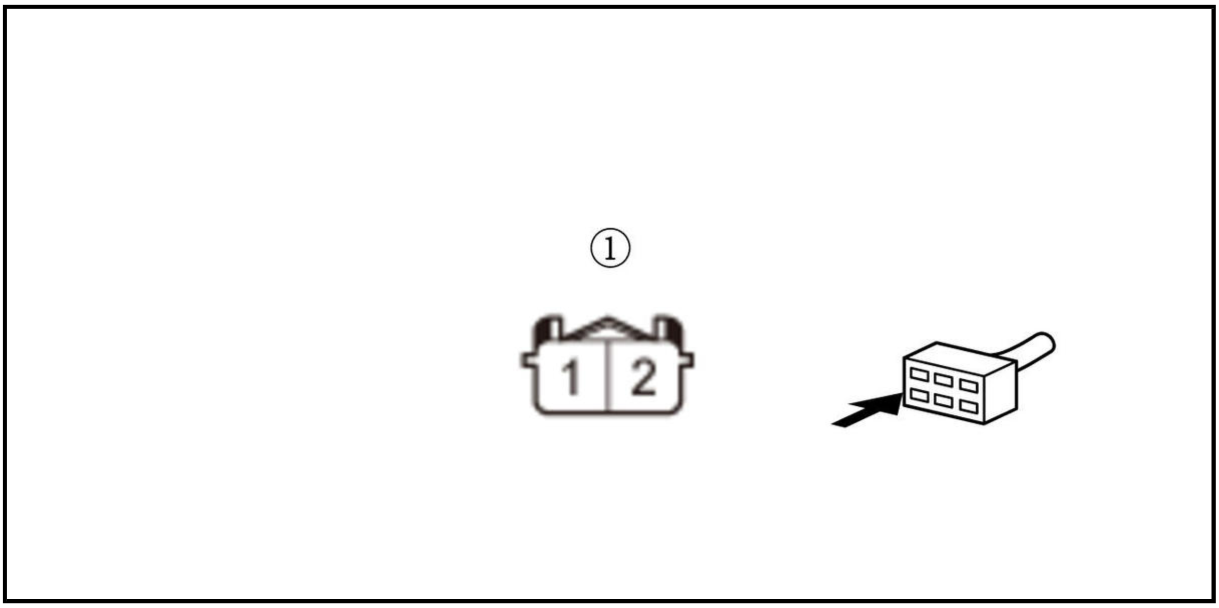
NO

Go to step 3.

3. Determine possible failure area (KS line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (KS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

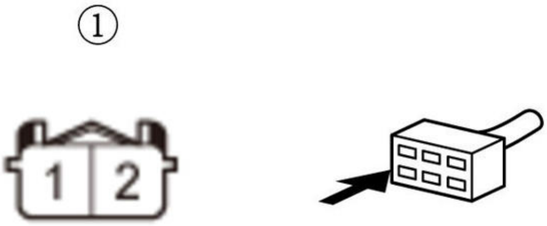
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Knock sensor 2P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 29**



Is there continuity?

YES

The KS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the KS wire between the PCM (C29) and the knock sensor.

5. Open wire check (KSGND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

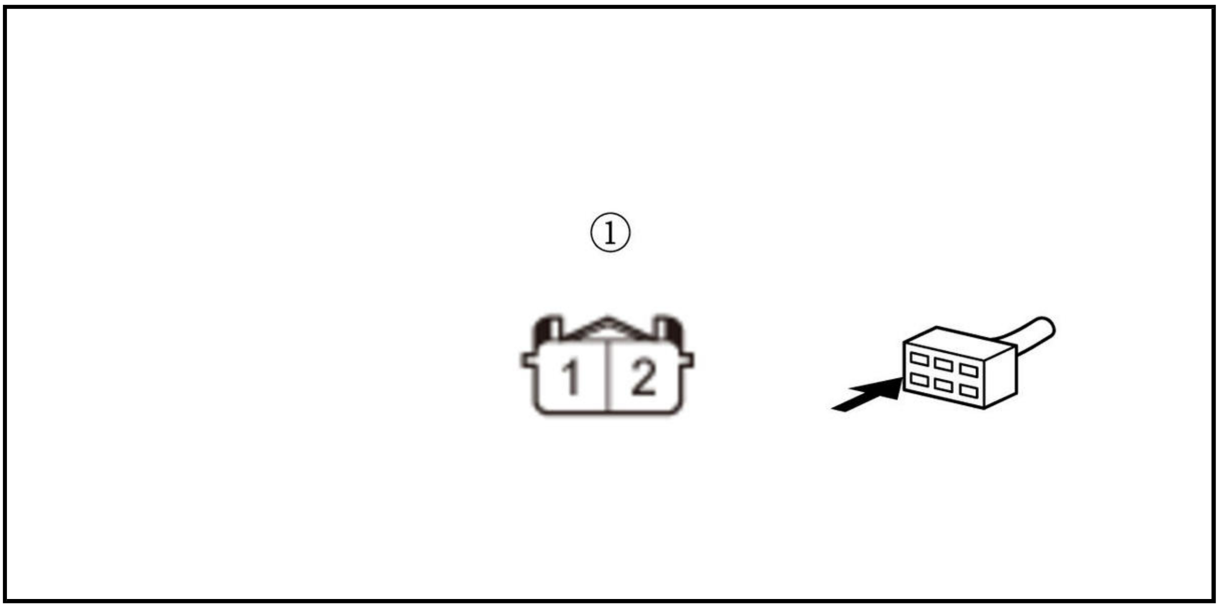
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Knock sensor 2P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector C (51P) No. 28**



Is there continuity?

YES

The KSGND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the KSGND wire between the PCM (C28) and the knock sensor.

DTC P0335 (1.5 L ENGINE)

DTC P0335 : CKP Sensor No Signal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0335 CKP Sensor No Signal	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0335 CKP Sensor No Signal	B	B

Is DTC P0335 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC1 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

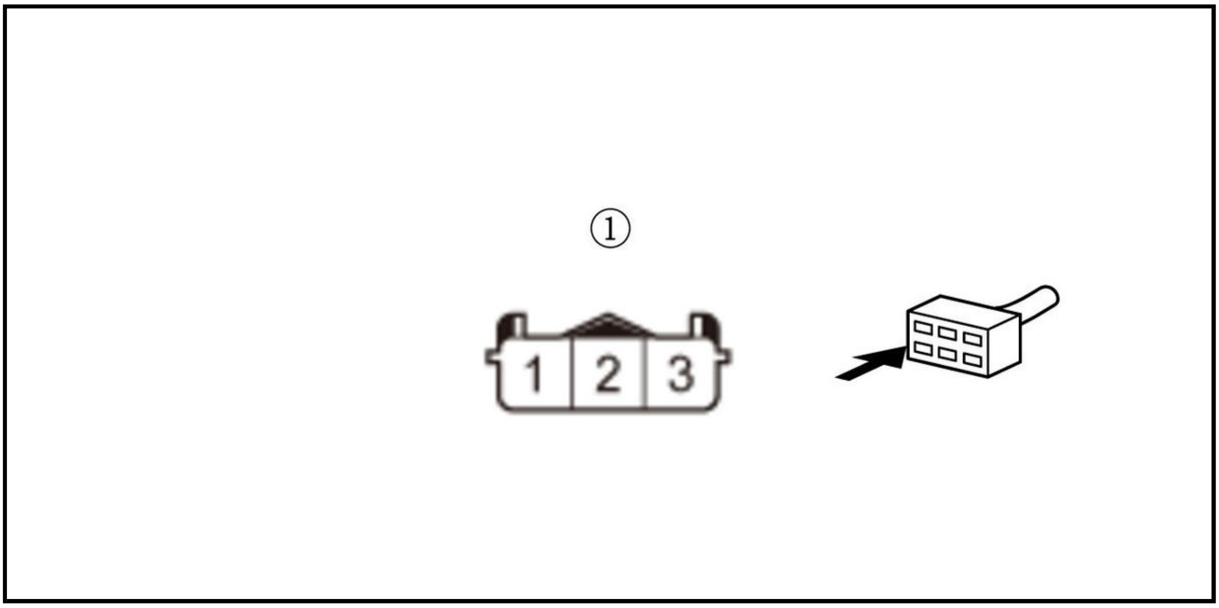
-2. Disconnect the following connector.

CKP sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (VCC1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

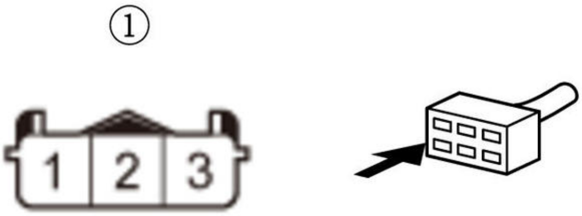
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 70**



Is there continuity?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

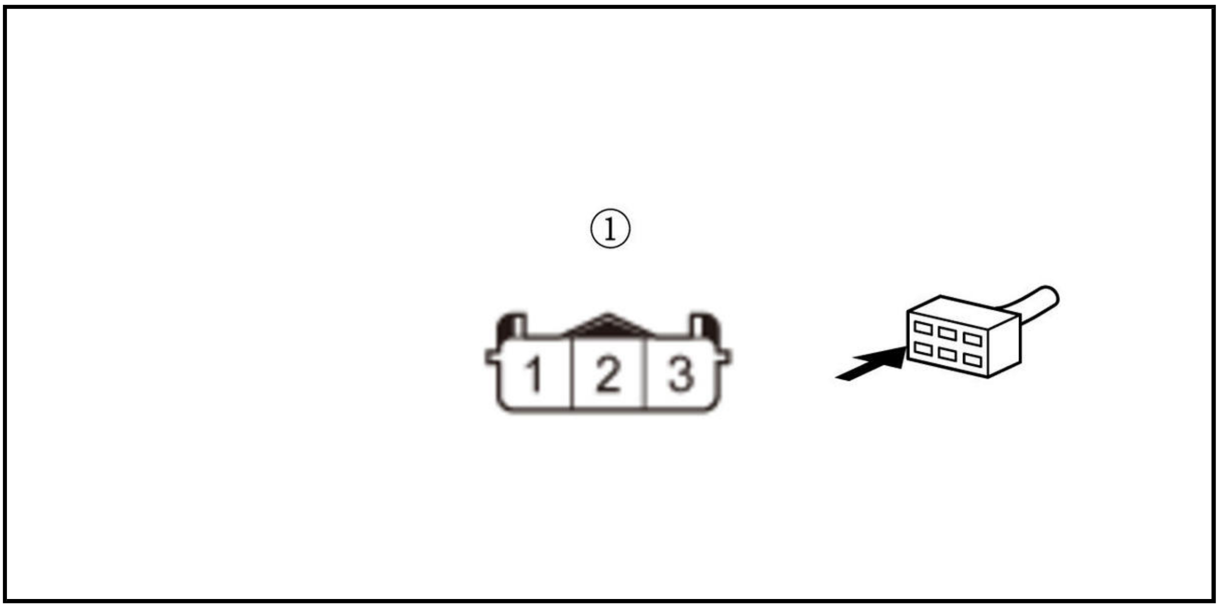
NO

Repair an open in the VCC1 wire between the PCM (E70) and the CKP sensor.

4. Determine possible failure area (CRKP line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

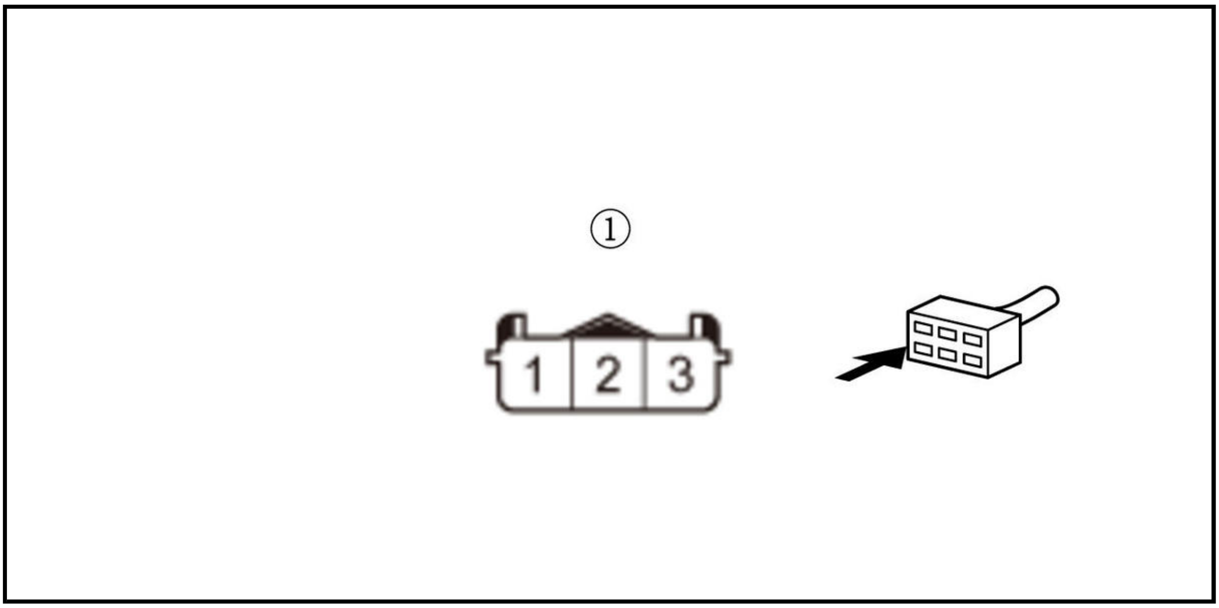
NO

Go to step 7.

5. Determine possible failure area (SG1 line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 2: ①
Test point 2	CKP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

The SG1 wire is OK. **Replace the CKP sensor** .

NO

Go to step 6.

6. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

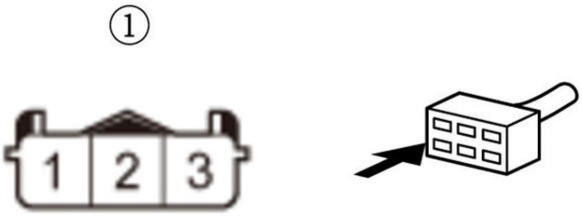
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 71**



Is there continuity?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (E71) and the CKP sensor.

7. Shorted wire check (CRKP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 44**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the CRKP wire between the PCM (E44) and the CKP sensor.

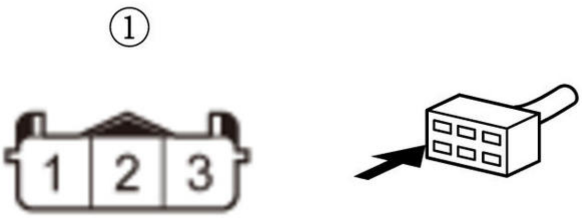
NO

Go to step 8.

8. Open wire check (CRKP line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 44**



Is there continuity?

YES

The CRKP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the CRKP wire between the PCM (E44) and the CKP sensor.

DTC P0335 (2.4 L ENGINE) (2017 2018 2019)

DTC P0335 : CKP Sensor No Signal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0335 CKP Sensor No Signal	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0335 CKP Sensor No Signal	B	B

   Is DTC P0335 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (IGP (CRANK)/IGP (MAIN)/FI MAIN RLY OUT line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

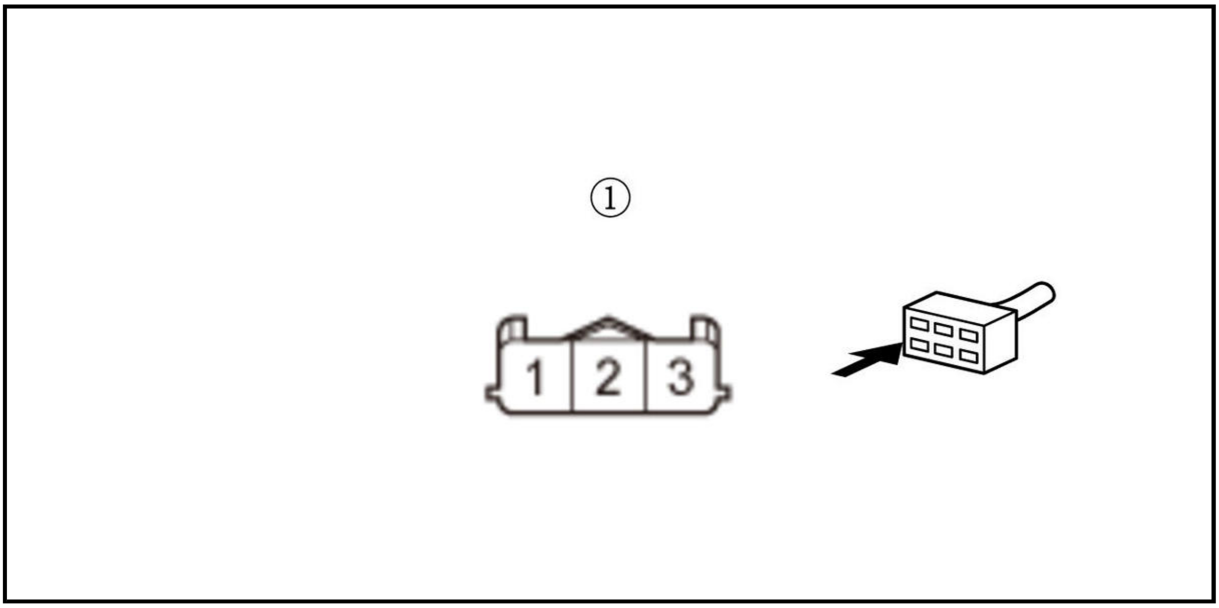
   -2. Disconnect the following connector.

CKP sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGP (CRK)/IGP (MAIN)/FI MAIN RLY OUT wire is OK. Go to step 3.

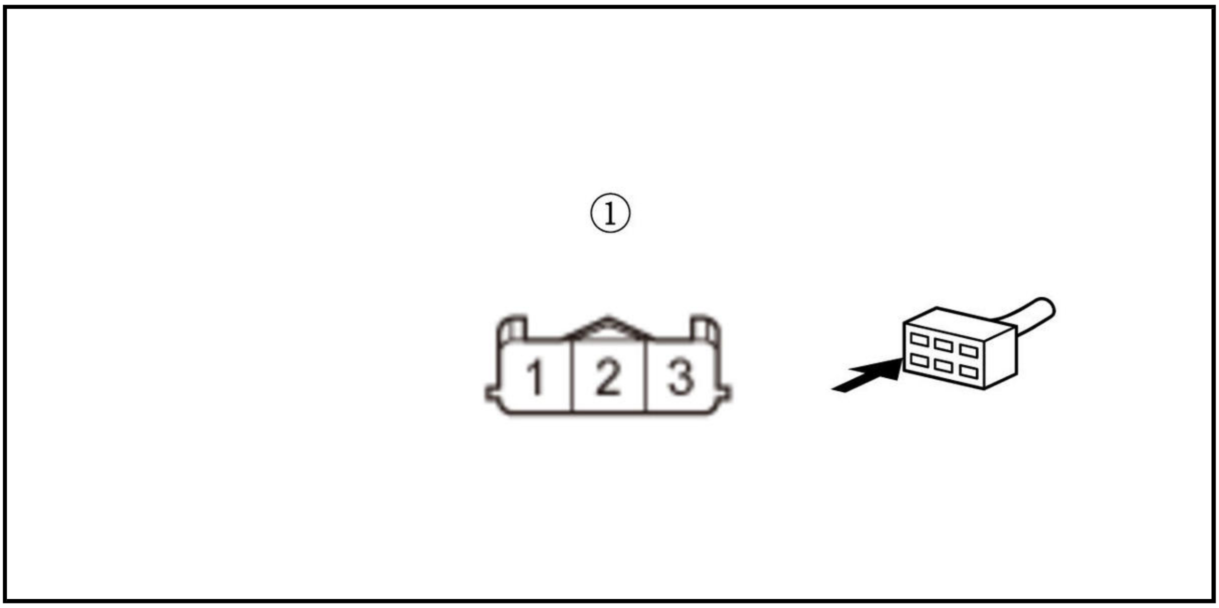
NO

Repair an open in the IGP (CRK)/IGP (MAIN)/FI MAIN RLY OUT wire between the CKP sensor and the relay circuit board (PGM-FI main relay 1 circuit).

3. Determine possible failure area (CRKN line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

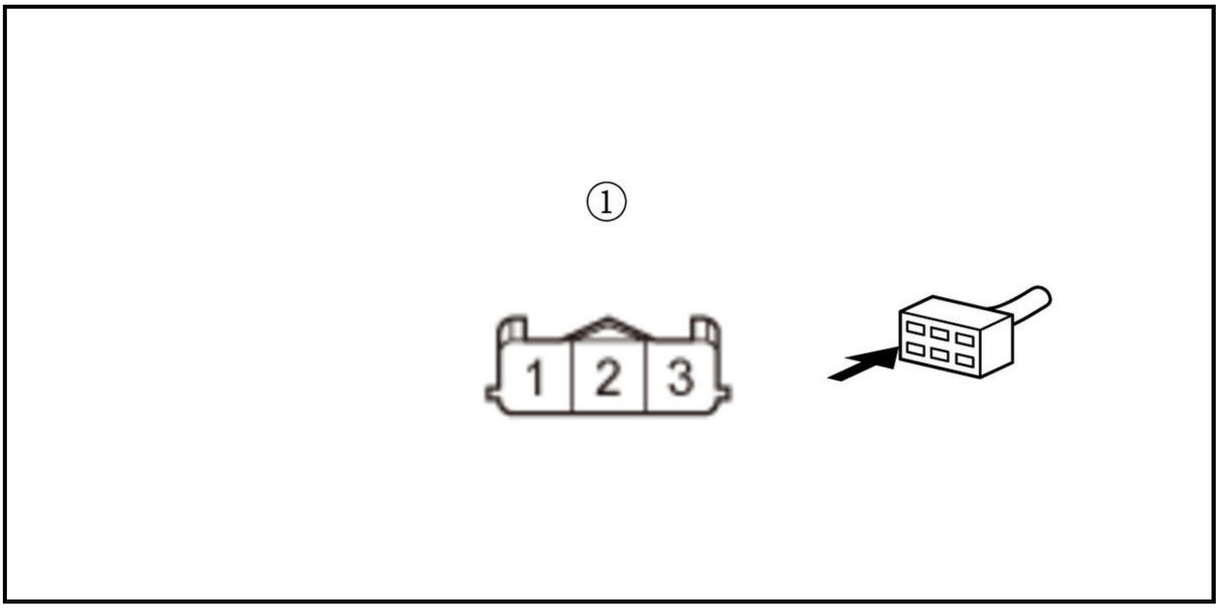
NO

Go to step 5.

4. Open wire check (LG/LG2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 2: ①
Test point 2	CKP sensor 3P connector (female terminals) No. 3: ①



Is there battery voltage?

YES

The LG/LG2 wire is OK. **Replace the CKP sensor** .

NO

Repair an open in the LG/LG2 wire between the CKP sensor and G101.

5. Shorted wire check (CRKN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 38**

Test point 2	Body ground

Is there continuity?

YES

Repair a short in the CRKN wire between the PCM (B38) and the CKP sensor.

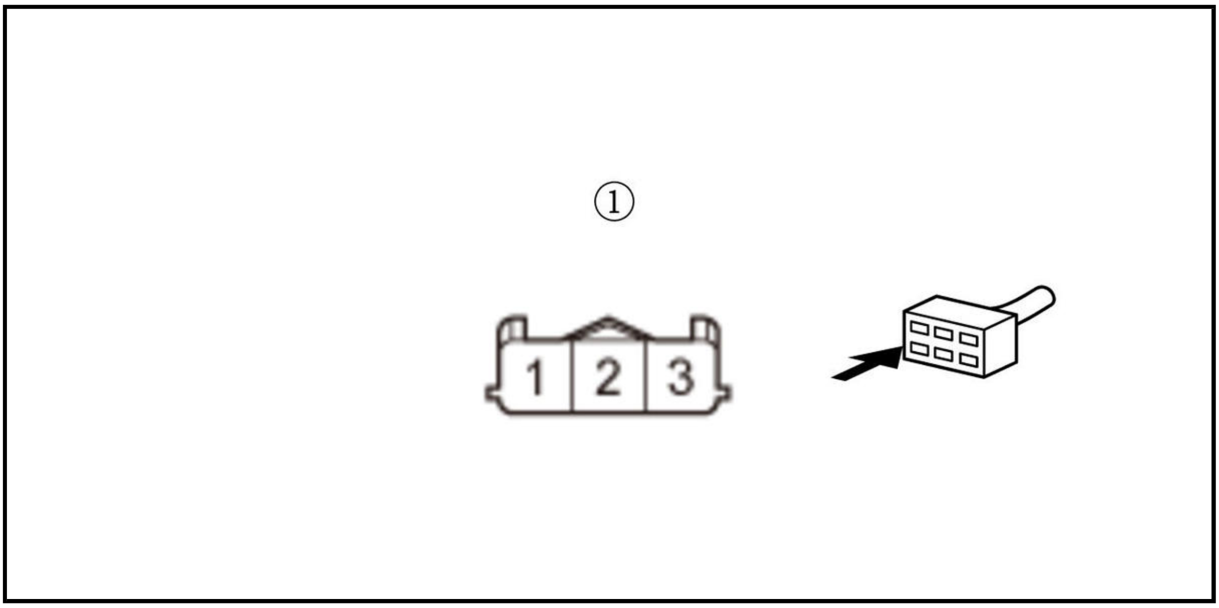
NO

The CRKN wire is not shorted. Go to step 6.

6. Open wire check (CRKN line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	CKP sensor 3P connector (female terminals) No. 1: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	CKP sensor 3P connector No. 1: jumped to body ground
B	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 38**
Test point 2	Body ground

Is there continuity?

YES

The CRKN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the CRKN wire between the PCM (B38) and the CKP sensor.

DTC P0339 (1.5 L ENGINE)

DTC P0339 : CKP Sensor Circuit Intermittent Interruption

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If A/T system DTCs are stored at the same time as DTC P0339, troubleshoot A/T system DTCs first, then recheck for DTC P0339.

DTC Description	Confirmed DTC	Pending DTC
P0339 CKP Sensor Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle for 10 seconds.

-5. Monitor the OBD STATUS for DTC P0339 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0339 CKP Sensor Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

Go to step 3.

NO

If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

-1. Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- ENGINE SPEED
- VEHICLE SPEED

-2. Monitor the OBD STATUS for DTC P0339 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0339 CKP Sensor Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

Go to step 3.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CKP sensor circuit connectors and terminals condition check:

Check for poor connections or loose terminals at these locations:

- CKP sensor
- PCM
- Engine ground
- Body ground

Are the connections and terminals OK?

YES

Go to step 4.

NO

Repair the connections or terminals.

4. CKP pulse plate visual check

-1. **Remove the CKP sensor** , and check for damage to the CKP pulse plate.

Is the pulse plate damaged or loose?

YES

Replace the CKP pulse plate .

NO

Replace the CKP sensor .

DTC P0339 (2.4 L ENGINE) (2017 2018 2019)

DTC P0339 : CKP Sensor Circuit Intermittent Interruption

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If A/T system DTCs are stored at the same time as DTC P0339, troubleshoot A/T system DTCs first, then recheck for DTC P0339.

DTC Description	Confirmed DTC	Pending DTC
P0339 CKP Sensor Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine, and let it idle for 10 seconds.

-4. Monitor the OBD STATUS for DTC P0339 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0339 CKP Sensor Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

-1. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

- ENGINE SPEED
- VEHICLE SPEED

-2. Monitor the OBD STATUS for DTC P0339 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0339 CKP Sensor Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CKP sensor circuit connectors and terminals condition check:

Check for poor connections or loose terminals at these locations:

- CKP sensor
- PCM
- Engine ground
- Body ground

Are the connections and terminals OK?

YES

Go to step 4.

NO

Repair the connections or terminals.

4. CKP pulse plate visual check

-1. **Remove the CKP sensor** , and check for damage to the CKP pulse plate.

Is the pulse plate damaged?

YES

Replace the CKP pulse plate .

NO

Replace the CKP sensor .

DTC P0340 (1.5 L ENGINE)

DTC P0340 : CMP Sensor A No Signal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0340 CMP Sensor A No Signal	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0340 CMP Sensor A No Signal	B	B

   Is DTC P0340 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC2 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

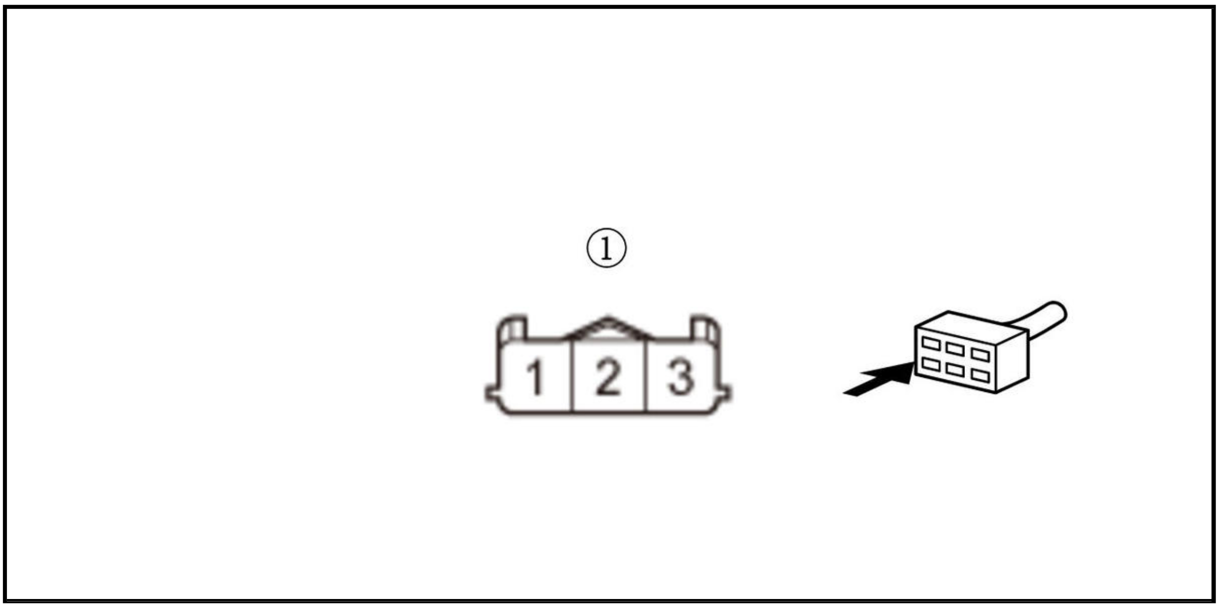
   -2. Disconnect the following connector.

CMP sensor A 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

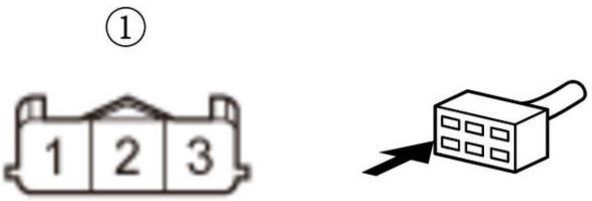
-2. Jump the SCS line with HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check the continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there continuity?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

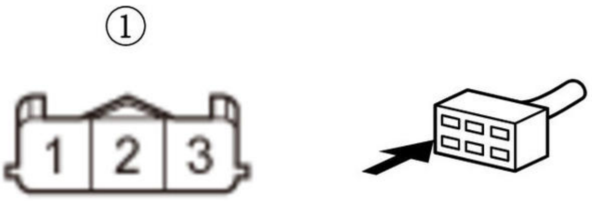
NO

Repair an open in the VCC2 wire between the PCM (E77) and CMP sensor A.

4. Determine possible failure area (TDCAM line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

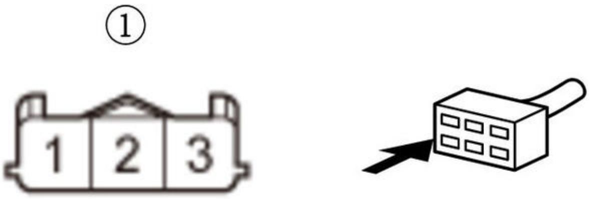
NO

Go to step 7.

5. Determine possible failure area (SG2 line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 1: ①
Test point 2	CMP sensor A 3P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

The SG2 wire is OK. **Replace CMP sensor A** .

NO

Go to step 6.

6. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

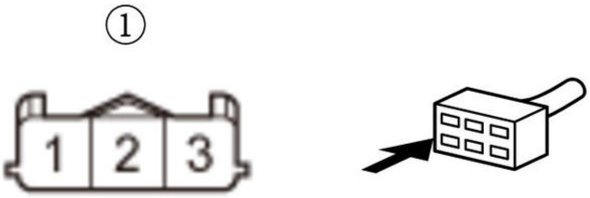
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnected the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and CMP sensor A.

7. Shorted wire check (TDCAM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 43**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the TDCAM wire between the PCM (E43) and CMP sensor A.

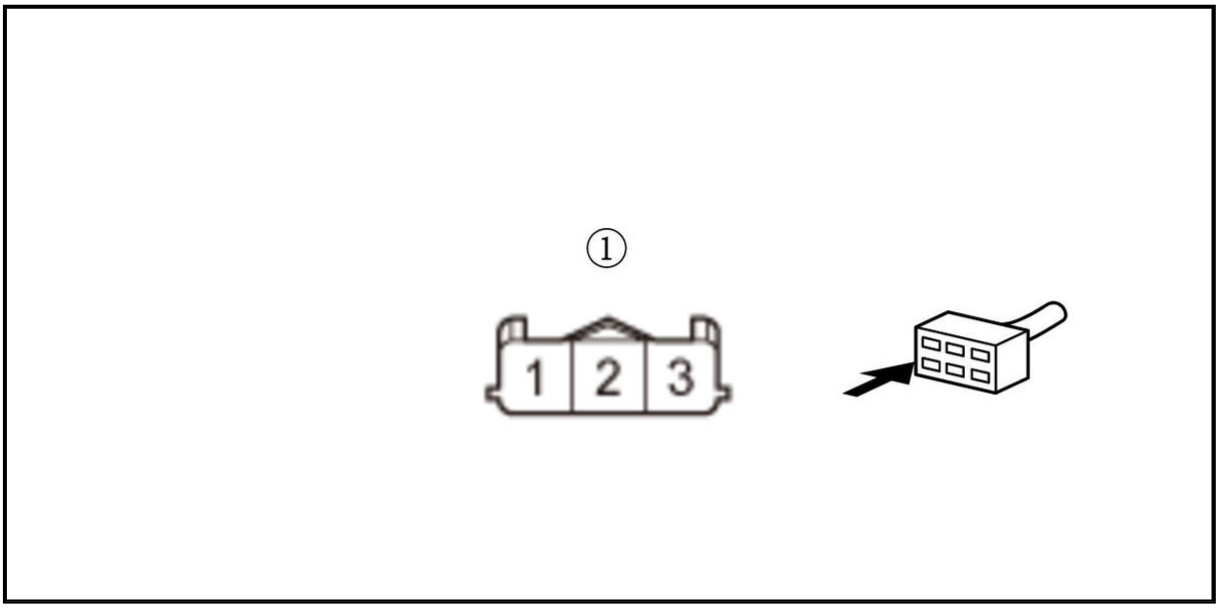
NO

Go to step 8.

8. Open wire check (TDCAM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 43**



Is there continuity?

YES

The TDCAM wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TDCAM wire between the PCM (E43) and CMP sensor A.

DTC P0340 (2.4 L ENGINE) (2017 2018 2019)

DTC P0340 : CMP Sensor A No Signal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0340 CMP Sensor A No Signal	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0340 CMP Sensor A No Signal	B	B

Is DTC P0340 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (IG1 ACG/IG1 (MAIN)/IG1 (CAM) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

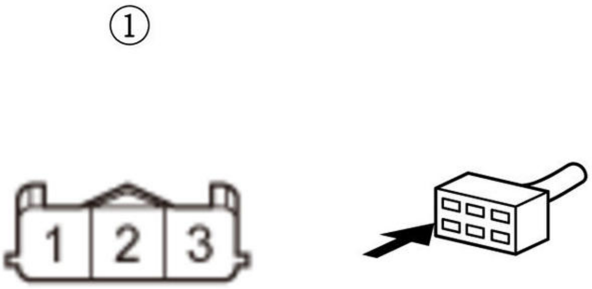
-2. Disconnect the following connector.

CMP sensor A 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 ACG/IG1 (MAIN)/IG1 (CAM) wire is OK. Go to step 3.

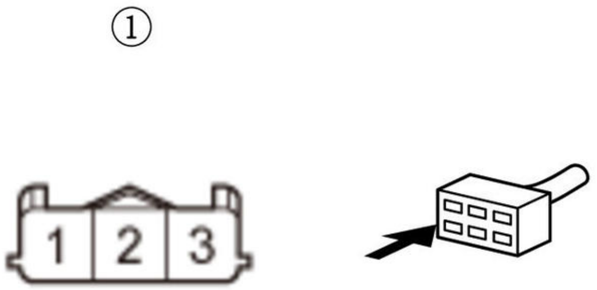
NO

Repair an open in the IG1 ACG/IG1 (MAIN)/IG1 (CAM) wire between No. D21 (10 A) fuse in the under-dash fuse/relay box and CMP sensor A.

3. Determine possible failure area (CAM line, LG/LG2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

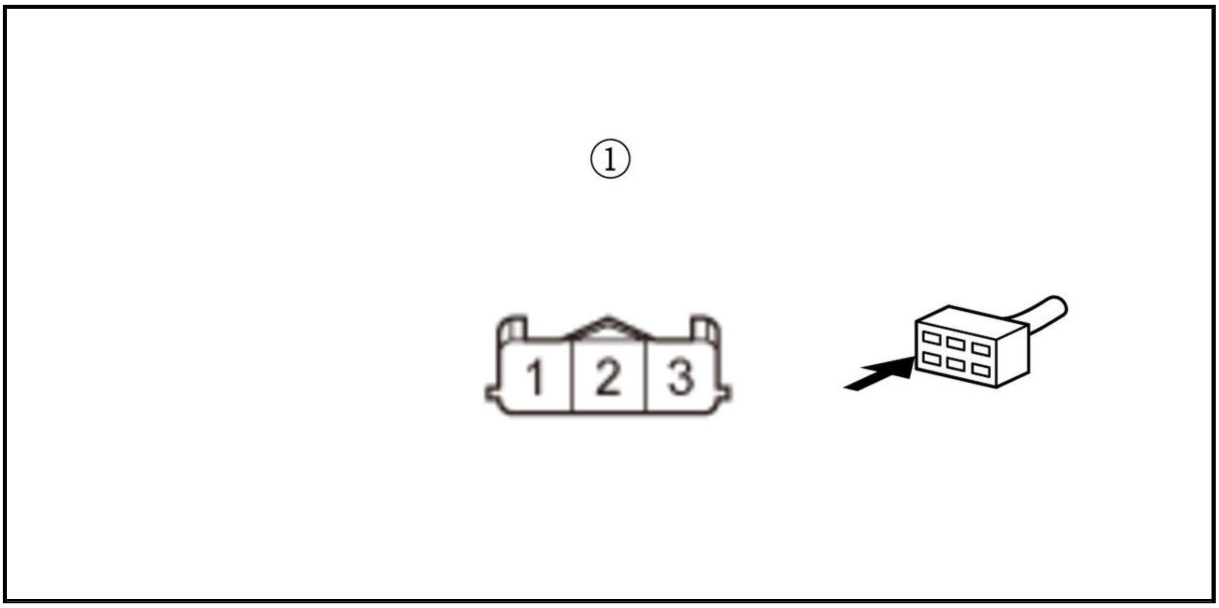
NO

Go to step 5.

4. Open wire check (LG/LG2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 1: ①
Test point 2	CMP sensor A 3P connector (female terminals) No. 2: ①



Is there battery voltage?

YES

The LG/LG2 wire is OK. **Replace CMP sensor A** .

NO

Repair an open in the LG/LG2 wire between CMP sensor A and G101.

5. Shorted wire check (CAM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 39**

Test point 2	Body ground

Is there continuity?

YES

Repair a short in the CAM wire between the PCM (B39) and CMP sensor A.

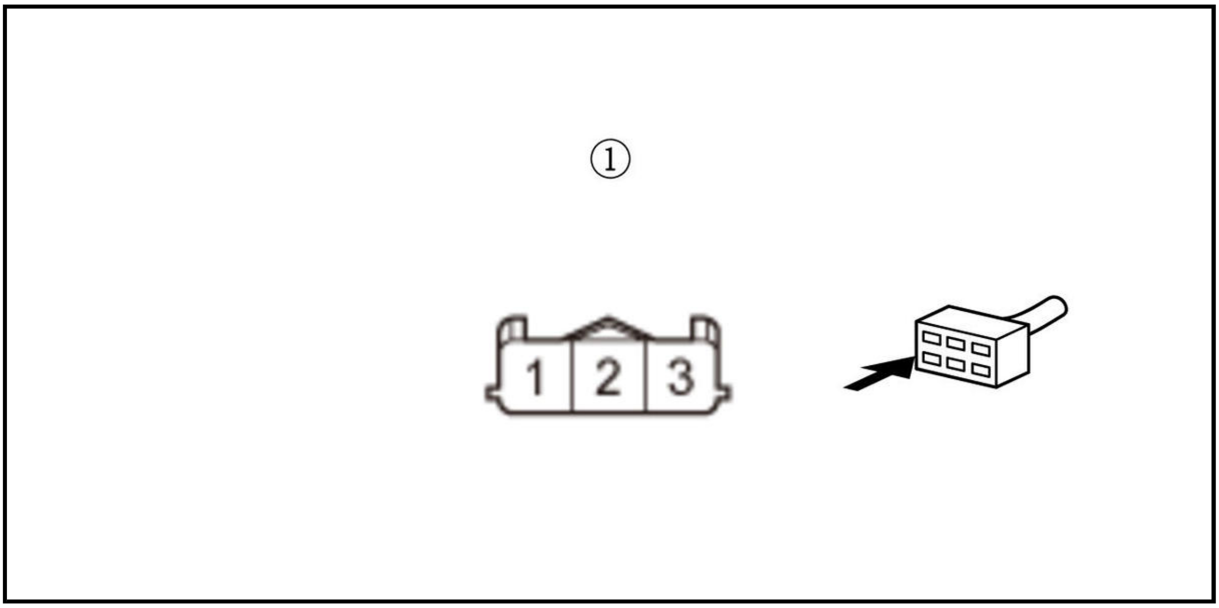
NO

The CAM wire is not shorted. Go to step 6.

6. Open wire check (CAM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector B (51P) No. 39**



Is there continuity?

YES

The CAM wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the CAM wire between the PCM (B39) and CMP sensor A.

DTC P0341 (1.5 L ENGINE)

DTC P0341 : CMP Sensor A and CKP Sensor Incorrect Phase Detected

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the DTC P1009 stored at the same time as DTC P0341, troubleshoot DTC P1009 first, then recheck for DTC P0341.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, and allow the engine to cool below 104 deg. F (40 deg. C).

-4. Start the engine, and let it idle without load (in P or N).

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

Is DTC P0341 indicated?

YES

Go to step 5.

NO

Go to step 2.

2. VTC system check (VTC TEST with the HDS)

-1. Select the VTC TEST in the INSPECTION MENU with the HDS, then select the IN-VTC.

VTC TEST

Is the result OK?

YES

Go to step 3.

NO

Go to step 5.

3. VTC system check (VTC STATUS check with the HDS)

-1. Test-drive the vehicle at a steady speed between 19-38 mph (30-60 km/h) for 10 minutes.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
VTC STATUS	ON	B	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Do the test-drive again, then recheck the VTC STATUS.

4. VTC system check (OBD status check)

-1. Monitor the OBD STATUS for DTC P0341 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B

Does the HDS indicate FAILED?

YES

Go to step 5.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 3, and recheck.

5. VTC oil control solenoid valve A operation check

-1. **Test VTC oil control solenoid valve A** .

Is the solenoid valve OK?

YES

Go to step 6.

NO

Replace VTC oil control solenoid valve A .

6. Camshaft timing check

-1. **Check the camshaft timing** .

Is the camshaft timing OK?

YES

Go to step 7.

NO

Reset the camshaft timing .

7. Cam chain check

-1. **Check for damage or stretch at the cam chain** .

Is the cam chain damaged or stretched?

YES

Replace the cam chain and **the auto-tensioner** .

NO

Go to step 8.

8. VTC actuator A check

-1. **Inspect VTC actuator A** .

Is the actuator OK?

YES

Go to step 9.

NO

Replace VTC actuator A .

9. PGM-FI system check (DTC check)

-1. Turn the vehicle to the ON mode.

-2. **Reset the PCM with the HDS** .

Reset PCM

-3. **Do the CKP pattern clear procedure** .

CRANK (CKP) PATTERN CLEAR

-4. **Do the PCM idle learn procedure** .

-5. **Do the CKP pattern learn procedure** .

CRANK PATTERN LEARNING

-6. Turn the vehicle to the OFF (LOCK) mode, and allow the engine to cool below 104 deg. F (40 deg. C).

-7. Start the engine, and let it idle without load (in P or N).

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

Is DTC P0341 indicated?

YES

Check for poor connections or loose terminals at VTC oil control solenoid valve A and the PCM, then go to step 1.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0341 (2.4 L ENGINE) (2017 2018 2019)

DTC P0341 : CMP Sensor A and CKP Sensor Incorrect Phase Detected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and allow the engine to cool below 104 deg. F (40 deg. C).

   -4. Start the engine, and let it idle without load (in P or N).

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

   Is DTC P0341 indicated?

   YES

   The failure is duplicated. Go to step 5.

   NO

   Go to step 2.

2. VTC system check (VTC TEST with the HDS)

   -1. Select the VTC TEST in the INSPECTION MENU with the HDS.

   VTC TEST

   Is the result OK?

   YES

   Go to step 3.

   NO

   Go to step 5.

3. VTC system check (VTC STATUS check with the HDS)

   -1. Test-drive at a steady speed between 19-38 mph (30-60 km/h) for 10 minutes.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
VTC STATUS	ON	B	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Do the test-drive again, then recheck the VTC STATUS.

4. VTC system check (DTC check)

   -1. Monitor the OBD STATUS for DTC P0341 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0011 VTC System Malfunction	B

   Does the HDS indicate FAILED?

   YES

   Go to step 5.

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 3, and recheck.

5. VTC oil control solenoid valve operation check

   -1. **Test the VTC oil control solenoid valve** .

   Is the VTC oil control valve OK?

   YES

   Go to step 6.

   NO

   Replace the VTC oil control solenoid valve .

6. Camshaft timing check

   -1. **Check the camshaft timing** .

   Is the camshaft timing OK?

   YES

   Go to step 7.

   NO

   Reset the camshaft timing .

7. Cam chain check

   -1. **Check for damage or stretch at the cam chain** .

Is the cam chain damaged or stretched?

YES

Replace the cam chain and **the auto-tensioner** .

NO

Go to step 8.

8. VTC actuator check

-1. **Inspect the VTC actuator** .

Is the actuator OK?

YES

Go to step 9.

NO

Replace the VTC actuator .

9. PGM-FI system check (DTC check)

-1. Turn the vehicle to the ON mode.

-2. **Reset the PCM with the HDS** .

Reset PCM

-3. **Do the CKP pattern clear procedure** .

CRANK (CKP) PATTERN CLEAR

-4. **Do the PCM idle learn procedure** .

-5. **Do the CKP pattern learn procedure** .

CRANK PATTERN LEARNING

Test-drive at a steady speed between 19-38 mph (30-60 km/h) for 10 minutes.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

Is DTC P0341 indicated?

YES

Check for poor connections or loose terminals at the VTC oil control solenoid valve and the PCM, then go to step 1.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0344 (1.5 L ENGINE)

DTC P0344 : CMP Sensor A Circuit Intermittent Interruption

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0344 CMP Sensor A Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine, and let it idle for 10 seconds.

   -5. Monitor the OBD STATUS for DTC P0344 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0344 CMP Sensor A Circuit Intermittent Interruption	B

   Does the HDS indicate FAILED?

   YES

   Go to step 3.

   NO

   If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

   -1. Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

   - ENGINE SPEED
   - VEHICLE SPEED

   On-board Snapshot

   -2. Monitor the OBD STATUS for DTC P0344 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0344 CMP Sensor A Circuit Intermittent Interruption	B

   Does the HDS indicate FAILED?

   YES

   Go to step 3.

   NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CMP sensor circuit connectors and terminals condition check:

   Check for poor connections or loose terminals at these locations:

   - CMP sensor A
   - PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

   YES

   Go to step 4.

   NO

   Repair the connections or terminals.

4. CMP pulse plate A visual check

   -1. **Remove the cylinder head cover** , then check for damage to CMP pulse plate A on the intake camshaft.

   Is the pulse plate damaged or loose?

   YES

   Replace the intake camshaft (CMP pulse plate A) .

   NO

   Replace the CMP sensor A .

DTC P0344 (2.4 L ENGINE) (2017 2018 2019)

DTC P0344 : CMP Sensor A Circuit Intermittent Interruption

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0344 CMP Sensor A Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle for 10 seconds.

   -4. Monitor the OBD STATUS for DTC P0344 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0344 CMP Sensor A Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

-1. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

- ENGINE SPEED
- VEHICLE SPEED

-2. Monitor the OBD STATUS for DTC P0344 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0344 CMP Sensor A Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CMP sensor circuit connectors and terminals condition check:

Check for poor connections or loose terminals at these locations:

- CMP sensor A
- PCM
- Engine ground
- Body ground

Are the connections and terminals OK?

YES

Go to step 4.

NO

Repair the connections or terminals.

4. CMP pulse plate A visual check

-1. Remove the cylinder head cover , then check for damage to CMP pulse plate A on the intake camshaft.

Is the pulse plate damaged?

YES

Replace the intake camshaft .

NO

Replace CMP sensor A .

DTC P0351, P0352, P0353, P0354 (1.5 L ENGINE)

DTC P0351 : No. 1 Cylinder Ignition Coil Circuit Malfunction **DTC P0352** : No. 2 Cylinder Ignition Coil Circuit Malfunction **DTC P0353** : No. 3 Cylinder Ignition Coil Circuit Malfunction **DTC P0354** : No. 4 Cylinder Ignition Coil Circuit Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B

DTC Description	Confirmed DTC	Pending DTC
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

Is DTC P0351, P0352, P0353, and/or P0354 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ignition coil and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Ignition coil check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Exchange the ignition coil from the problem cylinder with one from another cylinder** .

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B

DTC Description	Confirmed DTC	Pending DTC
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

   Is DTC indicated at the exchanged position?

   YES

   Replace the faulty ignition coil .

   NO

   Go to step 3.

3. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A15 (15 A)
Location	Under-hood fuse/relay box

   Is the fuse OK?

   YES

   Go to step 4.

   NO

   Check for a short in the +B IG COIL wire between the No. A15 (15 A) fuse and the relay circuit board, and repair it as needed. Also replace the No. A15 (15 A) fuse.

4. Relay circuit board check

   -1. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

Go to step 5.

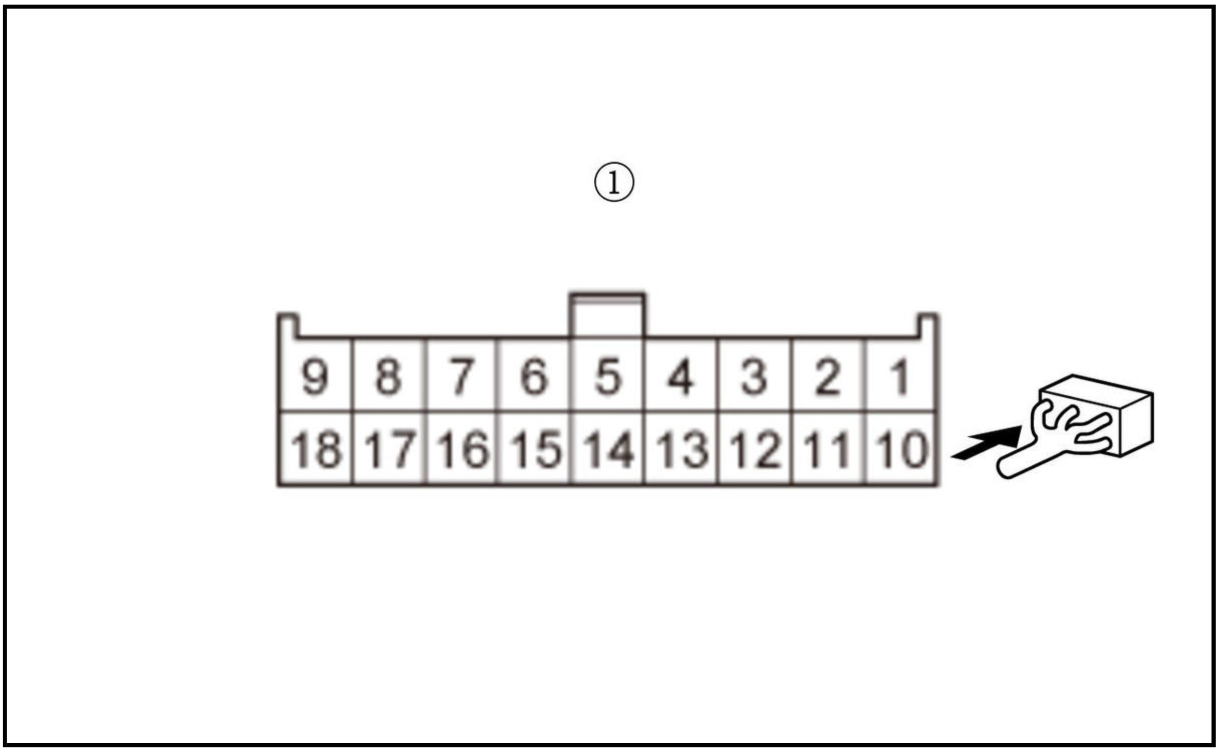
NO

Replace the relay circuit board .

5. Open wire check (+B IG COIL line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 9: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 6.

NO

Check for an open in the +B IG COIL wire between the No. A15 (15 A) fuse and the relay circuit board.

6. Open wire check (IG COIL RLY OUT/IG1 (COIL)/IG1 (IGN) line)

-1. Reinstall the relay circuit board.

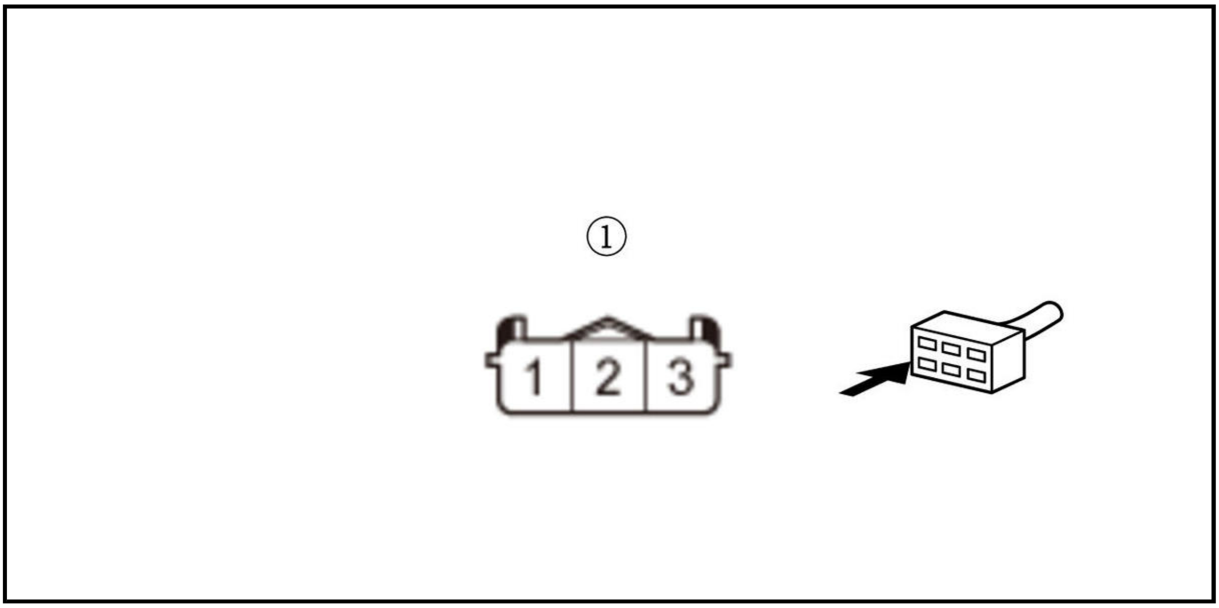
-2. Disconnect the following connector (s).

Ignition coil 3P connector (problem cylinder)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Ignition coil 3P connector (problem cylinder): disconnected
Test point 1	Ignition coil 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 7.

NO

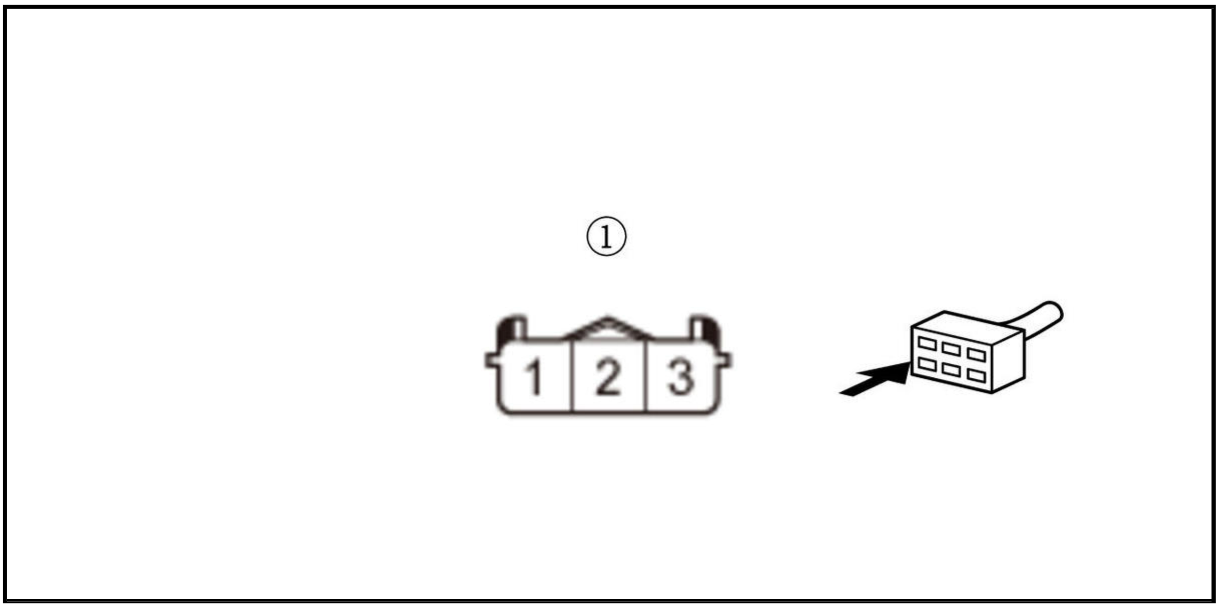
Repair an open in the IG COIL RLY OUT/IG1 (COIL)/IG1 (IGN) wire between the ignition coil and the relay circuit board (ignition coil relay circuit).

7. Open wire check (PG (COIL) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
Test point 1	Ignition coil 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 8.

NO

Repair an open in the PG (COIL) wire between the ignition coil and G101.

8. Shorted wire check (IGN lines)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Check for continuity between body ground and the appropriate PCM connector terminal of the problem ignition coil (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
B	PCM connector E (80P): disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0351	PCM connector E (80P)	No. 37
No. 2	P0352		No. 38
No. 3	P0353		No. 39
No. 4	P0354		No. 40

Is there continuity?

YES

Repair a short in the IGN wire between the PCM and the ignition coil.

NO

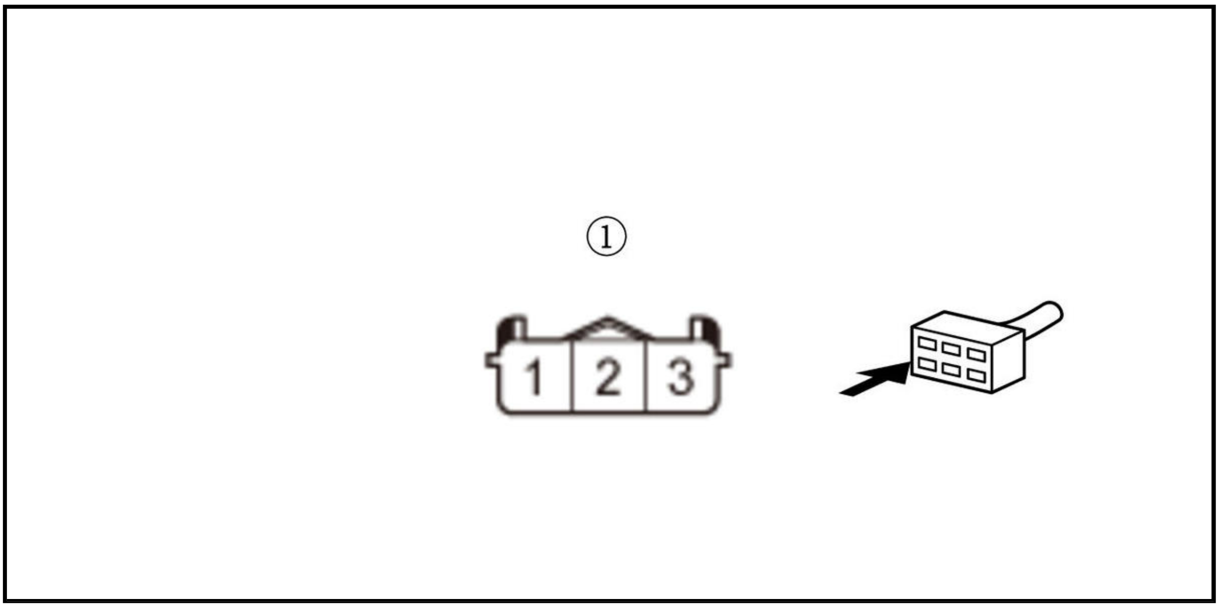
Go to step 9.

9. Open wire check (IGN lines)

-1. Check for continuity between appropriate ignition coil 3P connector terminal (female terminals) No. 3: ① and the appropriate PCM connector terminal of the problem ignition coil (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
B	PCM connector E (80P): disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0351	PCM connector E (80P)	No. 37
No. 2	P0352		No. 38
No. 3	P0353		No. 39
No. 4	P0354		No. 40



Is there continuity?

YES

The IGN wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the IGN wire between the PCM and the ignition coil.

DTC P0351, P0352, P0353, P0354 (2.4 L ENGINE) (2017 2018 2019)

DTC P0351 : No. 1 Cylinder Ignition Coil Circuit Malfunction **DTC P0352** : No. 2 Cylinder Ignition Coil Circuit Malfunction **DTC P0353** : No. 3 Cylinder Ignition Coil Circuit Malfunction **DTC P0354** : No. 4 Cylinder Ignition Coil Circuit Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B

DTC Description	Confirmed DTC	Pending DTC
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

   Is DTC P0351, P0352, P0353, and/or P0354 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ignition coil and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Ignition coil check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Exchange the ignition coil from the problem cylinder with one from another cylinder** .

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B

DTC Description	Confirmed DTC	Pending DTC
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

   Is DTC indicated at the exchanged position?

   YES

Replace the faulty ignition coil .

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A15 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Check for a short in the +B IG COIL wire between the No. A15 (15 A) fuse and the relay circuit board, and repair it as needed. Also replace the No. A15 (15 A) fuse.

4. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 5.

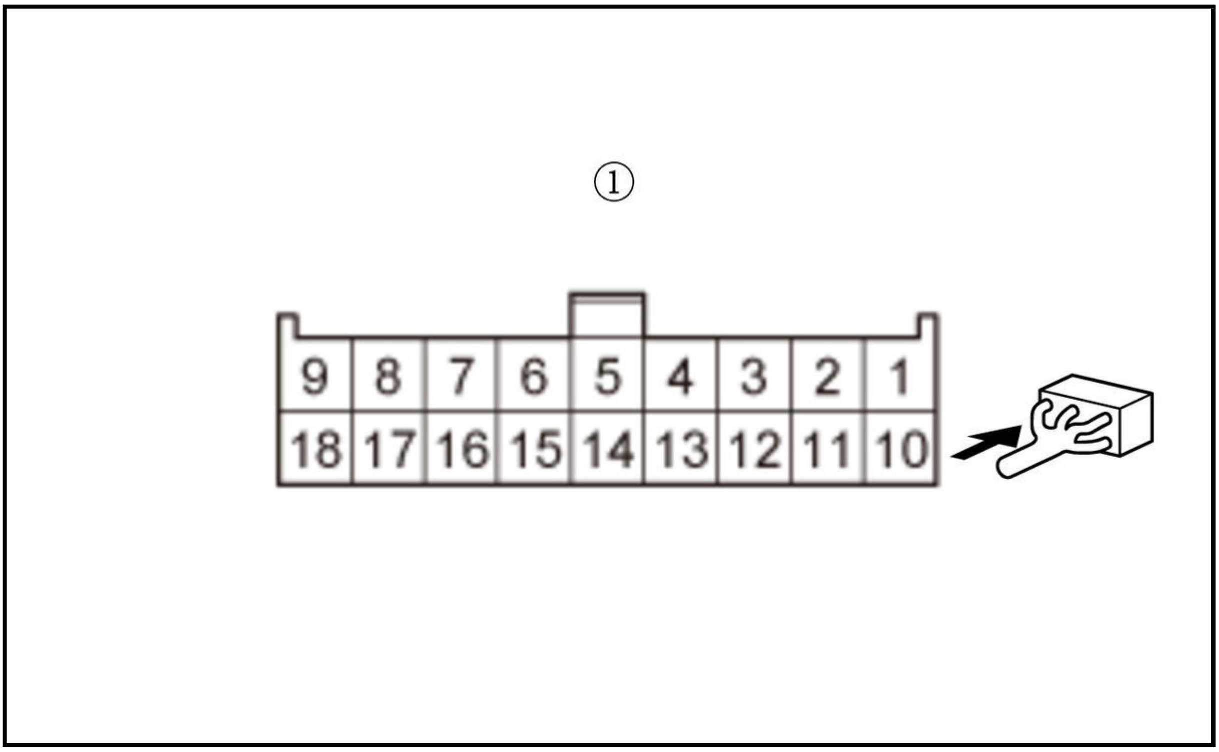
NO

Replace the relay circuit board .

5. Open wire check (+B IG COIL line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 9: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 6.

NO

Check for an open in the +B IG COIL wire between the No. A15 (15 A) fuse and the relay circuit board.

6. Open wire check (IG COIL RLY OUT/IG1 (COIL)/IG1 (IGN) line)

-1. Reinstall the relay circuit board.

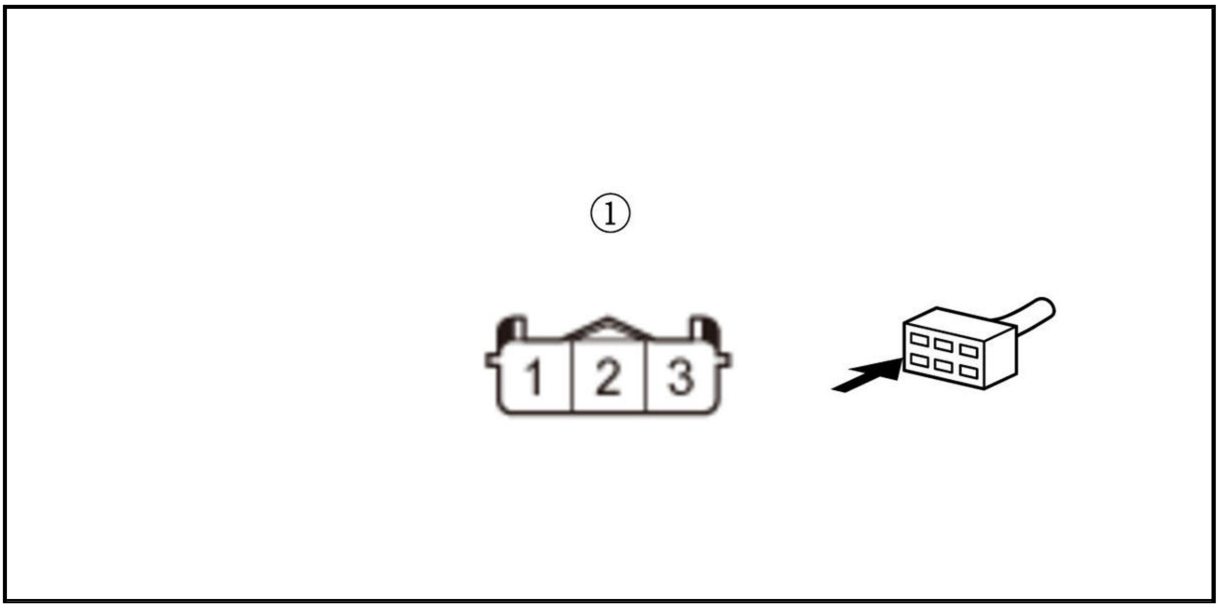
-2. Disconnect the following connector (s).

Ignition coil 3P connector (problem cylinder)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Ignition coil 3P connector (problem cylinder): disconnected
Test point 1	Ignition coil 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG COIL RLY OUT/IG1 (COIL)/IG1 (IGN) wire is OK. Go to step 7.

NO

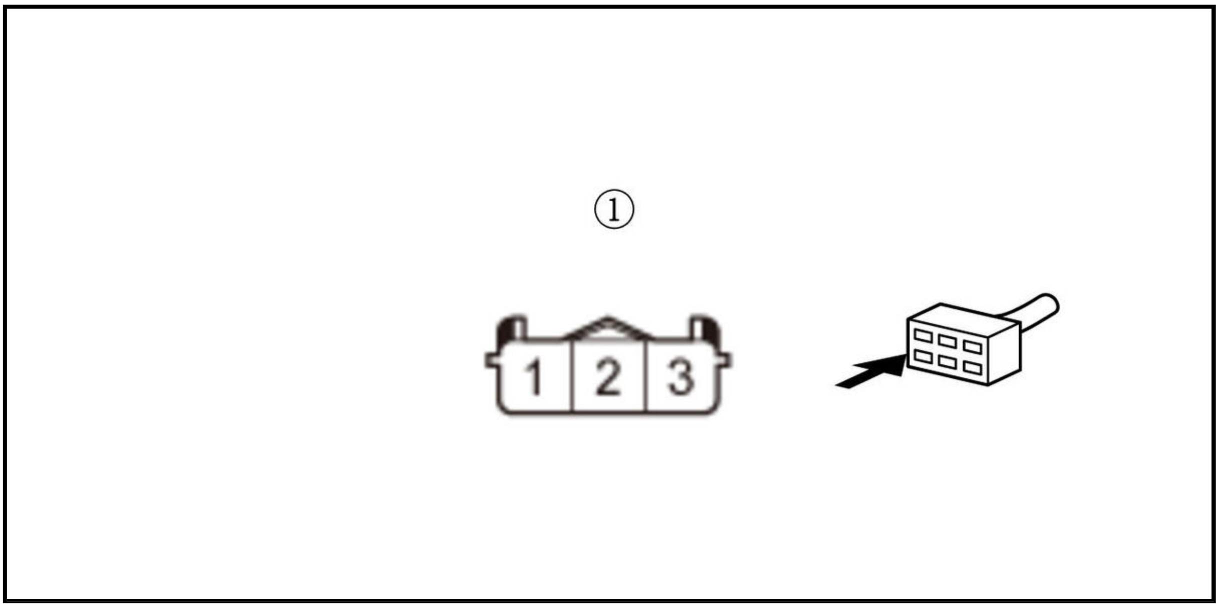
Repair an open in the IG COIL RLY OUT/IG1 (COIL)/IG1 (IGN) wire between the ignition coil and the relay circuit board (ignition coil relay).

7. Open wire check (PG (COIL) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
Test point 1	Ignition coil 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The PG (COIL) wires are OK. Go to step 8.

NO

Repair an open in the PG (COIL) wire between the ignition coil and G101.

8. Shorted wire check (IGN lines)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector B (51P)

-3. Check for continuity between body ground and the appropriate PCM connector terminal of the problem ignition coil (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
B	PCM connector B (51P): disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0351	PCM connector B (51P)	No. 24
No. 2	P0352		No. 25
No. 3	P0353		No. 26
No. 4	P0354		No. 27

Is there continuity?

YES

Repair a short in the IGN wire between the PCM and the ignition coil.

NO

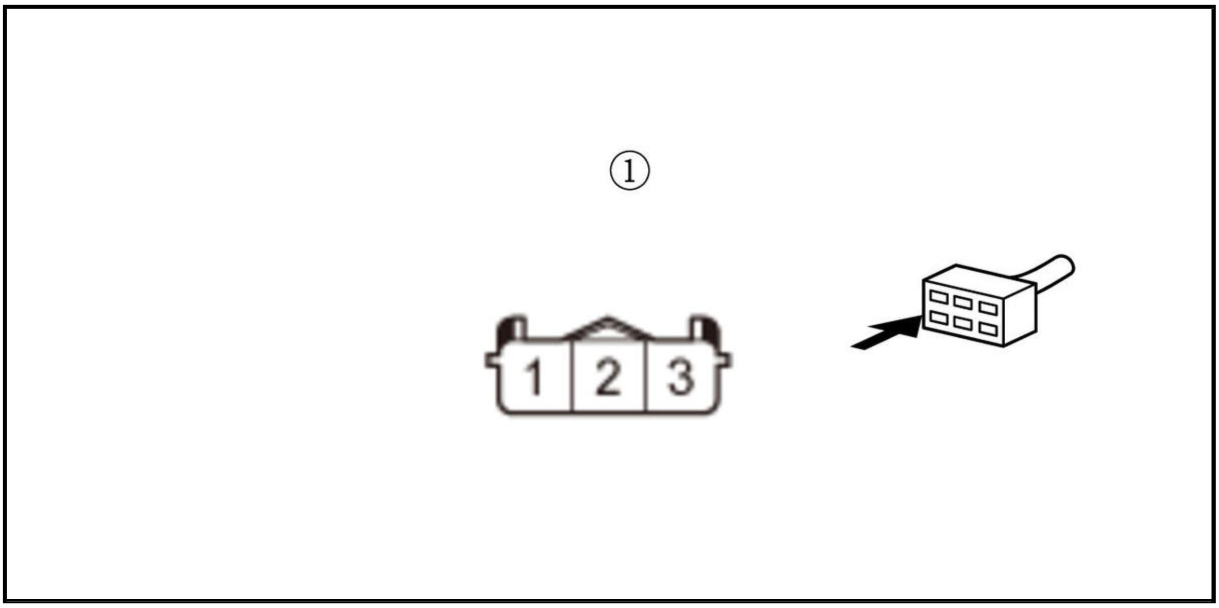
The IGN wires are not shorted. Go to step 9.

9. Open wire check (IGN lines)

-1. Check for continuity between the appropriate PCM connector terminal of the problem ignition coil (see table) and appropriate ignition coil 3P connector (female terminals) No. 3: ①

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
B	PCM connector B (51P): disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0351	PCM connector B (51P)	No. 24
No. 2	P0352		No. 25
No. 3	P0353		No. 26
No. 4	P0354		No. 27



Is there continuity?

YES

The IGN wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Repair an open in the IGN wire between the PCM and the ignition coil.

DTC P0365 (1.5 L ENGINE)

DTC P0365 : CMP Sensor B Circuit No Signal

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0365 CMP Sensor B Circuit No Signal	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0365 CMP Sensor B Circuit No Signal	B	B

Is DTC P0365 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor B and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC2 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

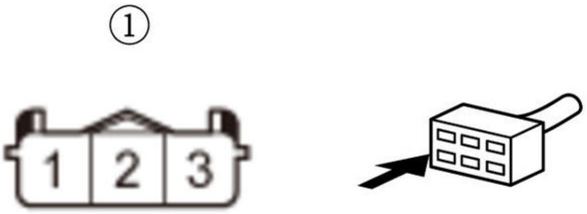
-2. Disconnect the following connector.

CMP sensor B 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

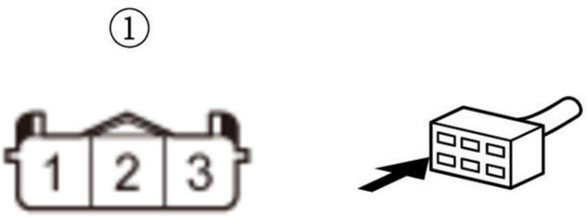
-2. Jump the SCS line with HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check the continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there continuity?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

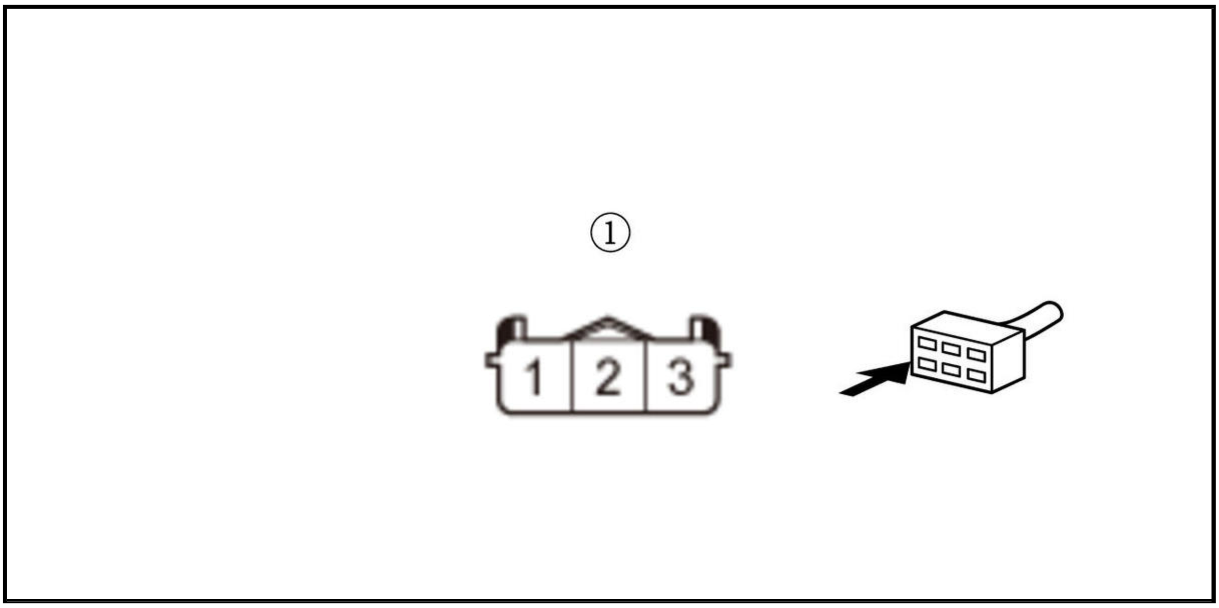
NO

Repair an open in the VCC2 wire between the PCM (E77) and CMP sensor B.

4. Determine possible failure area (CAM EX line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

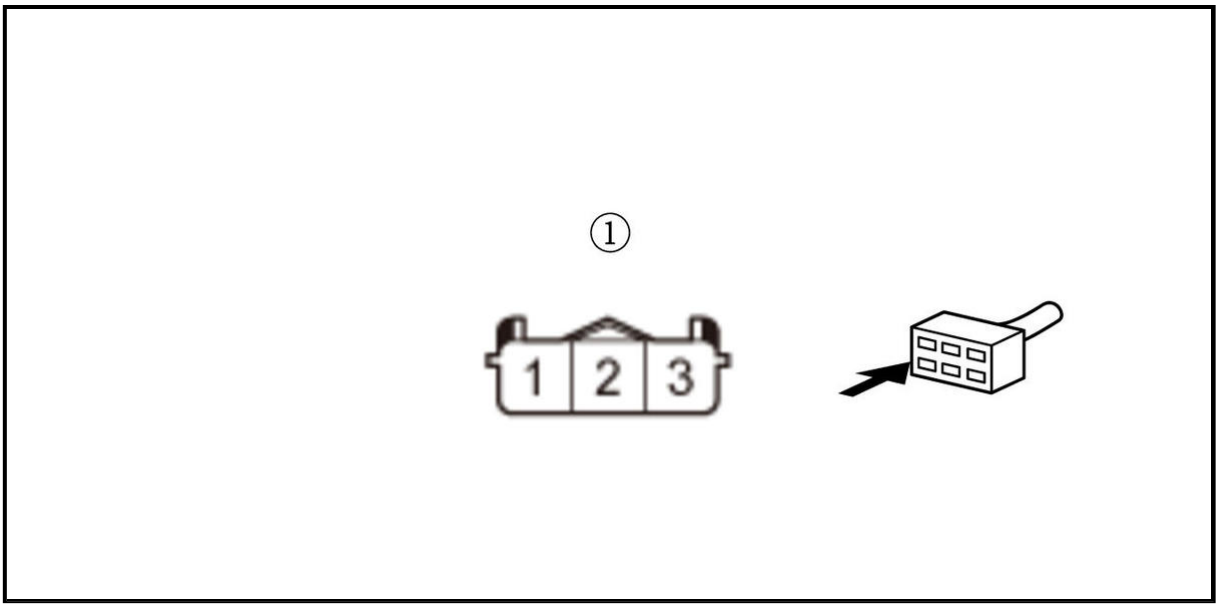
NO

Go to step 7.

5. Determine possible failure area (SG2 line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 1: ①
Test point 2	CMP sensor B 3P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

The SG2 wire is OK. **Replace CMP sensor B** .

NO

Go to step 6.

6. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

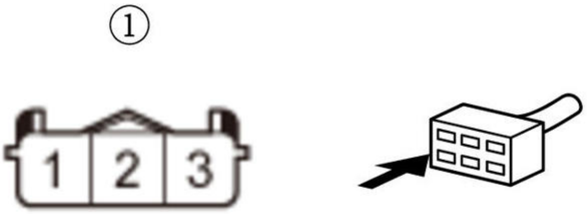
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnected the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and CMP sensor B.

7. Shorted wire check (CAM EX line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 32**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the CAM EX wire between the PCM (E32) and CMP sensor B.

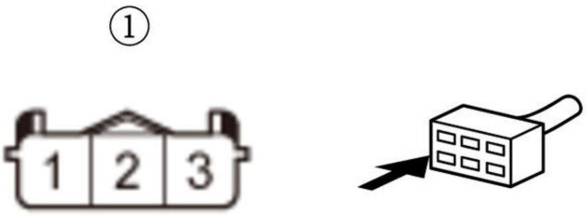
NO

Go to step 8.

8. Open wire check (CAM EX line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 32**



Is there continuity?

YES

The CAM EX wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the CAM EX wire between the PCM (E32) and CMP sensor B.

DTC P0365 (2.4 L ENGINE) (2017 2018 2019)

DTC P0365 : CMP Sensor B Circuit No Signal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0365 CMP Sensor B Circuit No Signal	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0365 CMP Sensor B Circuit No Signal	B	B

Is DTC P0365 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor B and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (IGP (TDC)/IGP (MAIN)/FI MAIN RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

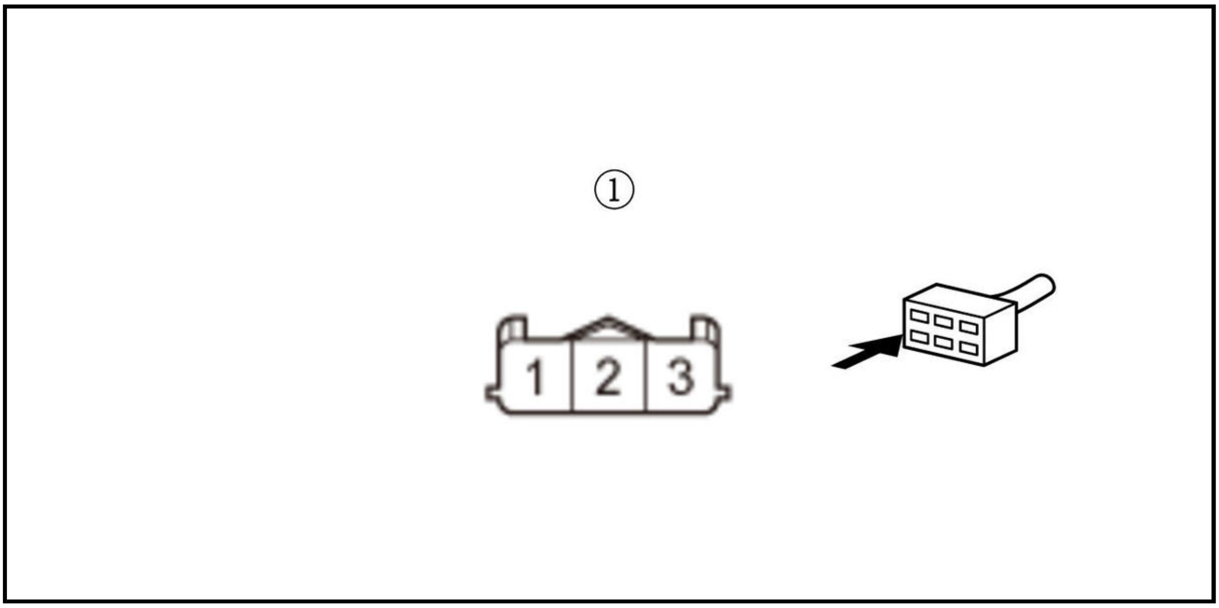
-2. Disconnect the following connector.

CMP sensor B 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGP (TDC)/IGP (MAIN)/FI MAIN RLY OUT wire is OK. Go to step 3.

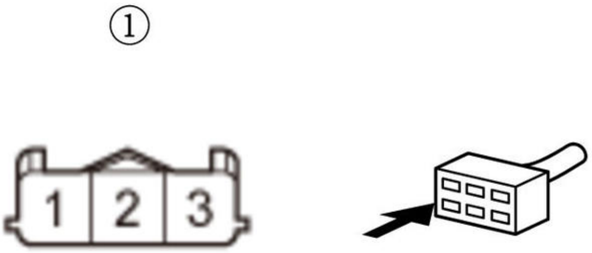
NO

Repair an open in the IGP (TDC)/IGP (MAIN)/FI MAIN RLY OUT wire between CMP sensor B and the relay circuit board (PGM-FI main relay 1 circuit).

3. Determine possible failure area (TDC line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

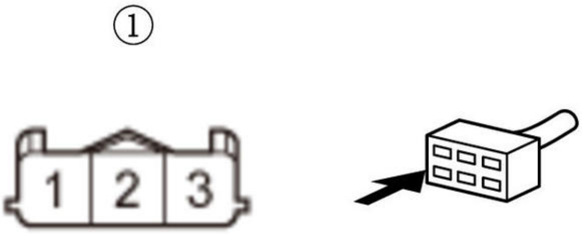
NO

Go to step 5.

4. Open wire check (LG/LG2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 1: ①
Test point 2	CMP sensor B 3P connector (female terminals) No. 2: ①



Is there battery voltage?

YES

The LG/LG2 wire is OK. **Replace CMP sensor B** .

NO

Repair an open in the LG/LG2 wire between CMP sensor B and G101.

5. Shorted wire check (TDC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 30**

Test point 2	Body ground

Is there continuity?

YES

Repair a short in the TDC wire between the PCM (B30) and CMP sensor B.

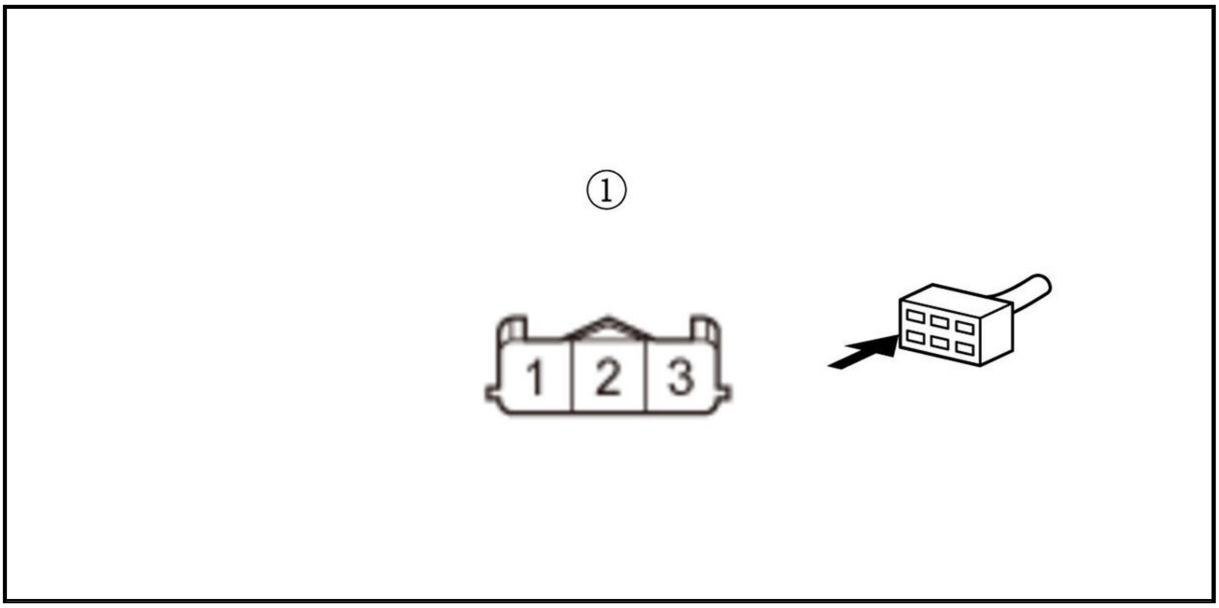
NO

The TDC wire is not shorted. Go to step 6.

6. Open wire check (TDC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector B (51P) No. 30**



Is there continuity?

YES

The TDC wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the TDC wire between the PCM (B30) and CMP sensor B.

DTC P0366 (1.5 L ENGINE)

DTC P0366 : CMP Sensor B and CKP Sensor Incorrect Phase Detected

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the DTC P101A stored at the same time as DTC P0366, troubleshoot DTC P101A first, then recheck for DTC P0366.

DTC Description	Confirmed DTC	Pending DTC
P0366 CMP Sensor B and CKP Sensor Incorrect Phase Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and allow the engine to cool below 104 deg. F (40 deg. C).

   -4. Start the engine, and let it idle without load (in P or N).

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0366 CMP Sensor B and CKP Sensor Incorrect Phase Detected	B	B

Is DTC P0366 indicated?

YES

Go to step 5.

NO

Go to step 2.

2. VTC system check (VTC TEST with the HDS)

-1. Select the VTC TEST in the INSPECTION MENU with the HDS, then select the EX-VTC.

VTC TEST - EX-VTC

Is the result OK?

YES

Go to step 3.

NO

Go to step 5.

3. VTC system check (VTC STATUS check with the HDS)

-1. Test-drive the vehicle at a steady speed between 19-38 mph (30-60 km/h) for 10 minutes.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EX VTC STATUS	ON	B	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Do the test-drive again, then recheck the VTC STATUS.

4. VTC system check (OBD status check)

-1. Monitor the OBD STATUS for DTC P0366 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0366 CMP Sensor B and CKP Sensor Incorrect Phase Detected	B

Does the HDS indicate FAILED?

YES

Go to step 5.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 3, and recheck.

5. VTC oil control solenoid valve B operation check

-1. **Test VTC oil control solenoid valve B** .

Is the solenoid valve OK?

YES

Go to step 6.

NO

Replace VTC oil control solenoid valve B .

6. Camshaft timing check

-1. **Check the camshaft timing** .

Is the camshaft timing OK?

YES

Go to step 7.

NO

Reset the camshaft timing .

7. Cam chain check

-1. **Check for damage or stretch at the cam chain** .

Is the cam chain damaged or stretched?

YES

Replace the cam chain and **the auto-tensioner** .

NO

Go to step 8.

8. VTC actuator B check

-1. **Inspect VTC actuator B** .

Is the actuator OK?

YES

Go to step 9.

NO

Replace VTC actuator B .

9. PGM-FI system check (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Reset the PCM with the HDS .

   Reset PCM

   -3. Do the CKP pattern clear procedure .

   CRANK (CKP) PATTERN CLEAR

   -4. Do the PCM idle learn procedure .

   -5. Do the CKP pattern learn procedure .

   CRANK PATTERN LEARNING

   Turn the vehicle to the OFF (LOCK) mode, and allow the engine to cool below 104 deg. F (40 deg. C).

   -7. Start the engine, and let it idle without load (in P or N).

   -8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0366 CMP Sensor B and CKP Sensor Incorrect Phase Detected	B	B

   Is DTC P0366 indicated?

   YES

   Check for poor connections or loose terminals at VTC oil control solenoid valve B and the PCM, then go to step 1.

   NO

   Intermittent failure, the system is OK at this time. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

DTC P0369 (1.5 L ENGINE)

DTC P0369 : CMP Sensor B Circuit Intermittent Interruption

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0369 CMP Sensor B Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle for 10 seconds.

-5. Monitor the OBD STATUS for DTC P0369 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0369 CMP Sensor B Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

Go to step 3.

NO

If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

-1. Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- ENGINE SPEED
- VEHICLE SPEED

-2. Monitor the OBD STATUS for DTC P0369 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0369 CMP Sensor B Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

Go to step 3.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor B and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CMP sensor circuit connectors and terminals condition check:

Check for poor connections or loose terminals at these locations:

- CMP sensor B
- PCM
- Engine ground
- Body ground

Are the connections and terminals OK?

YES

Go to step 4.

NO

Repair the connections or terminals.

4. CMP pulse plate B visual check

-1. **Remove the cylinder head cover** , then check for damage to CMP pulse plate B on the exhaust camshaft.

Is the pulse plate damaged or loose?

YES

Replace the exhaust camshaft (CMP pulse plate B) .

NO

Replace the CMP sensor B .

DTC P0369 (2.4 L ENGINE) (2017 2018 2019)

DTC P0369 : CMP Sensor B Circuit Intermittent Interruption

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0369 CMP Sensor B Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine, and let it idle for 10 seconds.

-4. Monitor the OBD STATUS for DTC P0369 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0369 CMP Sensor B Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

-1. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

- ENGINE SPEED
- VEHICLE SPEED

-2. Monitor the OBD STATUS for DTC P0369 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0369 CMP Sensor B Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor B and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CMP sensor B circuit connectors and terminals condition check:

   Check for poor connections or loose terminals at these locations:

   - CMP sensor B
   - PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

   YES

   Go to step 4.

   NO

   Repair the connections or terminals.

4. CMP pulse plate visual check

   -1. **Check for damage to CMP pulse plate** .

   Is the pulse plate damaged?

   YES

   Replace the exhaust camshaft (CMP pulse plate) .

   NO

   Replace CMP sensor B .

DTC P0420 (1.5 L ENGINE)

DTC P0420 : Catalyst System Efficiency Below Threshold

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .

- If some of the DTCs listed below are stored at the same time as DTC P0420, troubleshoot them first, then recheck for DTC P0420.

  P0137, P0138, P2270: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0300: Random misfire

  P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

- Poor quality fuel may cause this DTC.

DTC Description	Confirmed DTC	Pending DTC
P0420 Catalyst System Efficiency Below Threshold	B	B

DTC (PGM-FI)

1. PGM-FI system check 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -6. Test-drive the vehicle under these conditions:

   - Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
   - Transmission in D
   - Vehicle speed between 45-75 mph (70-120 km/h) for 5 minutes or more
   - Vehicle speed between 55-75 mph (90-120 km/h) for 10 seconds, then decelerate (with the throttle fully closed). Repeat this three or more times
   - Maintain the vehicle speed at 55 mph (90 km/h) for 9 minutes or more with cruise control set.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
VEHICLE SPEED	B	B

   -7. Monitor the OBD STATUS for DTC P0420 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0420 Catalyst System Efficiency Below Threshold	B

   Does the HDS indicate FAILED?

   YES

   Replace the TWC .

   NO

If the HDS indicates EXECUTING, go to step 2. If the HDS indicates OUT OF CONDITION, meet the test conditions and recheck. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates PASSED, intermittent failure the system is OK at this time.

2. PGM-FI system check 2

   -1. Continue test-drive until a result comes on.

   -2. Monitor the OBD STATUS for DTC P0420 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0420 Catalyst System Efficiency Below Threshold	B

   Does the HDS indicate FAILED?

   YES

   Replace the TWC .

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, meet the test conditions and recheck.

DTC P0420 (2.4 L ENGINE) (2017 2018 2019)

DTC P0420 : Catalyst System Efficiency Below Threshold

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If some of the DTCs listed below are stored at the same time as DTC P0420, troubleshoot them first, then recheck for DTC P0420.

  P0137, P0138, P2270: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0300: Random misfire

  P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

- Poor quality fuel may cause this DTC.

DTC Description	Confirmed DTC	Pending DTC
P0420 Catalyst System Efficiency Below Threshold	B	B

DTC (PGM-FI)

1. PGM-FI system check 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Vehicle speed between 45-75 mph (70-120 km/h) for 5 minutes or more
- Vehicle speed between 55-75 mph (90-120 km/h) for 10 seconds, then decelerate (with the throttle fully closed). Repeat this three or more times
- Maintain the vehicle speed at 55 mph (90 km/h) for 9 minutes or more with cruise control set.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
VEHICLE SPEED	B	B

-7. Monitor the OBD STATUS for DTC P0420 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0420 Catalyst System Efficiency Below Threshold	B

Does the HDS indicate FAILED?

YES

Replace the WU-TWC .

NO

If the HDS indicates EXECUTING, go to step 2. If the HDS indicates OUT OF CONDITION, meet the test conditions and recheck. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates PASSED, intermittent failure the system is OK at this time.

2. PGM-FI system check 2

-1. Continue test-drive until a result comes on.

-2. Monitor the OBD STATUS for DTC P0420 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0420 Catalyst System Efficiency Below Threshold	B

Does the HDS indicate FAILED?

YES

Replace the WU-TWC .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, meet the test conditions and recheck.

DTC P043E, P043F (1.5 L ENGINE)

DTC P043E : EVAP Leak Check Module Standard Pressure Low **DTC P043F** : EVAP Leak Check Module Standard Pressure High

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P043E EVAP Leak Check Module Standard Pressure Low	B	B
P043F EVAP Leak Check Module Standard Pressure High	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST (ELCM)

   Is the result OK?

   YES

   If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

   NO

   The failure is duplicated. Go to step 2.

2. EVAP leak check module drain hose check

   -1. Remove the EVAP leak check module and the EVAP canister filter , then check the blockage in the drain hoses and the EVAP canister filter.

   Are the parts OK?

   YES

   Replace the EVAP leak check module .

   NO

   Remove the blockage from them, or replace the part (s) if needed.

DTC P0441 (1.5 L ENGINE)

DTC P0441 : EVAP System Purge Flow Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0441 is indicated alone, do the troubleshooting for DTC P04DF and P04F1 using the on-board snapshot for P0441.
- If DTC P04F0, P04F1, P145D, and P0441 are stored at the same time, check for a poor connection, a blockage, or damage at the EVAP canister purge line between the EVAP canister purge valve and the EVAP canister. Also check for a stuck closed EVAP canister purge valve.
- If any of the DTCs listed below are indicated at the same time as DTC P0441, troubleshoot those DTCs first, then recheck for P0441.

  P04DF, P04F0, P04F1: EVAP system purge flow

DTC Description	Confirmed DTC	Pending DTC
P0441 EVAP System Purge Flow Malfunction	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Purge Flow Check Test with the HDS.

   EVAP TEST (ELCM)

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0441 EVAP System Purge Flow Malfunction	B	B
P04DF EVAP System High Purge Flow Detected	B	B
P04F0 EVAP System Incorrect Purge Flow Detected	B	B
P04F1 EVAP System Low Purge Flow Detected	B	B

   Are DTC P04DF, P04F0, or P04F1 and P0441 indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC P04DF**, **P04F0**, and **DTC P04F1**.

DTC P0441 (2.4 L ENGINE) (2017 2018 2019)

DTC P0441 : EVAP System Purge Flow Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0441 is indicated alone, do the troubleshooting for DTC P04DF and P04F1 using the on-board snapshot for P0441.
- If DTC P04F1 and P0441 are stored at the same time, check for a poor connection, a blockage, or damage at the EVAP canister purge line between the EVAP canister purge valve and the EVAP canister. Also check for a stuck closed EVAP canister purge valve.

- If any of the DTCs listed below are indicated at the same time as DTC P0441, troubleshoot those DTCs first, then recheck for P0441.

  P04DF, P04F1: EVAP system purge flow

DTC Description	Confirmed DTC	Pending DTC
P0441 EVAP System Purge Flow Malfunction	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P04DF EVAP System High Purge Flow Detected	B	B
P04F1 EVAP System Low Purge Flow Detected	B	B
P0441 EVAP System Purge Flow Malfunction	B	B

   Are DTC P04DF or P04F1 and P0441 indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC P04DF** and **DTC P04F1**.

DTC P0443 (1.5 L ENGINE)

DTC P0443 : EVAP Canister Purge Valve Circuit Malfunction

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0443 EVAP Canister Purge Valve Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0443 EVAP Canister Purge Valve Circuit Malfunction	B	B

Is DTC P0443 indicated?

YES

Go to step 2.

NO

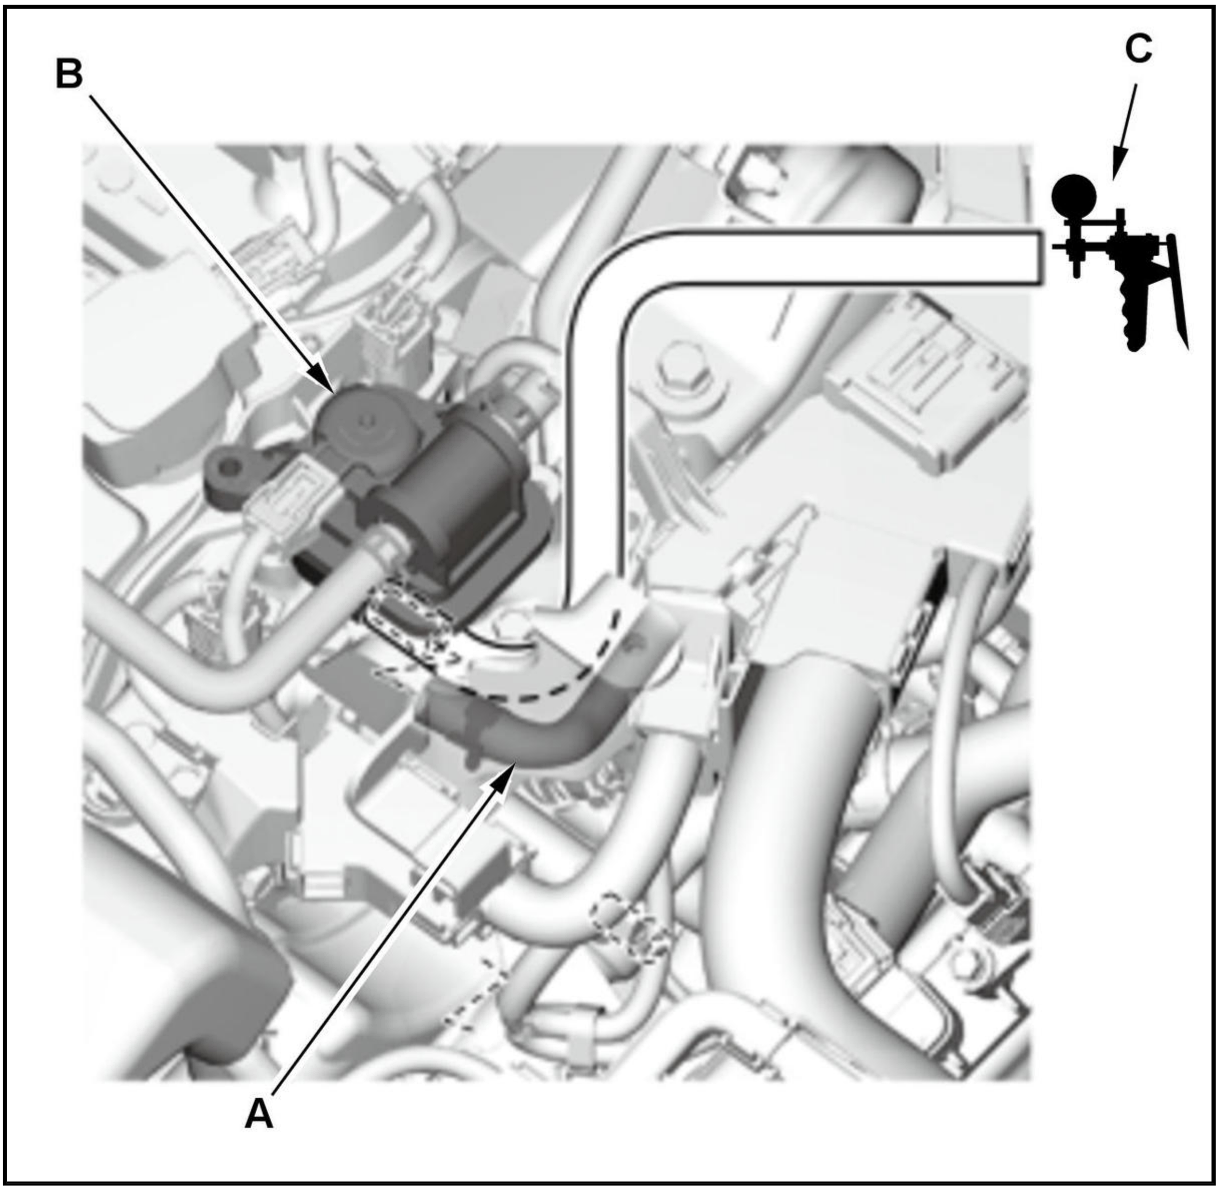
Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister purge valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (EVAP canister purge valve stuck open failure, EVAP canister purge valve stuck closed failure)

   -1. Turn the vehicle to the OFF (LOCK) mode, and allow the engine to cool below 131 deg. F (55 deg. C).

   -2. **Remove the EVAP canister purge valve** with its connector and vacuum hose connected.

   -3. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, then connect a vacuum pump/gauge, 0-30 inHg (C) to the EVAP canister purge valve as shown.



-4. Start the engine, and let it idle.

Is there vacuum?

YES

The EVAP canister purge valve is stuck open. Go to step 3.

NO

The EVAP canister purge valve is stuck closed. Go to step 5.

3. Determine possible failure area (IPV line, EVAP canister purge valve)

-1. Turn the vehicle to the OFF (LOCK) mode.

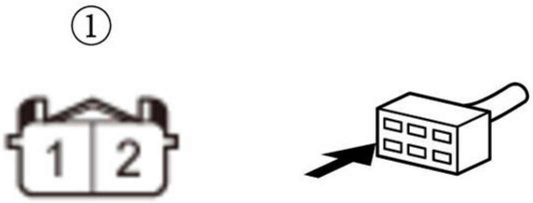
-2. Disconnect the following connector.

EVAP canister purge valve 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2P connector: disconnected

Test point 1	EVAP canister purge valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Replace the EVAP canister purge valve .

4. Shorted wire check (IPV line)

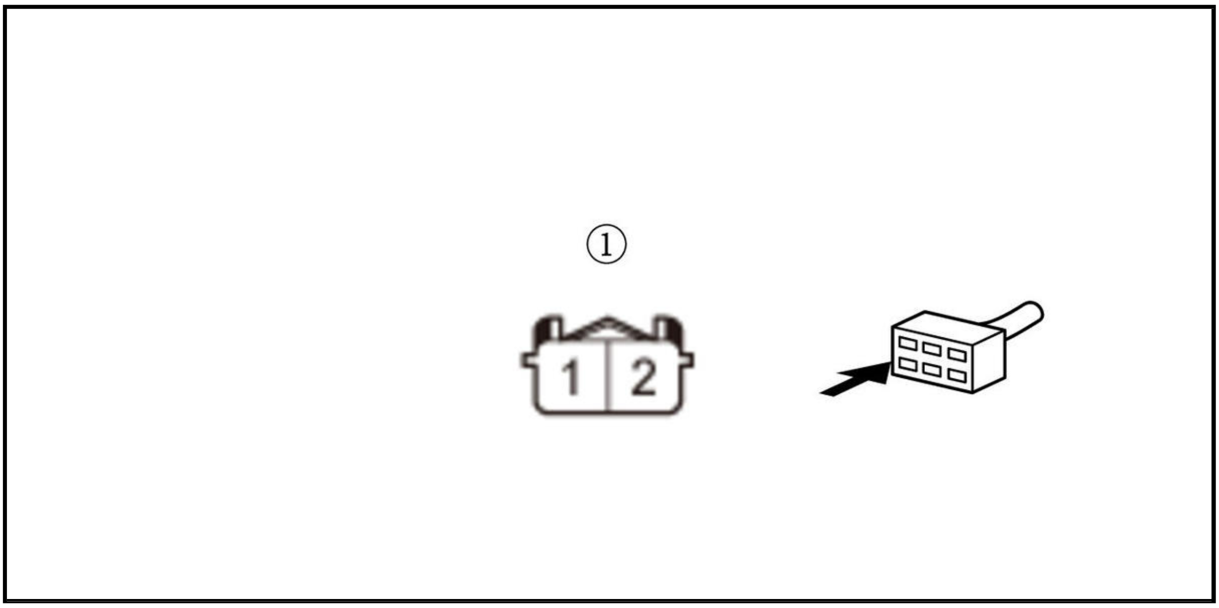
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EVAP canister purge valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the IPV wire between the PCM (E80) and the EVAP canister purge valve.

NO

The IPV wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Open wire check (IGPS (IPV)/IGPS (LAF) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

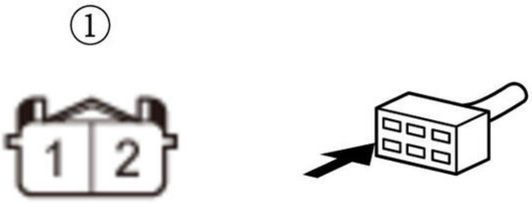
-2. Disconnect the following connector.

EVAP canister purge valve 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP canister purge valve 2P connector: disconnected
Test point 1	EVAP canister purge valve 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 6.

NO

Repair an open in the IGPS (IPV)/IGPS (LAF) wire between the EVAP canister purge valve and the No. A11 (7.5 A) fuse in the under-hood fuse/relay box.

6. Open wire check (IPV line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

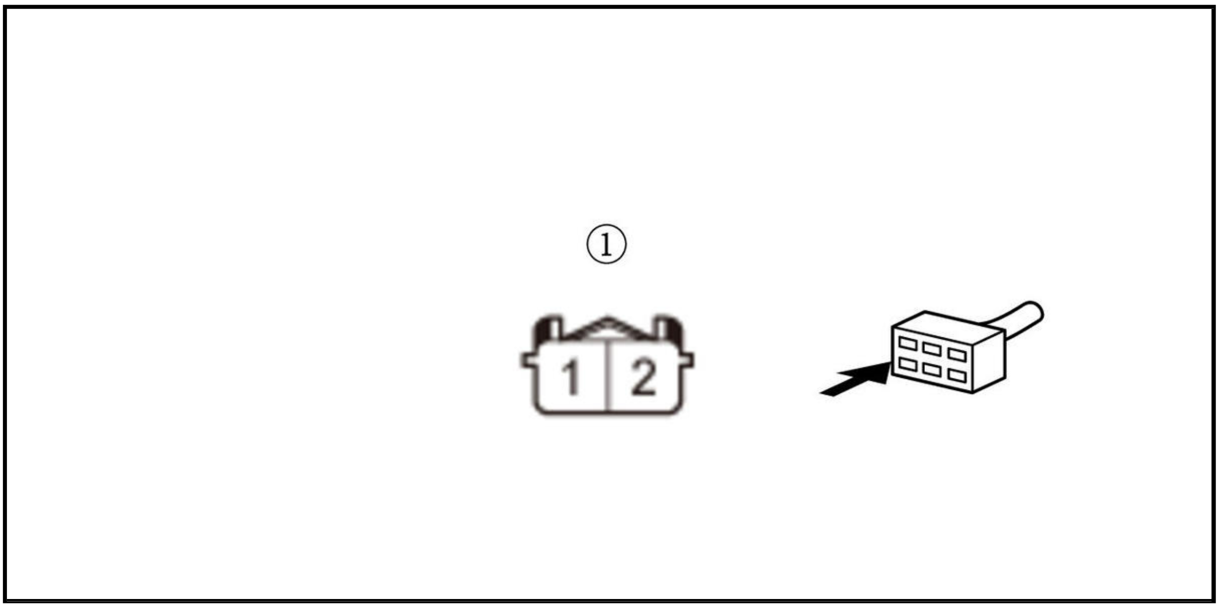
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector E (80P)

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EVAP canister purge valve 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 80**



Is there continuity?

YES

Go to step 7.

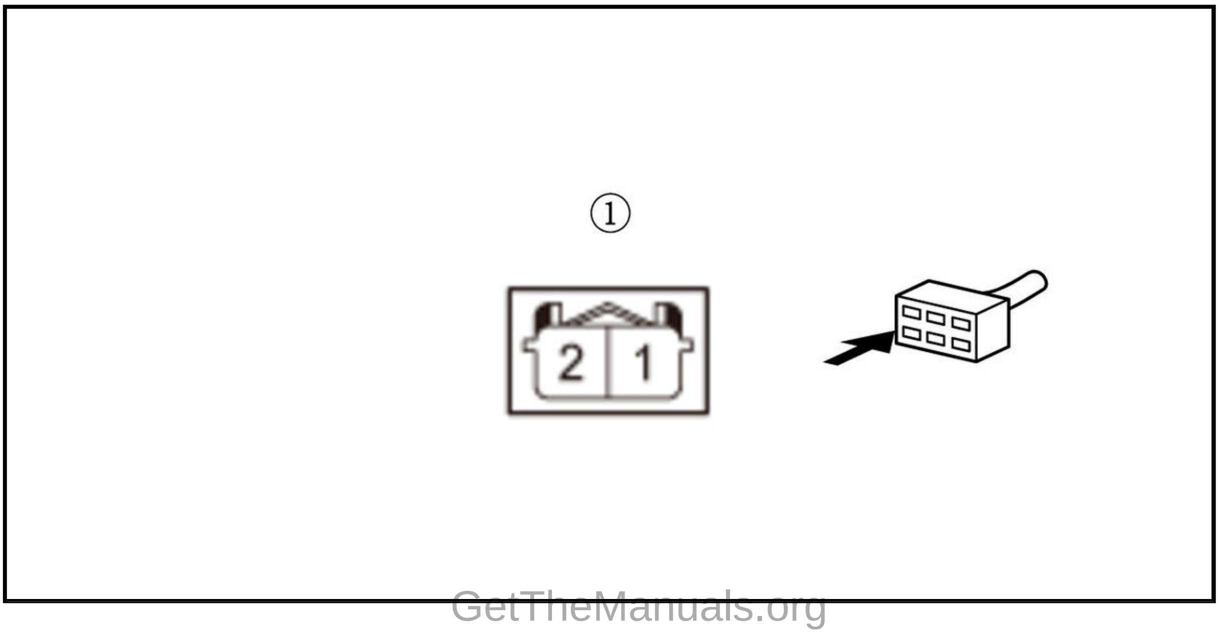
NO

Repair an open in the IPV wire between the PCM (E80) and the EVAP canister purge valve.

7. EVAP canister purge valve internal resistance check

-1. At the purge valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EVAP canister purge valve 2P connector (male terminals) No. 1 (EVAP canister purge valve side): ①
Test point 2	EVAP canister purge valve 2P connector (male terminals) No. 2 (EVAP canister purge valve side): ①



Is there about 23-26 Ω at room temperature?

YES

The EVAP canister purge valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the EVAP canister purge valve .

DTC P0443 (2.4 L ENGINE) (2017 2018 2019)

DTC P0443 : EVAP Canister Purge Valve Circuit Malfunction

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0443 EVAP Canister Purge Valve Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0443 EVAP Canister Purge Valve Circuit Malfunction	B	B

   Is DTC P0443 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

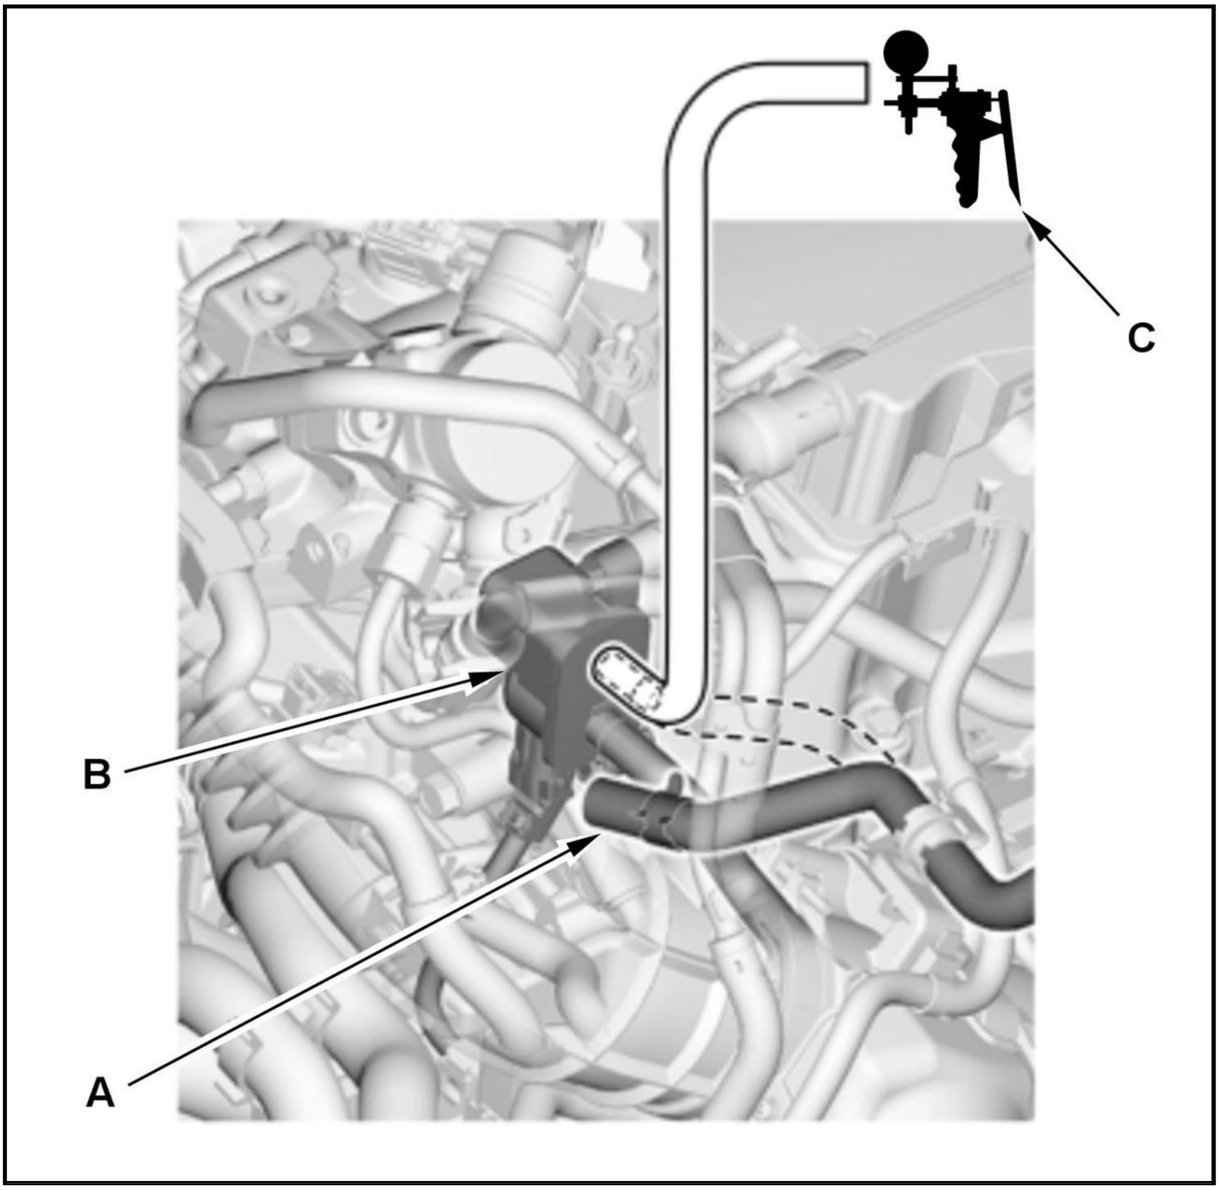
   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister purge valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (EVAP canister purge valve stuck open failure, EVAP canister purge valve stuck closed failure)

   -1. Remove the high pressure fuel pump cover and the fuel bracket.

-2. Turn the vehicle to the OFF (LOCK) mode, and allow the engine to cool below 140 deg. F (60 deg. C).

-3. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, then connect a vacuum pump/gauge, 0-30 inHg, (C) to the EVAP canister purge valve as shown.



-4. Start the engine, and let it idle.

Is there vacuum?

YES

The EVAP canister purge valve is stuck open. Go to step 3.

NO

The EVAP canister purge valve is stuck closed. Go to step 5.

3. Determine possible failure area (PCS line, EVAP canister purge valve)

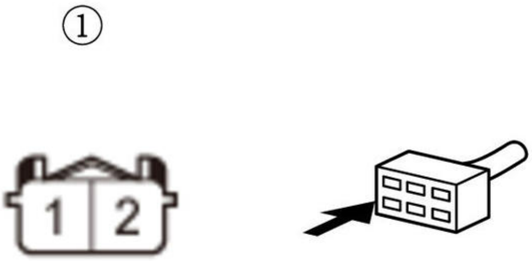
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP canister purge valve 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2P connector: disconnected
Test point 1	EVAP canister purge valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Replace the EVAP canister purge valve .

4. Shorted wire check (PCS line)

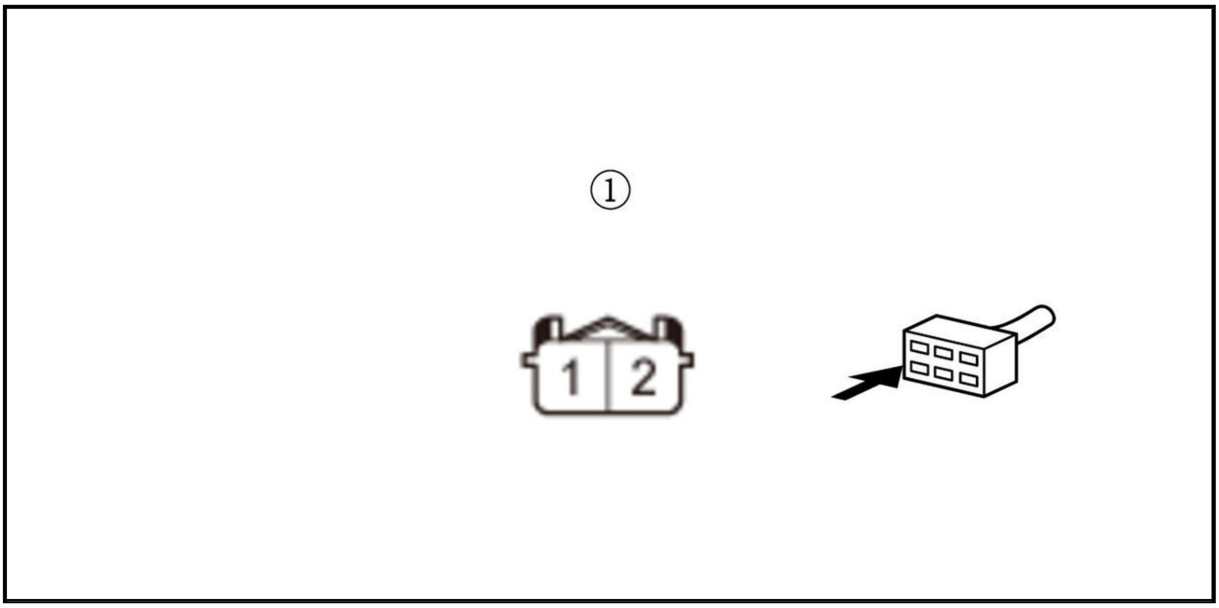
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	EVAP canister purge valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PCS wire between the PCM (B15) and the EVAP canister purge valve.

NO

The PCS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

5. Open wire check (IG1 ACG/IG1 (MAIN)/IG1 (PCS) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

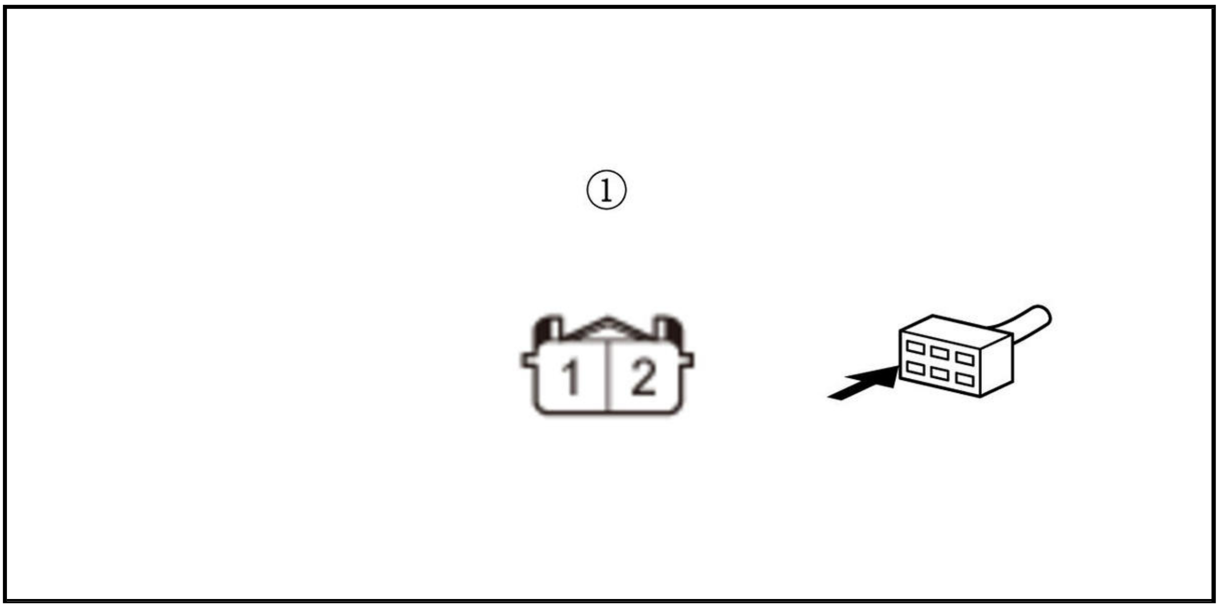
-2. Disconnect the following connector.

EVAP canister purge valve 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP canister purge valve 2P connector: disconnected
Test point 1	EVAP canister purge valve 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 ACG/IG1 (MAIN)/IG1 (PCS) wire is OK. Go to step 6.

NO

Repair an open in the IG1 ACG/IG1 (MAIN)/IG1 (PCS) wire between the EVAP canister purge valve and the No. D21 (10 A) fuse in the under-dash fuse/relay box.

6. Open wire check (PCS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

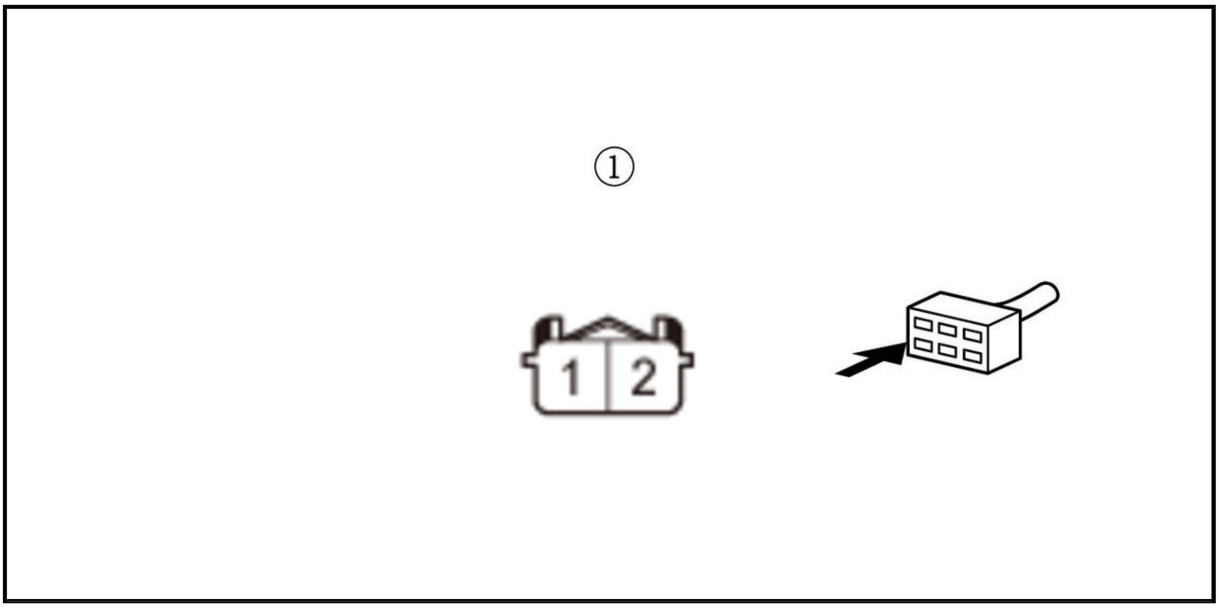
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	EVAP canister purge valve 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector B (51P) No. 15**



Is there continuity?

YES

The PCS wire is OK. Go to step 7.

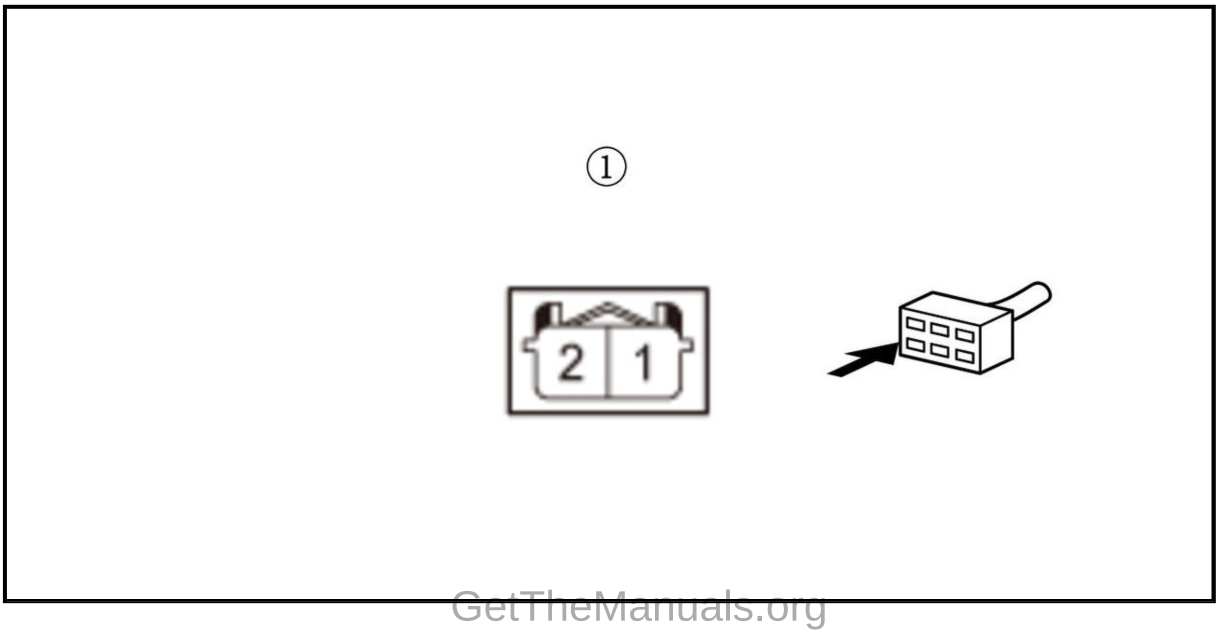
NO

Repair an open in the PCS wire between the PCM (B15) and the EVAP canister purge valve.

7. EVAP canister purge valve internal resistance check

-1. At the purge valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	EVAP canister purge valve 2P connector (male terminals) No. 1 (EVAP canister purge valve side): ①
Test point 2	EVAP canister purge valve 2P connector (male terminals) No. 2 (EVAP canister purge valve side): ①



Is there about 22-27 Ω at room temperature?

YES

The EVAP canister purge valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Replace the EVAP canister purge valve .

DTC P0451 (1.5 L ENGINE)

DTC P0451 : EVAP Leak Check Module Pressure Sensor Range/Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P24BA or P24BB is stored at the same time as DTC P0451, troubleshoot DTC P24BA or P24BB first, then recheck for DTC P0451.

DTC Description	Confirmed DTC	Pending DTC
P0451 EVAP Leak Check Module Pressure Sensor Range/Performance	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle for 1 minute.

   -4. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0451 EVAP Leak Check Module Pressure Sensor Range/Performance	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. **Replace the EVAP leak check module** .

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0451 (2.4 L ENGINE) (2017 2018 2019)

DTC P0451 : FTP Sensor Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2422 is stored at the same time as DTC P0451, troubleshoot DTC P2422 first, then recheck for DTC P0451.

DTC Description	Confirmed DTC	Pending DTC
P0451 FTP Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle for 1 minute.

   -4. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0451 FTP Sensor Circuit Range/Performance Problem	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. **Replace the FTP sensor** .

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0452 (2.4 L ENGINE) (2017 2018 2019)

DTC P0452 : FTP Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0452 FTP Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Insert the emergency fuel funnel into the fuel filler neck** .

   NOTE: The emergency fuel funnel is stored under the cargo lid.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
FTP SENSOR	Less than 0.3	V	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification

-1. Remove the emergency fuel funnel from the fuel filler neck.

-2. Start the engine, and let it idle.

-3. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

DTC Description	**OBD STATUS**
P0452 FTP Sensor Circuit Low Voltage	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

3. Determine possible failure area (PTANK line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

FTP sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
FTP SENSOR	Less than 0.3	V	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (PTANK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

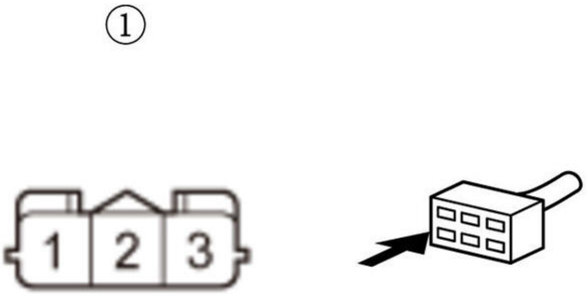
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	FTP sensor 3P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	FTP sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PTANK wire between the PCM (A42) and the FTP sensor.

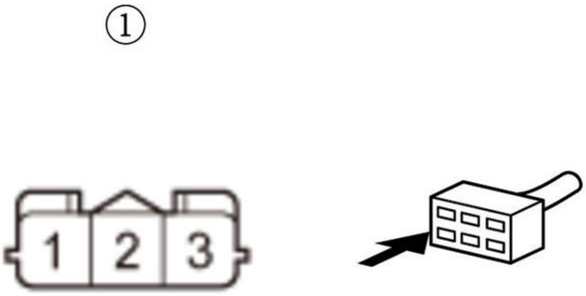
NO

The PTANK wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (FTP sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	FTP sensor 3P connector: disconnected
Test point 1	FTP sensor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the FTP sensor .

NO

Go to step 6.

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

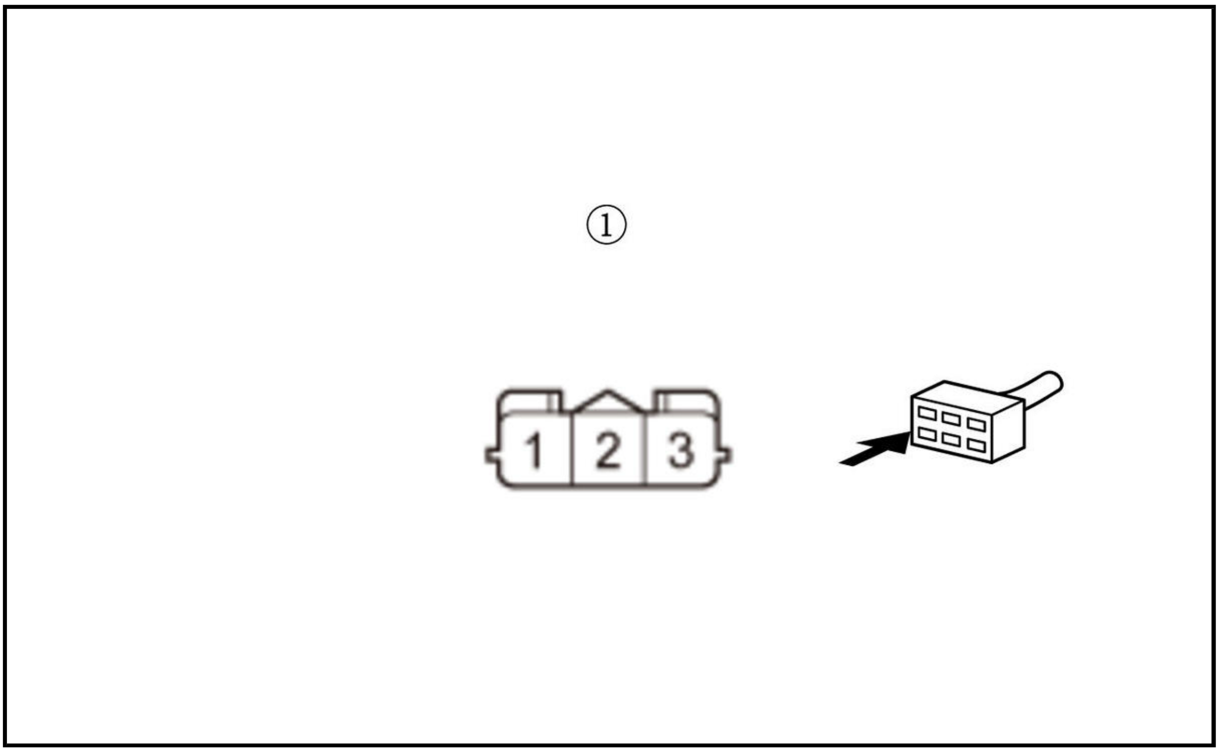
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	FTP sensor 3P connector (female terminals) No. 3: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	FTP sensor 3P connector: disconnected
	FTP sensor 3P connector No. 3: jumped to body ground
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 29**
Test point 2	Body ground

Is there continuity?

YES

The VCC6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC6 wire between the PCM (A29) and the FTP sensor.

DTC P0453 (2.4 L ENGINE) (2017 2018 2019)

DTC P0453 : FTP Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0453 FTP Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. **Insert the emergency fuel funnel into the fuel filler neck** .

NOTE: The emergency fuel funnel is stored under the cargo lid.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FTP Sensor	More than 4.7	V	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification

-1. Remove the emergency fuel funnel from the fuel filler neck.

-2. Start the engine.

-3. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-4. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0453 FTP Sensor Circuit High Voltage	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

3. Determine possible failure area (FTP sensor, others)

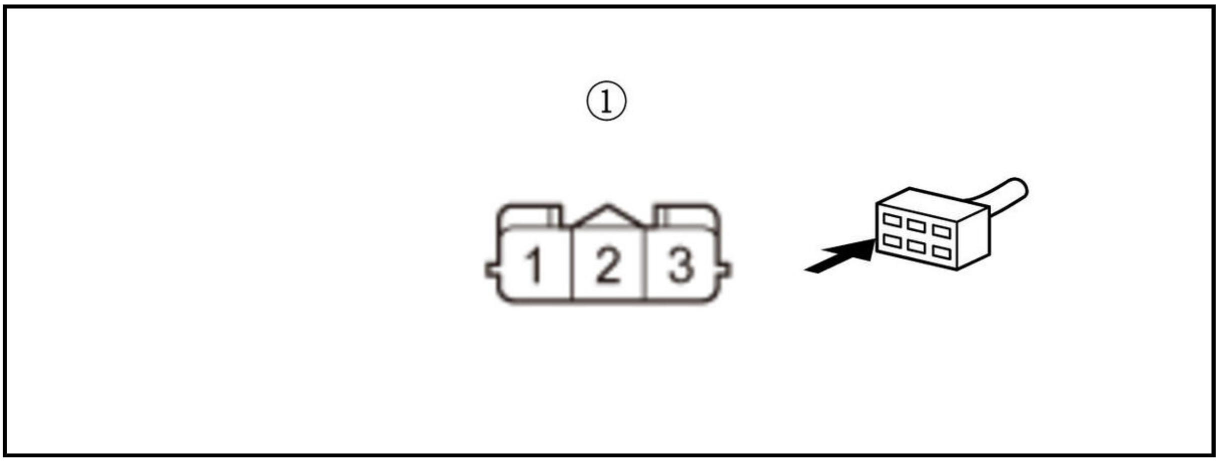
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

FTP sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	FTP sensor 3P connector (female terminals) No. 1: ①
Terminal B	FTP sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
FTP SENSOR	More than 4.7	V	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 4.

NO

Replace the FTP sensor .

4. Determine possible failure area (SG6 line, others)

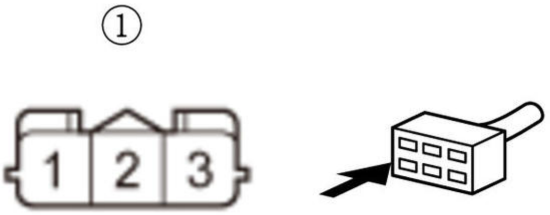
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the FTP sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	FTP sensor 3P connector: disconnected
Test point 1	FTP sensor 3P connector (female terminals) No. 1: ①
Test point 2	FTP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 6.

5. Open wire check (PTANK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

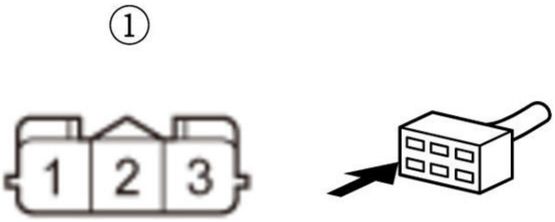
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	FTP sensor 3P connector (female terminals) No. 2: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	FTP sensor 3P connector: disconnected
	FTP sensor 3P connector No. 2: jumped to body ground

	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 42**
Test point 2	Body ground

Is there continuity?

YES

The PTANK wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the PTANK wire between the PCM (A42) and the FTP sensor.

6. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

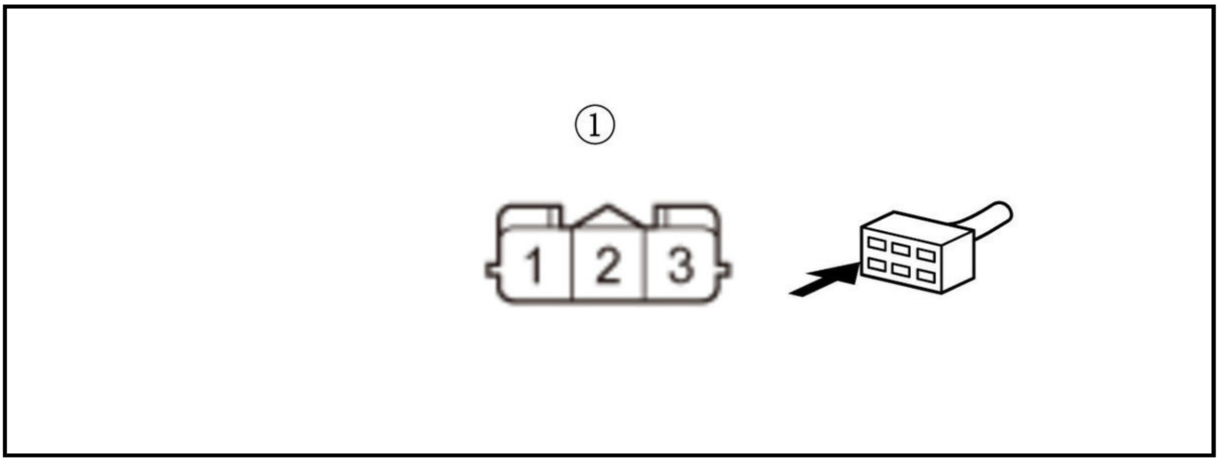
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	FTP sensor 3P connector (female terminals) No. 1: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	FTP sensor 3P connector: disconnected
	FTP sensor 3P connector No. 1: jumped to body ground
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 28**
Test point 2	Body ground

Is there continuity?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the SG6 wire between the PCM (A28) and the FTP sensor.

DTC P0455, P0456 (2.4 L ENGINE) (2017 2018 2019)

DTC P0455 : EVAP System Large Leak Detected **DTC P0456** : EVAP System Very Small Leak Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTICE:

The fuel system is designed to allow specified maximum vacuum and pressure conditions. Do not deviate from the vacuum and pressure tests as indicated in these procedures. Excessive pressure/vacuum would damage the EVAP components or cause eventual fuel tank failure.

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- Fresh fuel has a higher volatility that will create greater pressure/vacuum. The best condition for testing is less than a full tank of fresh fuel. If possible, to assist in leak detection, add 1 gallon of fresh fuel to the tank (as long as it will not fill the tank), just before starting these procedures.

DTC Description	Confirmed DTC	Pending DTC
P0455 EVAP System Large Leak Detected	B	B
P0456 EVAP System Very Small Leak Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST in the INSPECTION MENU, then select the FUNCTION TEST with the HDS.

   EVAP TEST

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot . If the vehicle returns with the same DTC, continue with step 4.

   NO

   The failure is duplicated. Go to step 2.

2. EVAP canister vent hose check

   -1. Check the EVAP canister vent hose (A) for a blockage or a restriction.

   Is there a blockage or a restriction in the hose?

   YES

   Remove a blockage or a restriction, if needed, replace the EVAP canister vent hose.

   NO

   Go to step 3.

3. Fuel tank vapor recirculation tube visual check

   -1. Check for a poor connection or damage at the fuel tank vapor recirculation tube.

   Is the tube OK?

   YES

   The tube is OK. Go to step 4.

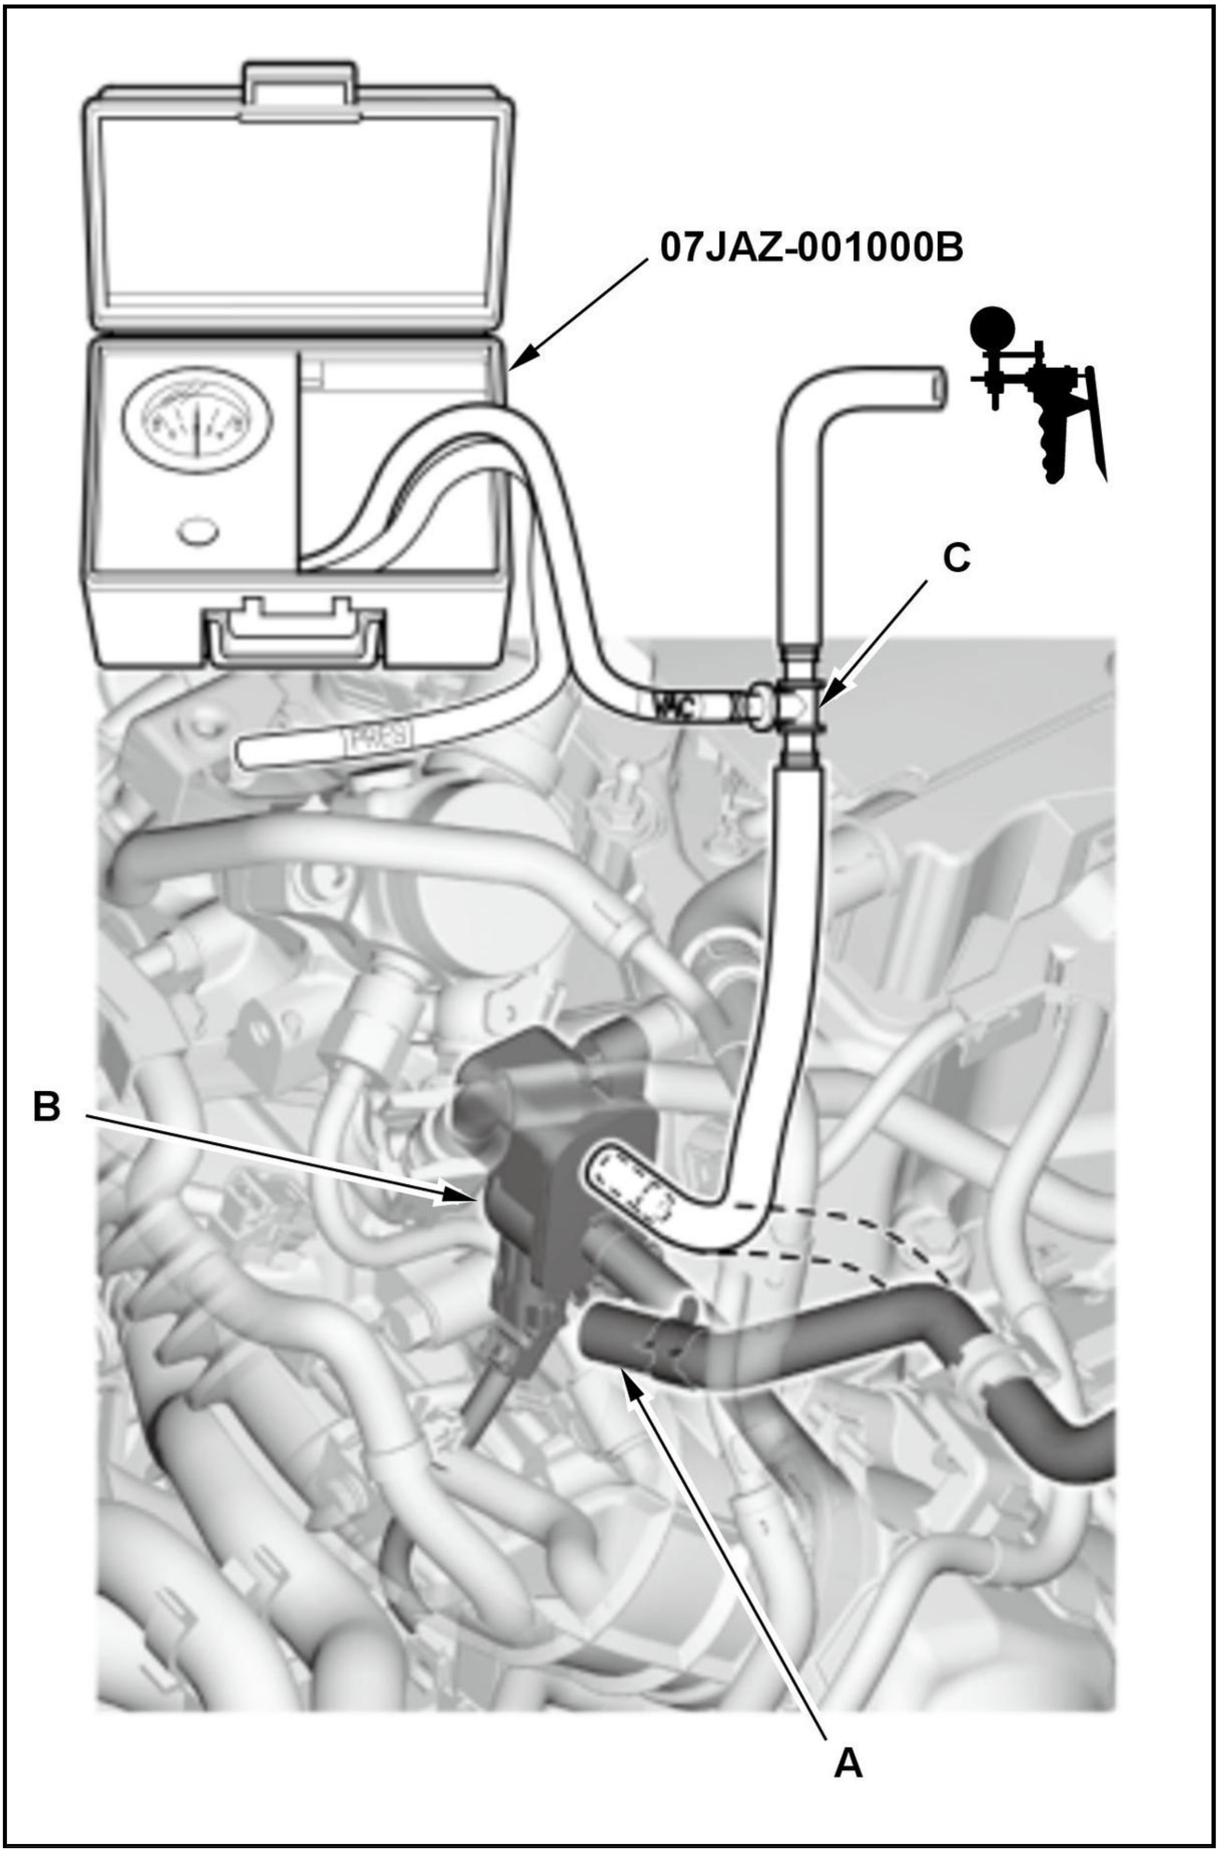
   NO

   Replace the fuel tank or **replace the fuel tank unit** if needed.

4. EVAP canister purge valve leak check

-1. **Remove the EVAP canister purge valve** with its connector and vacuum hose connected.

-2. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, then connect a T-fitting (C), a vacuum gauge, and a vacuum pump/gauge, 0-30 inHg, to the vacuum hose as shown.



-3. Slowly apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

Does it hold vacuum for 1 minute?

YES

Leak not detected at the EVAP canister purge valve. Go to step 5.

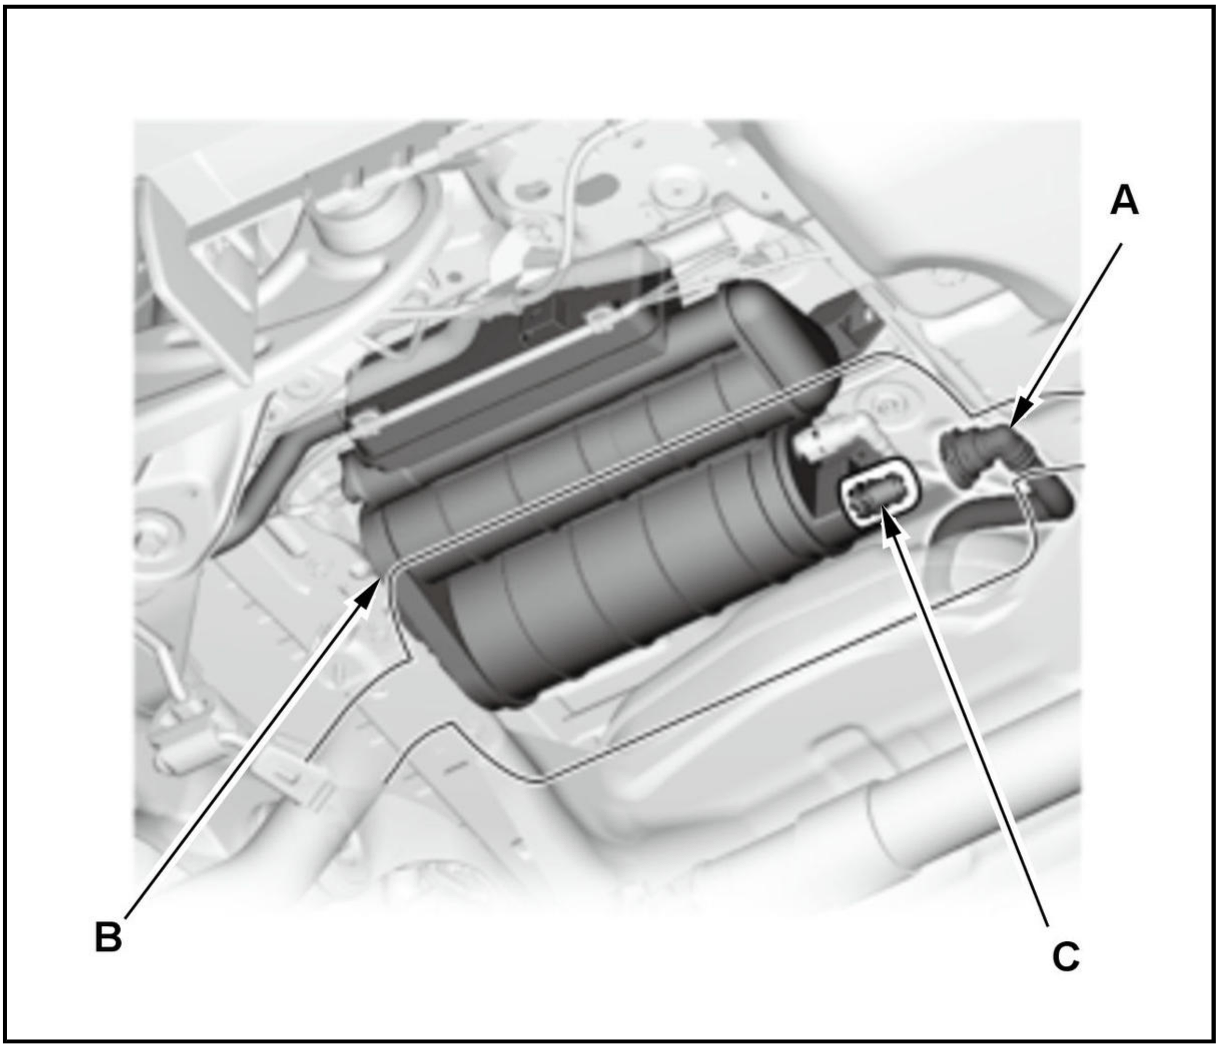
NO

Replace the EVAP canister purge valve .

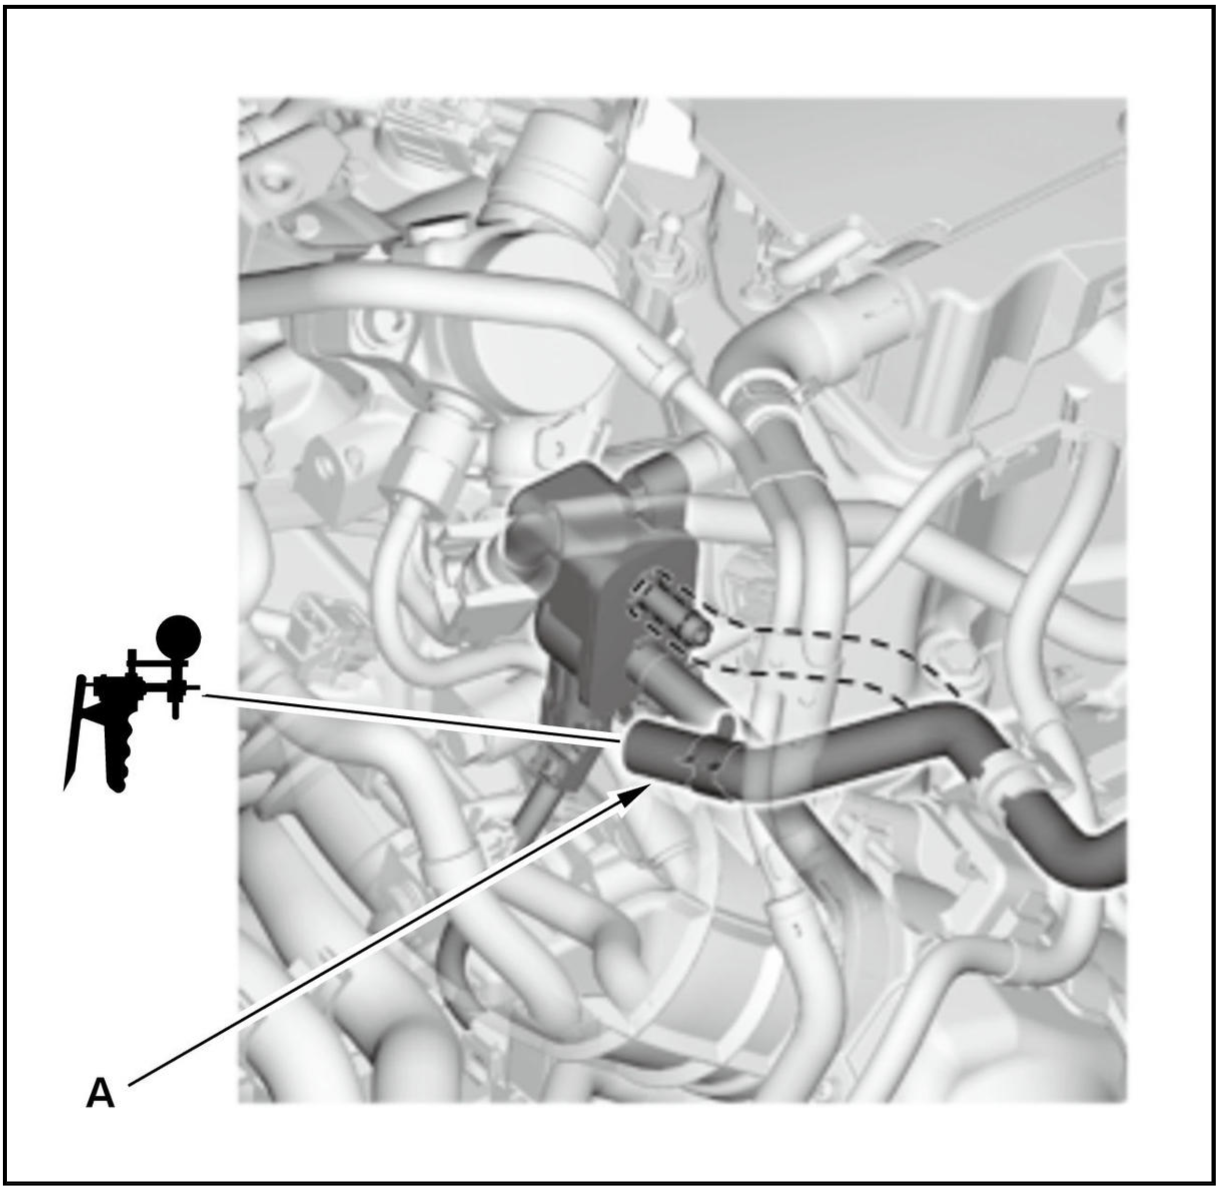
5. Determine possible failure area (EVAP canister vent shut valve, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the fuel vent tube (A) from the EVAP canister (B), and plug the EVAP canister port (C).



-3. Remove the T-fitting and vacuum pump/gauge, 0-30 inHg, and connect the vacuum pump/gauge, 0-30 inHg to the vacuum hose (purge line) (A) as shown.



-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST in the INSPECTION MENU, then select EVAP CVS ON in the SINGLE SOLENOID with the HDS.

EVAP TEST

Apply vacuum to the hose until the FTP reads 1.90 V (-0.59 inHg, -15.1 mmHg).

NOTE: Be careful not to exceed the vacuum. If you do, the FTP sensor can be damaged.

Signal	Current conditions	
	Values	**Unit**
FTP SENSOR	B	B

-7. Check the parameter (s) below with the HDS for 1 minute.

Signal	Current conditions	
	Values	**Unit**
FTP SENSOR	B	B

Does the voltage increase more than 0.2 V (0.1 inHg, 2.5 mmHg)?

YES

Go to step 6.

NO

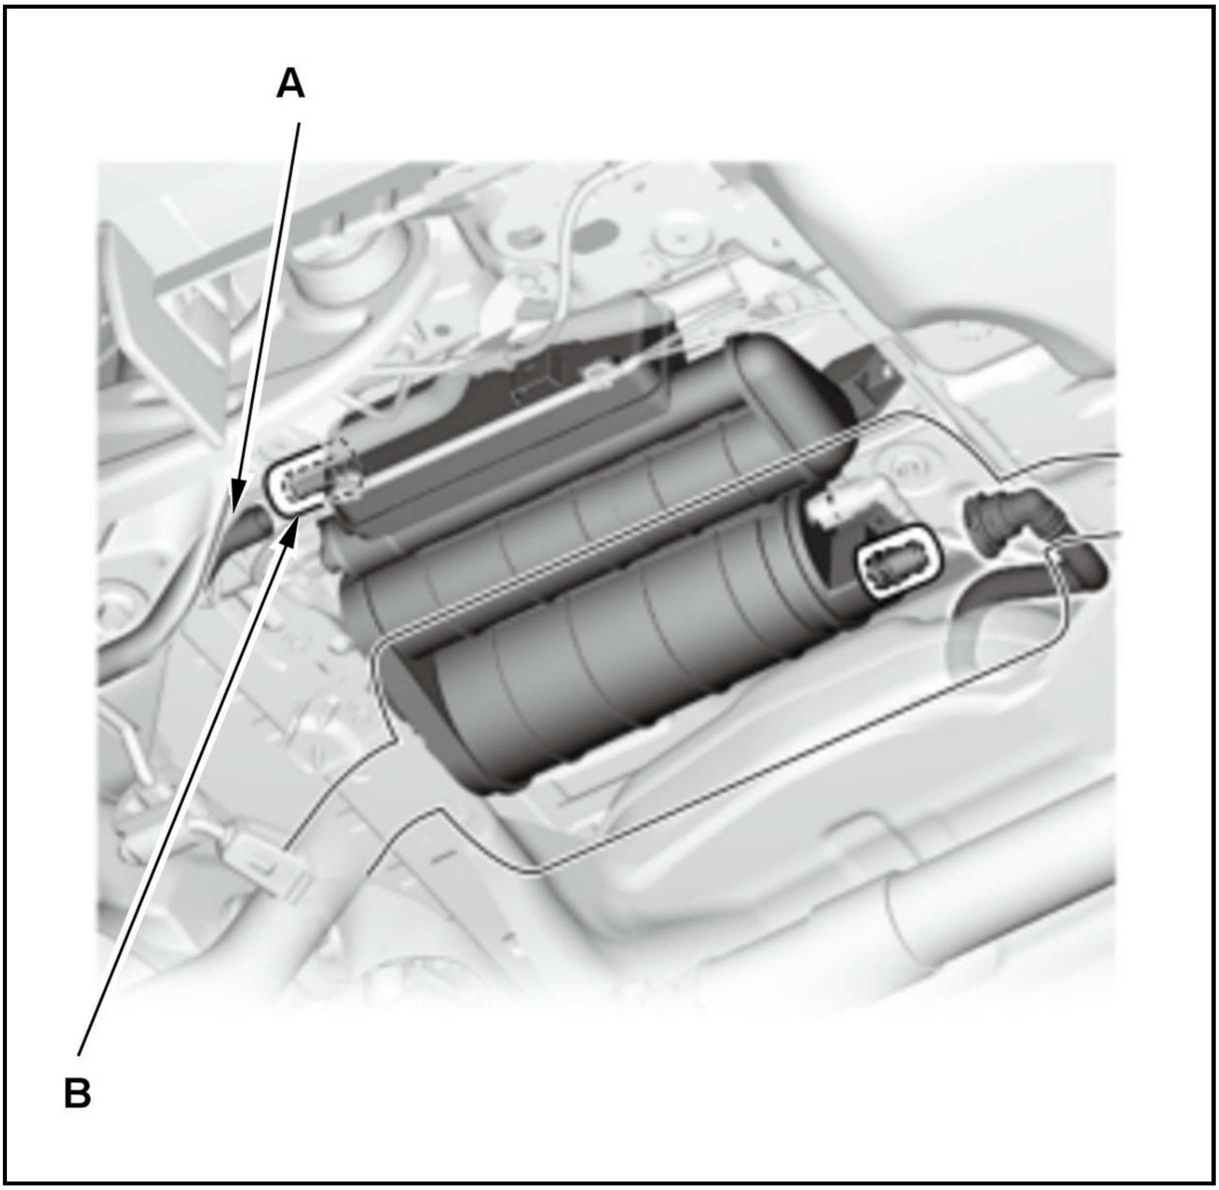
Go to step 8.

6. EVAP canister vent shut valve operation check

-1. Select the EVAP TEST in the INSPECTION MENU, then select EVAP CVS OFF in the SINGLE SOLENOID with the HDS.

EVAP TEST

-2. Disconnect the EVAP canister vent hose (A) from the EVAP canister vent shut valve port (B), and plug it.



-3. Apply vacuum to the hose until the FTP reads 1.90 V (-0.59 inHg, -15.1 mmHg).

NOTE: Be careful not to exceed the vacuum. If you do, the FTP sensor can be damaged.

Signal	Current conditions	
	Values	Unit
FTP SENSOR	B	B

-4. Check the parameter (s) below with the HDS for 1 minute.

Signal	Current conditions	
	Values	Unit
FTP Sensor	B	B

Does the voltage increase more than 0.2 V (0.1 inHg, 2.5 mmHg)?

YES

The EVAP canister vent shut valve is OK. Go to step 7.

NO

Replace the EVAP canister vent shut valve .

7. EVAP canister purge line visual check

   -1. Check for a poor connection or damaged EVAP canister purge line between the EVAP canister and the EVAP canister purge valve. Also check for damage to the EVAP canister.

   Are the line and the EVAP canister OK?

   1. **YES**

      Replace these parts.

      - FTP sensor O-ring
      - EVAP canister vent shut valve case and O-ring
      - EVAP canister

      NO

      Replace or repair the EVAP canister purge line or the canister.

8. Fuel fill pipe and fuel tank vapor recirculation tube visual check

   -1. Select the EVAP TEST in the INSPECTION MENU, then select EVAP CVS OFF in the SINGLE SOLENOID with the HDS.

   EVAP TEST

   Check for a poor connection or damage to the fuel fill pipe and the fuel tank vapor recirculation tube.

   Are the parts and connections OK?

   YES

   The fuel fill pipe and the fuel tank vapor recirculation tube are OK. Go to step 9.

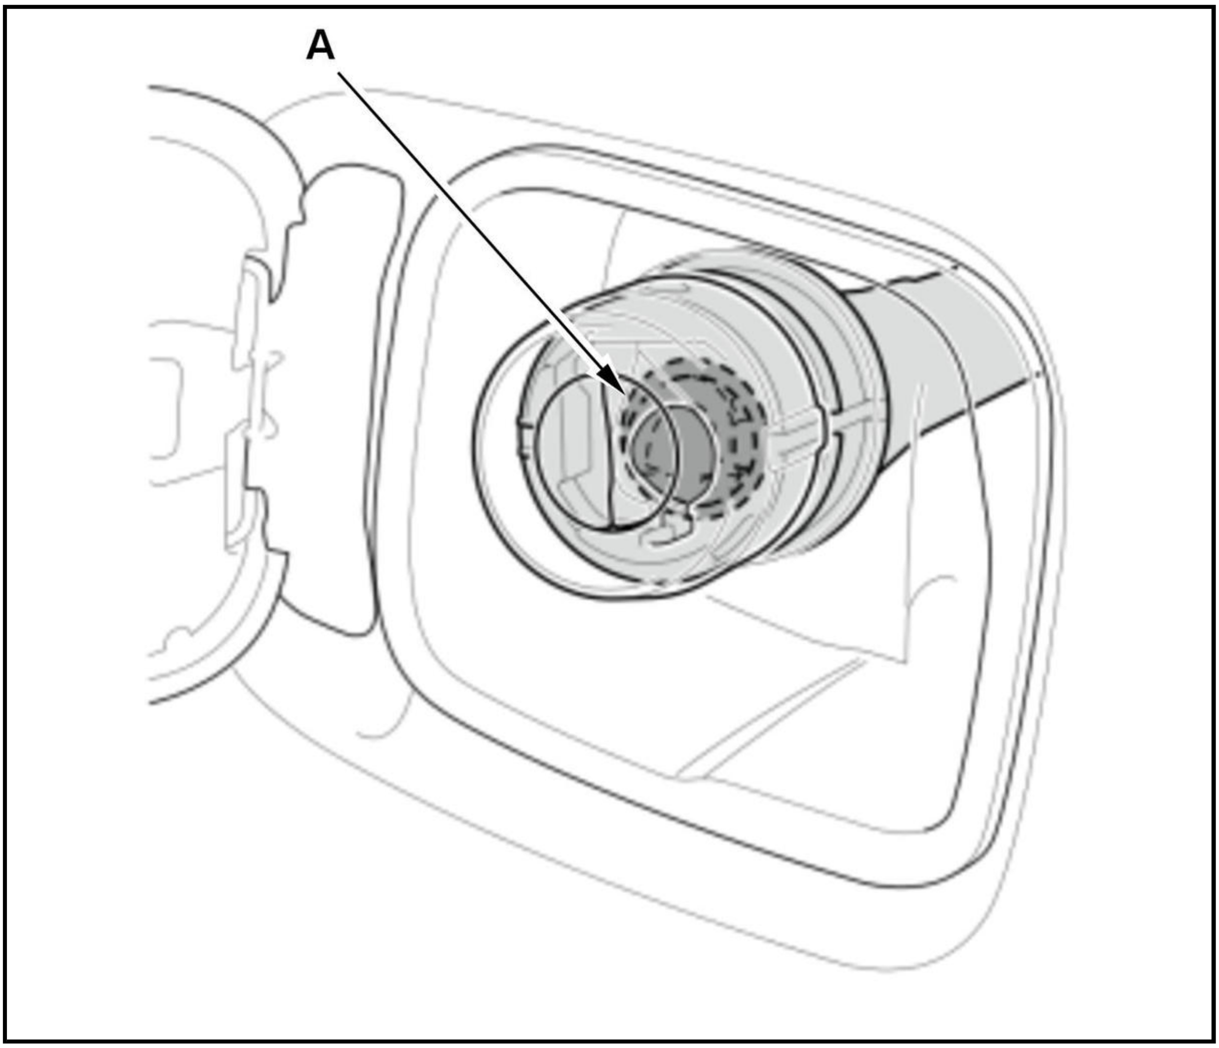
   NO

   Replace the fuel tank .

9. Shut-off valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the flap of the shut-off valve (A).



Is the flap closed?

YES

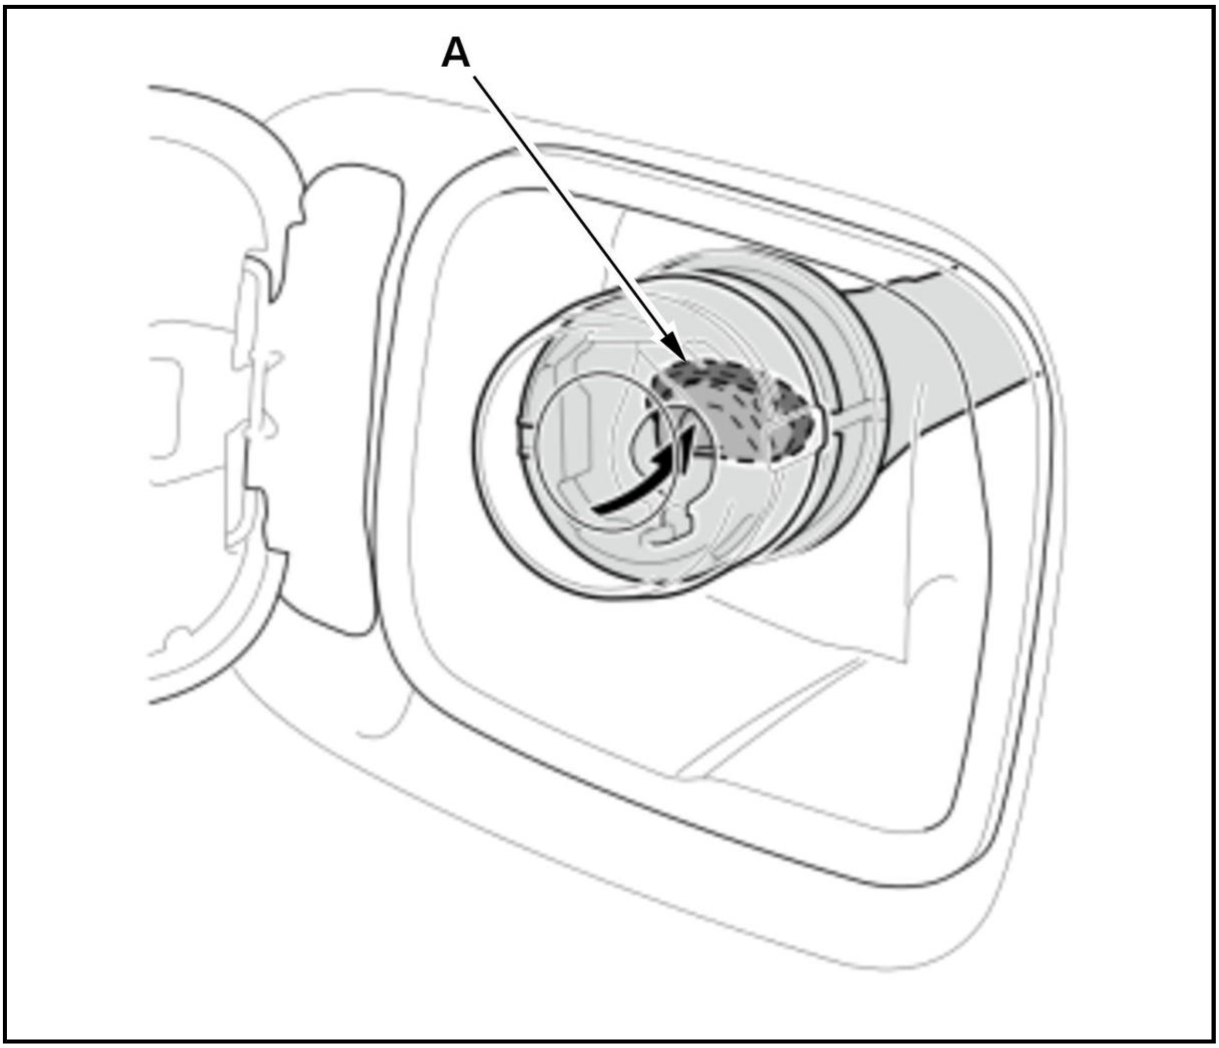
Go to step 10.

NO

Replace the main flap unit .

10. Shut-off valve seal check

    -1. Check the flap seal of the shut-off valve (A) and the mating surface on the shut-off valve.



Is the flap seal missing or damaged, is the shut-off valve mating surface damaged?

YES

Replace the main flap unit .

NO

The shut-off valve is OK. Check the fuel tank unit base gasket and fuel tank.

DTC P0456 (1.5 L ENGINE)

DTC P0456 : EVAP System Very Small Leak Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTICE:

The fuel system is designed to allow specified maximum vacuum and pressure conditions. Do not deviate from the vacuum and pressure tests as indicated in these procedures. Excessive pressure/vacuum would damage the EVAP components or cause eventual fuel tank failure.

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .

- Fresh fuel has a higher volatility that will create greater pressure/vacuum. The best condition for testing is less than a full tank of fresh fuel. If possible, to assist in leak detection, add 1 gallon of fresh fuel to the tank (as long as it will not fill the tank), just before starting these procedures.

DTC Description	Confirmed DTC	Pending DTC
P0456 EVAP System Very Small Leak Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST (ELCM)

   Is the result OK?

   YES

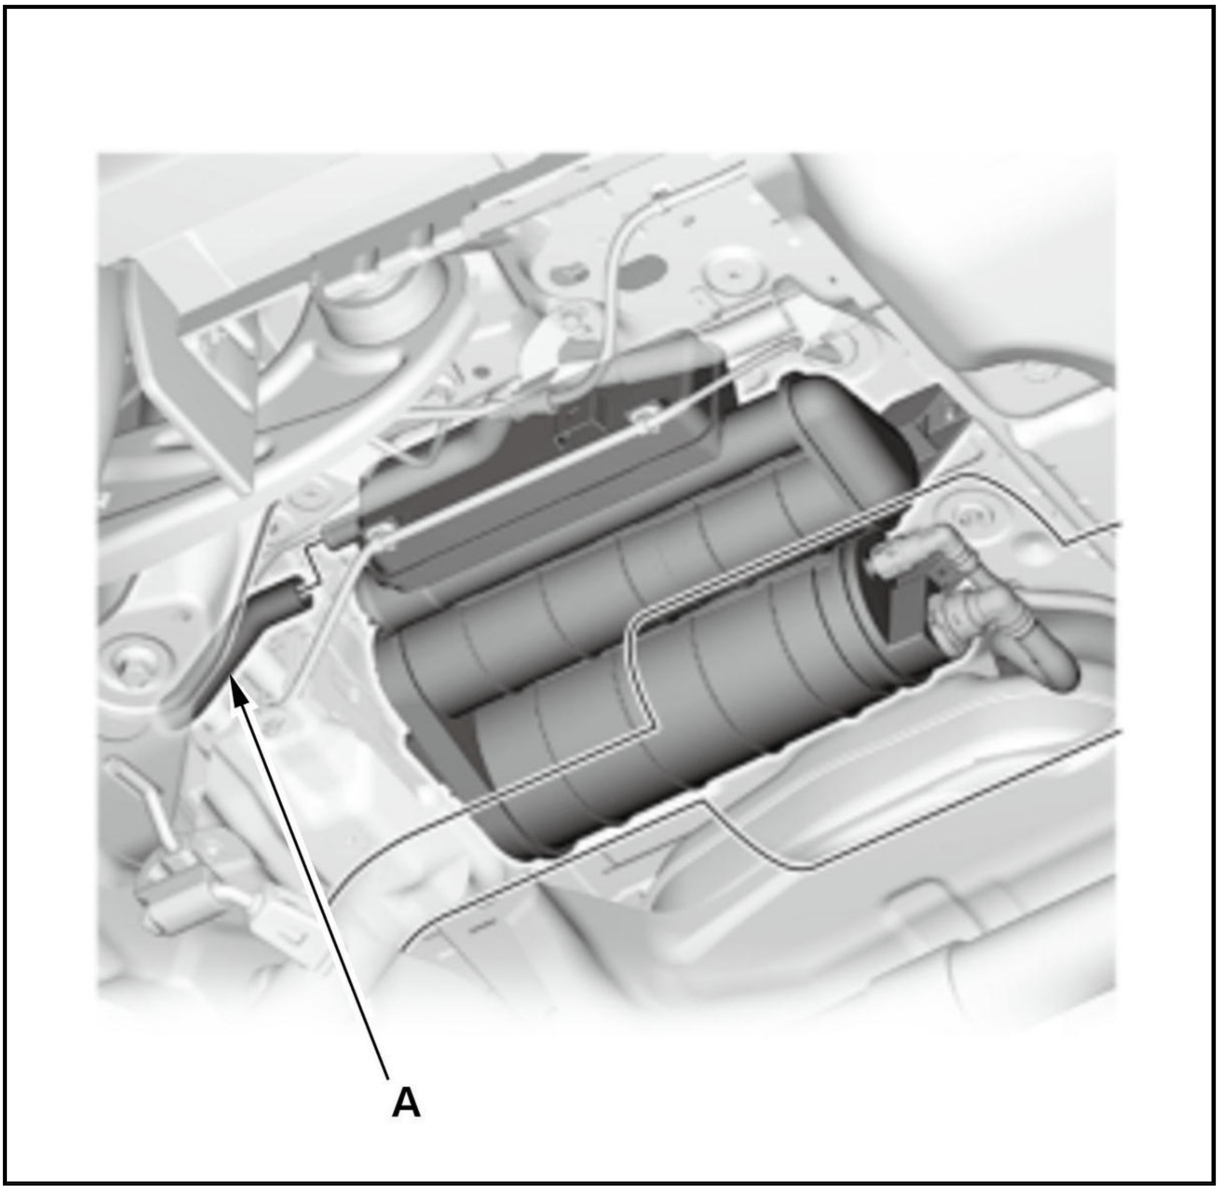
   If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module, the EVAP canister purge valve, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the vehicle returns with the same DTC, continue with step 5.

   NO

   The failure is duplicated. Go to step 2.

2. EVAP canister vent hose check

   -1. Check the EVAP canister drain hose (A) for a blockage or a restriction.



Is there a blockage or a restriction in the hose?

YES

Remove a blockage or a restriction, if needed, replace the EVAP canister drain hose.

NO

Go to step 3.

3. EVAP leak check module drain hose check

-1. **Remove the EVAP canister filter** , then check the blockage in the hoses and the EVAP canister filter.

Are the parts OK?

YES

Go to step 4.

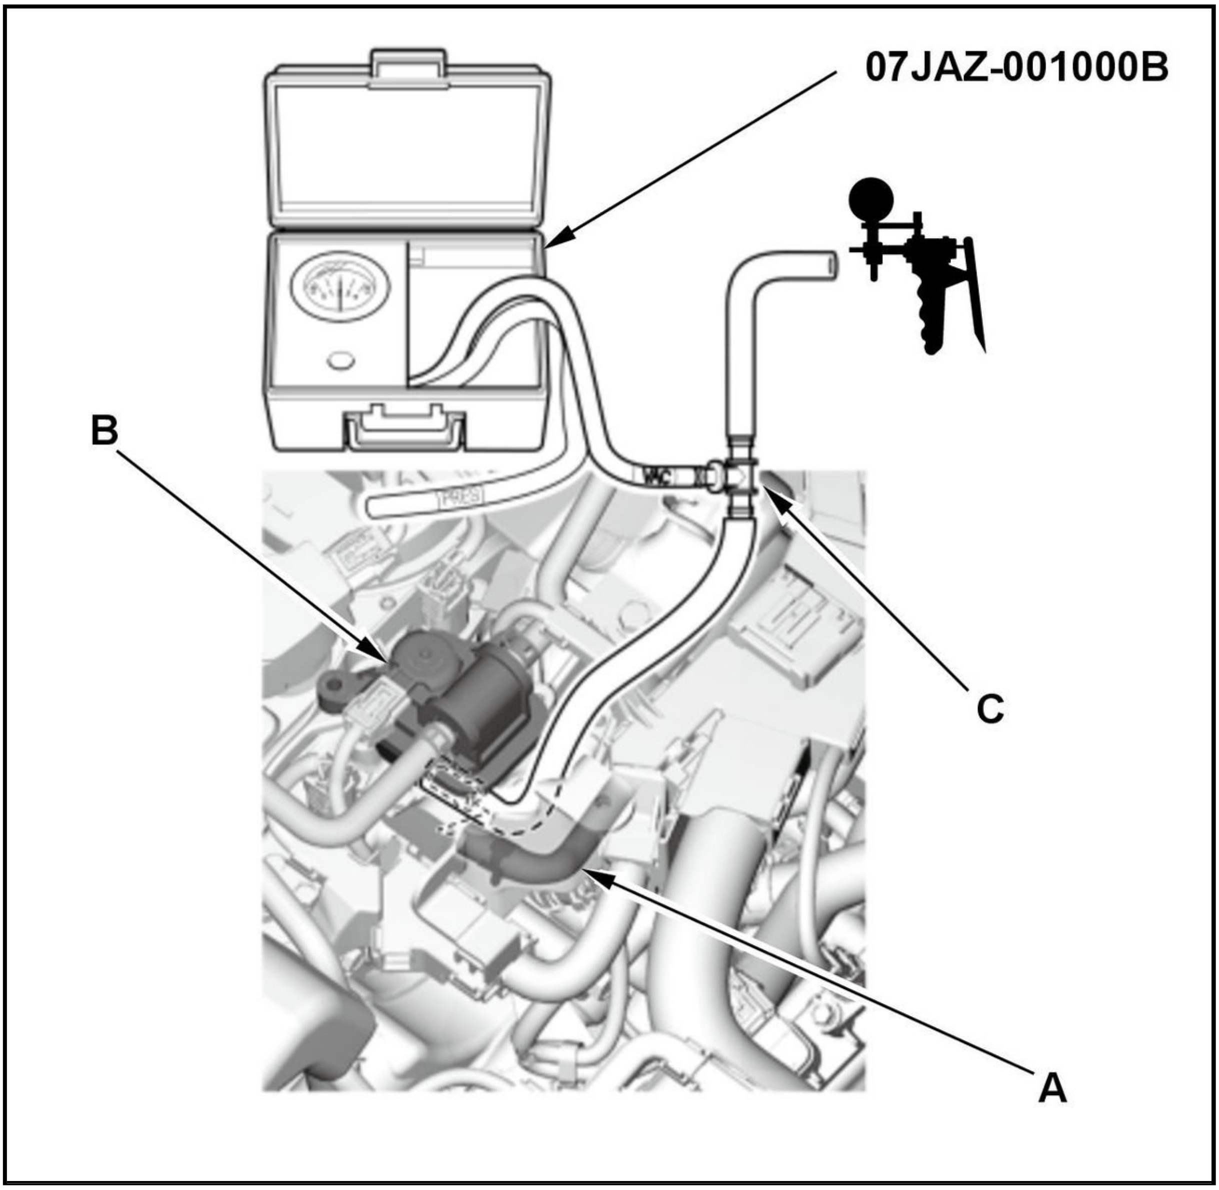
NO

Remove the blockage from them, or replace the part (s) if needed.

4. EVAP canister purge valve leak check

-1. Remove the EVAP canister purge valve with its connector and vacuum hose connected.

-2. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, then connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg as shown.



-3. Slowly apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

Does it hold vacuum for 1 minute?

YES

Leak not detected at the EVAP canister purge valve. Go to step 5.

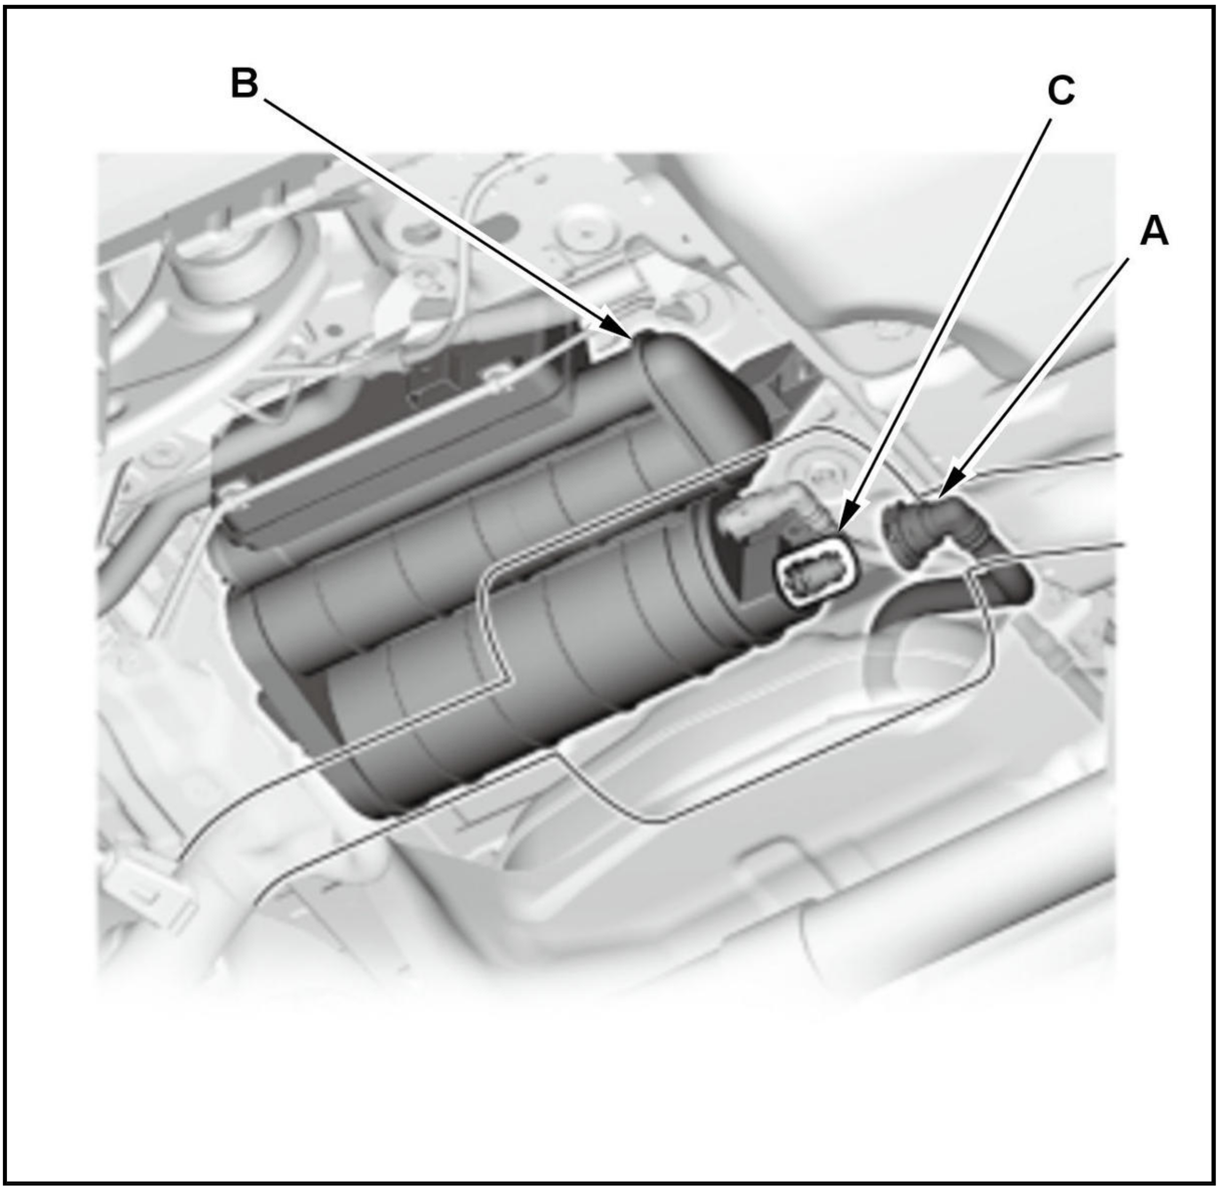
NO

Replace the EVAP canister purge valve .

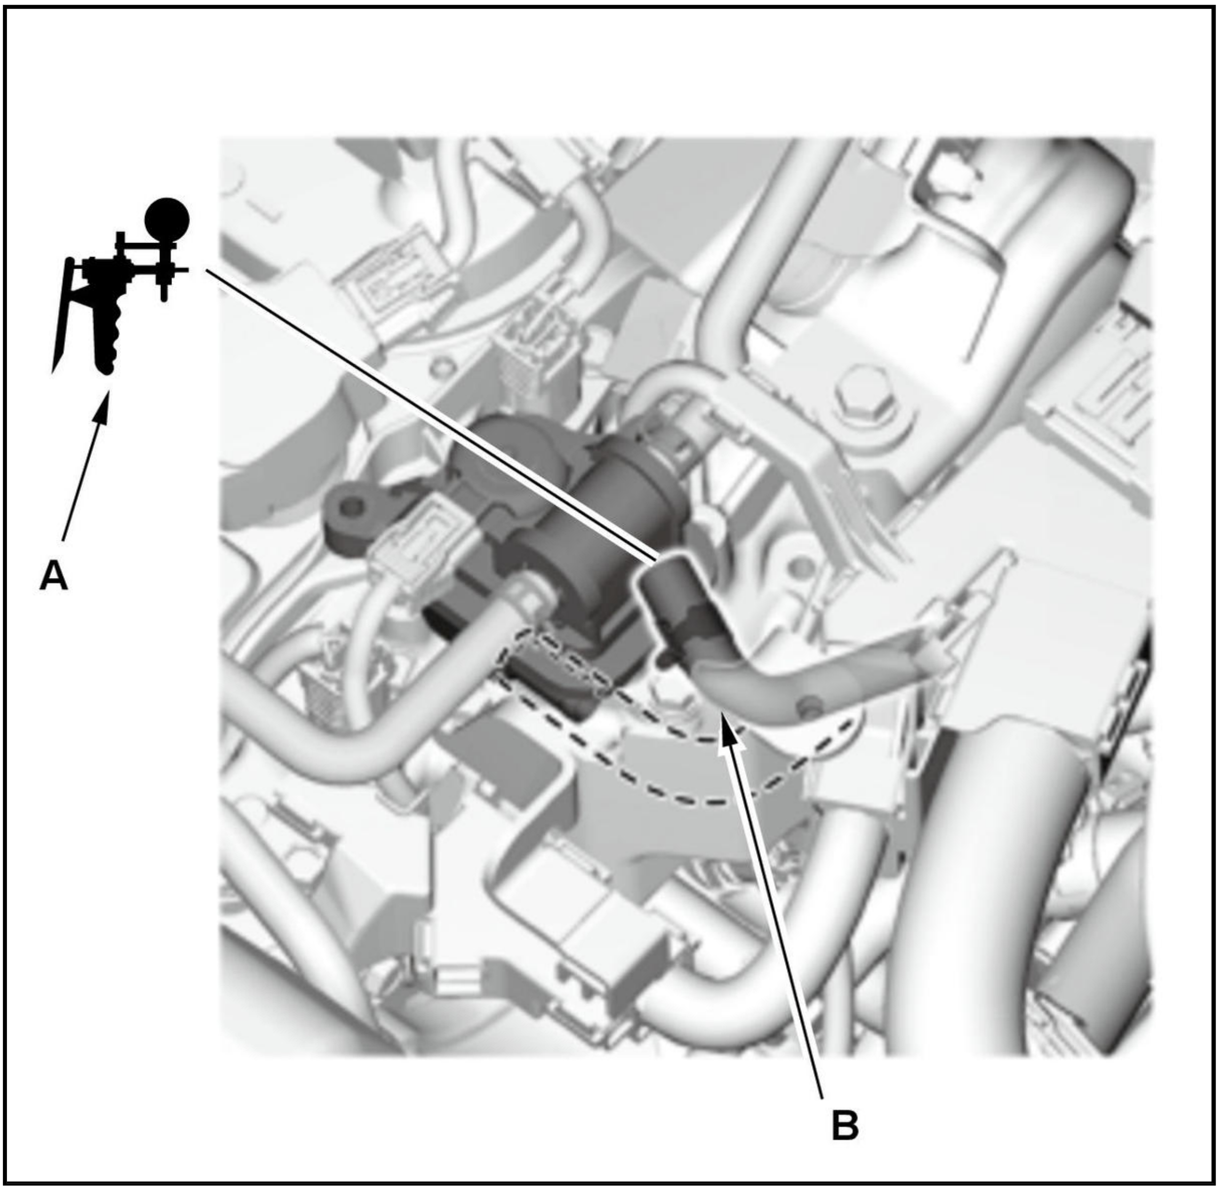
5. Determine possible failure area (EVAP canister, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the fuel vent tube (A) from the EVAP canister (B), and plug the EVAP canister port (C).



-3. Remove the vacuum gauge and the tube joint adapter, and connect the vacuum pump/gauge (A) to the vacuum hose (purge line) (B) as shown.



-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select CCV ON in the Single Solenoid Test with the HDS.

EVAP TEST (ELCM)

-6. Apply vacuum to the hose until the Absolute Pressure of ELCM Pressure Sensor 2 kPa (0.6 inHg, 15 mmHg).

NOTE: Be careful not to exceed the vacuum. If you do, the EVAP leak check module can be damaged.

Signal	Current conditions	
	Values	**Unit**
Absolute Pressure of ELCM Pressure Sensor	B	B

-7. Check the parameter (s) below with the HDS for 1 minute.

Signal	Current conditions	
	Values	**Unit**
Absolute Pressure of ELCM Pressure Sensor	B	B

Does it hold a vacuum?

YES

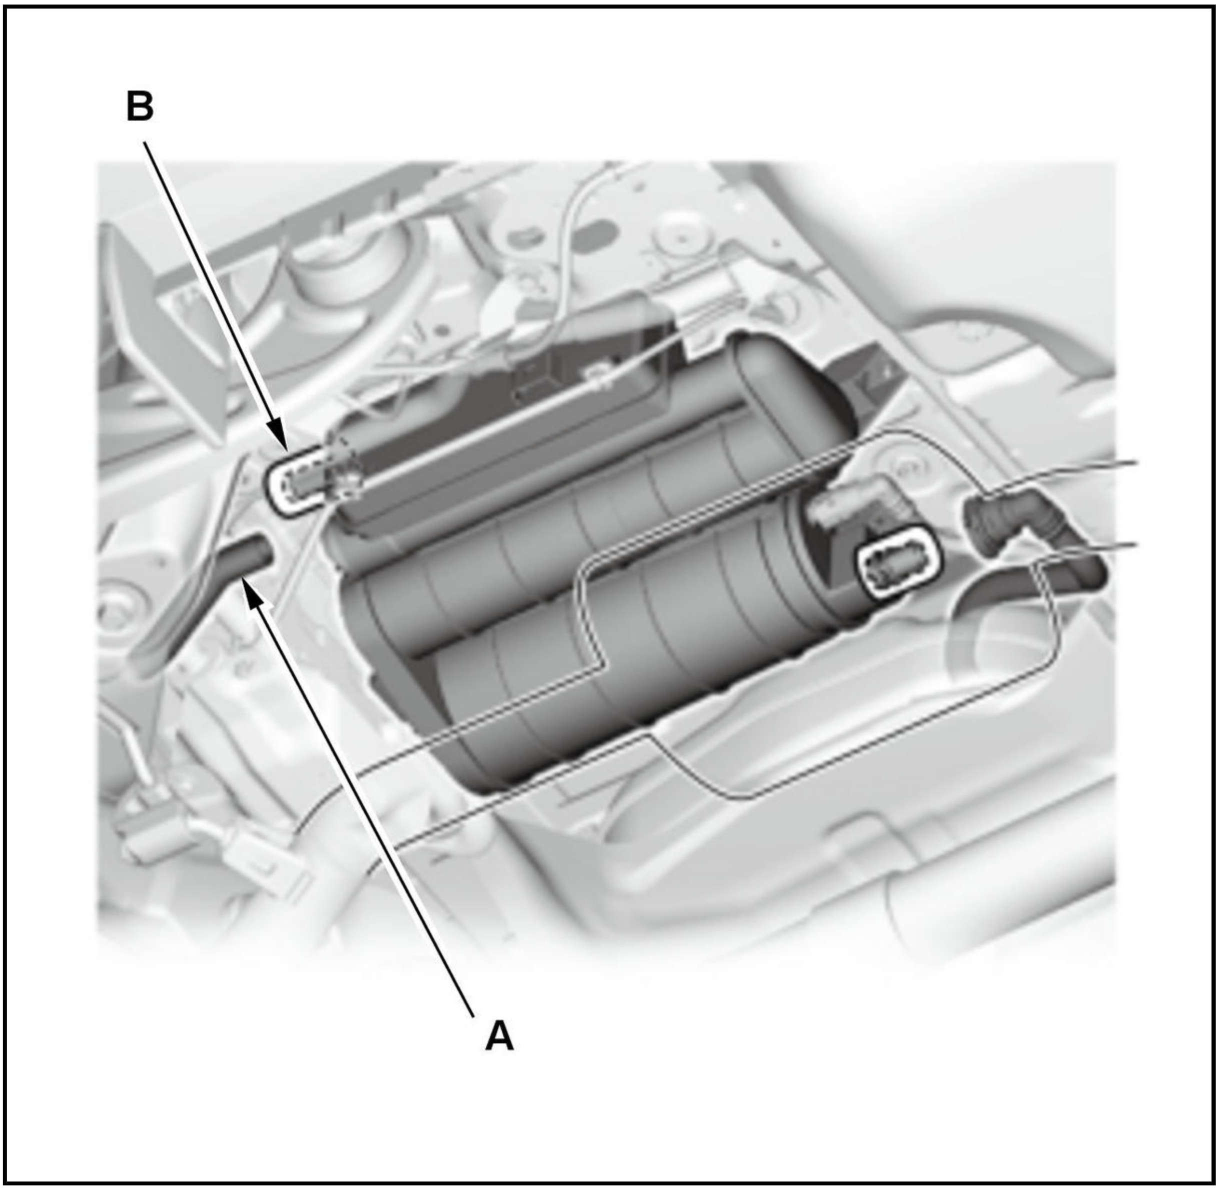
Go to step 7.

NO

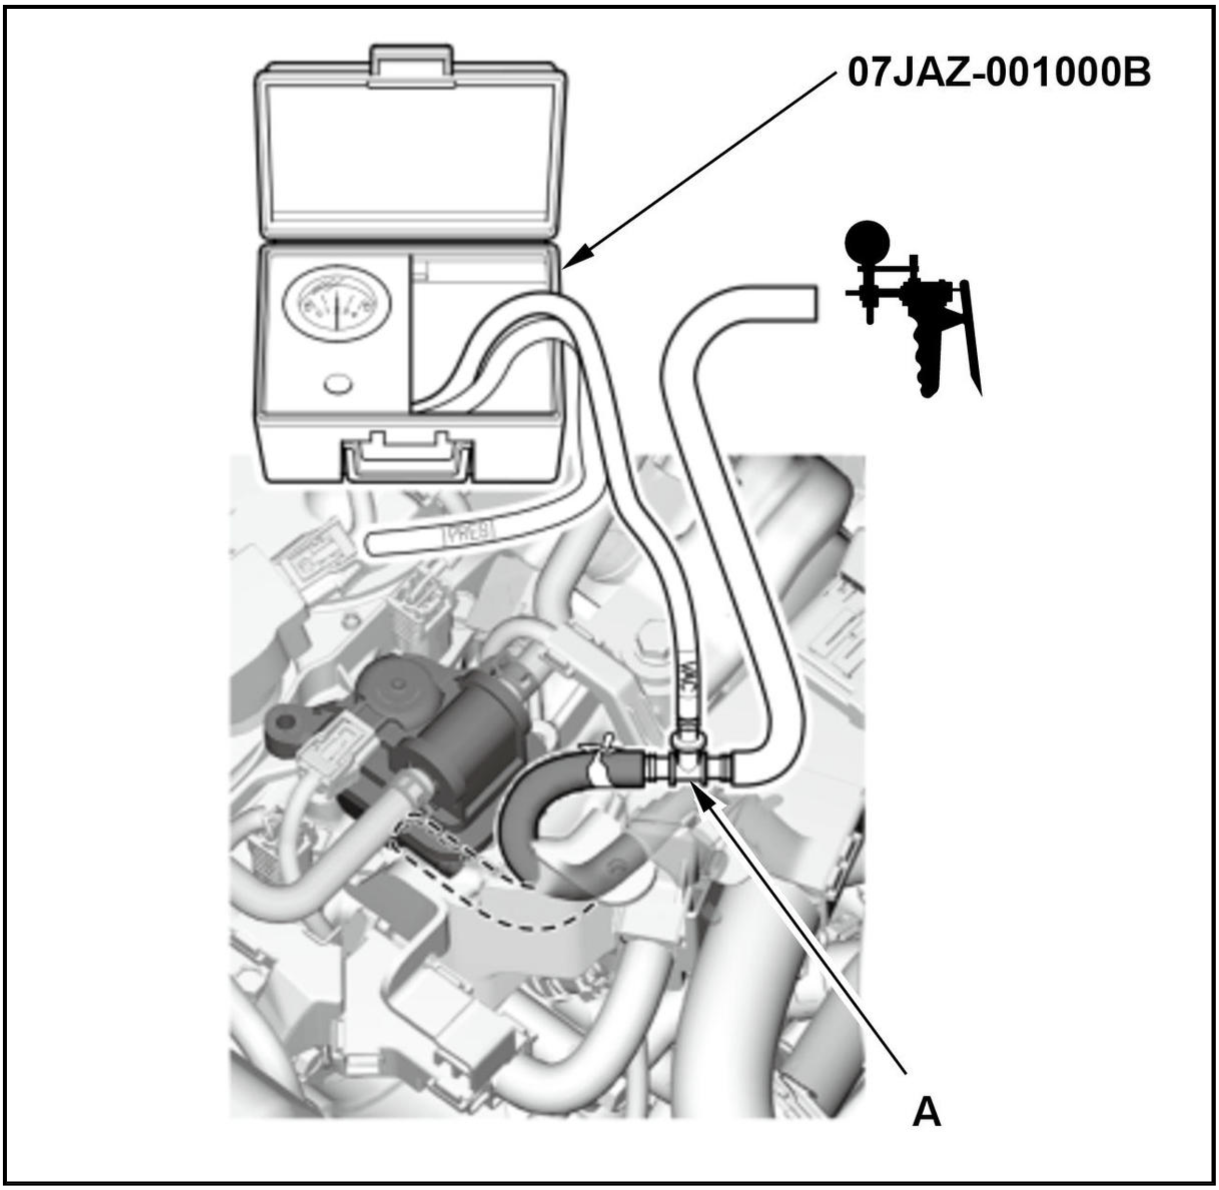
Go to step 6.

6. EVAP canister check

-1. Disconnect the EVAP canister drain hose (A) from the EVAP leak check module port (B), and plug it.



-2. Connect the T-fitting (A), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg as shown.



-3. Slow apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

Does the hose hold vacuum?

YES

The EVAP canister is OK. **Replace the EVAP leak check module** .

NO

Check for a poor connection or damage to the EVAP purge line between the EVAP canister purge valve and the EVAP canister, then **replace the EVAP canister** .

7. Fuel fill pipe and fuel tank vapor recirculation tube visual check

-1. Check for a poor connection or damage to the fuel fill pipe and the fuel tank vapor recirculation tube.

Are the parts and connections OK?

YES

The fuel fill pipe and fuel tank vapor recirculation tube are OK. Go to step 8.

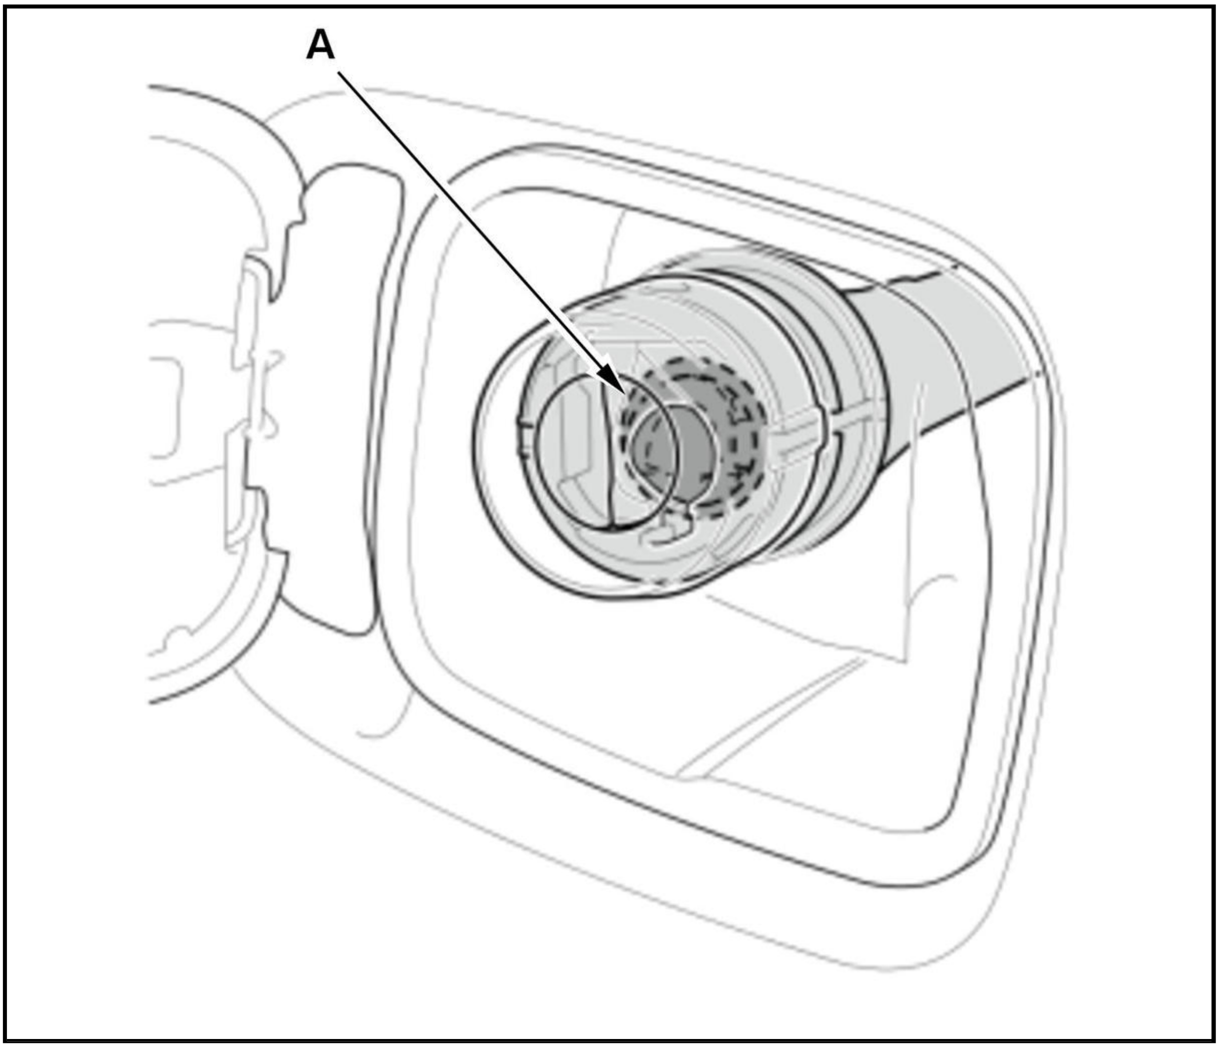
NO

Replace the fuel tank .

8. Shut-off valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the flap of the shut-off valve (A).



Is the flap closed?

YES

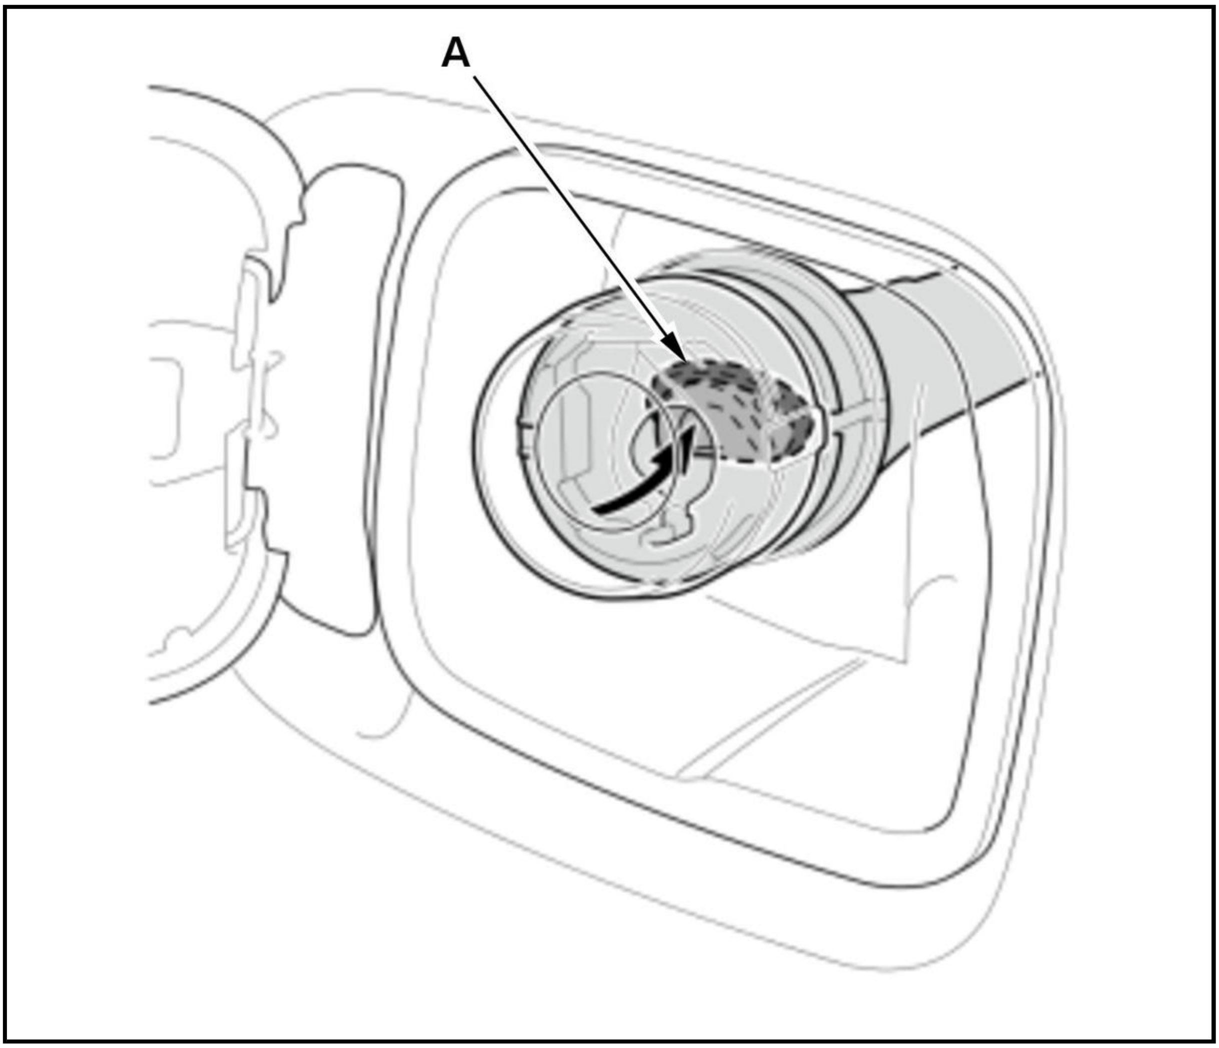
Go to step 9.

NO

Replace the main flap unit .

9. Shut-off valve seal check

   -1. Check the flap seal of the shut-off valve (A) and the mating surface on the shut-off valve.



Is the flap seal missing or damaged, is the shut-off valve mating surface damaged?

YES

Replace the main flap unit .

NO

The shut-off valve is OK. Check the fuel tank unit base gasket and fuel tank.

DTC P0460 (1.5 L ENGINE) (2020 2021)

DTC P0460 : Fuel Level Sensor (Fuel Gauge Sending Unit) Out of Range

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0462 and/or P0463 are stored at the same time as DTC P0460, troubleshoot those DTCs first, then recheck for DTC P0460.

DTC Description	Confirmed DTC	Pending DTC
P0460 Fuel Level Sensor (Fuel Gauge Sending Unit) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Wait 30 seconds.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0460 Fuel Level Sensor (Fuel Gauge Sending Unit) Out of Range	B	B

Is DTC P0460 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel tank unit. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (FUEL GAUGE+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

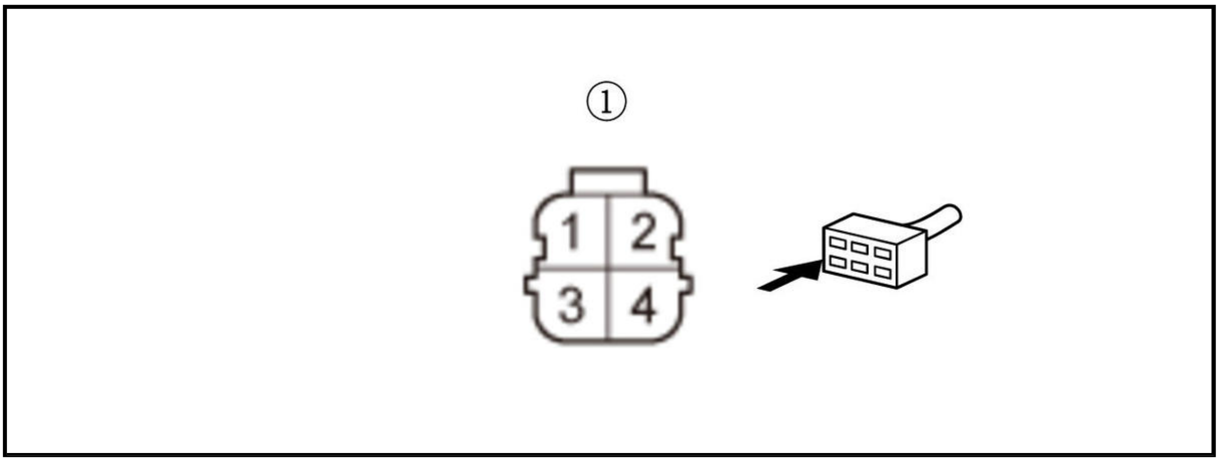
-2. **Remove the gauge control module** .

-3. Disconnect the following connectors.

Fuel tank unit 4P connector
Gauge control module connector A (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Fuel tank unit 4P connector: disconnected
	Gauge control module connector A (32P): disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 3.

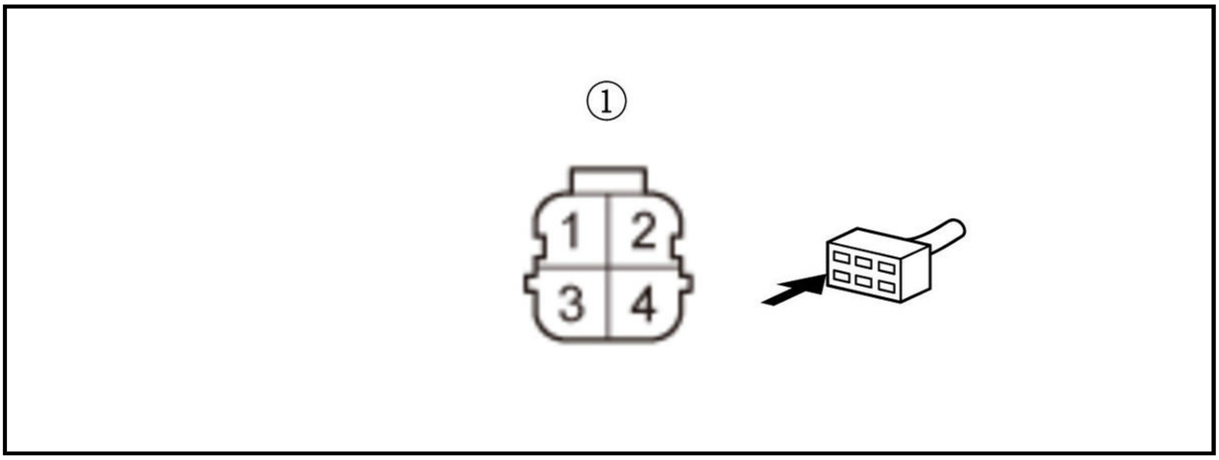
NO

Repair a short in the FUEL GAUGE+ wire between the gauge control module and the fuel tank unit.

3. Open wire check (FUEL GAUGE+ line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 2: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel tank unit 4P connector: disconnected
B	Gauge control module connector A (32P): disconnected
B	Fuel tank unit 4P connector No. 2: jumped to body ground
Test point 1	Gauge control module connector A (32P) No. 22
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 4.

NO

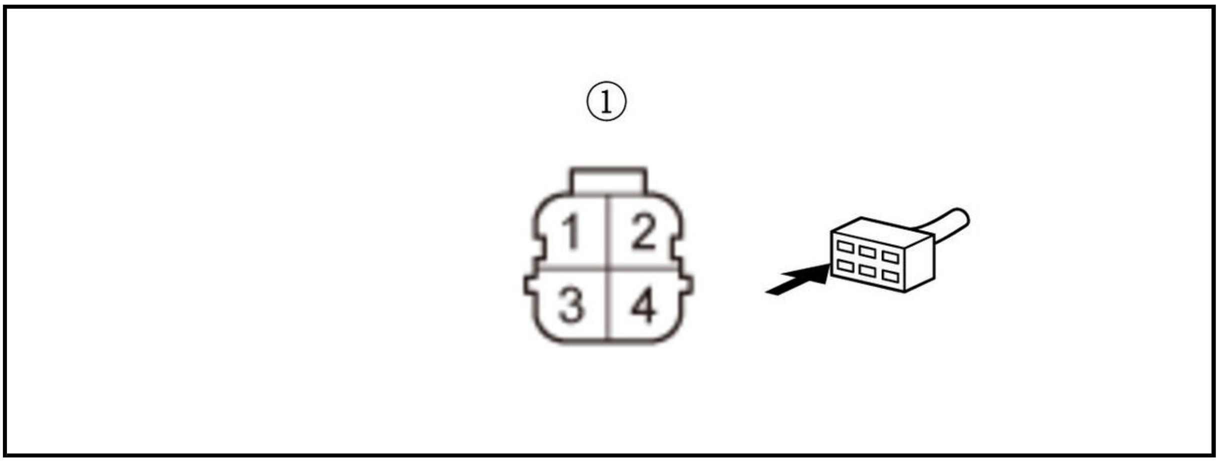
Repair an open in the FUEL GAUGE+ wire between the gauge control module and the fuel tank unit.

4. Open wire check (FUEL GAUGE- line)

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 4: ①
Terminal B	Body ground



-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel tank unit 4P connector: disconnected
B	Gauge control module connector A (32P): disconnected
B	Fuel tank unit 4P connector No. 4: jumped to body ground
Test point 1	**Gauge control module connector A (32P) No. 21**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 5.

NO

Repair an open in the FUEL GAUGE- wire between the gauge control module and the fuel tank unit.

5. Fuel gauge sending unit check

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC P0461 (1.5 L ENGINE) (2017 2018 2019 2020)

DTC P0461 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Because it requires 124 miles (200 km) of driving without refueling to complete this diagnosis, DTC P0461 cannot be duplicated during this troubleshooting.

DTC Description	Confirmed DTC	Pending DTC
P0461 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Fuel gauge sending unit performance check

-1. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Check for poor connections or loose terminals at the fuel gauge sending unit and the gauge control module. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Replace the fuel gauge sending unit .

DTC P0461 (1.5 L ENGINE) (2021)

DTC P0461 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Because it requires 4.7 US gal (17.7L) of fuel consumption without refueling to complete this diagnosis, DTC P0461 cannot be duplicated during this troubleshooting.
- DTC P0461 may be stored due to the following:
-
    - -

      Repeated small amounts of refueling
    - -

      Fuel draining during repairs
    - -

Constant cornering or driving on a sloping road for a certain period of time

DTC Description	Confirmed DTC	Pending DTC
P0461 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Customer usage check

   -1. Ask the customer about their refueling method.

   Has the vehicle been repeatedly refilled with less than 1.3 US gal (5.0 L) at each refuel?

   YES

   Direct the customer on the proper refilling conditions in the How to Refuel section of the owner's manual.

   NO

   Go to step 2.

2. Fuel gauge sending unit performance check

   -1. **Test the fuel gauge sending unit** .

   Is the fuel gauge sending unit OK?

   YES

   Check for poor connections or loose terminals at the fuel gauge sending unit and the gauge control module. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   Replace the fuel gauge sending unit .

DTC P0461 (2.4 L ENGINE) (2017 2018 2019)

DTC P0461 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Because it requires 124 miles (200 km) of driving without refueling to complete this diagnosis, DTC P0461 cannot be duplicated during this troubleshooting.

DTC Description	Confirmed DTC	Pending DTC
P0461 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Fuel gauge sending unit performance check

   -1. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Check for poor connections or loose terminals at the fuel gauge sending unit and the gauge control module. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Replace the fuel gauge sending unit .

DTC P0462 (1.5 L ENGINE)

DTC P0462 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0462 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Wait 5 seconds.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0462 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage	B	B

   Is DTC P0462 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel tank unit. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (FUEL GAUGE+ line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the gauge control module** .

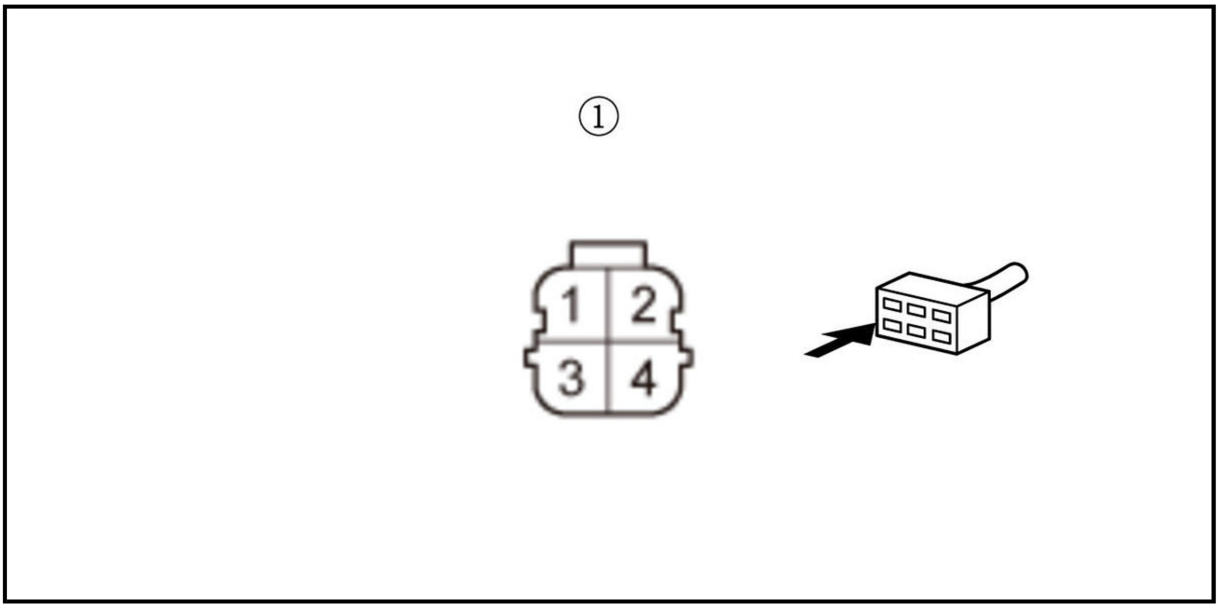
   -3. Disconnect the following connectors.

Fuel tank unit 4P connector

Gauge control module connector A (32P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Fuel tank unit 4P connector: disconnected
	Gauge control module connector A (32P): disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the FUEL GAUGE+ wire between the gauge control module and the fuel tank unit.

NO

Go to step 3.

3. Fuel gauge sending unit check

-1. Test the fuel gauge sending unit .

Is the fuel gauge sending unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC P0462 (2.4 L ENGINE) (2017 2018 2019)

DTC P0462 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0462 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Wait 5 seconds.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0462 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage	B	B

   Is DTC P0462 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel tank unit. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (FUEL GAUGE+ line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

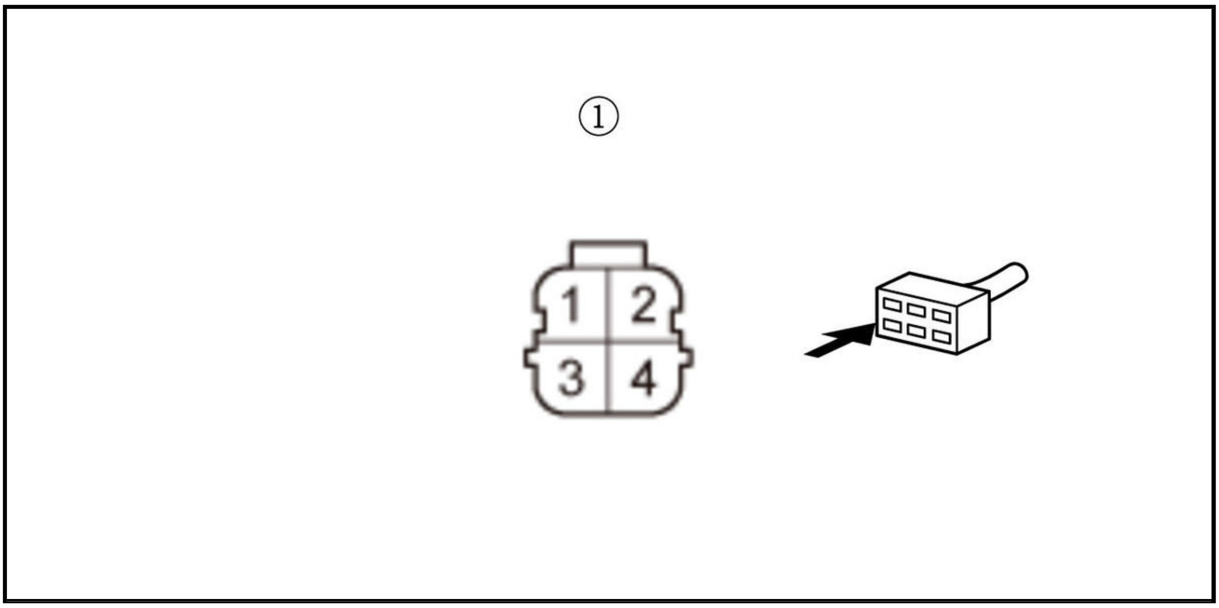
   -2. **Remove the gauge control module** .

   -3. Disconnect the following connectors.

Fuel tank unit 4P connector
Gauge control module connector A (32P)

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Fuel tank unit 4P connector: disconnected
	Gauge control module connector A (32P): disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the FUEL GAUGE+ wire between the gauge control module and the fuel tank unit.

NO

Go to step 3.

3. Fuel gauge sending unit check

-1. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC P0463 (1.5 L ENGINE)

DTC P0463 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0463 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Wait 5 seconds.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0463 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage	B	B

Is DTC P0463 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel tank unit. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (FUEL GAUGE- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

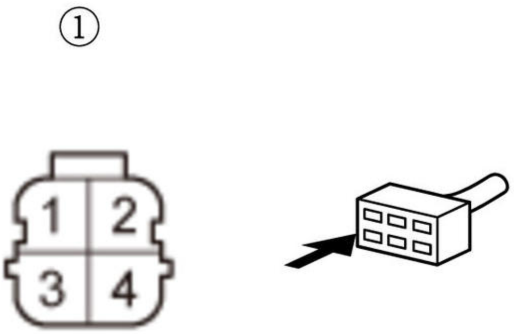
-2. **Remove the gauge control module** .

-3. Disconnect the following connectors.

Fuel tank unit 4P connector
Gauge control module connector A (32P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Fuel tank unit 4P connector: disconnected

	Fuel tank unit 4P connector No. 4: jumped to body ground
	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 21**
Test point 2	Body ground

Is there continuity?

YES

Go to step 3.

NO

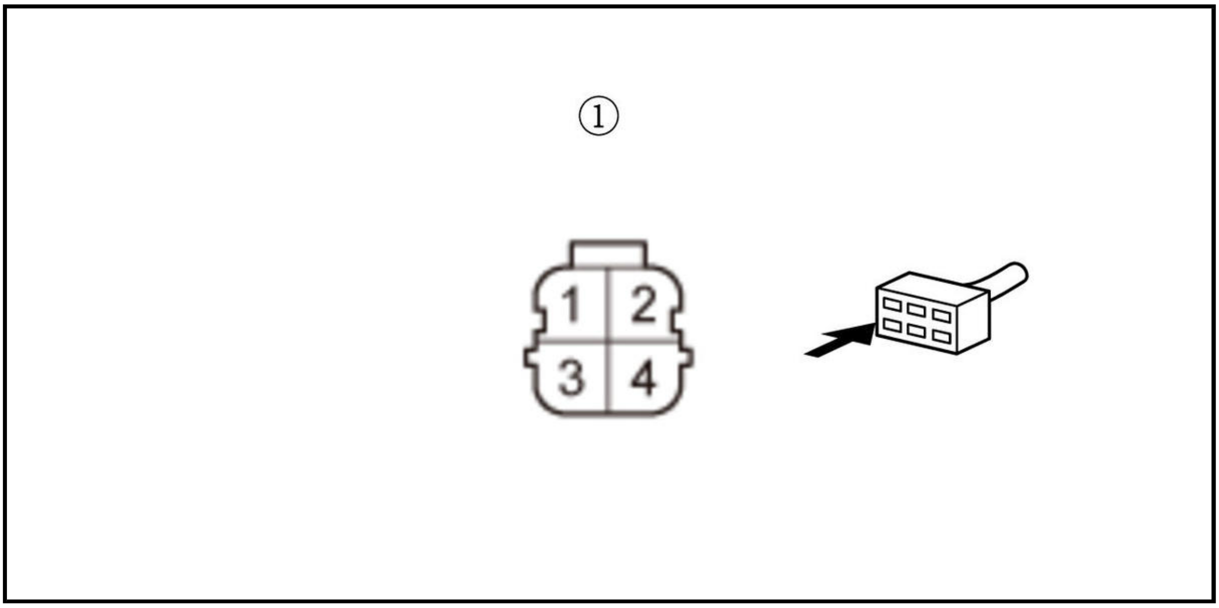
Repair an open in the FUEL GAUGE- wire between the gauge control module and the fuel tank unit.

3. Open wire check (FUEL GAUGE+ line)

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 2: ①
Terminal B	Body ground



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Fuel tank unit 4P connector: disconnected
	Fuel tank unit 4P connector No. 2: jumped to body ground
	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 22**
Test point 2	Body ground

Is there continuity?

YES

Go to step 4.

NO

Repair an open in the FUEL GAUGE+ wire between the gauge control module and the fuel tank unit.

4. Fuel gauge sending unit check

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC P0463 (2.4 L ENGINE) (2017 2018 2019)

DTC P0463 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0463 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Wait 5 seconds.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0463 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage	B	B

Is DTC P0463 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel tank unit. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (FUEL GAUGE- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

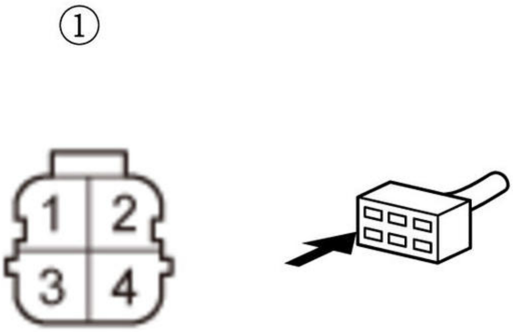
-2. **Remove the gauge control module** .

-3. Disconnect the following connectors.

Fuel tank unit 4P connector
Gauge control module connector A (32P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Fuel tank unit 4P connector: disconnected
	Fuel tank unit 4P connector No. 4: jumped to body ground
	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 21**
Test point 2	Body ground

Is there continuity?

YES

Go to step 3.

NO

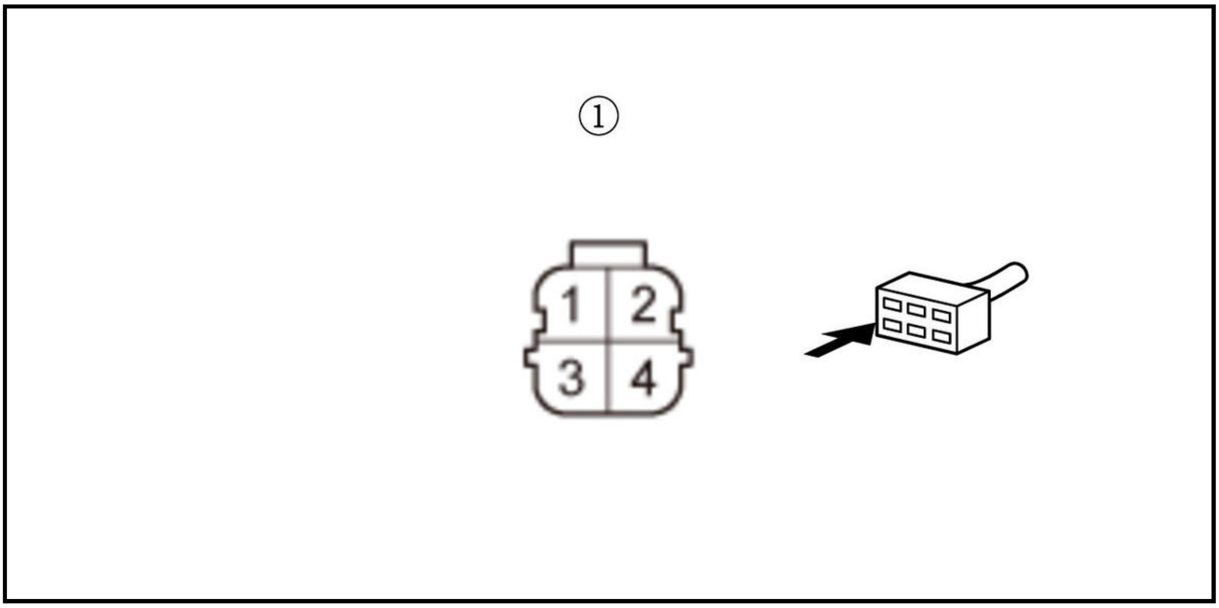
Repair an open in the FUEL GAUGE- wire between the gauge control module and the fuel tank unit.

3. Open wire check (FUEL GAUGE+ line)

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 2: ①
Terminal B	Body ground



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Fuel tank unit 4P connector: disconnected Fuel tank unit 4P connector No. 2: jumped to body ground Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 22**
Test point 2	Body ground

Is there continuity?

YES

Go to step 4.

NO

Repair an open in the FUEL GAUGE+ wire between the gauge control module and the fuel tank unit.

4. Fuel gauge sending unit check

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC P0498 (2.4 L ENGINE) (2017 2018)

DTC P0498 : EVAP Canister Vent Shut Valve Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle without load (in P or N) for at least 5 seconds.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

   Is DTC P0498 indicated?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification

   -1. Select the EVAP TEST in the INSPECTION MENU, and do the EVAP CVS ON in the SINGLE SOLENOID with the HDS.

   EVAP FUNCTION TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

   Is DTC P0498 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Open wire check (DBW RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

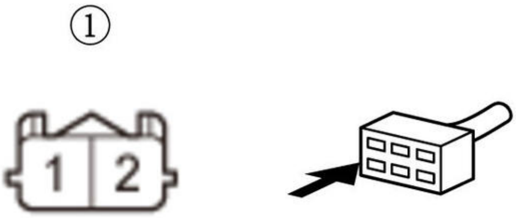
-2. Disconnect the following connector.

EVAP canister vent shut valve 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	EVAP canister vent shut valve 2P connector: disconnected
Test point 1	EVAP canister vent shut valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The DBW RLY OUT wire is OK. Go to step 4.

NO

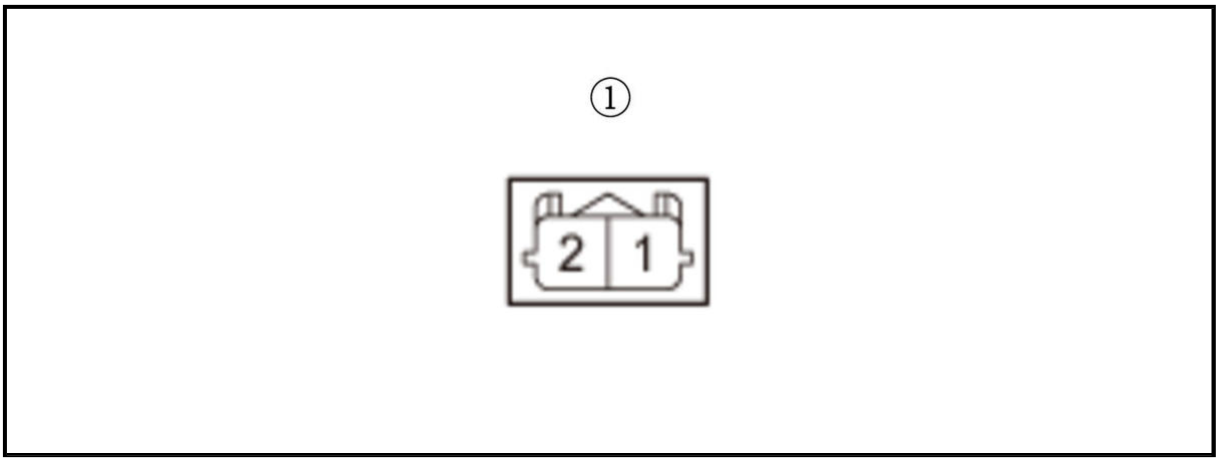
Repair an open in the DBW RLY OUT wire between the EVAP canister vent shut valve and the relay circuit board (PGM-FI subrelay circuit).

4. EVAP canister vent shut valve internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. At the vent shut valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister vent shut valve 2P connector: disconnected
Test point 1	EVAP canister vent shut valve 2P connector (male terminals) No. 1 (EVAP canister vent shut valve side): ①
Test point 2	EVAP canister vent shut valve 2P connector (male terminals) No. 2 (EVAP canister vent shut valve side): ①



Is there about 25-30 Ω at room temperature?

YES

The EVAP canister vent shut valve is OK. Go to step 5.

NO

Replace the EVAP canister vent shut valve .

5. Shorted wire check (VSV line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP canister vent shut valve 2P connector: disconnected
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 17**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the VSV wire between the PCM (A17) and the EVAP canister vent shut valve.

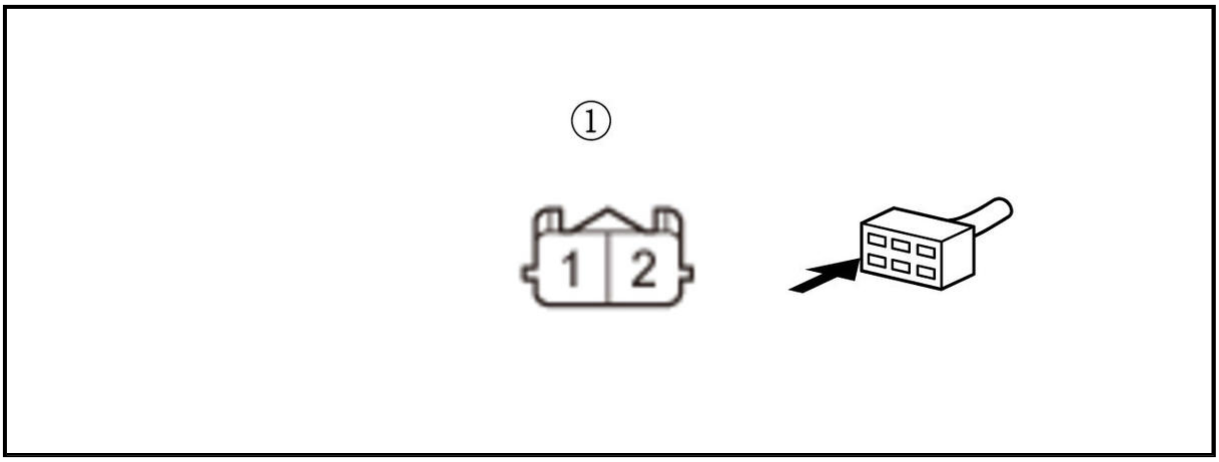
NO

The VSV wire is not shorted. Go to step 6.

6. Open wire check (VSV line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	EVAP canister vent shut valve 2P connector (female terminals) No. 2: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP canister vent shut valve 2P connector: disconnected
	EVAP canister vent shut valve 2P connector No. 2: jumped to body ground
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 17**
Test point 2	Body ground

Is there continuity?

YES

The VSV wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VSV wire between the PCM (A17) and the EVAP canister vent shut valve.

DTC P0498 (2.4 L ENGINE) (2018)

DTC P0498 : EVAP Canister Vent Shut Valve Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine, and let it idle without load (in P or N) for at least 5 seconds.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

Is DTC P0498 indicated?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification

-1. Select the EVAP TEST in the INSPECTION MENU, and do the EVAP CVS ON in the SINGLE SOLENOID with the HDS.

EVAP TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

Is DTC P0498 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Open wire check (DBW RLY OUT/IGPS (LAF) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

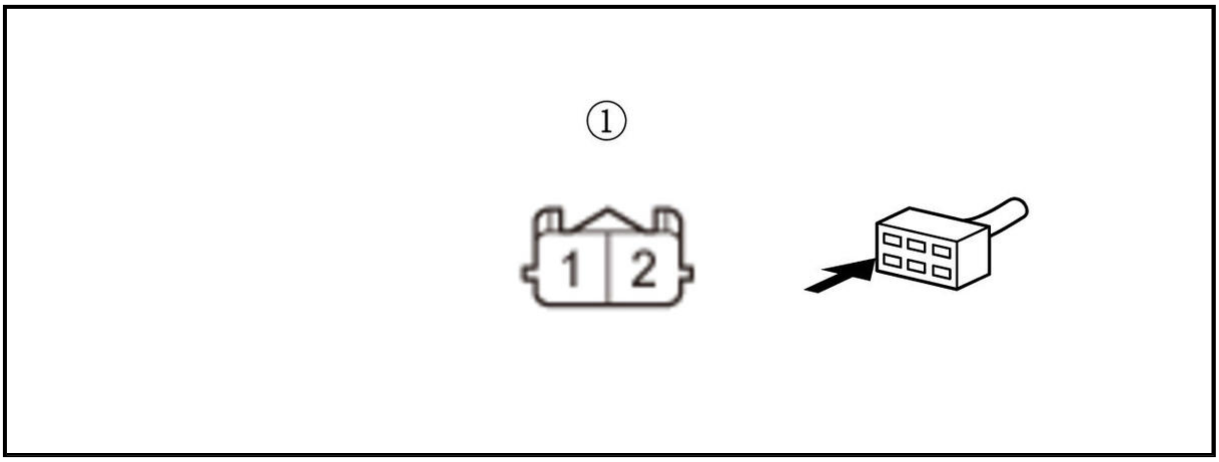
-2. Disconnect the following connector.

EVAP canister vent shut valve 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	EVAP canister vent shut valve 2P connector: disconnected
Test point 1	EVAP canister vent shut valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The DBW RLY OUT/IGPS (LAF) wire is OK. Go to step 4.

NO

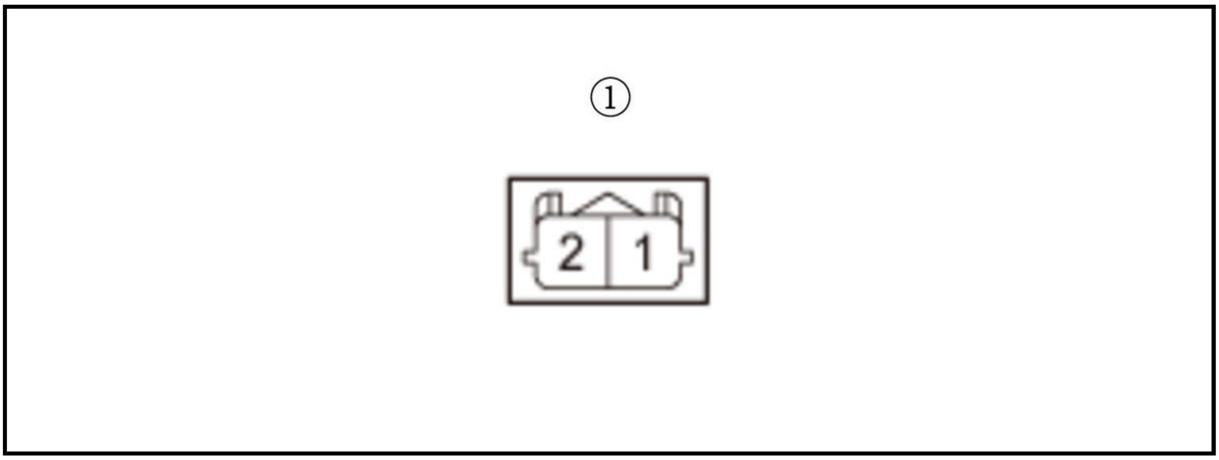
Repair an open in the DBW RLY OUT/IGPS (LAF) wire between the EVAP canister vent shut valve and the No. A11 (7.5 A) fuse . Also replace the No. A11 (7.5 A) fuse.

4. EVAP canister vent shut valve internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. At the vent shut valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister vent shut valve 2P connector: disconnected
Test point 1	EVAP canister vent shut valve 2P connector (male terminals) No. 1 (EVAP canister vent shut valve side): ①
Test point 2	EVAP canister vent shut valve 2P connector (male terminals) No. 2 (EVAP canister vent shut valve side): ①



Is there about 25-30 Ω at room temperature?

YES

The EVAP canister vent shut valve is OK. Go to step 5.

NO

Replace the EVAP canister vent shut valve .

5. Shorted wire check (VSV line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP canister vent shut valve 2P connector: disconnected
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 17**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the VSV wire between the PCM (A17) and the EVAP canister vent shut valve.

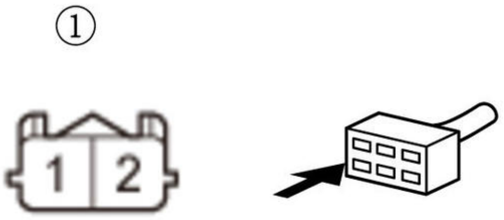
NO

The VSV wire is not shorted. Go to step 6.

6. Open wire check (VSV line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	EVAP canister vent shut valve 2P connector (female terminals) No. 2: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP canister vent shut valve 2P connector: disconnected

	EVAP canister vent shut valve 2P connector No. 2: jumped to body ground
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 17**
Test point 2	Body ground

Is there continuity?

YES

The VSV wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VSV wire between the PCM (A17) and the EVAP canister vent shut valve.

DTC P0498 (2.4 L ENGINE) (2019)

DTC P0498 : EVAP Canister Vent Shut Valve Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle without load (in P or N) for at least 5 seconds.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

   Is DTC P0498 indicated?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification

   -1. Select the EVAP TEST in the INSPECTION MENU, and do the EVAP CVS ON in the SINGLE SOLENOID with the HDS.

   EVAP TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0498 EVAP Canister Vent Shut Valve Circuit Low Voltage	B	B

Is DTC P0498 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Open wire check (IGPS (LAF) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

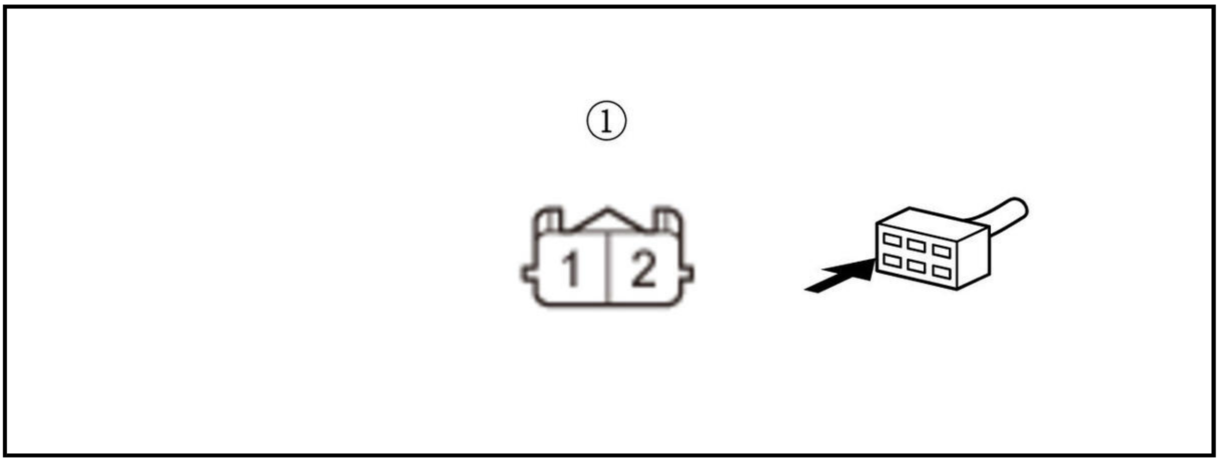
-2. Disconnect the following connector.

EVAP canister vent shut valve 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	EVAP canister vent shut valve 2P connector: disconnected
Test point 1	EVAP canister vent shut valve 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGPS (LAF) wire is OK. Go to step 4.

NO

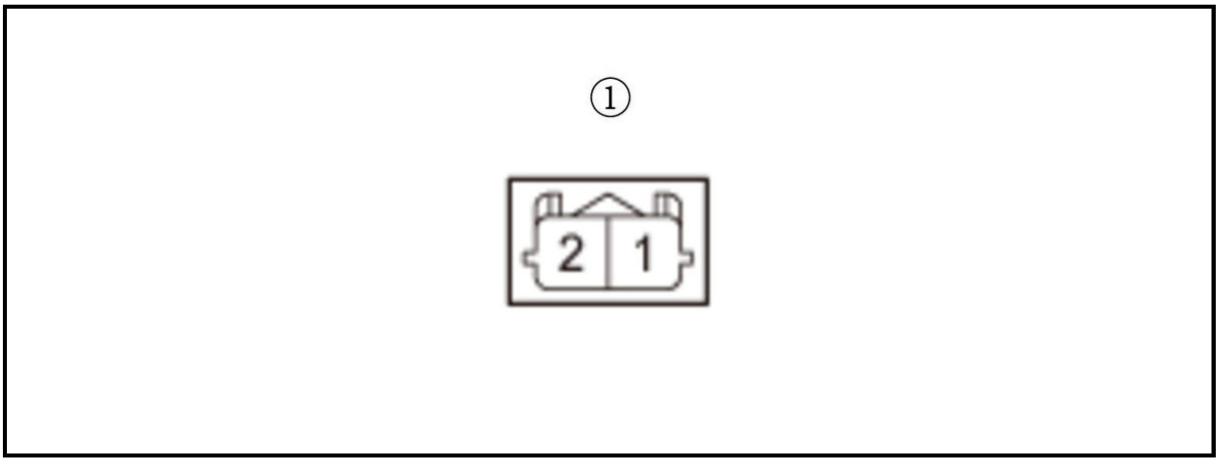
Repair an open in the IGPS (LAF) wire between the EVAP canister vent shut valve and the **No. A11 (7.5 A) fuse** . Also replace the No. A11 (7.5 A) fuse.

4. EVAP canister vent shut valve internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. At the vent shut valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister vent shut valve 2P connector: disconnected
Test point 1	EVAP canister vent shut valve 2P connector (male terminals) No. 1 (EVAP canister vent shut valve side): ①
Test point 2	EVAP canister vent shut valve 2P connector (male terminals) No. 2 (EVAP canister vent shut valve side): ①



Is there about 25-30 Ω at room temperature?

YES

The EVAP canister vent shut valve is OK. Go to step 5.

NO

Replace the EVAP canister vent shut valve .

5. Shorted wire check (VSV line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP canister vent shut valve 2P connector: disconnected
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 17**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the VSV wire between the PCM (A17) and the EVAP canister vent shut valve.

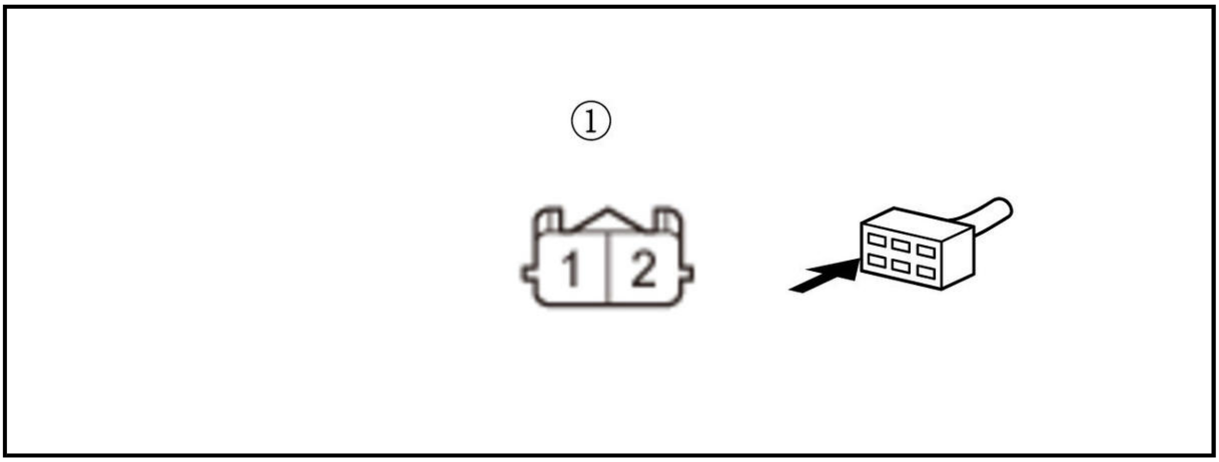
NO

The VSV wire is not shorted. Go to step 6.

6. Open wire check (VSV line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	EVAP canister vent shut valve 2P connector (female terminals) No. 2: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP canister vent shut valve 2P connector: disconnected
	EVAP canister vent shut valve 2P connector No. 2: jumped to body ground
	PCM connector A (51P): disconnected
Test point 1	PCM connector A (51P) No. 17
Test point 2	Body ground

Is there continuity?

YES

The VSV wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the VSV wire between the PCM (A17) and the EVAP canister vent shut valve.

DTC P0499 (2.4 L ENGINE) (2017 2018 2019)

DTC P0499 : EVAP Canister Vent Shut Valve Circuit High Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0499 EVAP Canister Vent Shut Valve Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST in the INSPECTION MENU, and do the EVAP CVS ON in the SINGLE SOLENOID with the HDS.

   EVAP FUNCTION TEST

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0499 EVAP Canister Vent Shut Valve Circuit High Voltage	B	B

   Is DTC P0499 indicated?

   YES

   The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P04DF (1.5 L ENGINE)

DTC P04DF : EVAP System High Purge Flow Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P04DF EVAP System High Purge Flow Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

   NOTE: If the test could not be completed because of another DTC, do the troubleshooting for that DTC.

EVAP TEST (ELCM)

Is the result OK?

YES

If the test result is PASSED, intermittent failure, the system is OK at this time. Check the EVAP canister purge valve for debris that may cause it to stick open intermittently. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

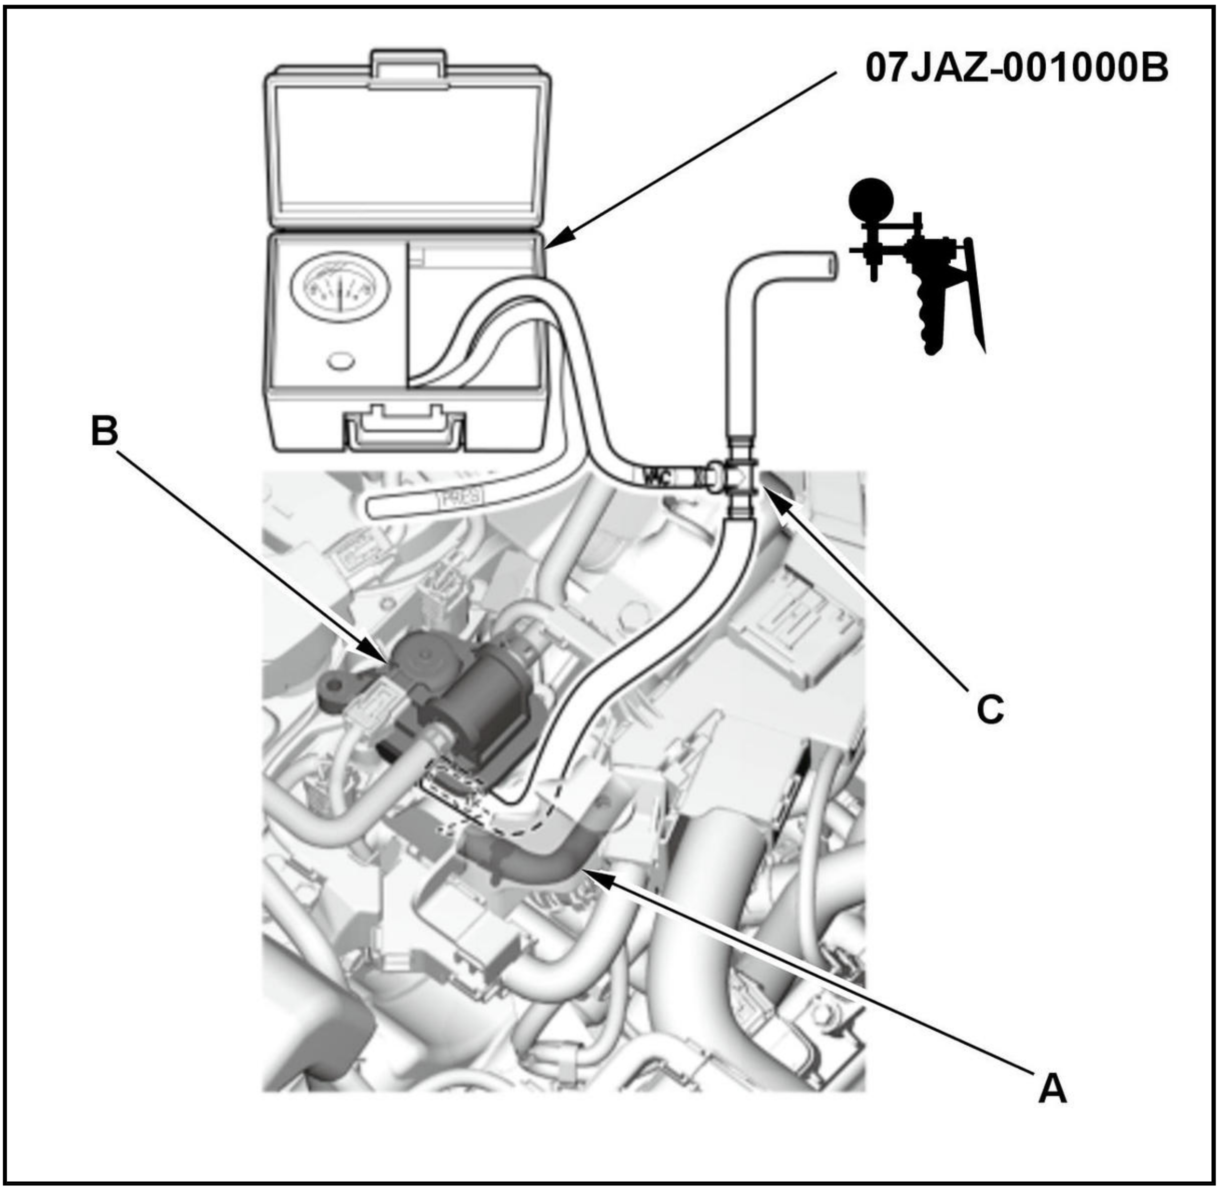
NO

The failure is duplicated. Go to step 2.

2. EVAP canister purge valve open stuck check

-1. **Remove the EVAP canister purge valve** with its connector and vacuum hose connected.

-2. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, then connect a T-fitting (C), a vacuum gauge, and a vacuum pump/gauge, 0-30 inHg, to the vacuum hose as shown.



-3. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the EVAP canister purge valve.

Does it hold vacuum?

YES

Go to step 3.

NO

Replace the EVAP canister purge valve .

3. Non-return valve check

   -1. **Inspect the non-return valve** .

   Is the valve OK?

   YES

   Replace the EVAP leak check module .

   NO

   Replace the EVAP canister purge valve .

DTC P04DF (2.4 L ENGINE) (2017 2018 2019)

DTC P04DF : EVAP System High Purge Flow Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P04DF EVAP System High Purge Flow Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST in the INSPECTION MENU, then select the FUNCTION TEST with the HDS.

   NOTE: If the test could not be completed because of another DTC, do the troubleshooting for that DTC.

   Is the result OK?

   YES

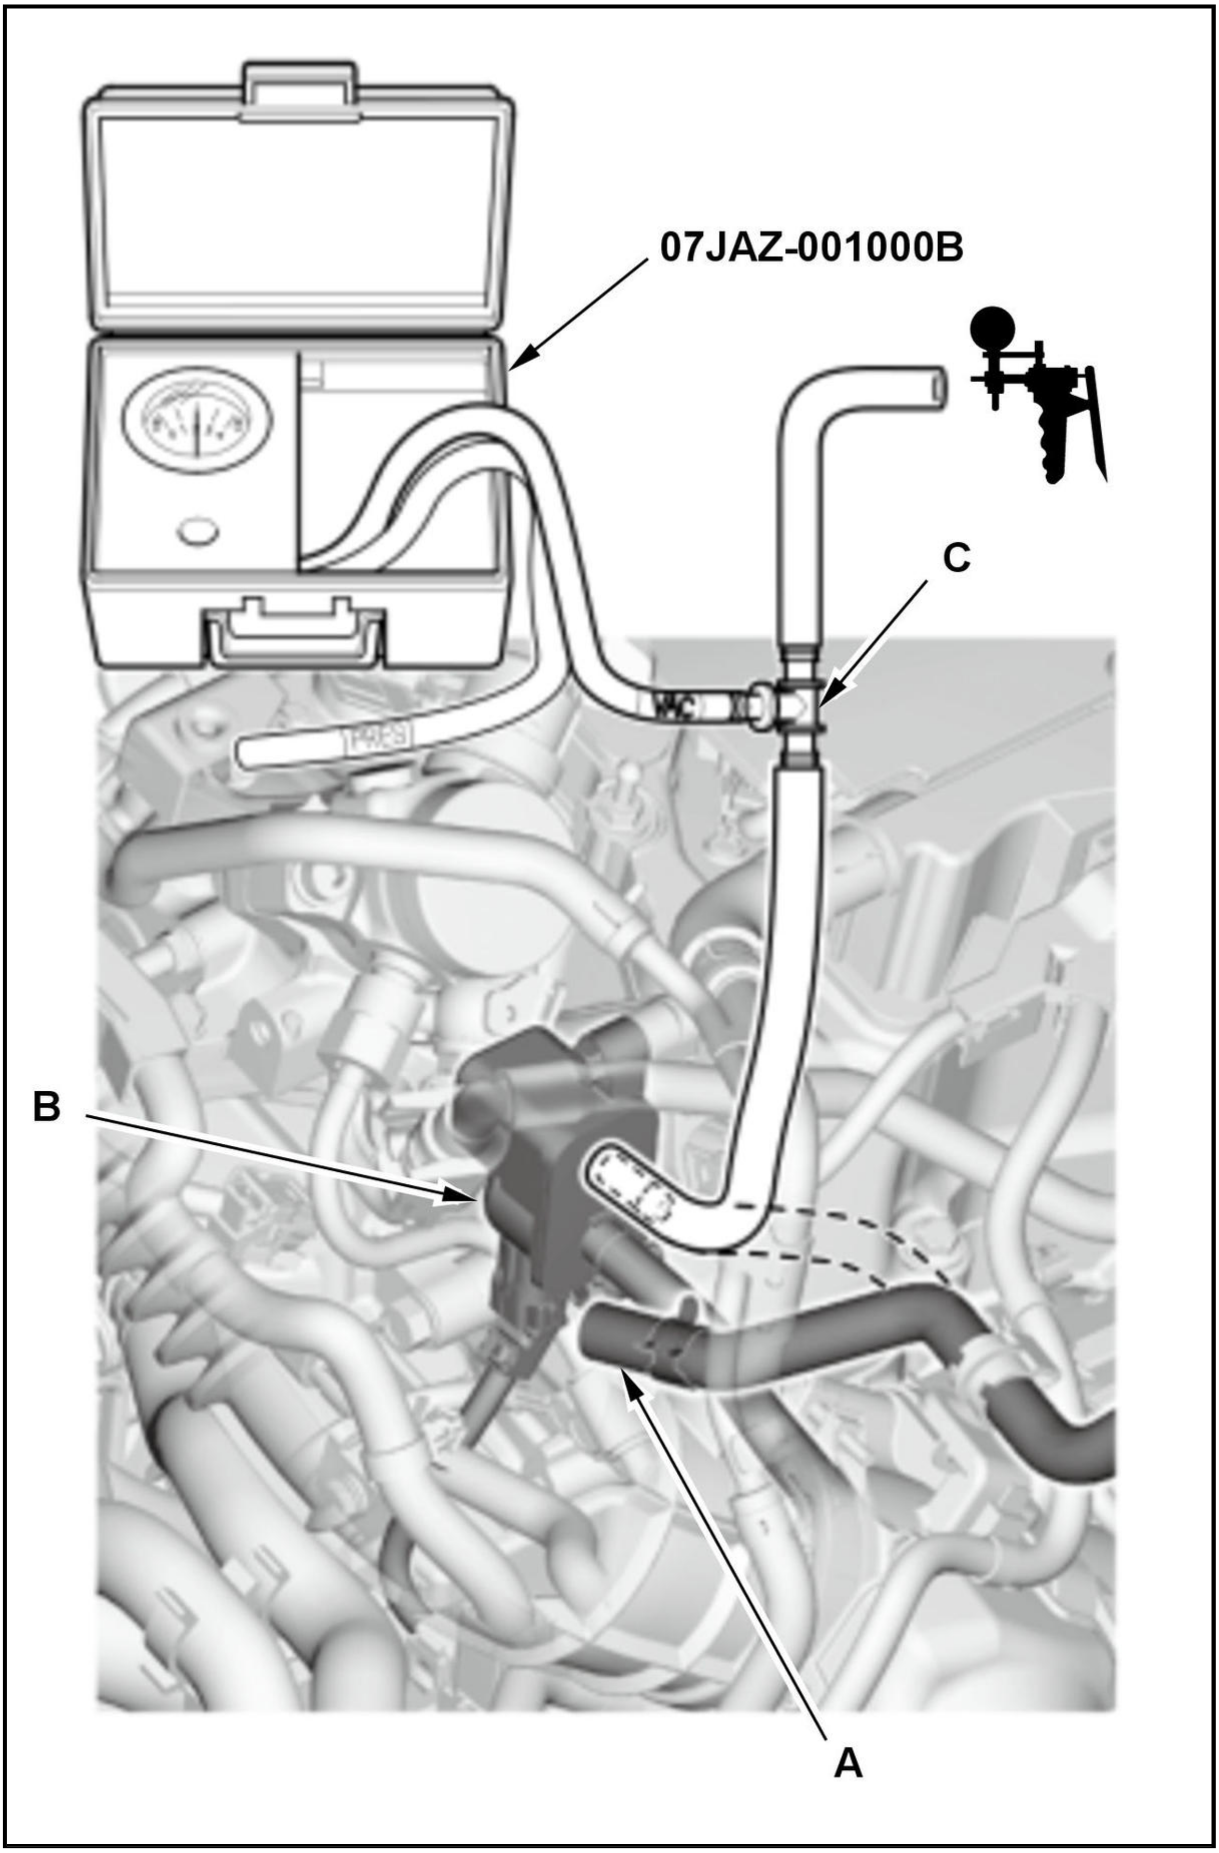
   Intermittent failure, the system is OK at this time. Check the EVAP canister purge valve for debris that may cause it to stick open intermittently. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   The failure is duplicated. Go to step 2.

2. EVAP canister purge valve open stuck check

-1. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, then connect a T-fitting (C), a vacuum gauge, and a vacuum pump/gauge, 0-30 inHg, to the vacuum hose as shown.



-2. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the EVAP canister purge valve.

Does it hold vacuum?

YES

Replace the EVAP canister vent shut valve .

NO

Replace the EVAP canister purge valve .

DTC P04F0 (1.5 L ENGINE)

DTC P04F0 : EVAP System Incorrect Purge Flow Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P04F0 EVAP System Incorrect Purge Flow Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Purge Flow Check Test with the HDS.

   EVAP TEST (ELCM)

   Is DTC P04F0 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module, the EVAP canister purge valve, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Purge tube B visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for poor connection, blockage, or damage at purge tube B between the EVAP canister purge nozzle and the EVAP canister purge valve.

Is the line OK?

YES

Go to step 3.

NO

Reconnect or repair purge tube B.

3. Purge tube D visual check

   -1. Check for poor connection, blockage, or damage at purge tube D between the EVAP canister purge nozzle and intake air duct E.

   Is the hose OK?

   YES

   Go to step 4.

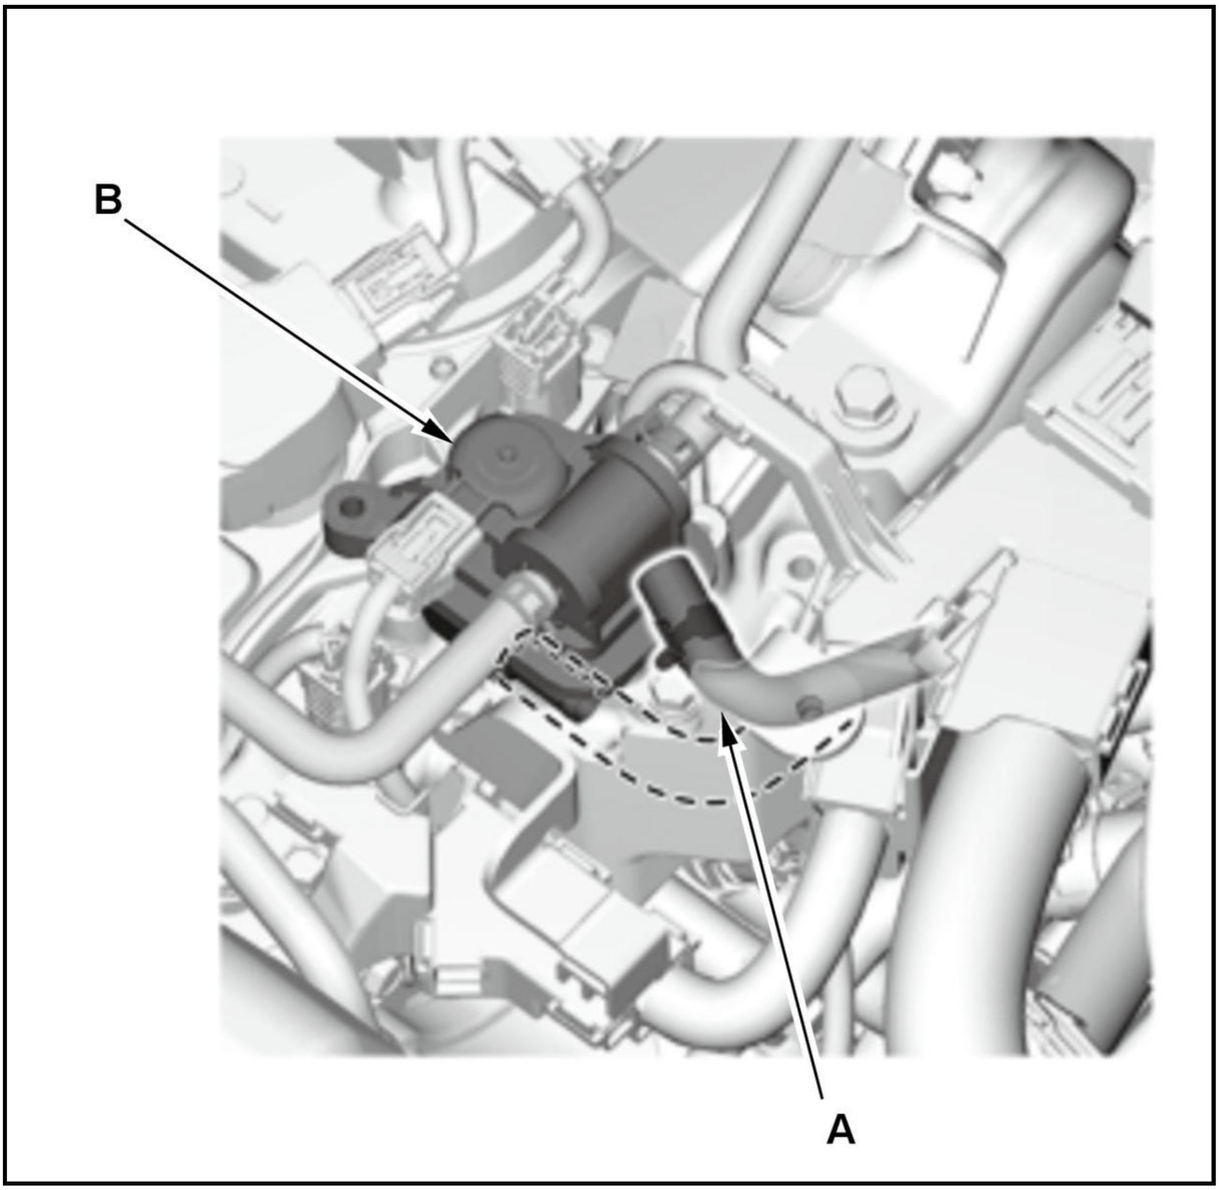
   NO

   Reconnect or replace purge tube D.

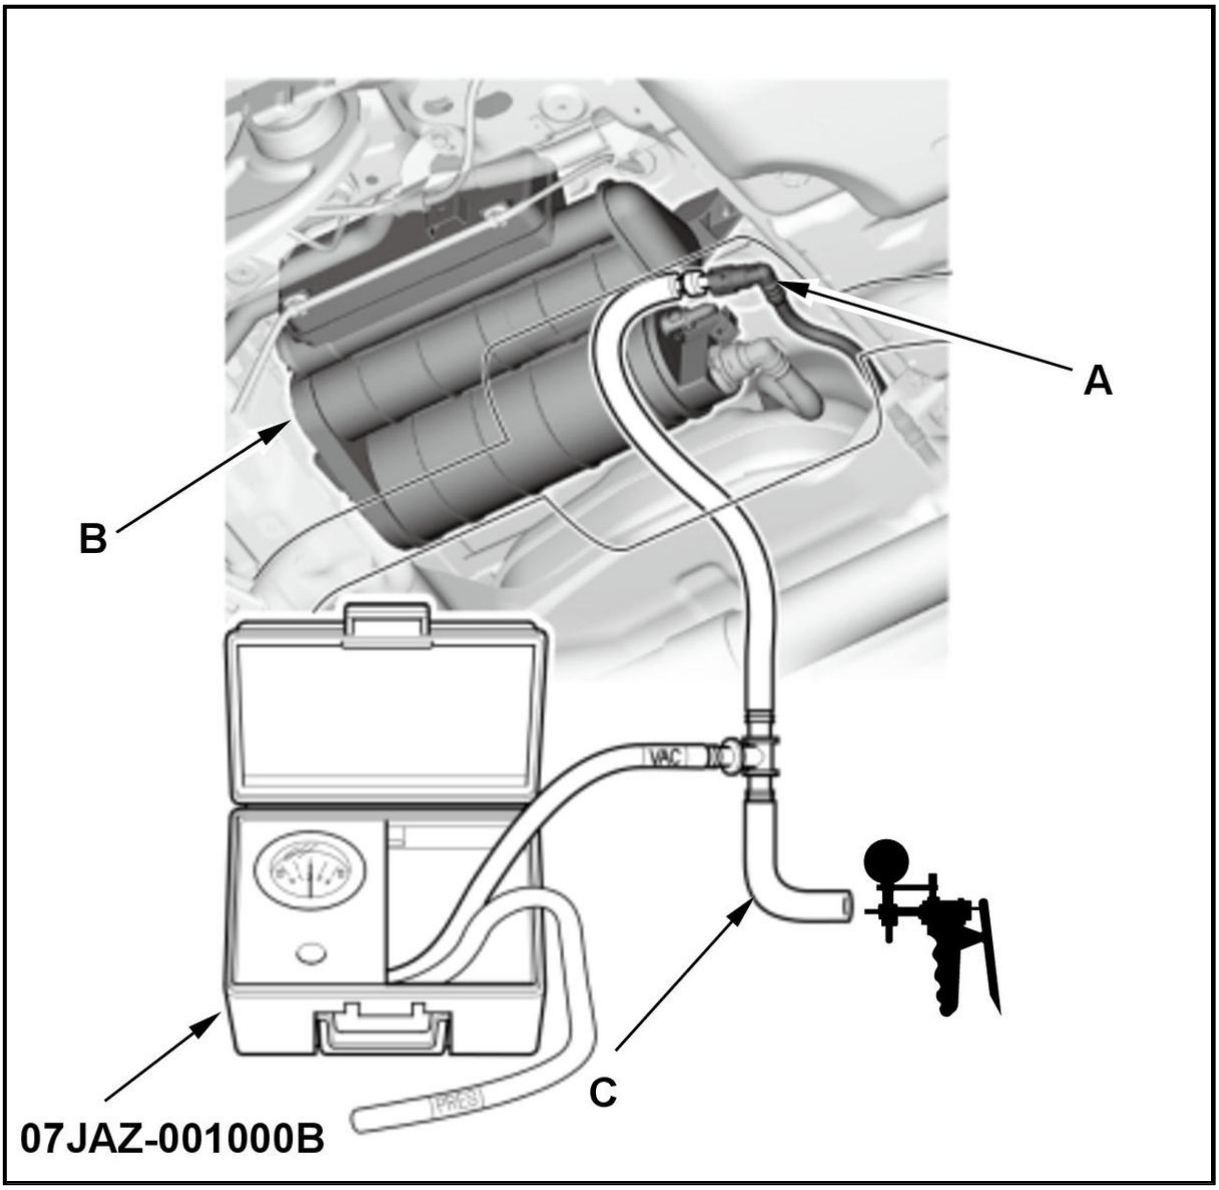
4. Determine possible failure area (EVAP canister purge line, others)

   -1. **Remove the EVAP canister purge valve** with its connector and vacuum hose connected.

   -2. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B).



-3. Disconnect the EVAP canister purge line (A) from the EVAP canister (B). Connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg to the EVAP canister purge line as shown.



-4. Slow apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

Does the hose hold vacuum?

YES

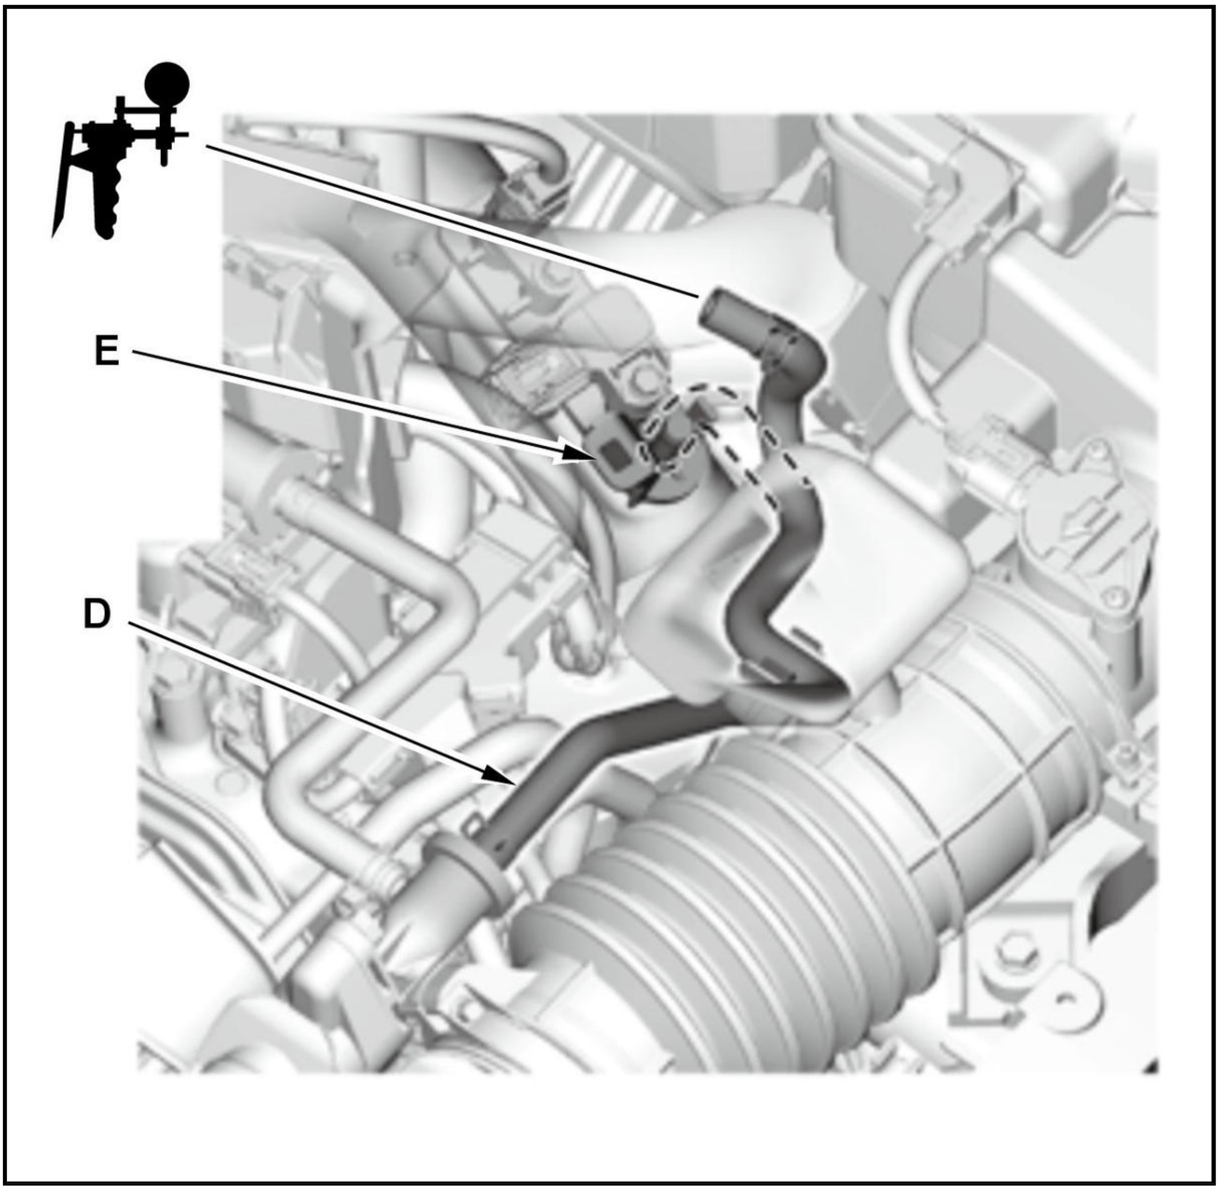
Check for blockage in the EVAP canister purge line between the EVAP canister purge valve and the EVAP canister.

NO

Go to step 5.

5. Purge tube D check

-1. Disconnect purge tube D from intake air duct E, and connect the vacuum pump/gauge, to purge tube D as shown.



-2. Apply vacuum to the hose.

Does it hold vacuum?

YES

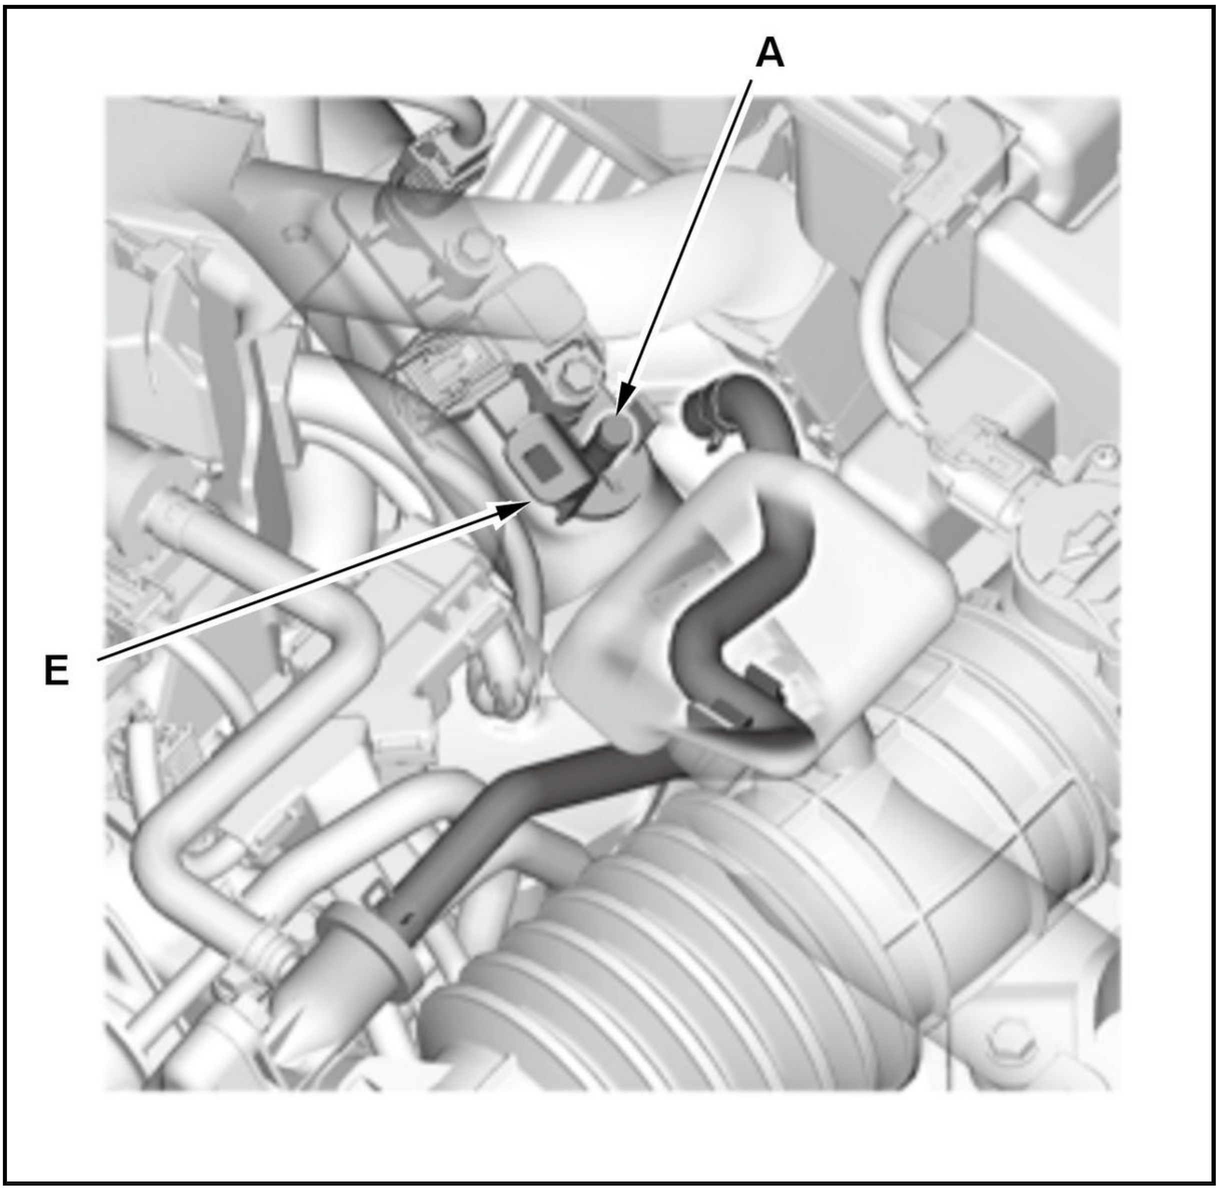
Check for blockage at purge tube D between intake air duct E and the EVAP canister purge nozzle.

NO

Go to step 6.

6. Intake air duct port check

-1. Check for debris or clogging at the port (A) of intake air duct E.



Is the port OK?

YES

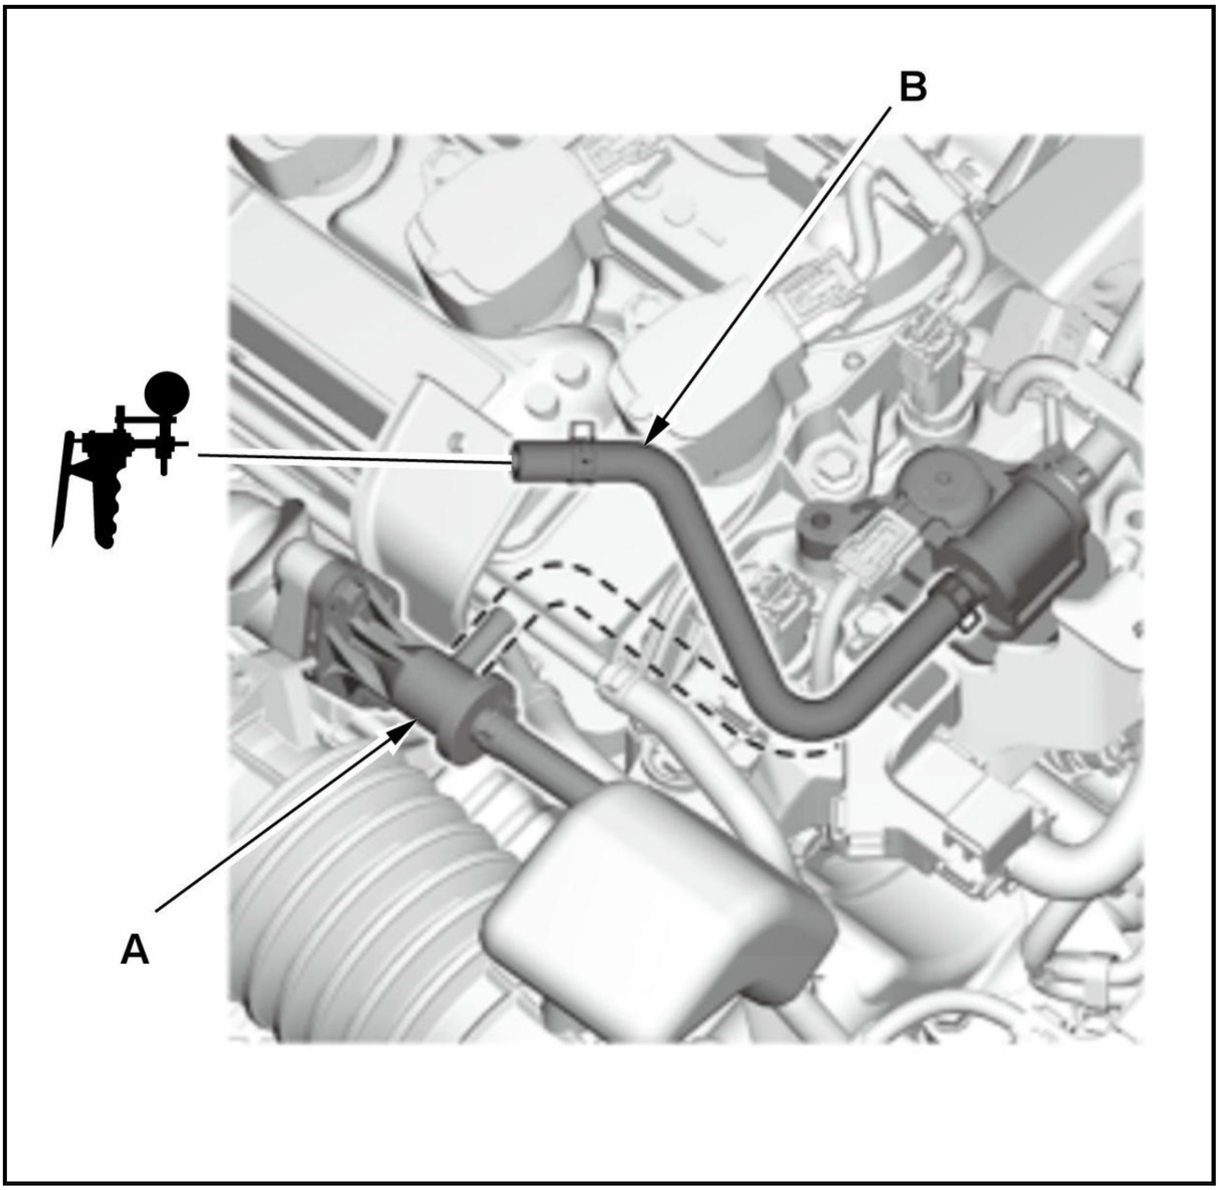
Go to step 7.

NO

Clean intake air duct E port, or replace intake air duct E if needed .

7. Purge tube B check

-1. Disconnect purge tube B from the EVAP canister purge nozzle (A), and connect the vacuum pump/gauge, to the hose as shown.



-2. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select PCS ON in the Single Solenoid Test with the HDS.

EVAP TEST (ELCM)

Apply vacuum to the tube.

Does it hold vacuum?

YES

Check for blockage at purge tube B line between the EVAP canister purge nozzle and the EVAP canister purge valve.

NO

Go to step 8.

8. Non-return valve B check

-1. **Inspect non-return valve B** .

Is the valve OK?

YES

Check for debris or clogging at the EVAP canister purge nozzle port and intake air duct E port. If needed, replace the EVAP canister purge valve .

NO

Replace the EVAP canister purge valve .

DTC P04F1 (1.5 L ENGINE)

DTC P04F1 : EVAP System Low Purge Flow Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P04F1 EVAP System Low Purge Flow Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST (ELCM)

   Is the result OK?

   YES

   If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module, the EVAP canister purge valve, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

   NO

   The failure is duplicated. Go to step 2.

2. EVAP canister purge line visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for poor connection, blockage, or damage at the EVAP canister purge line between the intake manifold and the EVAP canister.

   Is the line OK?

   YES

   Go to step 3.

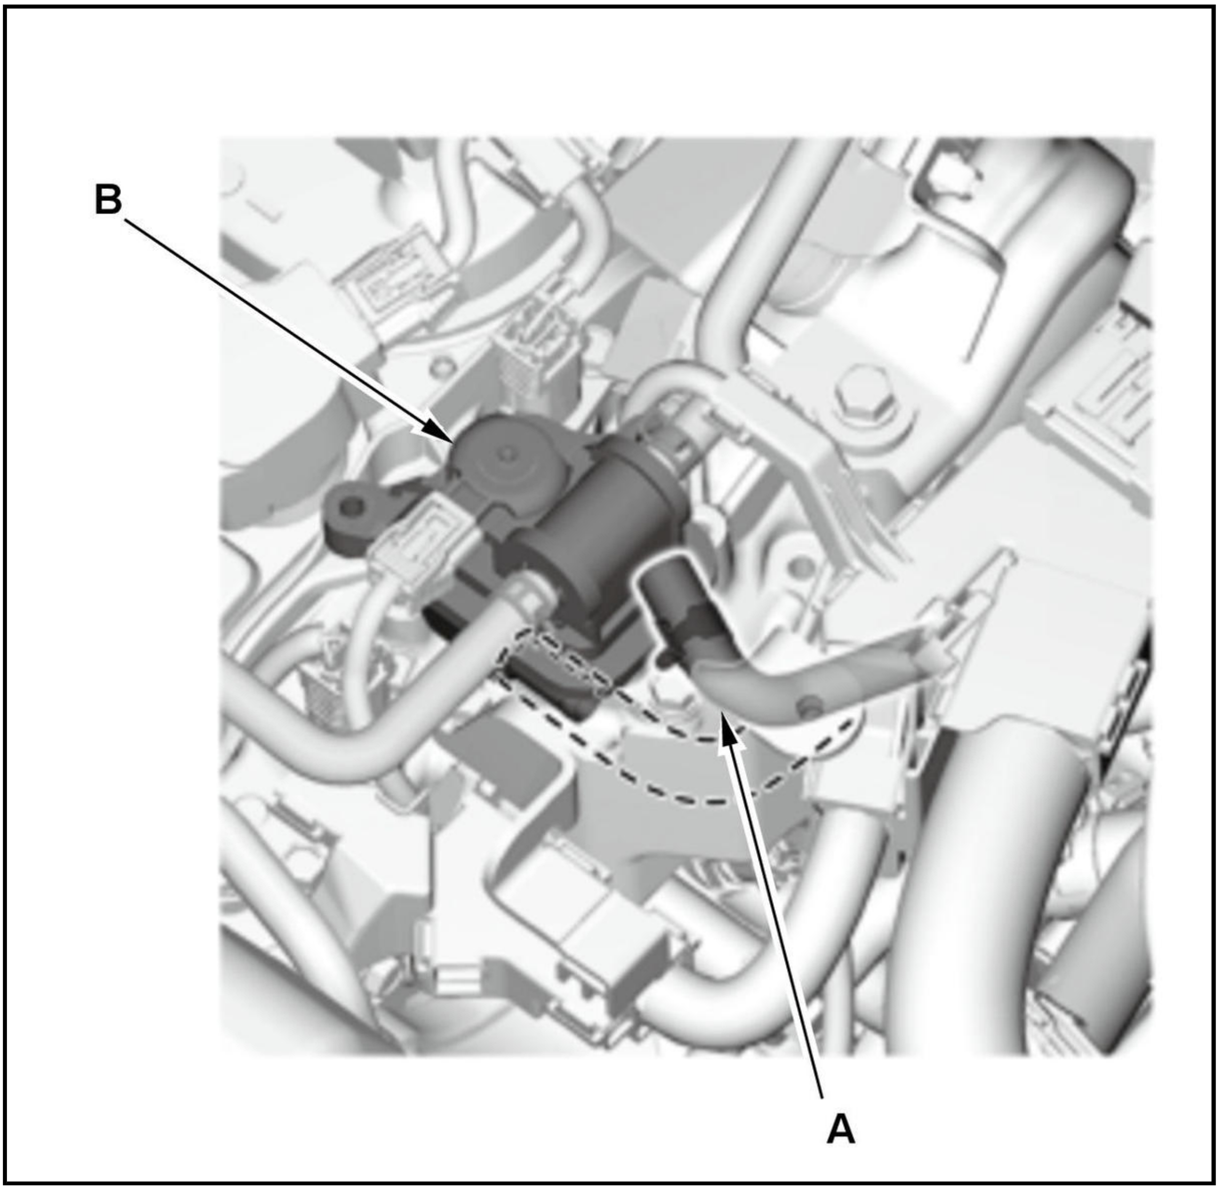
NO

Reconnect or repair the EVAP canister purge line.

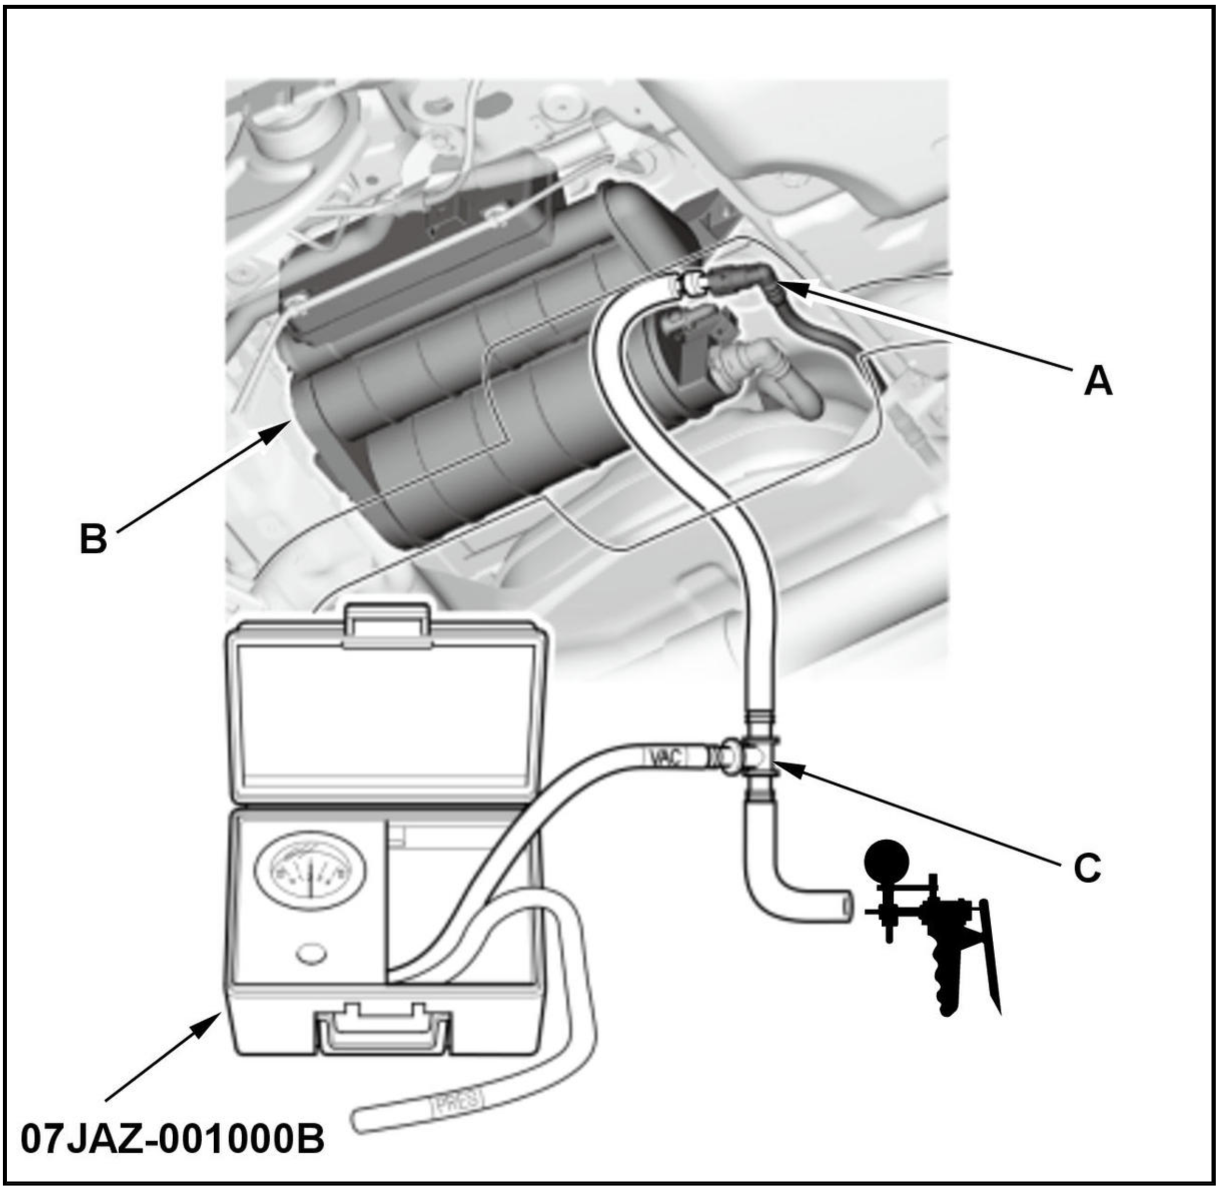
3. Determine possible failure area (EVAP canister purge line, others)

-1. **Remove the EVAP canister purge valve** with its connector and vacuum hose connected.

-2. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B).



-3. Disconnect the EVAP canister purge line (A) from the EVAP canister (B). Connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg to the EVAP canister purge line as shown.



-4. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

Does the hose hold vacuum?

YES

Check for blockage in the EVAP purge line between the EVAP canister purge valve and the EVAP canister.

NO

Go to step 4.

4. EVAP canister purge valve check

-1. **Inspect the EVAP canister purge valve** .

Is the EVAP canister purge valve OK?

YES

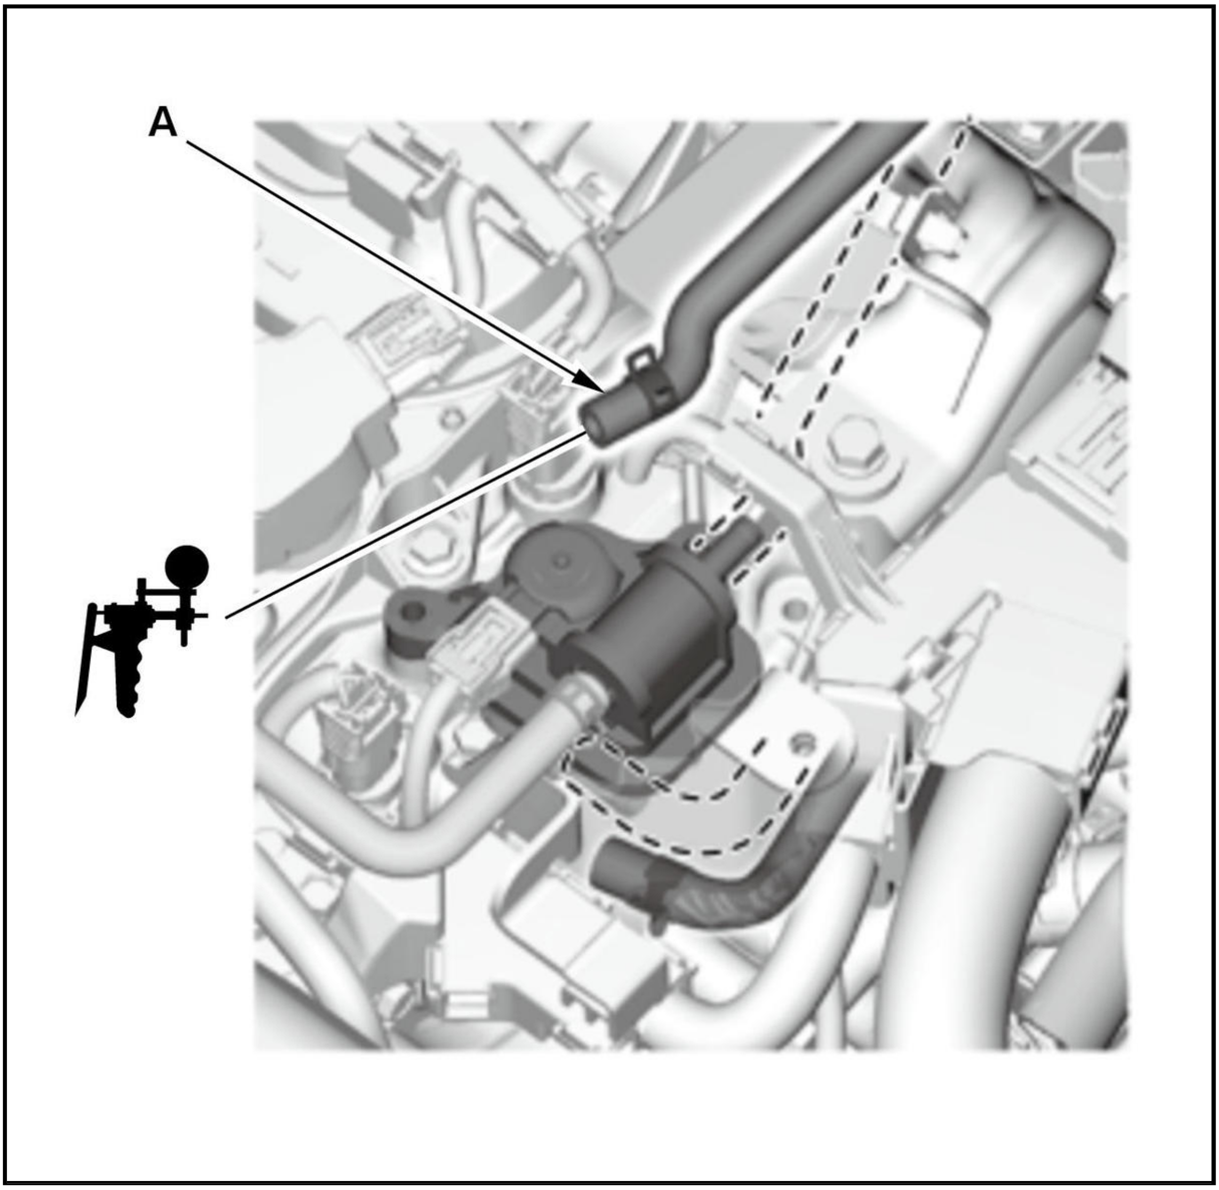
Go to step 5.

NO

Replace the EVAP canister purge valve .

5. Purge tube A check

-1. Connect the vacuum pump/gauge, to purge tube A as shown.



-2. Start the engine, and let it idle.

Is there vacuum?

YES

Go to step 6.

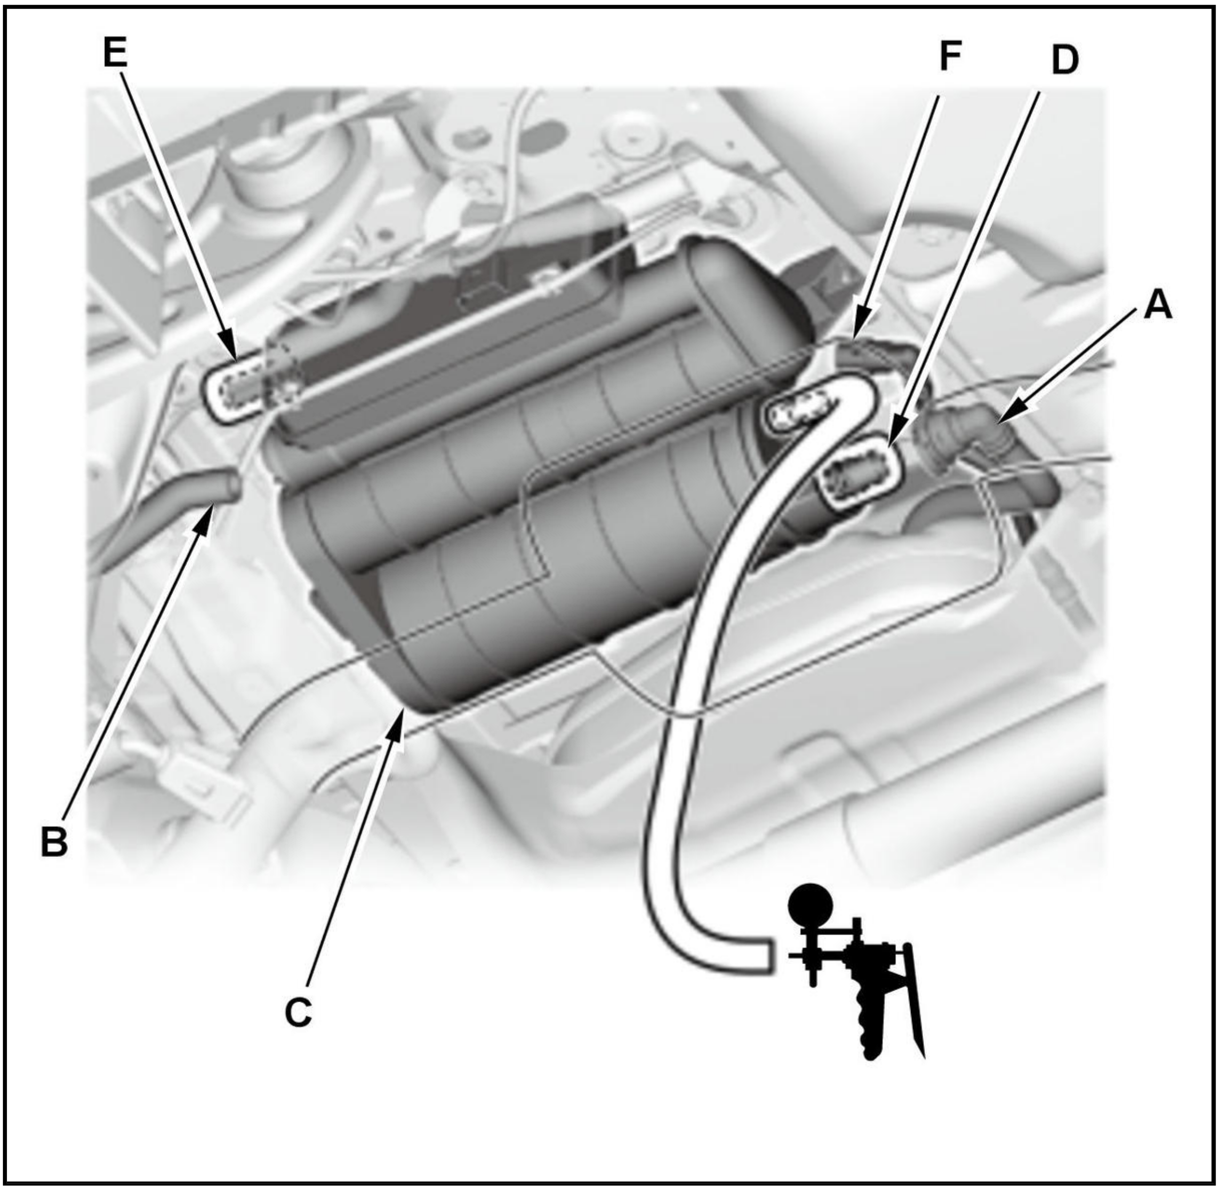
NO

Check for blockage at purge tube A between the intake manifold and the EVAP canister purge valve.

6. EVAP canister check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the fuel vent tube (A) and the EVAP canister drain hose (B) from the EVAP canister (C), and plug the EVAP canister port (D) and the EVAP leak check module port (E).



-3. Disconnect the EVAP canister purge line (F) from the EVAP canister. Connect the vacuum pump/gauge.

-4. Slowly apply the vacuum to the EVAP canister.

Does it hold vacuum?

YES

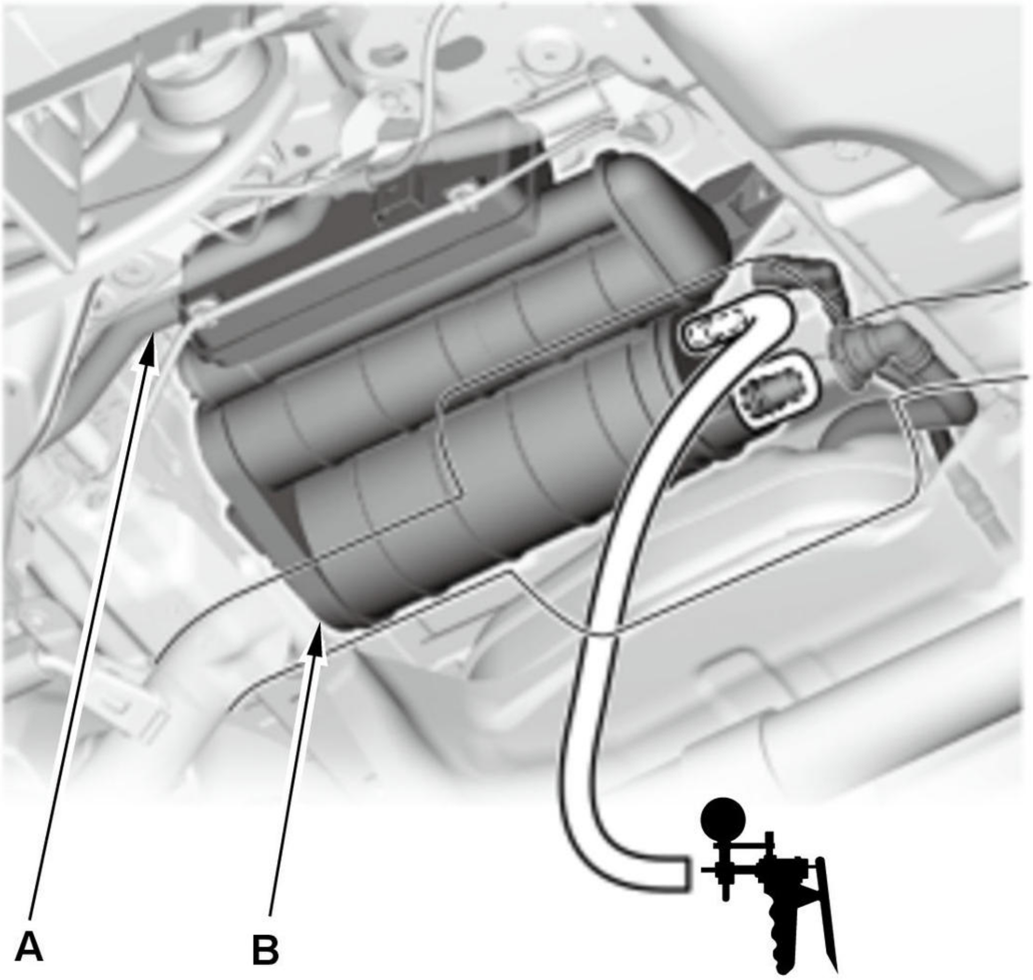
Replace the EVAP canister .

NO

The EVAP canister is OK. Go to step 7.

7. EVAP leak check module performance check

-1. Connect the EVAP canister drain hose (A) to the EVAP canister (B).



-2. Turn the vehicle to the ON mode.

-3. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select CCV ON in the Single Solenoid Test with the HDS.

EVAP TEST (ELCM)

-4. Check and record the Absolute Pressure of ELCM Pressure Sensor reading in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	B	B

-5. Slowly apply about 1.3 kPa (0.4 inHg, 10 mmHg) of vacuum to the hose.

NOTE: Be careful not to exceed the vacuum. If you do, the EVAP leak check module can be damaged.

-6. Check the Absolute Pressure of ELCM Pressure Sensor in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	B	B

Does the value change?

YES

Check for blockage at the EVAP canister purge line port.

NO

Replace the EVAP leak check module .

DTC P04F1 (2.4 L ENGINE) (2017 2018 2019)

DTC P04F1 : EVAP System Low Purge Flow Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P04F1 EVAP System Low Purge Flow Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST in the INSPECTION MENU, then select the FUNCTION TEST with the HDS.

   EVAP TEST

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

   NO

   The failure is duplicated. Go to step 2.

2. EVAP canister purge line visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for a poor connection, a blockage, or damage at the EVAP canister purge line between the intake manifold and the EVAP canister.

   Is the line OK?

YES

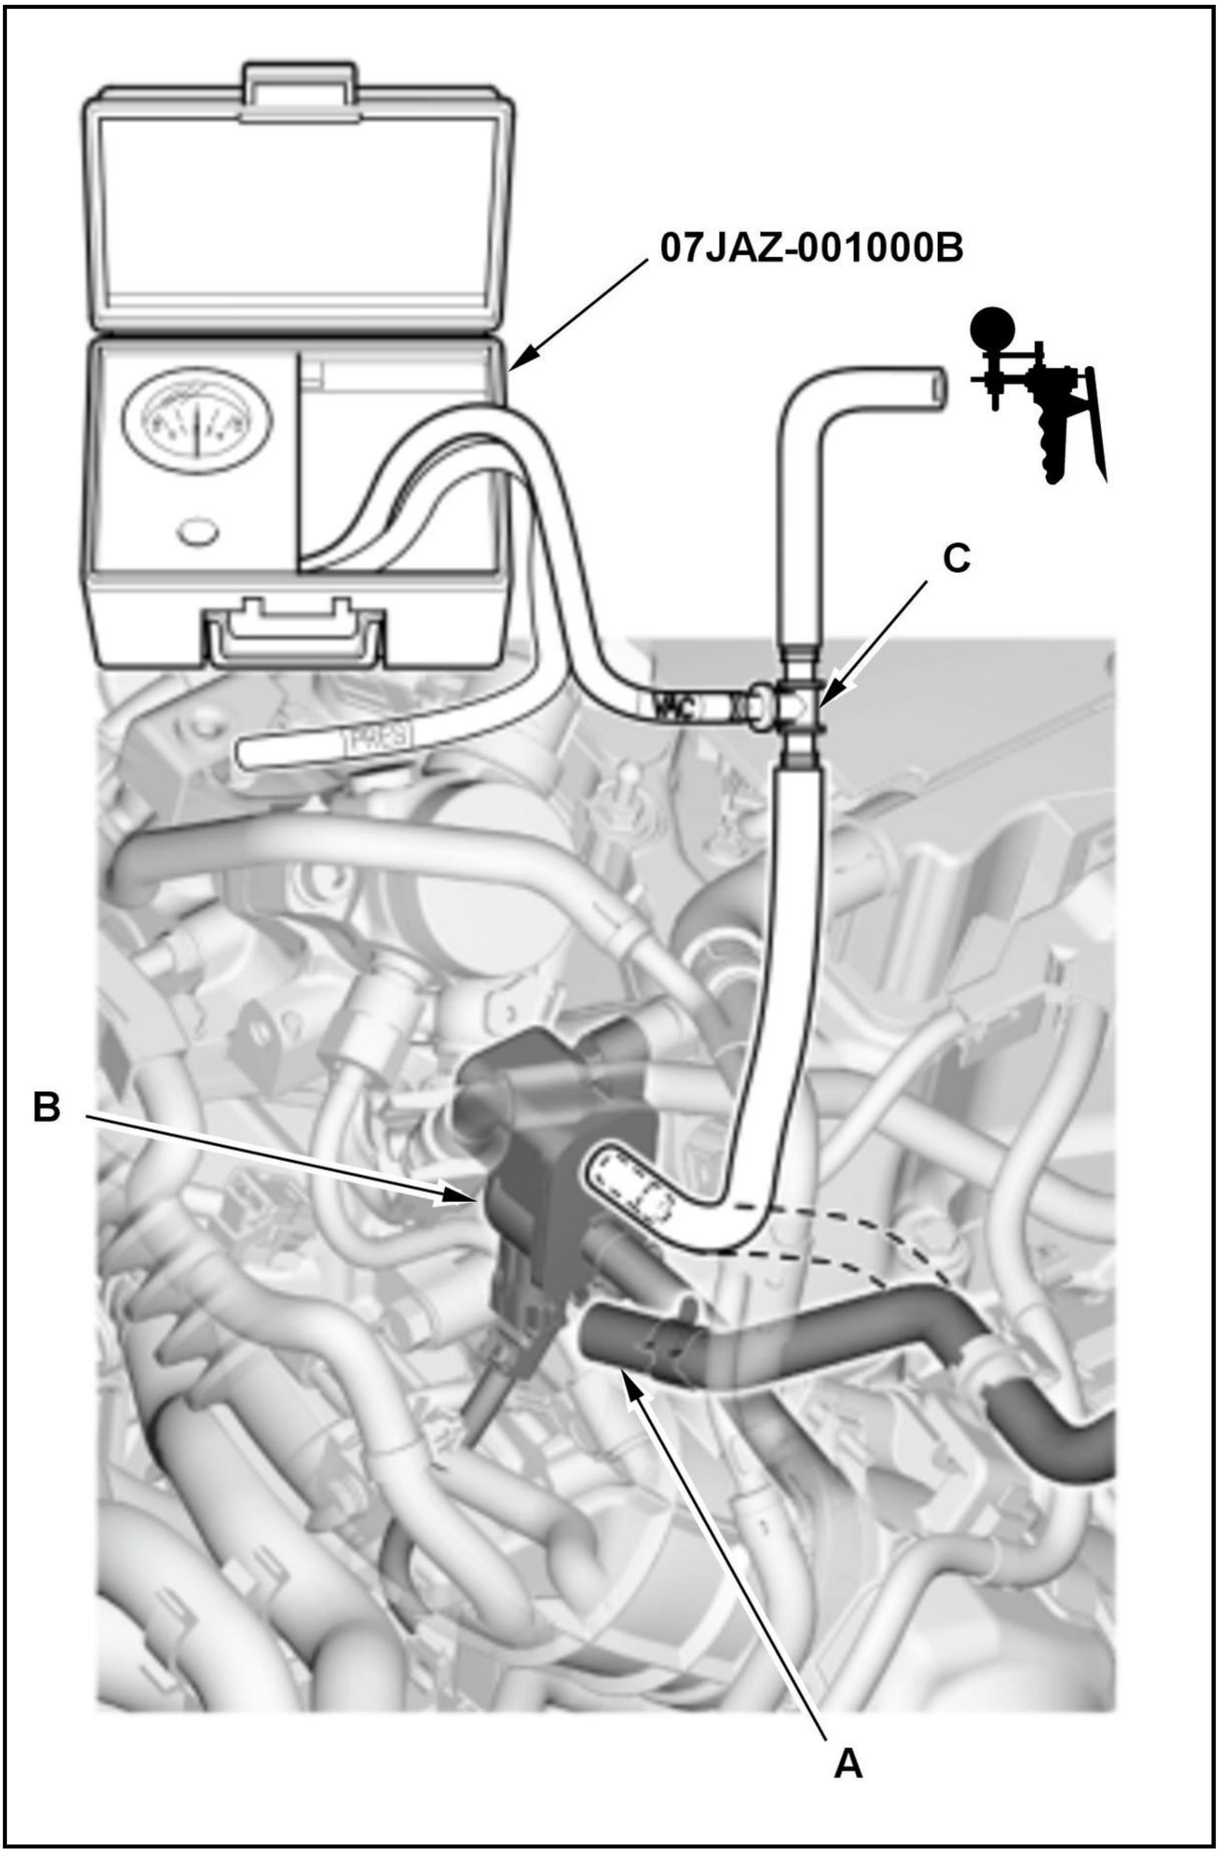
Go to step 3.

NO

Reconnect or repair the EVAP canister purge line.

3. Determine possible failure area (EVAP canister purge valve, others)

   -1. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, then connect a T-fitting (C), a vacuum gauge, and a vacuum pump/gauge, 0-30 inHg, to the vacuum hose as shown.



07JAZ-001000B
C
B
A

-2. Turn the vehicle to the ON mode.

-3. Select the EVAP TEST in the INSPECTION MENU, then select the EVAP PCS ON in the SINGLE SOLENOID with the HDS.

EVAP TEST

Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

Does it hold vacuum?

YES

Replace the EVAP canister purge valve .

NO

Go to step 4.

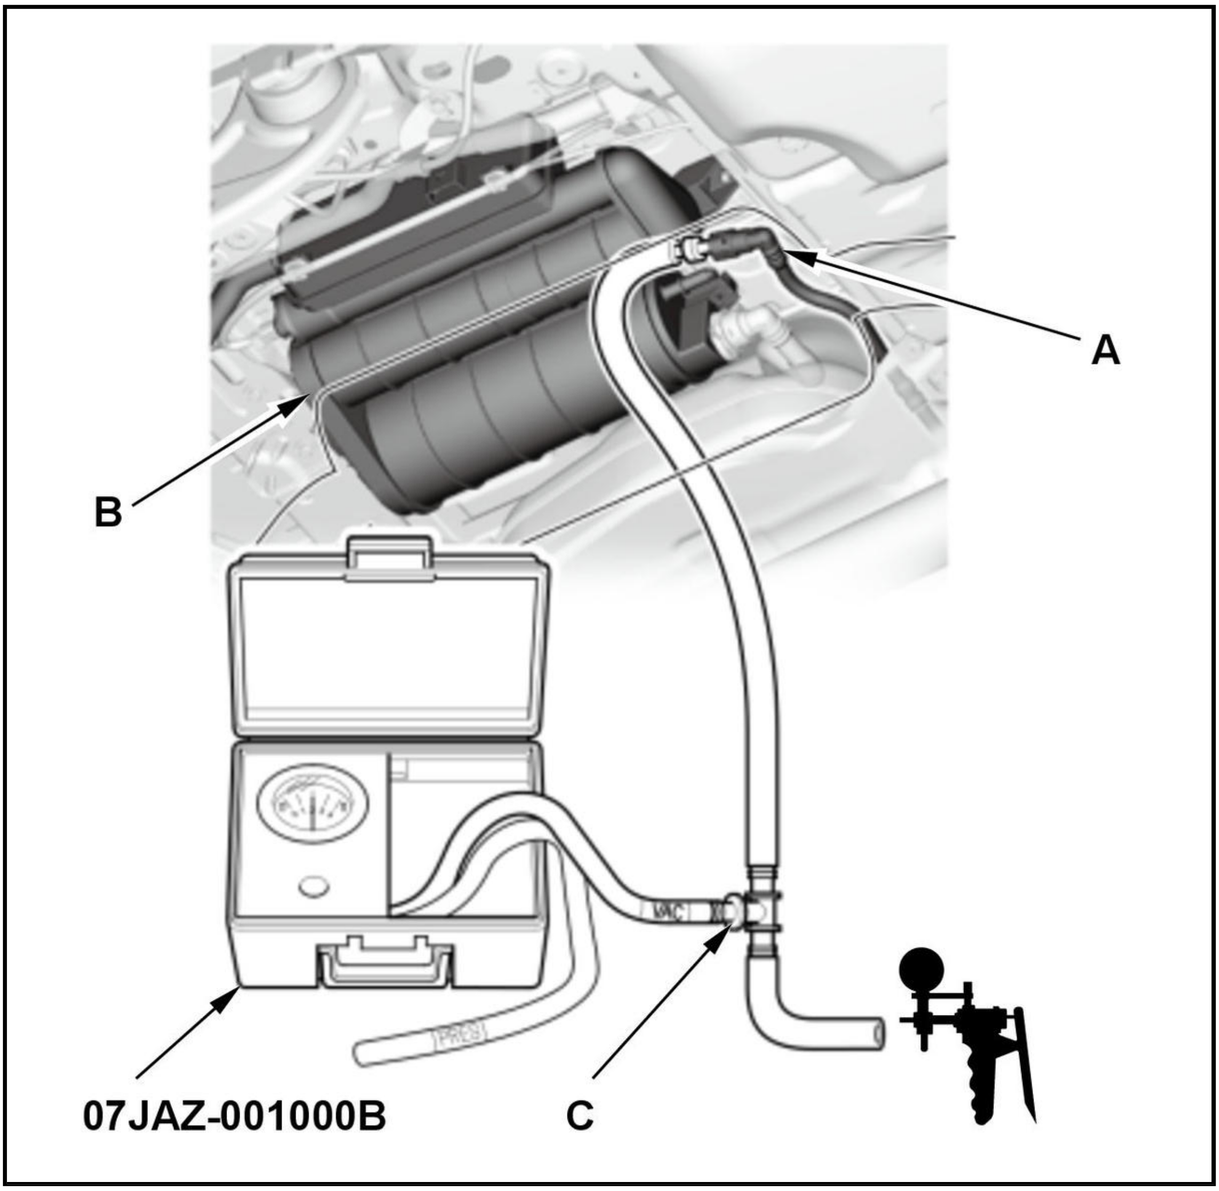
4. Determine possible failure area (EVAP canister purge line, others)

-1. Select the EVAP TEST in the INSPECTION MENU, then select the EVAP PCS OFF in the SINGLE SOLENOID with the HDS.

EVAP TEST

-2. Reconnect the vacuum hose to the EVAP canister purge valve.

-3. Disconnect the EVAP canister purge line (A) from the canister (B). Connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg, to the EVAP canister purge line as shown.



-4. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

-5. Select the EVAP PCS ON in the SINGLE SOLENOID with the HDS.

EVAP TEST

Does it hold vacuum?

YES

Check for a blockage in the purge line between the EVAP canister purge valve and the EVAP canister.

NO

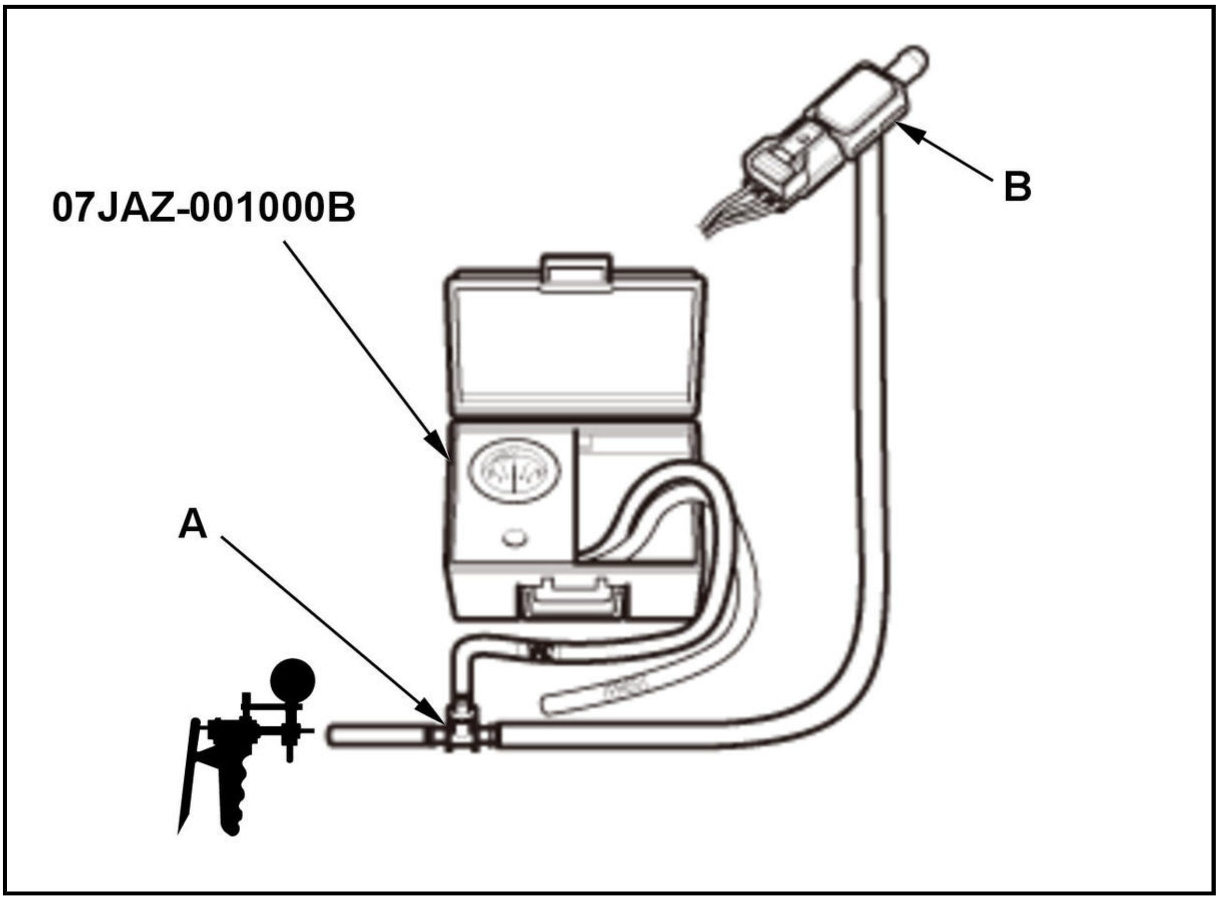
Go to step 5.

5. FTP sensor performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the FTP sensor with its connector connected** .

-3. Connect the T-fitting (A) to the vacuum pump/gauge, 0-30 inHg, and the vacuum gauge to the FTP sensor (B) as shown.



-4. Turn the vehicle to the ON mode.

-5. Check and record the FTP sensor reading in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
FTP SENSOR	B	B

-6. Slowly apply about 1.3 kPa (0.4 inHg, 10 mmHg) of vacuum to the hose.

NOTE: Be careful not to exceed the vacuum. If you do, the FTP sensor can be damaged.

-7. Check the FTP SENSOR in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	**Unit**
FTP SENSOR	B	B

Does the value change?

YES

Go to step 6.

NO

Replace the FTP sensor .

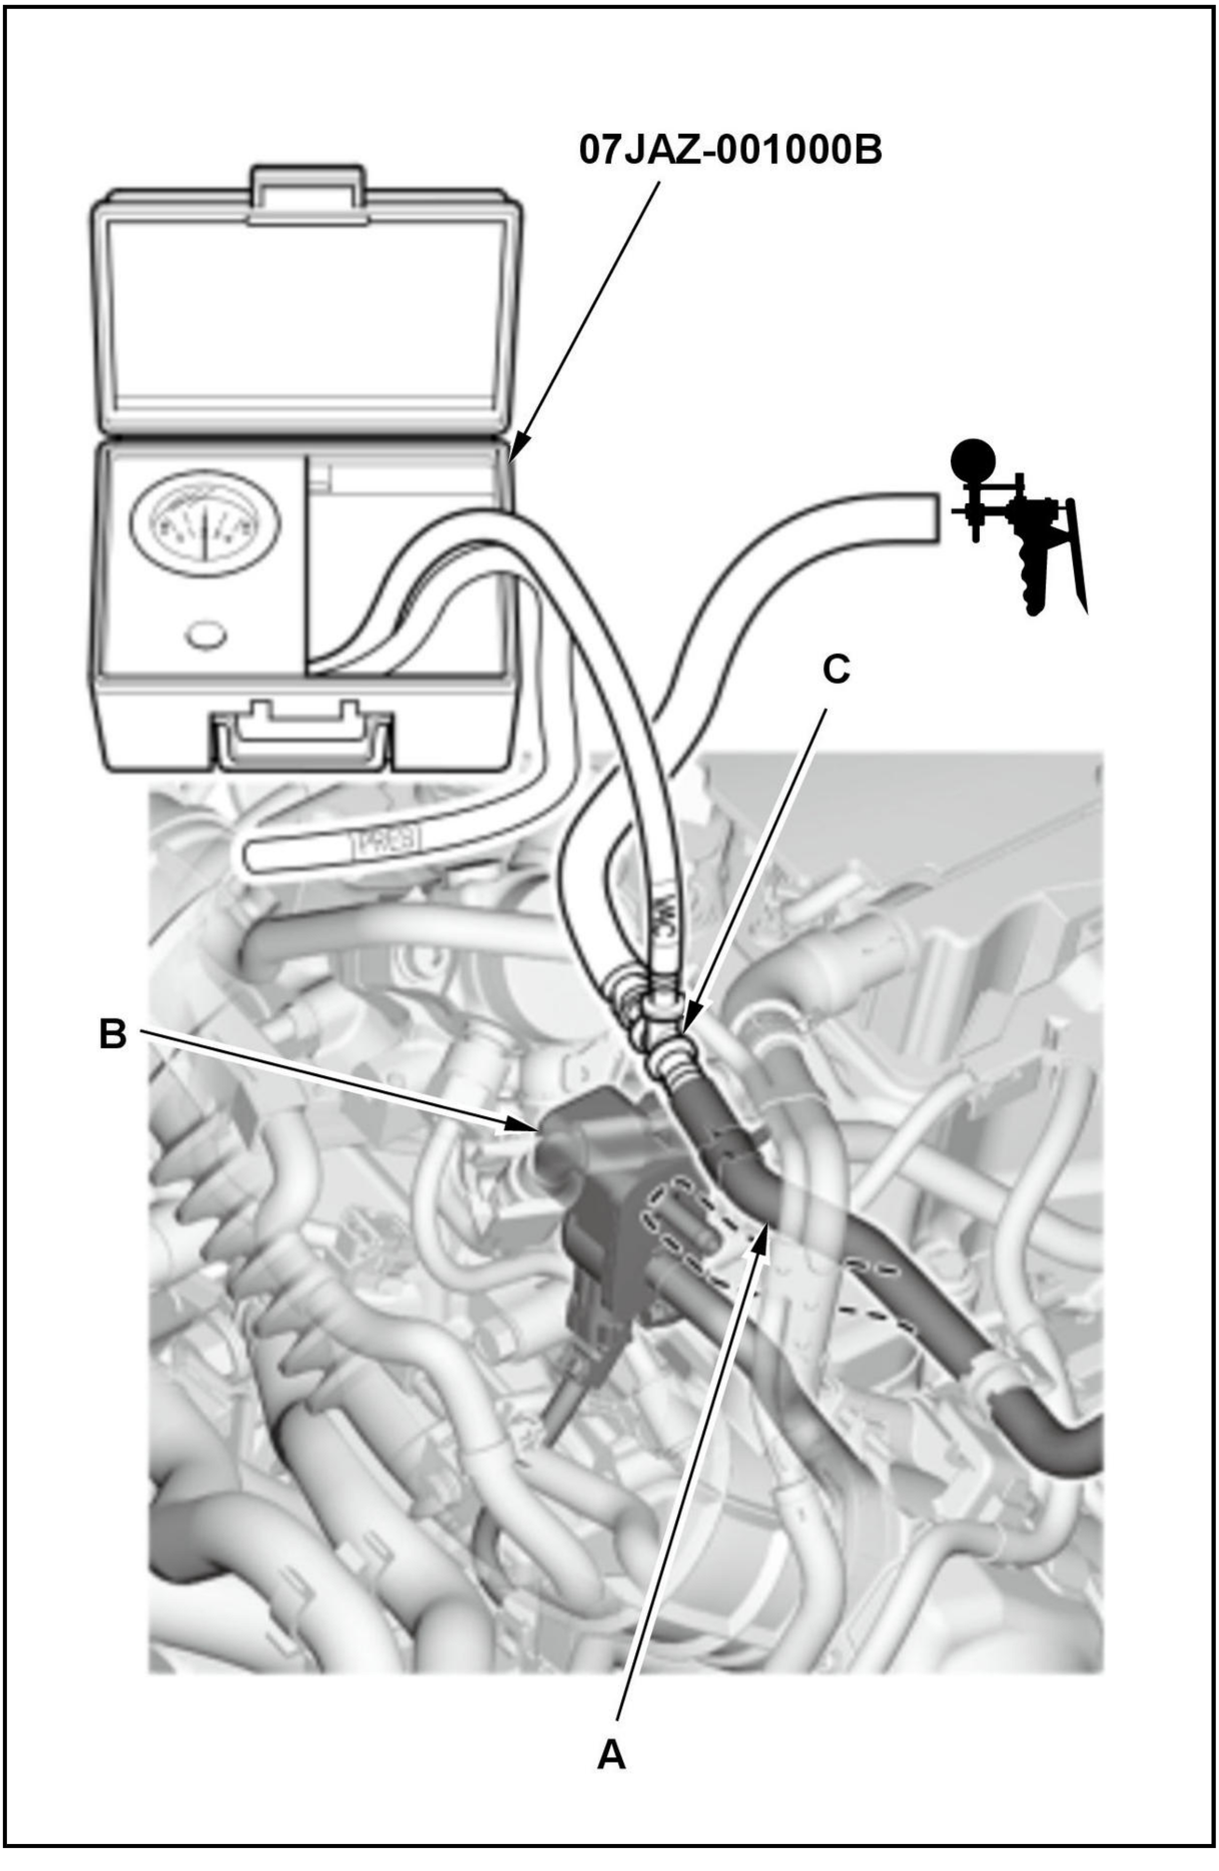
6. EVAP canister purge line check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Reconnect the EVAP canister purge line to the EVAP canister, and **reinstall the FTP sensor** .

   -3. **Remove the EVAP canister vent shut valve** .

   -4. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, then connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg, to the vacuum hose as shown.



07JAZ-001000B
C
B
A

-5. Slowly apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

Does the hose hold vacuum?

YES

Check for a blockage at the EVAP canister purge line port.

NO

Replace the EVAP canister vent shut valve .

DTC P0501 (CVT (ECM/PCM))

DTC P0501 : CVT Speed Sensor Circuit Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0501 CVT Speed Sensor Circuit Range/Performance	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

   -4. Start the engine.

   -5. **Enter the VSA maintenance mode** .

   -6. Test-drive the vehicle in D position/mode, and the engine speed at 1, 000 rpm or higher, then release the accelerator without pressing it again, for at least 4 seconds. Slow down and stop the wheels.

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0501 CVT Speed Sensor Circuit Range/Performance	B	B	B

   Is DTC P0501 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Vehicle speed sensor installation check

   -1. Check for poor connections and loose terminals between the vehicle speed sensor and the PCM, and check for proper installation of the vehicle speed sensor.

Are the connection and installation OK?

YES

Connection and installation are OK. **Replace the CVT speed sensor** .

NO

Repair faulty connection or installation.

DTC P0502 (CVT (ECM/PCM))

DTC P0502 : CVT Speed Sensor Circuit Open/Short

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0502 CVT Speed Sensor Circuit Open/Short	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

   -4. Start the engine.

   -5. **Enter the VSA maintenance mode** .

   -6. Test-drive the vehicle in D position/mode, and the engine speed at 1, 000 rpm or higher, then release the accelerator without pressing it again, for at least 4 seconds. Slow down and stop the wheels.

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0502 CVT Speed Sensor Circuit Open/Short	B	B	B

   Is DTC P0502 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (VCC2 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

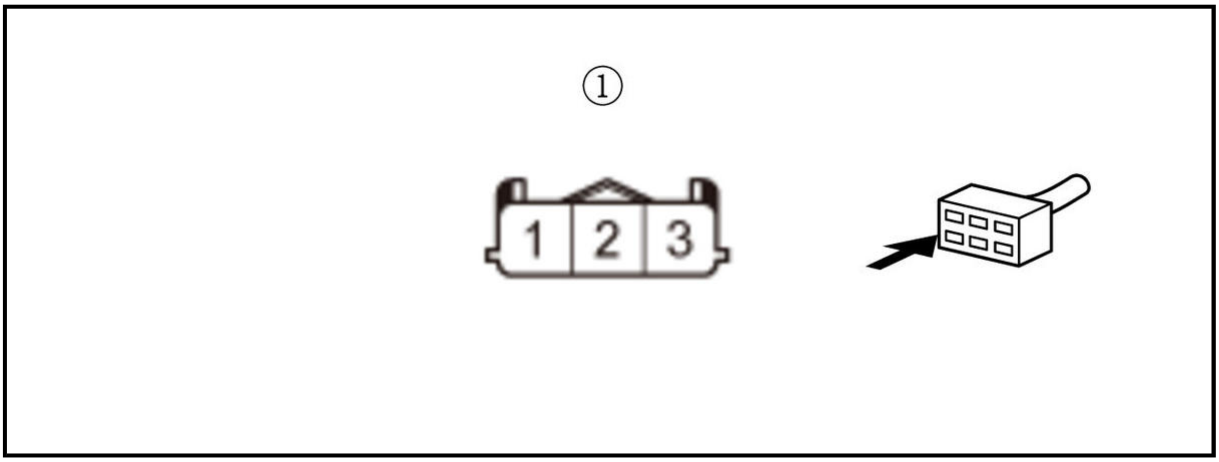
-2. Disconnect the following connector.

CVT speed sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT speed sensor 3P connector: disconnected
Test point 1	CVT speed sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

The VCC2 wire is OK. Go to step 4.

NO

Go to step 3.

3. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT speed sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	CVT speed sensor 3P connector (female terminals) No. 3 : ①

Test point 2	**PCM connector C (51P) No. 30**

Is there continuity?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

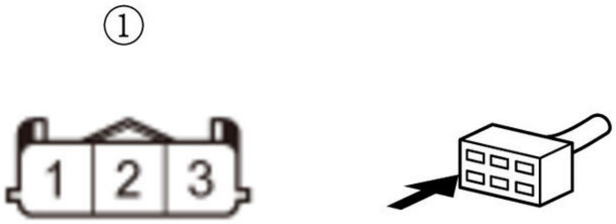
NO

Repair an open in the VCC2 wire between the CVT speed sensor and the PCM.

4. Open wire check (SG2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT speed sensor 3P connector: disconnected
Test point 1	CVT speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	CVT speed sensor 3P connector (female terminals) No. 3 : ①



Is there about 5 V?

YES

The SG2 wire is OK. Go to step 5.

NO

Repair an open in the SG2 wire between the CVT speed sensor and the PCM.

5. Shorted wire check (VEL DD line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

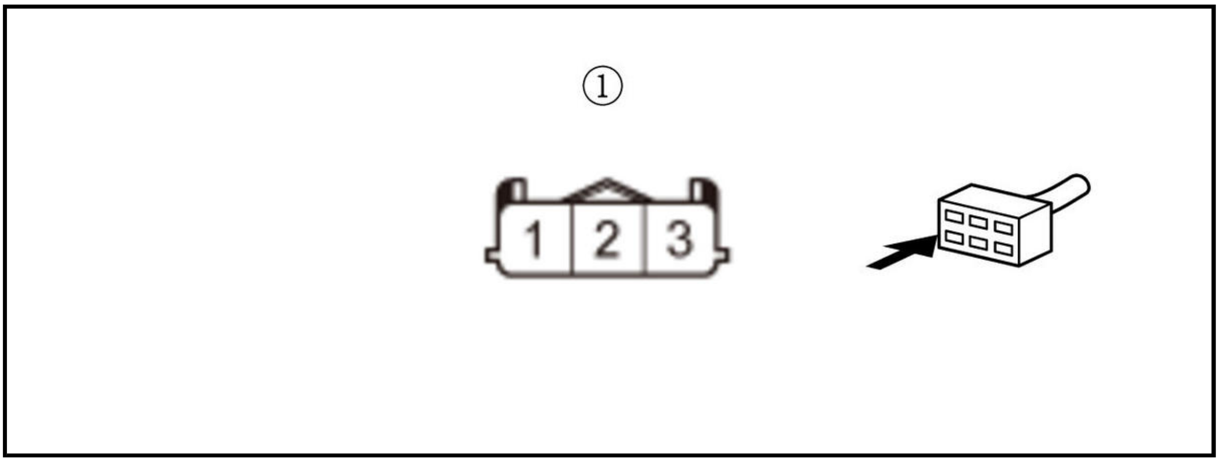
-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT speed sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected

Test point 1	CVT speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the VEL DD wire between the CVT speed sensor and the PCM.

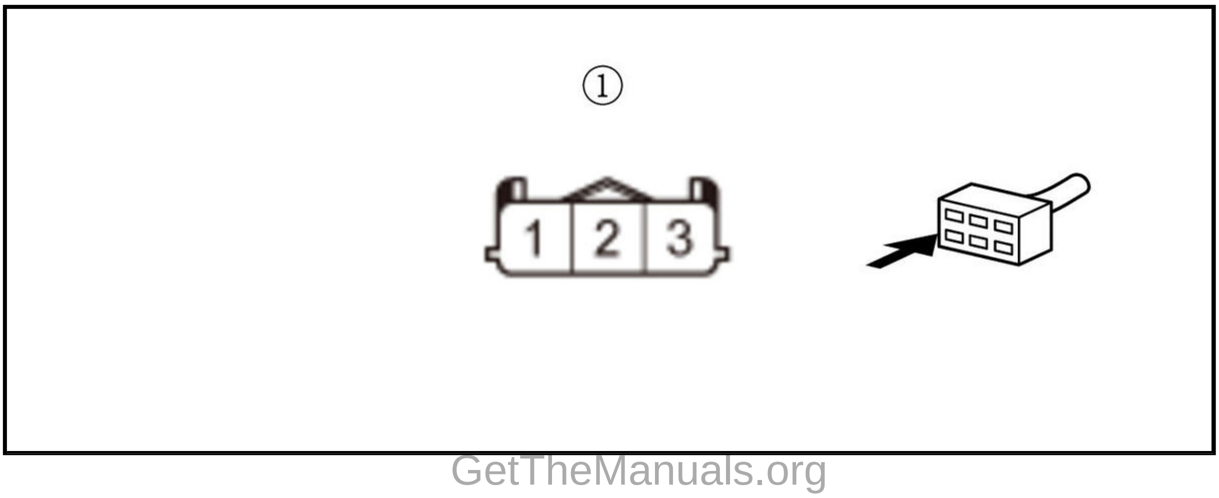
NO

The VEL DD wire is not shorted. Go to step 6.

6. Open wire check (VEL DD line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT speed sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	CVT speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	**PCM connector C (51P) No. 32**



Is there continuity?

YES

The VEL DD wire is OK. **Replace the CVT speed sensor** .

NO

Repair an open in the VEL DD wire between the CVT speed sensor and the PCM.

DTC P0506 (1.5 L ENGINE)

DTC P0506 : Idle Control System RPM Lower Than Expected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0506 Idle Control System RPM Lower Than Expected	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle at least 20 seconds.

-5. Check for these conditions in the DATA LIST with the HDS.

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- IAT SENSOR (1) above 18 deg. F (-7.6 deg. C)
- VEHICLE SPEED is 0 mph (0 km/h)
- AF FB (ST FUEL TRIM) between 0.75 and 1.47
- FSS is CLOSED

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
IAT SENSOR (1)	B	B
VEHICLE SPEED	B	B
AF FB (ST FUEL TRIM)	B	B
FSS	B	B

-6. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0506 Idle Control System RPM Lower Than Expected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, go to step 3. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-5 and recheck.

2. Throttle body visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the intake air duct from the throttle body** .

-3. Check for dirt, carbon, or damage in the throttle bore.

Is there dirt, carbon, or damage in the throttle bore?

YES

If there is dirt or carbon, **clean the throttle body** . Also check for damage to the air cleaner element. If there is damage in the throttle bore, **replace the throttle body** .

NO

The throttle body is OK. Check the A/C system, then go to step 4.

3. Throttle body visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the intake air duct from the throttle body** .

-3. Check for dirt, carbon, or damage in the throttle bore.

Is there dirt, carbon, or damage in the throttle bore?

YES

If there is dirt or carbon, **clean the throttle body** . Also check for damage to the air cleaner element. If there is damage in the throttle bore, **replace the throttle body** .

NO

The throttle body is OK. Go to step 4.

4. Idle control system check

-1. **Reinstall the intake air duct** .

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle at least 20 seconds.

-6. Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)

- IAT SENSOR (1) above 18 deg. F (-7.6 deg. C)
- VEHICLE SPEED is 0 mph (0 km/h)
- AF FB (ST FUEL TRIM) between 0.75 and 1.47
- FSS is CLOSED

Signal	Current conditions	
	Values	**Unit**
ECT SENSOR 1	B	B
IAT SENSOR (1)	B	B
VEHICLE SPEED	B	B
AF FB (ST FUEL TRIM)	B	B
FSS	B	B

-7. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0506 Idle Control System RPM Lower Than Expected	B

Does the HDS indicate PASSED?

YES

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

If the HDS indicates FAILED, check the A/C system, then recheck. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 4-6 and recheck.

DTC P0506 (2.4 L ENGINE) (2017 2018 2019)

DTC P0506 : Idle Control System RPM Lower Than Expected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0506 Idle Control System RPM Lower Than Expected	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle at least 20 seconds.

-5. Check for these conditions in the DATA LIST with the HDS.

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)

- IAT SENSOR (1) above 18 deg. F (-7.6 deg. C)
- VEHICLE SPEED is 0 mph (0 km/h)
- AF FB (ST FUEL TRIM) between 0.69 and 1.47
- FSS is CLOSED

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
IAT SENSOR (1)	B	B
VEHICLE SPEED	B	B
AF FB (ST FUEL TRIM)	B	B
FSS	B	B

-6. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0506 Idle Control System RPM Lower Than Expected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, go to step 3. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-5 and recheck.

2. Throttle body visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the intake air duct from the throttle body** .

-3. Check for dirt, carbon, or damage in the throttle bore.

Is there dirt, carbon, or damage in the throttle bore?

YES

If there is dirt or carbon, **clean the throttle body** . Also check for damage to the air cleaner element. If there is damage in the throttle bore, **replace the throttle body** .

NO

The throttle body is OK. Check the A/C system, then go to step 4.

3. Throttle body visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the intake air duct from the throttle body** .

-3. Check for dirt, carbon, or damage in the throttle bore.

Is there dirt, carbon, or damage in the throttle bore?

YES

If there is dirt or carbon, **clean the throttle body** . Also check for damage to the air cleaner element. If there is damage in the throttle bore, **replace the throttle body** .

NO

The throttle body is OK. Go to step 4.

4. Idle control system check

-1. **Reinstall the intake air duct** .

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle at least 20 seconds.

-6. Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- IAT SENSOR (1) above 18 deg. F (-7.6 deg. C)
- VEHICLE SPEED is 0 mph (0 km/h)
- AF FB (ST FUEL TRIM) between 0.69 and 1.47
- FSS is CLOSED

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
IAT SENSOR (1)	B	B
VEHICLE SPEED	B	B
AF FB (ST FUEL TRIM)	B	B
FSS	B	B

-7. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0506 Idle Control System RPM Lower Than Expected	B

Does the HDS indicate PASSED?

YES

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

If the HDS indicates FAILED, check the A/C system, then recheck. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 4-6 and recheck.

DTC P0507 (1.5 L ENGINE)

DTC P0507 : Idle Control System RPM Higher Than Expected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0507 Idle Control System RPM Higher Than Expected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle at least 20 seconds.

   -5. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0507 Idle Control System RPM Higher Than Expected	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 2.

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, recheck with different load conditions (electrical, A/C, gear position, etc.), then go to step 1

2. Vacuum leak check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   Check for vacuum leaks at these parts:

   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake air duct
   - Intake manifold
   - All parts through the turbocharger joint to the throttle body

   Are there any leaks?

   YES

Repair or replace the leaking part (s).

NO

Recheck with different load conditions (turn on the headlights, the blower motor, or the A/C, change the gear position, etc.).

DTC P0507 (2.4 L ENGINE) (2017 2018 2019)

DTC P0507 : Idle Control System RPM Higher Than Expected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0507 Idle Control System RPM Higher Than Expected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle at least 20 seconds.

   -5. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0507 Idle Control System RPM Higher Than Expected	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 2.

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, recheck with different load conditions (electrical, A/C, gear position, etc.), then go to step 1

2. Vacuum leak check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   Check for vacuum leaks at these parts:

   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body

- Intake air duct
- Intake manifold
- All parts through the turbocharger joint to the throttle body

Are there any leaks?

YES

Repair or replace the leaking part (s).

NO

Recheck with different load conditions (turn on the headlights, the blower motor, or the A/C, change the gear position, etc.).

DTC P050A (1.5 L ENGINE)

DTC P050A : Cold Start Idle Air Control System Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P050A Cold Start Idle Air Control System Performance Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

    -1. Turn the vehicle to the ON mode.

    -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

    Are any Pending or Confirmed DTCs other than P050A indicated?

    YES

    Go to the indicated DTC's troubleshooting.

    NO

    Go to step 2.

2. Intake air duct visual check

    -1. Check for poor connection or blockage at the intake air duct.

    Is it OK?

    YES

    Go to step 3.

    NO

    Reconnect or repair the intake air duct, or **replace it if needed** .

3. Air cleaner housing visual check

-1. Check for poor connection or blockage at the air cleaner housing .

Is it OK?

YES

Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. Check for dirt or debris on the air cleaner element .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-2. Clear the DTC with the HDS.

-3. Start the engine, and let it idle for 10 seconds or more.

-4. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P050A Cold Start Idle Air Control System Performance Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor 1, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-1 and recheck.

6. Throttle body test

-1. Select the ETCS TEST in the INSPECTION MENU with the HDS.

ETCS TEST

Is the THROTTLE ACTUATOR CONTROL VALVE normal?

YES

Go to step 7.

NO

Replace the throttle body .

7. MAF sensor performance check

-1. Start the engine.

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	4.1-5.7	g/s	B	B

Do the current condition (s) match the threshold?

YES

The MAF sensor is OK. Go to step 8.

NO

Replace MAF sensor/IAT sensor 1 .

8. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of the IAT SENSOR (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT SENSOR (1)	B	B

-6. Compare the value of the IAT SENSOR (1) with the ambient temperature.

Does the value of the IAT SENSOR (1) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

The IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P050A (2.4 L ENGINE) (2017 2018 2019)

DTC P050A : Cold Start Idle Air Control System Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P050A Cold Start Idle Air Control System Performance Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any Pending or Confirmed DTCs other than P050A indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Intake air duct visual check

   -1. Check for poor connection or blockage at the intake air duct.

   Is it OK?

   YES

   Go to step 3.

   NO

   Reconnect or repair the intake air duct, or **replace it if needed** .

3. Air cleaner housing visual check

   -1. **Check for poor connection or blockage at the air cleaner housing** .

Is it OK?

YES

Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. **Check for dirt or debris on the air cleaner element** .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	Current conditions	
	Values	**Unit**
ECT SENSOR 1	B	B

-2. Clear the DTC with the HDS.

-3. Start the engine, and let it idle for 10 seconds or more.

-4. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P050A Cold Start Idle Air Control System Performance Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor 1, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-1 and recheck.

6. Throttle body test

-1. Select the ETCS TEST in the INSPECTION MENU with the HDS.

ETCS TEST

Is the THROTTLE ACTUATOR CONTROL VALVE normal?

YES

Go to step 7.

NO

Replace the throttle body .

7. MAF sensor performance check

-1. Start the engine.

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	6.5-9.1	g/s	B	B

Do the current condition (s) match the threshold?

YES

The MAF sensor is OK. Go to step 8.

NO

Replace MAF sensor/IAT sensor 1 .

8. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of the IAT SENSOR (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT SENSOR (1)	B	B

-6. Compare the value of the IAT SENSOR (1) with the ambient temperature.

Does the value of the IAT SENSOR (1) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

The IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P050B (1.5 L ENGINE) (2020 2021)

DTC P050B : Cold Start Ignition Timing Control System Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P050B Cold Start Ignition Timing Control System Performance Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any Pending or Confirmed DTCs other than P050B indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Inlet pipe visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for poor connection or blockage at the inlet pipe.

   Is it OK?

   YES

   Go to step 3.

   NO

   Reconnect or repair the inlet pipe, or replace it if needed.

3. Air cleaner housing visual check

   -1. **Check for poor connection or blockage at the air cleaner housing** .

   Is it OK?

   YES

   Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. Check for dirt or debris on the air cleaner element .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT SENSOR 1 is 77 deg. F (25 deg. C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Start the engine, and let it idle for 10 seconds or more.

-6. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P050B Cold Start Ignition Timing Control System Performance Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor, the throttle body, MAF sensor/IAT sensor 1, ECT sensor 1, ECT sensor 2, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-2 and recheck.

6. MAF sensor performance check

-1. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-2. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	4.1-5.7	g/s	B	B

Do the current condition (s) match the malfunction threshold?

YES

The MAF sensor is OK. Go to step 7.

NO

Replace MAF sensor/IAT sensor 1 .

7. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of IAT SENSOR (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT SENSOR (1)	B	B

-6. Compare the value of the IAT SENSOR (1) with the ambient temperature.

Does the value of the IAT SENSOR (1) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P050D (1.5 L ENGINE)

DTC P050D : Cold Start Idle Speed Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P050D Cold Start Idle Speed Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P050D Cold Start Idle Speed Problem	B	B

Are any Pending or Confirmed DTCs other than P050D indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Intake air duct visual check

-1. Check for poor connection or blockage at the intake air duct.

Is it OK?

YES

Go to step 3.

NO

Reconnect or repair the intake air duct, or **replace it if needed** .

3. Air cleaner housing visual check

-1. **Check for poor connection or blockage at the air cleaner housing** .

Is it OK?

YES

Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. **Check for dirt or debris on the air cleaner element** .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-2. Clear the DTC with the HDS.

-3. Start the engine and let it idle for 10 seconds or more.

-4. Monitor the OBD STATUS for DTC P050D in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P050D Cold Start Idle Speed Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor, the throttle body, MAF/IAT sensor 1, ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-1 and recheck.

6. MAF sensor performance check

-1. Start the engine.

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	4.1-5.7	g/s	B	B

Do the current condition (s) match the malfunction threshold?

YES

The MAF sensor is OK. Go to step 7.

NO

Replace MAF sensor/IAT sensor 1 .

7. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of IAT SENSOR (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1) Voltage	B	B

-6. Compare the value of the IAT SENSOR with the ambient temperature.

Does the value of the IAT SENSOR (1) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

The IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P050D (2.4 L ENGINE) (2017 2018 2019)

DTC P050D : Cold Start Idle Speed Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P050D Cold Start Idle Speed Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P050D Cold Start Idle Speed Problem	B	B

Are any Pending or Confirmed DTCs other than P050D indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Intake air duct visual check

-1. Check for poor connection or blockage at the intake air duct.

Is it OK?

YES

Go to step 3.

NO

Reconnect or repair the intake air duct, or **replace it if needed** .

3. Air cleaner housing visual check

-1. **Check for poor connection or blockage at the air cleaner housing** .

Is it OK?

YES

Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. **Check for dirt or debris on the air cleaner element** .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-2. Clear the DTC with the HDS.

-3. Start the engine and let it idle for 10 seconds or more.

-4. Monitor the OBD STATUS for DTC P050D in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P050D Cold Start Idle Speed Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor, the throttle body, MAF/IAT sensor 1, ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-1 and recheck.

6. MAF sensor performance check

-1. Start the engine.

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	6.5-9.1	g/s	B	B

Do the current condition (s) match the malfunction threshold?

YES

The MAF sensor is OK. Go to step 7.

NO

Replace MAF sensor/IAT sensor 1 .

7. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of IAT SENSOR (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1) Voltage	B	B

-6. Compare the value of the IAT SENSOR with the ambient temperature.

Does the value of the IAT SENSOR (1) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

The IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P0532 (1.5 L ENGINE)

DTC P0532 : A/C Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0532 A/C Pressure Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Start the engine, and let it idle.

   -2. Turn the blower switch on.

   -3. Turn the A/C switch on.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/C PRESSURE SENSOR	Less than 0.24	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (PD SENSOR line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

A/C pressure sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/C PRESSURE SENSOR	Less than 0.24	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

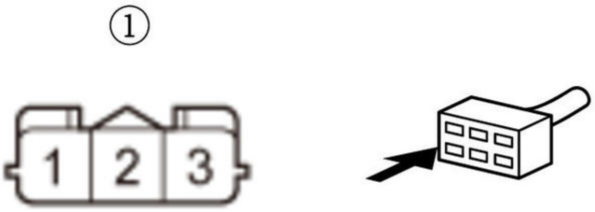
NO

Go to step 3.

3. Determine possible failure area (A/C pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/C pressure sensor 3P connector: disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	A/C pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the A/C pressure sensor .

NO

Go to step 4.

4. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

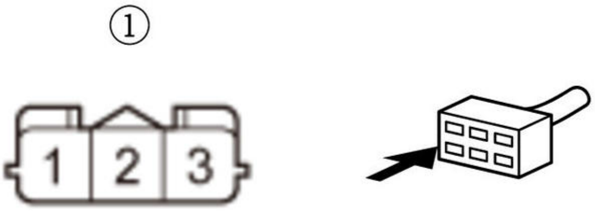
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 63**



Is there continuity?

YES

The VCC6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC6 wire between the PCM (E63) and the A/C pressure sensor.

5. Shorted wire check (PD SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

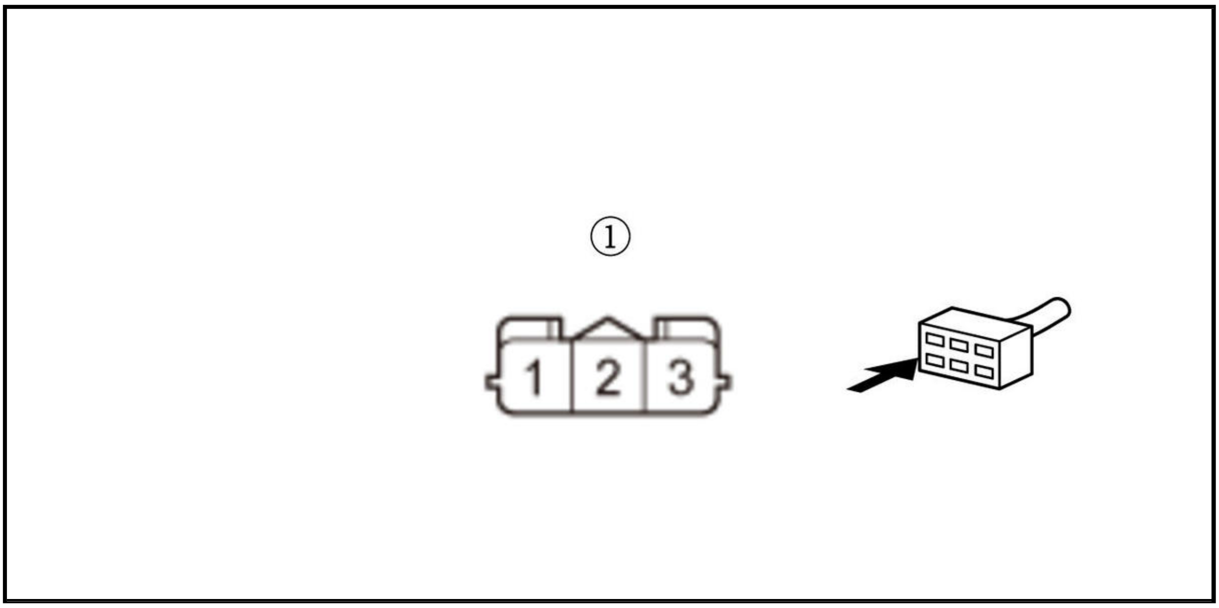
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PD SENSOR wire between the PCM (A33) and the A/C pressure sensor.

NO

The PD SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0532 (2.4 L ENGINE) (2017 2018 2019)

DTC P0532 : A/C Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0532 A/C Pressure Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Start the engine, and let it idle.

-2. Turn the blower switch on.

-3. Turn the A/C switch on.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/C Pressure Sensor	Less than 0.24	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (PD SENSOR line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

A/C pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
A/C Pressure Sensor	Less than 0.24	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

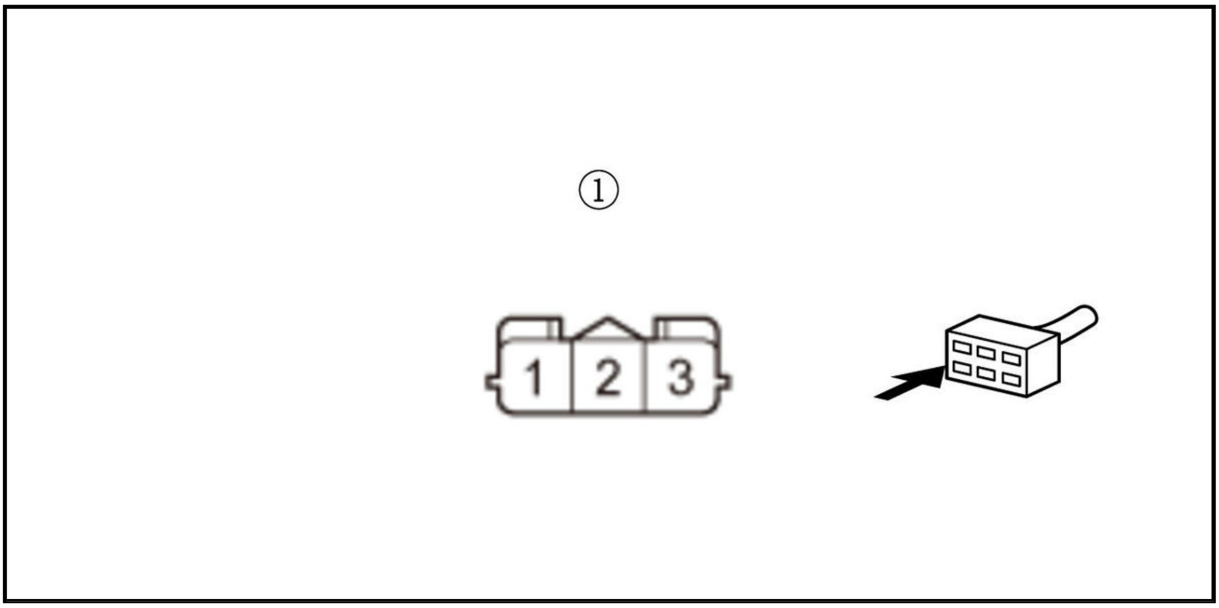
NO

Go to step 3.

3. Determine possible failure area (A/C pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/C pressure sensor 3P connector: disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	A/C pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the A/C pressure sensor .

NO

Go to step 4.

4. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

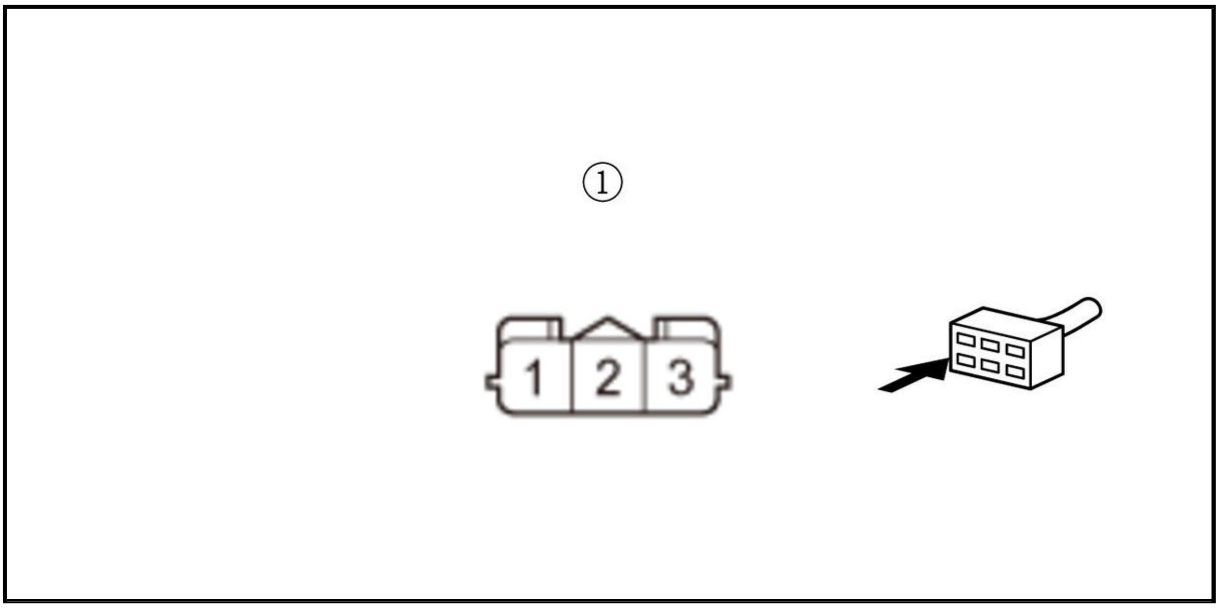
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector A (51P) No. 29**



Is there continuity?

YES

The VCC6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC6 wire between the PCM (A29) and the A/C pressure sensor.

5. Shorted wire check (PD SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

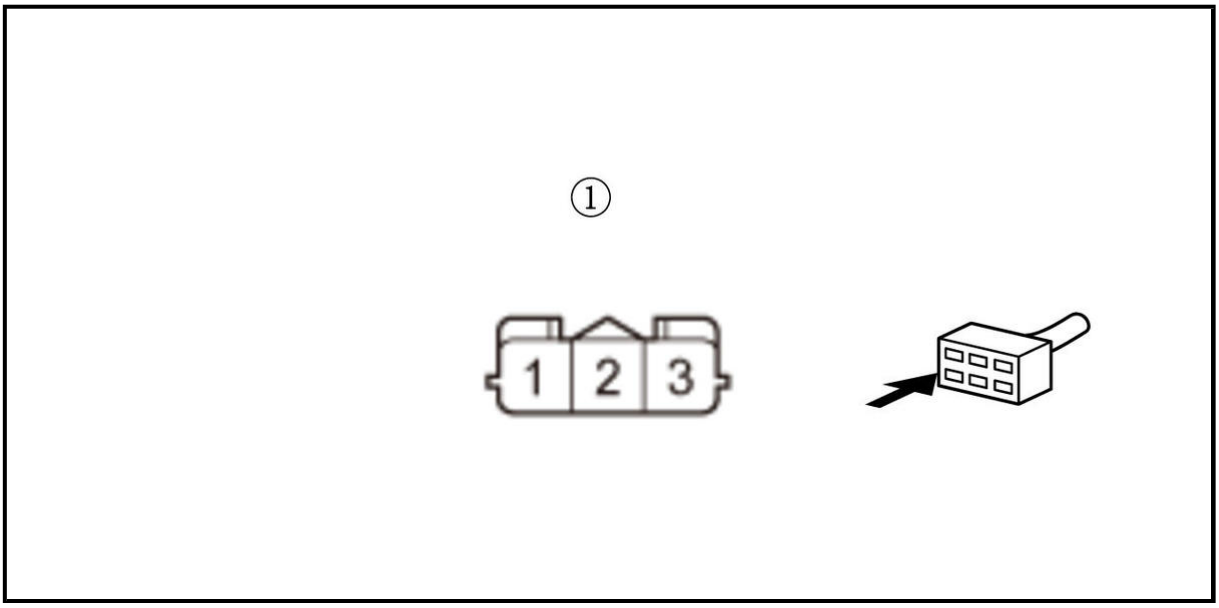
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PD SENSOR wire between the PCM (A41) and the A/C pressure sensor.

NO

The PD SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0533 (1.5 L ENGINE)

DTC P0533 : A/C Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0533 A/C Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Start the engine, and let it idle.

-2. Turn the blower switch on.

-3. Turn the A/C switch on.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/C PRESSURE SENSOR	More than 4.75	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (A/C pressure sensor, others)

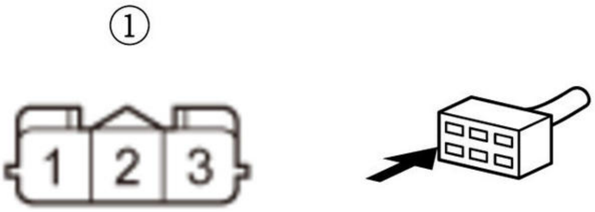
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

A/C pressure sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	A/C pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/C PRESSURE SENSOR	More than 4.75	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the A/C pressure sensor .

3. Determine possible failure area (SG6 line, others)

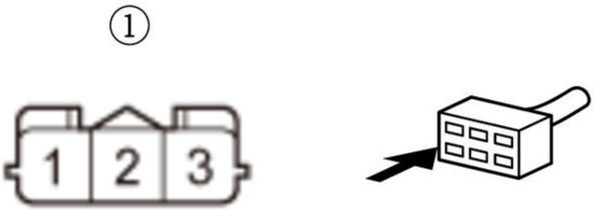
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the A/C pressure sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/C pressure sensor 3P connector: disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	A/C pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (PD SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

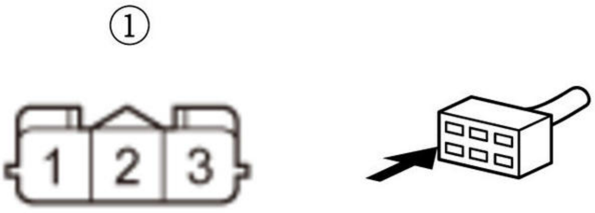
-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector A (50P): disconnected

Test point 1	A/C pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 33**



Is there continuity?

YES

The PD SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the PD SENSOR wire between the PCM (A33) and the A/C pressure sensor.

5. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

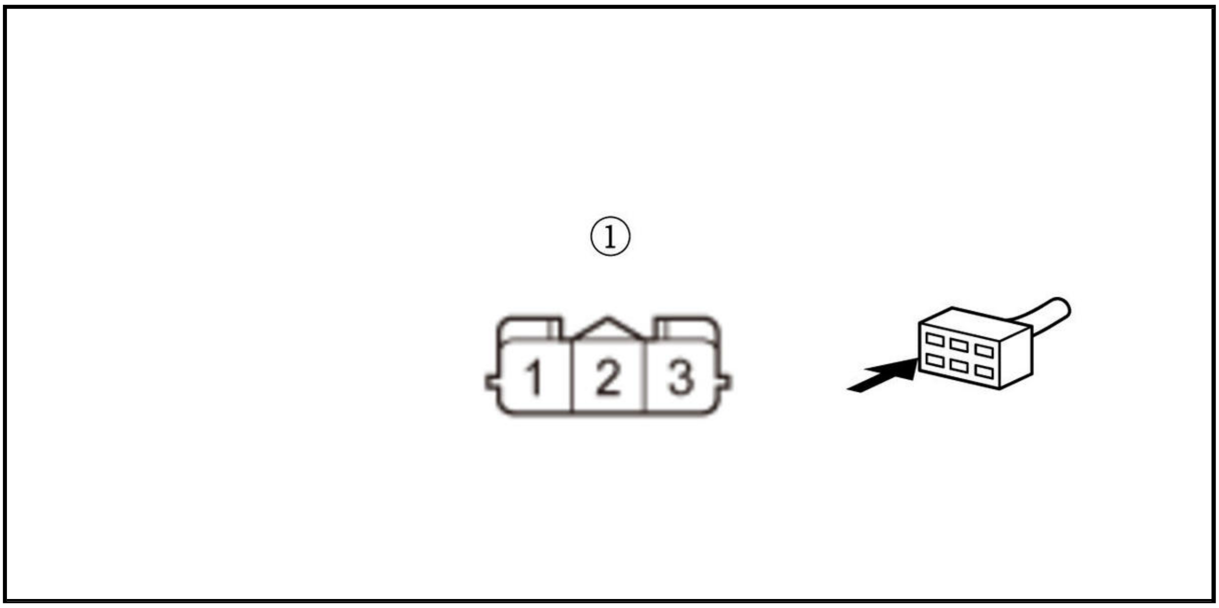
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 45**



Is there continuity?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the SG6 wire between the PCM (E45) and the A/C pressure sensor.

DTC P0533 (2.4 L ENGINE) (2017 2018 2019)

DTC P0533 : A/C Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0533 A/C Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Start the engine, and let it idle.

-2. Turn the blower switch on.

-3. Turn the A/C switch on.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/C Pressure Sensor	More than 4.75	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (A/C pressure sensor, others)

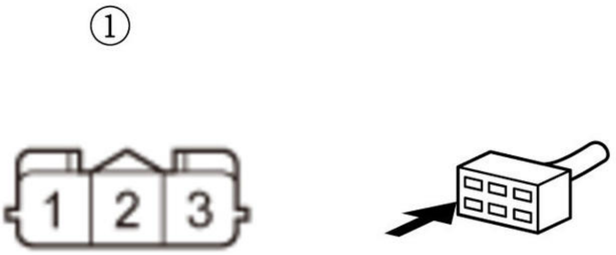
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

A/C pressure sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	A/C pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/C Pressure Sensor	More than 4.75	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the A/C pressure sensor .

3. Determine possible failure area (SG6 line, others)

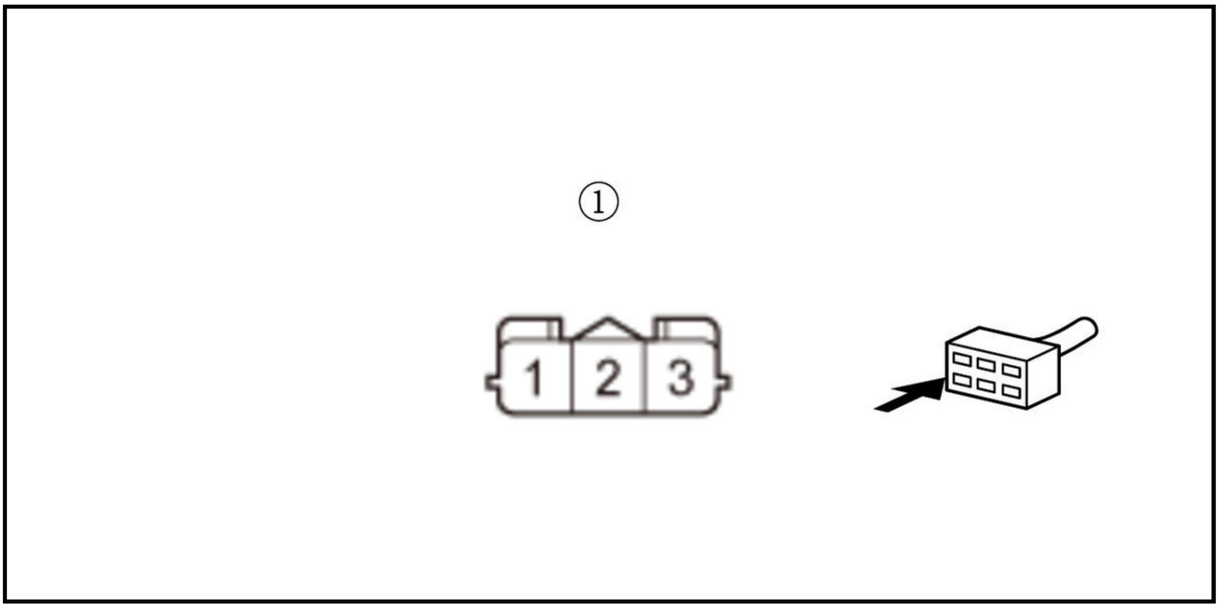
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the A/C pressure sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/C pressure sensor 3P connector: disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	A/C pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (PD SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

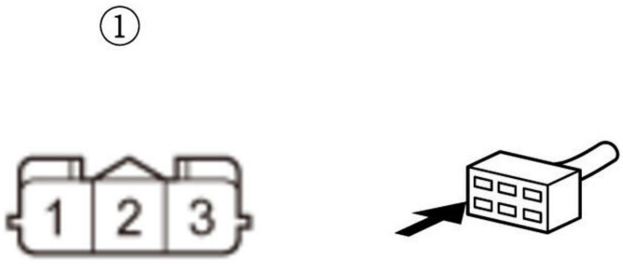
-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector A (51P): disconnected

Test point 1	A/C pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (51P) No. 41**



Is there continuity?

YES

The PD SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the PD SENSOR wire between the PCM (A41) and the A/C pressure sensor.

5. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

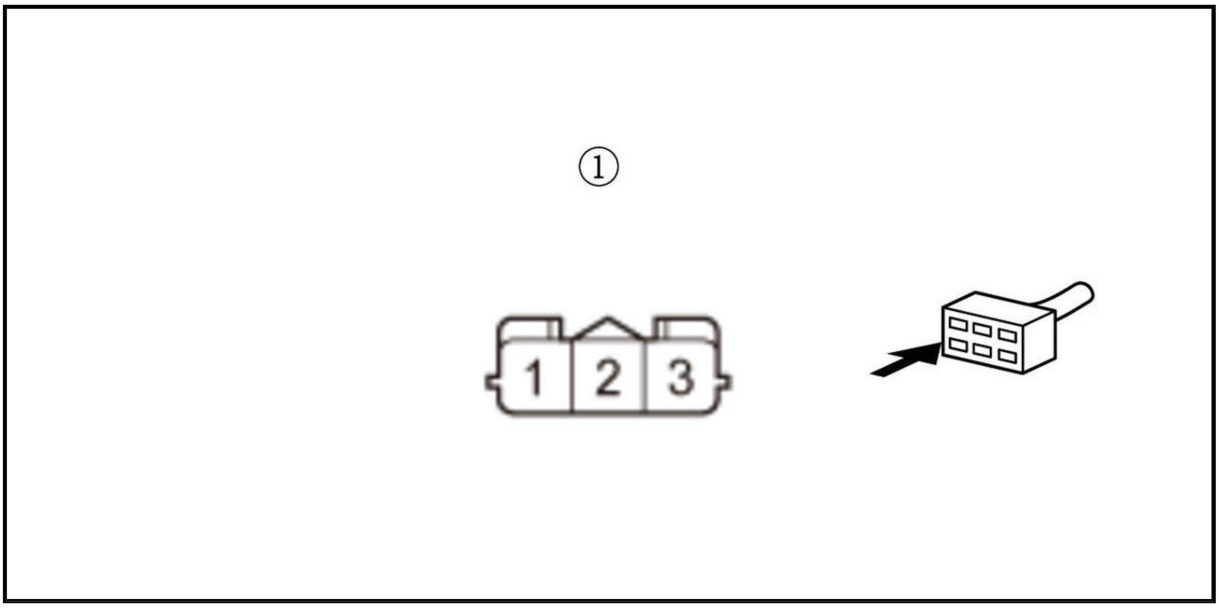
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector A (51P) No. 28**



Is there continuity?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (A28) and the A/C pressure sensor.

DTC P0562 (1.5 L ENGINE)

DTC P0562 : Charging System Low Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Check for a loose terminal on the alternator (+B terminal). If the alternator +B terminal was loose, DTC P0562 will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0562 Charging System Low Voltage	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine, and let it idle without load (in P or N) for 1 minute.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16BB Alternator B Terminal Circuit Low Voltage	B	B

Is DTC P16BB indicated?

YES

Go to the troubleshooting for **DTC P16BB** .

NO

Go to step 2.

2. Problem verification

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0562 Charging System Low Voltage	B	B

   Is DTC P0562 is indicated?

   YES

   The failure is duplicated. **Repair** or **replace the alternator** .

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the +B terminal on the alternator and the under-hood fuse/relay box. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0562 (2.4 L ENGINE) (2017 2018 2019)

DTC P0562 : Charging System Low Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Check for a loose terminal on the alternator (+B terminal). If the alternator +B terminal was loose, DTC P0562 will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0562 Charging System Low Voltage	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle without load (in P or N) for 1 minute.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16BB Alternator B Terminal Circuit Low Voltage	B	B

   Is DTC P16BB indicated?

YES

Go to the troubleshooting for DTC P16BB .

NO

Go to step 2.

2. Problem verification

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0562 Charging System Low Voltage	B	B

   Is DTC P0562 is indicated?

   YES

   The failure is duplicated. **Repair** or **replace the alternator** .

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the +B terminal on the alternator and the under-hood fuse/relay box. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0563 (1.5 L ENGINE)

DTC P0563 : PCM Power Source Circuit Unexpected Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0563 PCM Power Source Circuit Unexpected Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Wait 10 seconds.

   -5. Turn the vehicle to the ON mode.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0563 PCM Power Source Circuit Unexpected Voltage	B	B

   Is DTC P0563 indicated?

   YES

   Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (PGM-FI main relay 1 circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (FI MAIN RLY CL- line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 5**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 5.

NO

Go to step 3.

3. Shorted wire check (FI MAIN RLY CL- line)

-1. Disconnect the following connector

Relay circuit board connector A (8P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Relay circuit board connector A (8P): disconnected
Test point 1	**PCM connector A (50P) No. 5**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the FI MAIN RLY CL- wire between the PCM (A5) and the relay circuit board (PGM-FI main relay 1 circuit).

NO

Go to step 4.

4. Relay circuit board check

   -1. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

   NO

   Replace the relay circuit board .

5. Shorted wire check (FI MAIN RLY OUT line to power)

   -1. Disconnect the following connector.

Relay circuit board connector C (18P)

   -2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Relay circuit board connector C (18P): disconnected
Test point 1	**PCM connector A (50P) No. 8**
Test point 2	Body ground

   Is there battery voltage?

   YES

   Repair a short to power in the FI MAIN RLY OUT wire between the PCM (A8) and the relay circuit board (PGM-FI main relay 1 circuit).

   NO

   Go to step 6.

6. Relay circuit board check

   -1. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   The relay circuit board is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

   NO

   Replace the relay circuit board .

DTC P0563 (2.4 L ENGINE) (2017 2018 2019)

DTC P0563 : PCM Power Source Circuit Unexpected Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0563 PCM Power Source Circuit Unexpected Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Wait 10 seconds.

   -5. Turn the vehicle to the ON mode.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0563 PCM Power Source Circuit Unexpected Voltage	B	B

   Is DTC P0563 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (PGM-FI main relay 1 circuit) and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Determine possible failure area (FI MAIN RLY CL- line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (51P)

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
Test point 1	PCM connector A (51P) No. 3
Test point 2	Body ground

   Is there battery voltage?

   YES

   Go to step 5.

NO

Go to step 3.

3. Shorted wire check (FI MAIN RLY CL- line)

-1. Disconnect the following connector

Relay circuit board connector A (8P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Relay circuit board connector A (8P): disconnected
Test point 1	**PCM connector A (51P) No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the FI MAIN RLY CL- wire between the PCM (A3) and the relay circuit board (PGM-FI main relay 1 circuit).

NO

The FI MAIN RLY CL- wire is OK. Go to step 4.

4. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Replace the relay circuit board .

5. Shorted wire check (FI MAIN RLY OUT line to power)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Relay circuit board connector C (18P): disconnected
Test point 1	**PCM connector A (51P) No. 5**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the FI MAIN RLY OUT wire between the PCM (A5) and the relay circuit board (PGM-FI main relay 1 circuit).

NO

The FI MAIN RLY OUT wire is OK. Go to step 6.

6. Relay circuit board check

   -1. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   The relay circuit board is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

   NO

   Replace the relay circuit board .

DTC P0571 (1.5 L ENGINE)

DTC P0571 : Brake Pedal Position Switch Circuit Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the accelerator pedal is pressed with pressing the brake pedal lightly and continuously for 5 minutes or more, this DTC will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0571 Brake Pedal Position Switch Circuit Malfunction	B	B

DTC (PGM-FI)

1. Brake lights check 1

   -1. Check the brake lights without the brake pedal pressed.

   Do the brake lights stay on?

   YES

   Go to step 9.

   NO

   Go to step 2.

2. Brake lights check 2

   -1. Check the brake lights with the brake pedal pressed.

   Do the brake lights come on?

YES

Go to step 3.

NO

Go to step 5.

3. Brake pedal position switch signal check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
BRAKE SWITCH	B	B

Does the signal change ON and OFF when the brake pedal is pressed and released?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the brake pedal position switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Go to step 4.

4. Open wire check (STOP SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Press the brake pedal, and measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Brake pedal: pressed
Test point 1	**PCM connector A (50P) No. 26**
Test point 2	Body ground

Is there battery voltage?

YES

The STOP SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the STOP SW wire between the PCM (A26) and the brake pedal position switch.

5. Brake pedal position switch check

-1. **Test the brake pedal position switch** .

Is the brake pedal position switch normal?

YES

Go to step 6.

NO

Replace the brake pedal position switch .

6. Fuse check

-1. Check the following fuse.

Fuse	No. A9 (10 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 7.

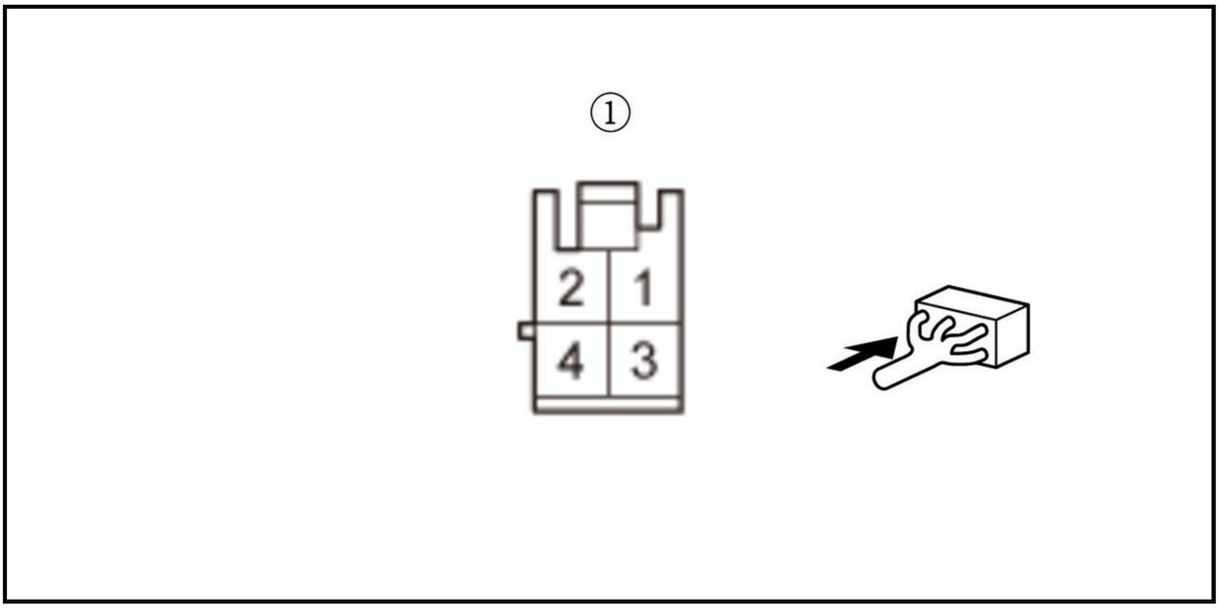
NO

Replace the No. A9 (10 A) fuse. Also check for a short to ground on the No. A9 (10 A) fuse circuit if needed.

7. Open wire check (+B STOP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Brake pedal position switch 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 8.

NO

Repair an open in the +B STOP wire between the No. A9 (10 A) fuse in the under-hood fuse/relay box and the brake pedal position switch.

8. Open wire check (STOP SW line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Press the brake pedal, and measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Brake pedal: pressed
Test point 1	**PCM connector A (50P) No. 26**
Test point 2	Body ground

Is there battery voltage?

YES

The STOP SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the STOP SW wire between the PCM (A26) and the brake pedal position switch.

9. Brake pedal position switch installation check

-1. **Remove the brake pedal position switch with the connector is connected** .

-2. Check the brake lights with the rod of the brake pedal position switch pressed.

Do the brake lights go off?

YES

The brake pedal position switch installation is incorrect, **install the brake pedal position switch and adjust the pedal height** .

NO

Go to step 10.

10. Brake pedal position switch check

-1. **Test the brake pedal position switch** .

Is the brake pedal position switch normal?

YES

The brake pedal position switch is OK, repair a short to power in the STOP SW wire between the PCM (A26) and the brake pedal position switch.

NO

Replace the brake pedal position switch .

DTC P0571 (2.4 L ENGINE) (2017 2018 2019)

DTC P0571 : Brake Pedal Position Switch Circuit Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the accelerator pedal is pressed with pressing the brake pedal lightly and continuously for 5 minutes or more, this DTC will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0571 Brake Pedal Position Switch Circuit Malfunction	B	B

DTC (PGM-FI)

1. Brake lights check 1

   -1. Check the brake lights without the brake pedal pressed.

   Do the brake lights stay on?

   YES

   Go to step 9.

   NO

   Go to step 2.

2. Brake lights check 2

   -1. Check the brake lights with the brake pedal pressed.

   Do the brake lights come on?

   YES

   Go to step 3.

   NO

   Go to step 5.

3. Brake pedal position switch signal check

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
BRAKE SWITCH	B	B

Does the signal change ON and OFF when the brake pedal is pressed and released?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the brake pedal position switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Go to step 4.

4. Open wire check (STOP SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Press the brake pedal, and measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Brake pedal: pressed
Test point 1	**PCM connector A (51P) No. 37**
Test point 2	Body ground

Is there battery voltage?

YES

The STOP SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the STOP SW wire between the PCM (A37) and the brake pedal position switch.

5. Brake pedal position switch check

-1. **Test the brake pedal position switch** .

Is the brake pedal position switch normal?

YES

Go to step 6.

NO

Replace the brake pedal position switch .

6. Fuse check

-1. Check the following fuse.

Fuse	No. A9 (10 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 7.

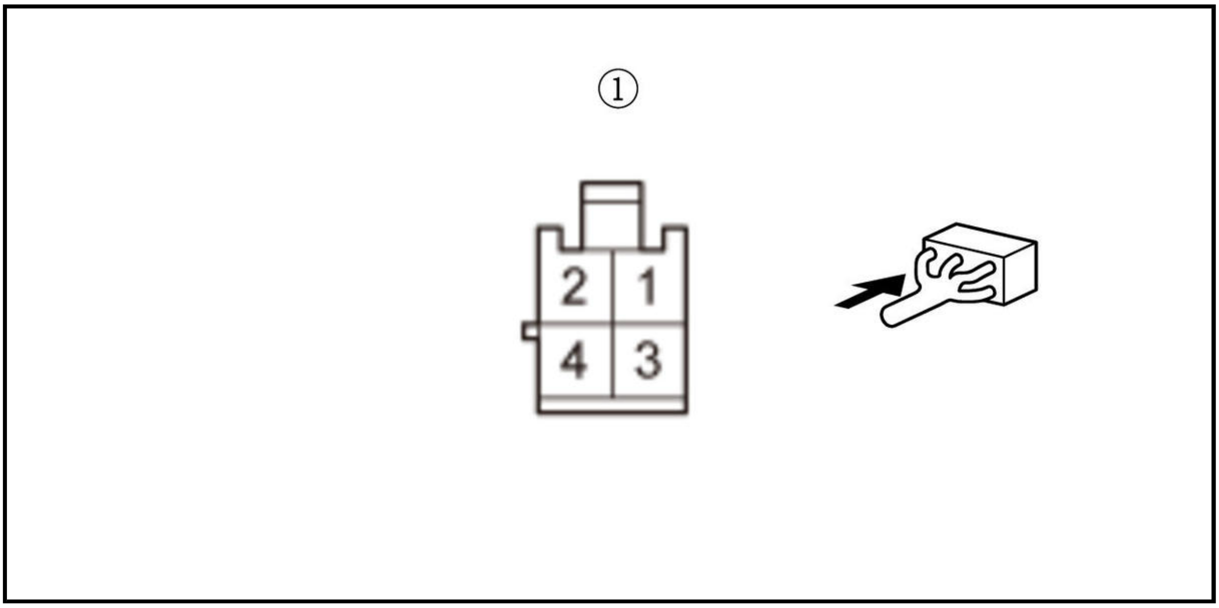
NO

Replace the No. A9 (10 A) fuse. Also check for a short to ground on the No. A9 (10 A) fuse circuit if needed.

7. Open wire check (+B STOP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Brake pedal position switch 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B STOP wire is OK. Go to step 8.

NO

Repair an open in the +B STOP wire between the No. A9 (10 A) fuse in the under-hood fuse/relay box and the brake pedal position switch.

8. Open wire check (STOP SW line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (51P)

-3. Press the brake pedal, and measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Brake pedal: pressed
Test point 1	**PCM connector A (51P) No. 37**
Test point 2	Body ground

Is there battery voltage?

YES

The STOP SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the STOP SW wire between the PCM (A37) and the brake pedal position switch.

9. Brake pedal position switch installation check

-1. **Remove the brake pedal position switch with the connector is connected** .

-2. Check the brake lights with the rod of the brake pedal position switch pressed.

Do the brake lights go off?

YES

The brake pedal position switch installation is incorrect, **install the brake pedal position switch and adjust the pedal height** .

NO

Go to step 10.

10. Brake pedal position switch check

-1. **Test the brake pedal position switch** .

Is the brake pedal position switch normal?

YES

The brake pedal position switch is OK, repair a short to power in the STOP SW wire between the PCM (A37) and the brake pedal position switch.

NO

Replace the brake pedal position switch .

DTC P059F, P05A3, P05A8, P05C0 (1.5 L ENGINE)

DTC P059F : Shutter Grille Assembly (Upper) Malfunction **DTC P05A3** : Shutter Grille Actuator (Upper) Malfunction **DTC P05A8** : Shutter Grille Actuator (Upper) Malfunction **DTC P05C0** : Shutter Grille Actuator (Upper) Temperature Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P059F Shutter Grille Assembly (Upper) Malfunction	B	B
P05A3 Shutter Grille Actuator (Upper) Malfunction	B	B

DTC Description	Confirmed DTC	Pending DTC
P05A8 Shutter Grille Actuator (Upper) Malfunction	B	B
P05C0 Shutter Grille Actuator (Upper) Temperature Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine, then let it idle.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P059F Shutter Grille Assembly (Upper) Malfunction	B	B
P05A3 Shutter Grille Actuator (Upper) Malfunction	B	B
P05A8 Shutter Grille Actuator (Upper) Malfunction	B	B
P05C0 Shutter Grille Actuator (Upper) Temperature Malfunction	B	B

   Is DTC P059F, P05A3, P05A8, or P05C0 is indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille (upper) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shutter grille condition check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for condition (damage, fixation, foreign material, etc.) at shutter grille.

   Is the shutter grille OK?

   YES (Without wireless charger)

   Go to step 3.

   YES (With wireless charger)

Go to step 4.

NO

Reassembly or repair the shutter grille, if needed.

3. Shorted wire check (VMP line)

-1. Check the following fuse.

Fuse	**No. A23**

Is the fuse OK?

YES

Go to step 6.

NO

Repair a short in the VMP wire between shutter grille (upper) and the No. A23 fuse. Also replace the No. A23 fuse.

4. Shorted wire check (VMP line)

-1. Check the following fuse.

Fuse	**No. G31**

Is the fuse OK?

YES

Go to step 5.

NO

Repair a short in the VMP wire between shutter grille (upper) and the No. G31 fuse. Also replace the No. G31 fuse.

5. Shorted wire check (+B FI ECU MAIN line)

-1. Check the following fuse.

Fuse	**No. A23**

Is the fuse OK?

YES

Go to step 6.

NO

Repair a short in the +B FI ECU MAIN wire between the A23 fuse and the No. G31 fuse. Also replace the No. A23 fuse.

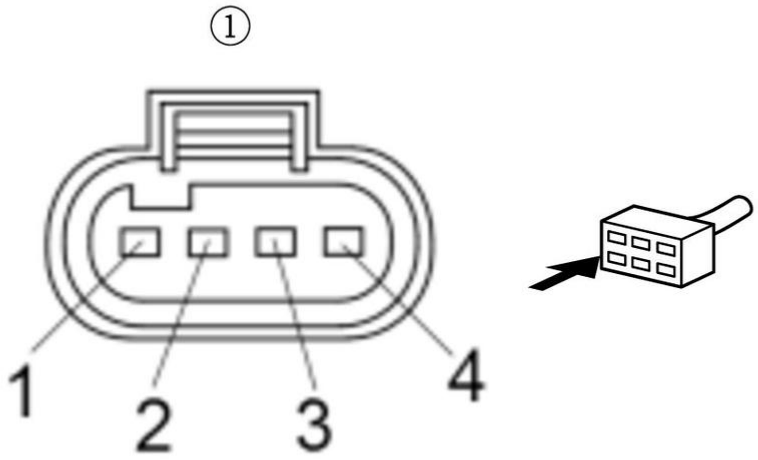
6. Open wire check (VMP line)

-1. Disconnect the following connector.

Shutter grille (upper) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper) 4P connector: disconnected
Test point 1	Shutter grille (upper) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 7.

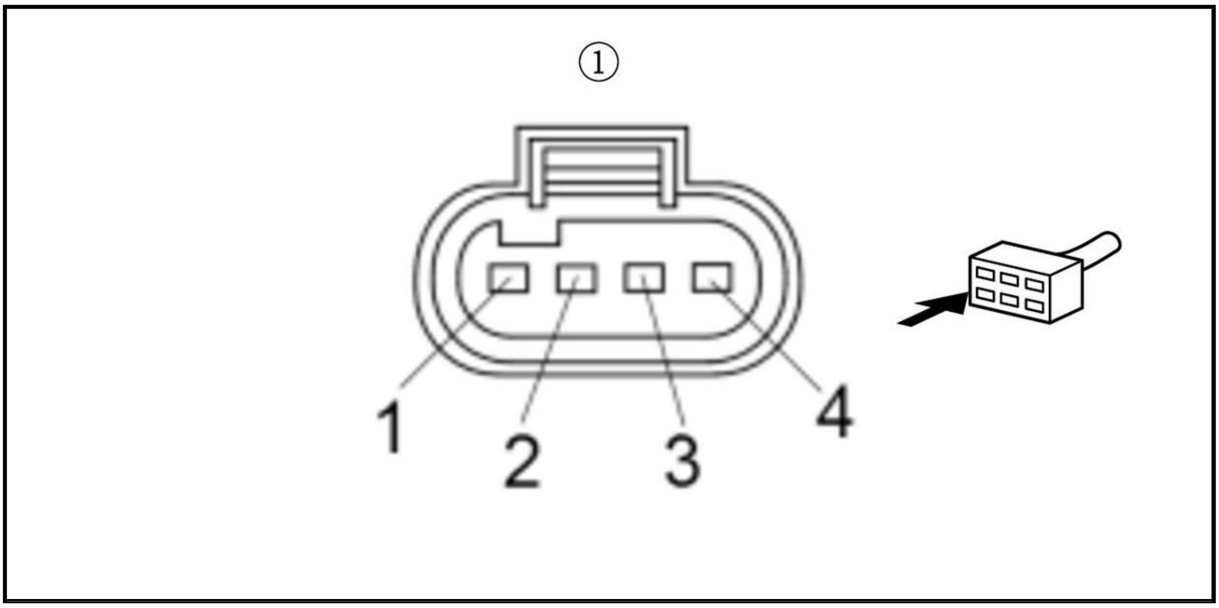
NO

Repair an open in the VMP wire between the shutter grille (upper) and the **No. A23 fuse** (with wireless charger: **No. G31 fuse**).

7. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper) 4P connector: disconnected
Test point 1	Shutter grille (upper) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Replace the shutter grille (upper) .

NO

Repair an open in the GND wire between the shutter grille (upper) and G351.

DTC P059F, P05A3, P05A8, P05C0 (2.4 L ENGINE) (2017 2018 2019)

DTC P059F : Shutter Grille Assembly (Upper) Malfunction **DTC P05A3** : Shutter Grille Actuator (Upper) Malfunction **DTC P05A8** : Shutter Grille Actuator (Upper) Malfunction **DTC P05C0** : Shutter Grille Actuator (Upper) Temperature Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P059F Shutter Grille Assembly (Upper) Malfunction	B	B
P05A3 Shutter Grille Actuator (Upper) Malfunction	B	B
P05A8 Shutter Grille Actuator (Upper) Malfunction	B	B
P05C0 Shutter Grille Actuator (Upper) Temperature Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, then let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P059F Shutter Grille Assembly (Upper) Malfunction	B	B
P05A3 Shutter Grille Actuator (Upper) Malfunction	B	B
P05A8 Shutter Grille Actuator (Upper) Malfunction	B	B
P05C0 Shutter Grille Actuator (Upper) Temperature Malfunction	B	B

Is DTC P059F, P05A3, P05A8, or P05C0 is indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille (upper) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shutter grille condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for condition (damage, fixation, foreign material, etc.) at shutter grille.

Is the shutter grille OK?

YES

Go to step 3.

NO

Reassembly or repair the shutter grille, if needed.

3. Shorted wire check (VMP line)

-1. Check the following fuse.

Fuse	No. A23 (10 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the VMP wire between shutter grille (upper) and the No. A23 (10 A) fuse. Also replace the No. A23 (10 A) fuse.

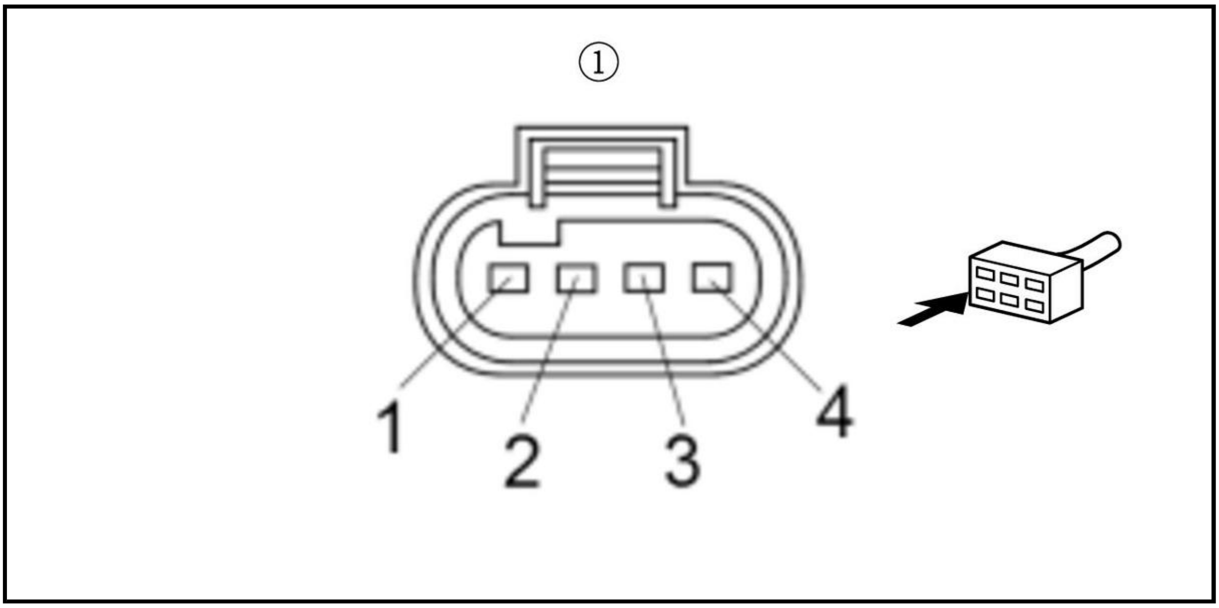
4. Open wire check (VMP line)

-1. Disconnect the following connector.

Shutter grille (upper) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper) 4P connector: disconnected
Test point 1	Shutter grille (upper) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

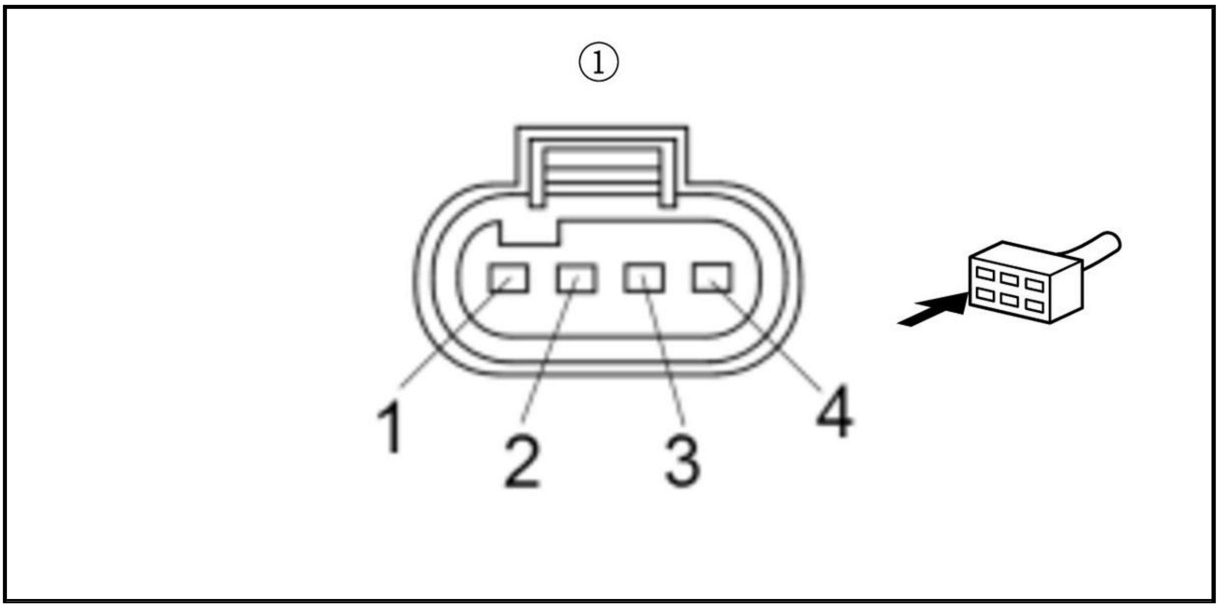
NO

Repair an open in the VMP wire between the shutter grille (upper) and the No. A23 (10 A) fuse in the under-hood fuse/relay box.

5. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper) 4P connector: disconnected
Test point 1	Shutter grille (upper) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the shutter grille (upper) .

NO

Repair an open in the GND wire between the shutter grille (upper) and G351.

DTC P05A0 (1.5 L ENGINE)

DTC P05A0 : Shutter Grille Assembly (Upper) Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P05A0 Shutter Grille Assembly (Upper) Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, then let it idle.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Upper shutter grill block error	Normal	B	B	B
Upper shutter grill initial learning error	Completed	B	B	B

Do the current condition (s) match the threshold?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille (upper) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Go to step 2.

2. Shutter grille condition check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Inspect the upper shutter grille for any damage or foreign materials caught in the shutter assembly.

   Is the shutter grille OK?

   YES (Without wireless charger)

   Go to step 3.

   YES (With wireless charger)

   Go to step 4.

   NO

   Remove the foreign material or **replace the shutter grille (upper)** .

3. Shorted wire check (VMP line)

   -1. Check the following fuse.

Fuse	**No. A23**

   Is the fuse OK?

   YES

   Go to step 6.

   NO

   Repair a short in the VMP wire between shutter grille (upper) and the No. A23 fuse. Also replace the No. A23 fuse.

4. Shorted wire check (VMP line)

   -1. Check the following fuse.

Fuse	**No. G31**

   Is the fuse OK?

   YES

   Go to step 5.

   NO

Repair a short in the VMP wire between shutter grille (upper) and the No. G31 fuse. Also replace the No. G31 fuse.

5. Shorted wire check (+B FI ECU MAIN line)

-1. Check the following fuse.

Fuse	**No. A23**

Is the fuse OK?

YES

Go to step 6.

NO

Repair a short in the +B FI ECU MAIN wire between the A23 fuse and the No. G31 fuse. Also replace the No. A23 fuse.

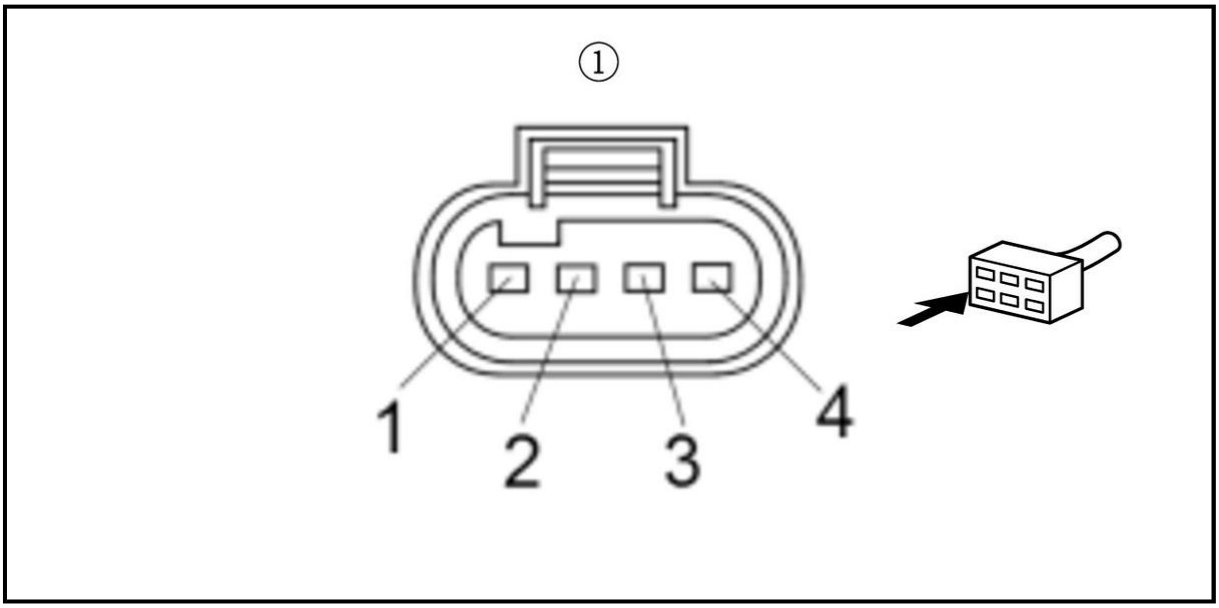
6. Open wire check (VMP line)

-1. Disconnect the following connector.

Shutter grille (upper) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper) 4P connector: disconnected
Test point 1	Shutter grille (upper) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 7.

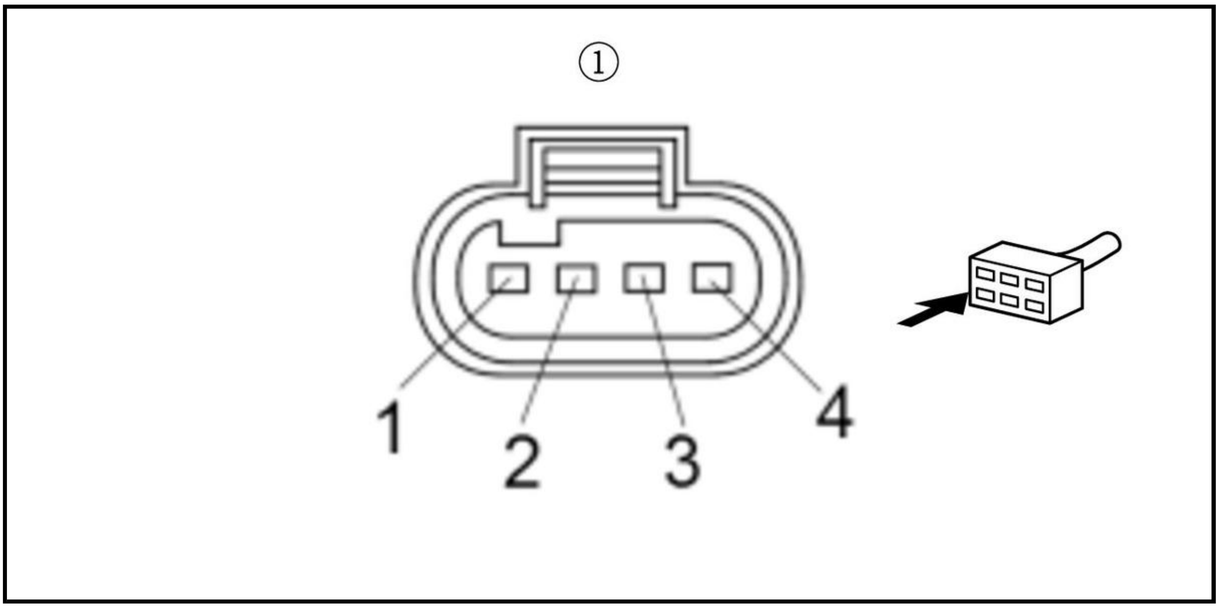
NO

Repair an open in the VMP wire between the shutter grille (upper) and the **No. A23 fuse** (with wireless charger: **No. G31 fuse**).

7. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper) 4P connector: disconnected
Test point 1	Shutter grille (upper) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Replace the shutter grille (upper) .

NO

Repair an open in the GND wire between the shutter grille (upper) and G351.

DTC P05A0 (2.4 L ENGINE) (2017 2018 2019)

DTC P05A0 : Shutter Grille Assembly (Upper) Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P05A0 Shutter Grille Assembly (Upper) Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, then let it idle.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Upper shutter grill block error	Normal	B	B	B
Upper shutter grill initial learning error	Completed	B	B	B

Do the current condition (s) match the threshold?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille (upper) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Go to step 2.

2. Shutter grille condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the upper shutter grille for any damage or foreign materials caught in the shutter assembly.

Is the shutter grille OK?

YES

Go to step 3.

NO

Remove the foreign material or **replace the shutter grille (upper)** .

3. Shorted wire check (VMP line)

-1. Check the following fuse.

Fuse	No. A23 (10 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the VMP wire between shutter grille (upper) and the No. A23 (10 A) fuse. Also replace the No. A23 (10 A) fuse.

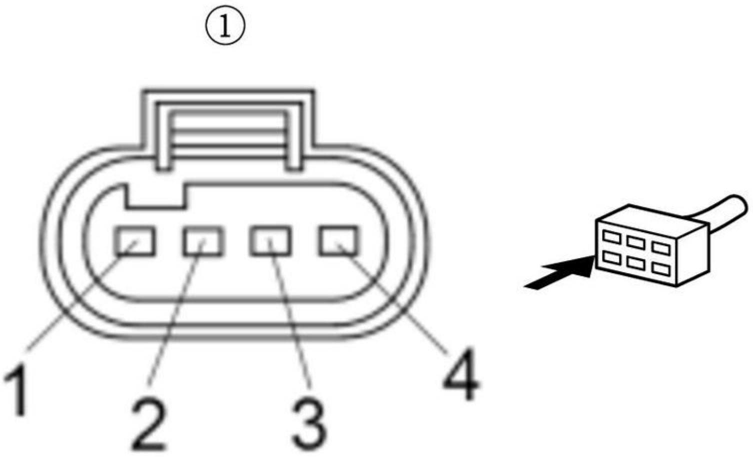
4. Open wire check (VMP line)

-1. Disconnect the following connector.

Shutter grille (upper) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper) 4P connector: disconnected
Test point 1	Shutter grille (upper) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

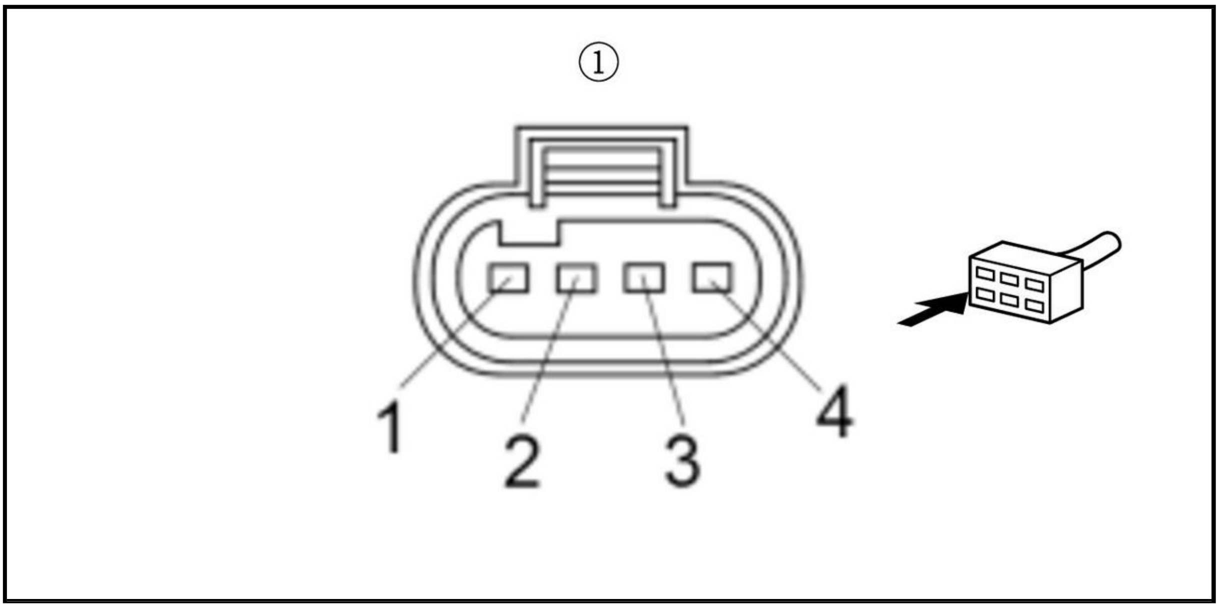
NO

Repair an open in the VMP wire between the shutter grille (upper) and the No. A23 (10 A) fuse in the under-hood fuse/relay box.

5. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper) 4P connector: disconnected
Test point 1	Shutter grille (upper) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the shutter grille (upper) .

NO

Repair an open in the GND wire between the shutter grille (upper) and G351.

DTC P05AE, P05B2, P05B7, P05C1 (1.5 L ENGINE)

DTC P05AE : Shutter Grille Assembly (Lower) Malfunction **DTC P05B2** : Shutter Grille Actuator (Lower) Malfunction **DTC P05B7** : Shutter Grille Actuator (Lower) Malfunction **DTC P05C1** : Shutter Grille Actuator (Lower) Temperature Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P05AE Shutter Grille Assembly (Lower) Malfunction	B	B
P05B2 Shutter Grille Actuator (Lower) Malfunction	B	B
P05B7 Shutter Grille Actuator (Lower) Malfunction	B	B
P05C1 Shutter Grille Actuator (Lower) Temperature Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine, then let it idle.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P05AE Shutter Grille Assembly (Lower) Malfunction	B	B
P05B2 Shutter Grille Actuator (Lower) Malfunction	B	B
P05B7 Shutter Grille Actuator (Lower) Malfunction	B	B
P05C1 Shutter Grille Actuator (Lower) Temperature Malfunction	B	B

Is DTC P05AE, P05B2, P05B7, or P05C1 is indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille (lower) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shutter grille condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for condition (damage, fixation, foreign material, etc.) at shutter grille.

Is the shutter grille OK?

YES

Go to step 3.

NO

Reassembly or repair the shutter grille, if needed.

3. Shorted wire check (+B FR FOG/VMP line)

-1. Check the following fuse.

Fuse	**No. A22**

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the +B FR FOG/VMP wire between shutter grille (lower) and the No. A22 fuse. Also replace the No. A22 fuse.

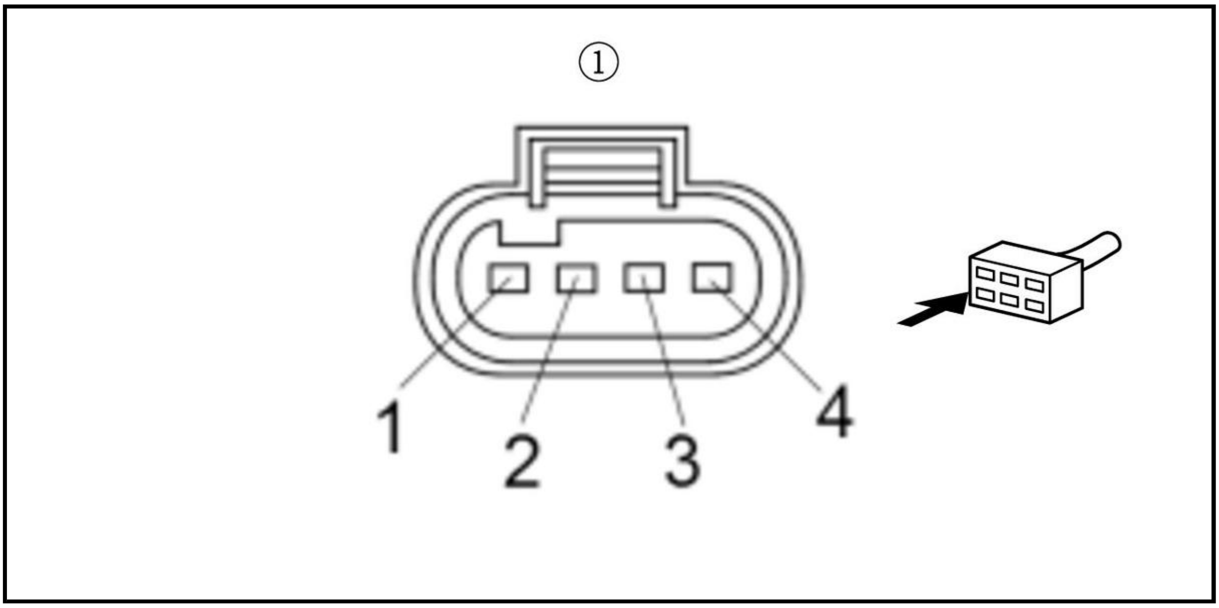
4. Open wire check (+B FR FOG/VMP line)

-1. Disconnect the following connector.

Shutter grille (lower) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Shutter grille (lower) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

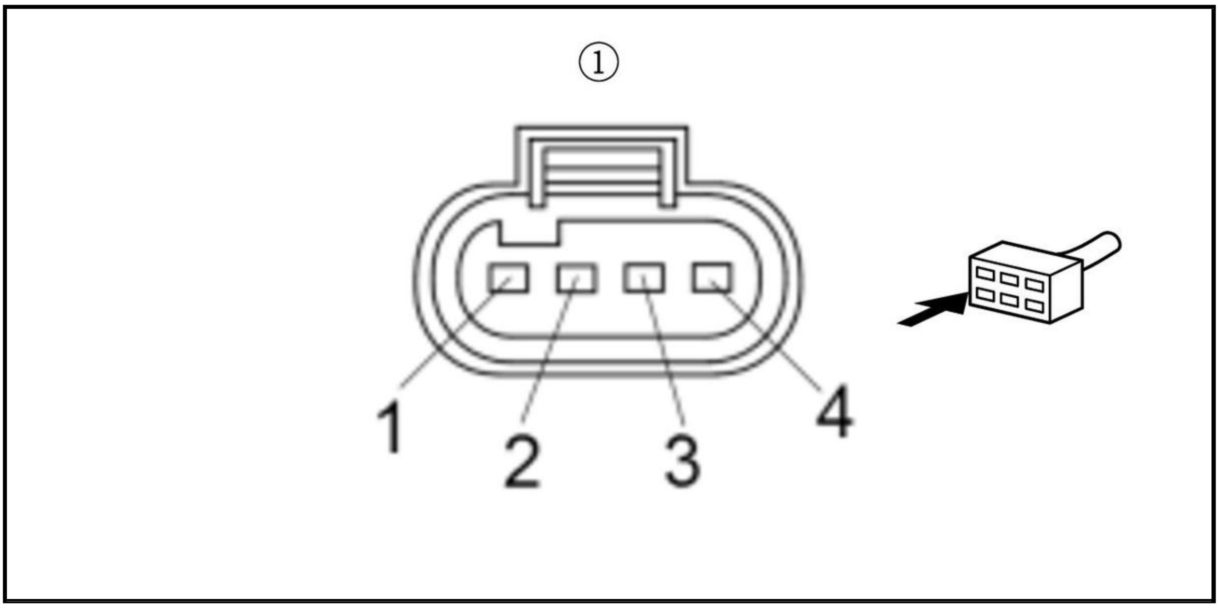
NO

Repair an open in the +B FR FOG/VMP wire between the shutter grille (lower) and the **No. A22 fuse** .

5. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Shutter grille (lower) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Replace the shutter grille (lower) .

NO

Repair an open in the GND wire between the shutter grille (lower) and G251.

DTC P05AE, P05B2, P05B7, P05C1 (2.4 L ENGINE) (2017 2018 2019)

DTC P05AE : Shutter Grille Assembly (Lower) Malfunction **DTC P05B2** : Shutter Grille Actuator (Lower) Malfunction **DTC P05B7** : Shutter Grille Actuator (Lower) Malfunction **DTC P05C1** : Shutter Grille Actuator (Lower) Temperature Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P05AE Shutter Grille Assembly (Lower) Malfunction	B	B
P05B2 Shutter Grille Actuator (Lower) Malfunction	B	B
P05B7 Shutter Grille Actuator (Lower) Malfunction	B	B
P05C1 Shutter Grille Actuator (Lower) Temperature Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine, then let it idle.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P05AE Shutter Grille Assembly (Lower) Malfunction	B	B
P05B2 Shutter Grille Actuator (Lower) Malfunction	B	B
P05B7 Shutter Grille Actuator (Lower) Malfunction	B	B
P05C1 Shutter Grille Actuator (Lower) Temperature Malfunction	B	B

Is DTC P05AE, P05B2, P05B7, or P05C1 is indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille (lower) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shutter grille condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for condition (damage, fixation, foreign material, etc.) at shutter grille.

Is the shutter grille OK?

YES

Go to step 3.

NO

Reassembly or repair the shutter grille, if needed.

3. Shorted wire check (+B FR FOG line)

-1. Check the following fuse.

Fuse	No. A22 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the +B FR FOG wire between shutter grille (lower) and the No. A22 (15 A) fuse. Also replace the No. A22 (15 A) fuse.

4. Open wire check (+B FR FOG line)

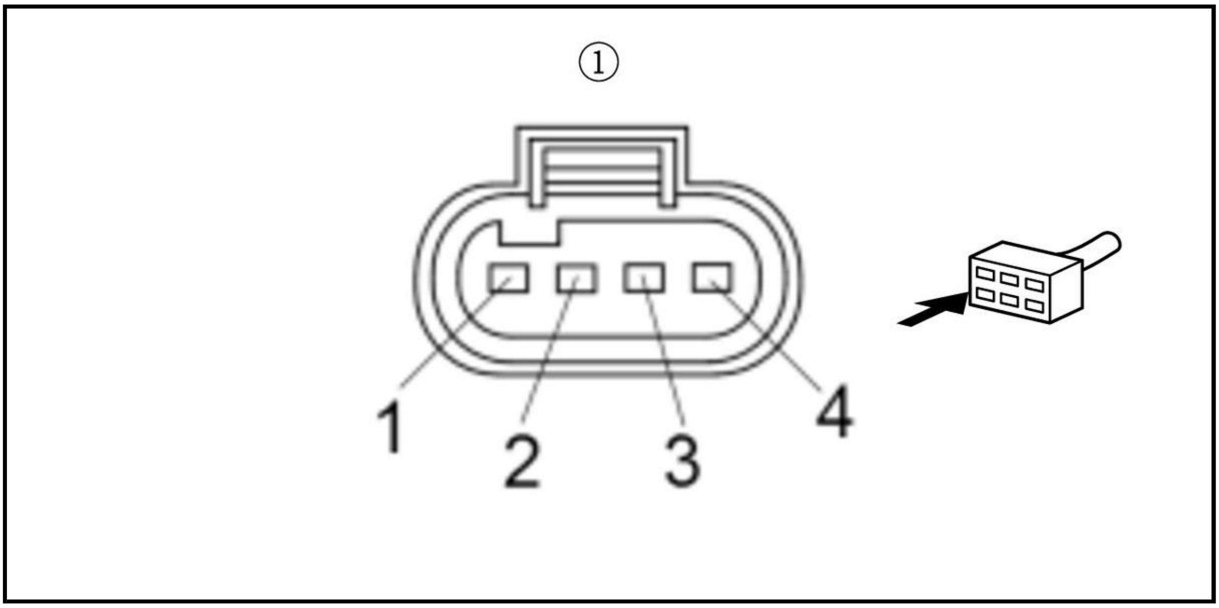
-1. Disconnect the following connector.

Shutter grille (lower) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Shutter grille (lower) 4P connector (female terminals) No. 1: ①

Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

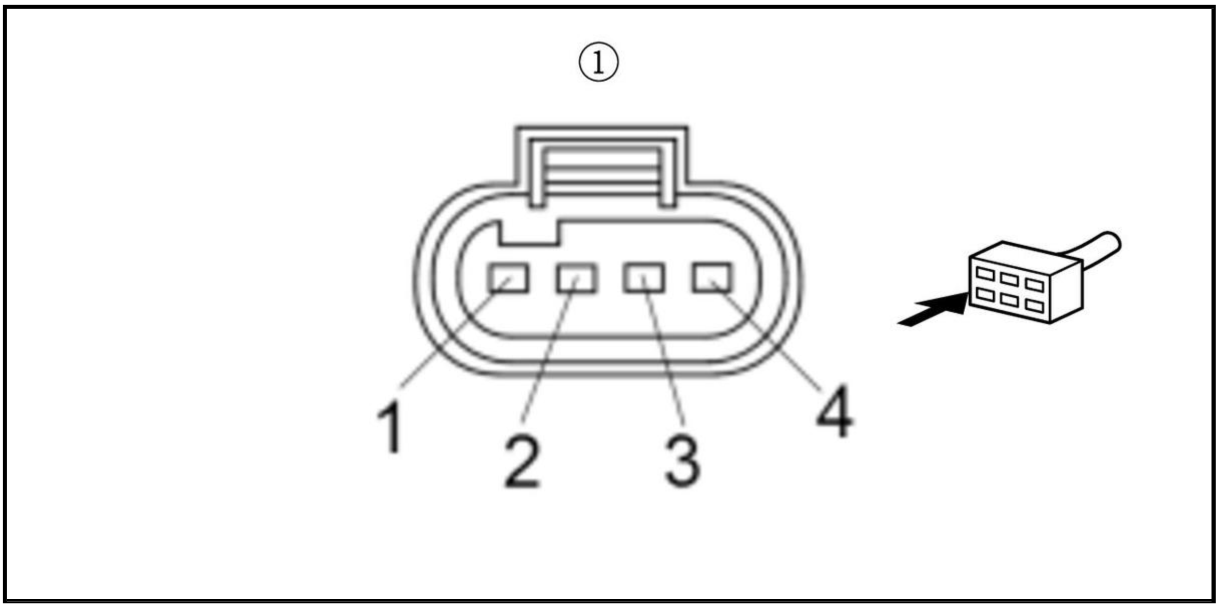
NO

Repair an open in the +B FR FOG wire between the shutter grille (lower) and the No. A22 (15 A) fuse in the under-hood fuse/relay box.

5. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Shutter grille (lower) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the shutter grille (lower) .

NO

Repair an open in the GND wire between the shutter grille (lower) and G251.

DTC P05AF (1.5 L ENGINE)

DTC P05AF : Shutter Grille Assembly (Lower) Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P05AF Shutter Grille Assembly (Lower) Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, then let it idle.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Lower shutter grill block error	Normal	B	B	B
Lower shutter grill initial learning error	Completed	B	B	B

Do the current condition (s) match the threshold?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille (lower) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Go to step 2.

2. Shutter grille condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the lower shutter grille for any damage or foreign materials caught in the shutter assembly.

Is the shutter grille OK?

YES

Go to step 3.

NO

Remove the foreign material or **replace the shutter grille (lower)** .

3. Shorted wire check (+B FR FOG/VMP line)

-1. Check the following fuse.

Fuse	**No. A22**

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the +B FR FOG/VMP wire between shutter grille (lower) and the No. A22 fuse. Also replace the No. A22 fuse.

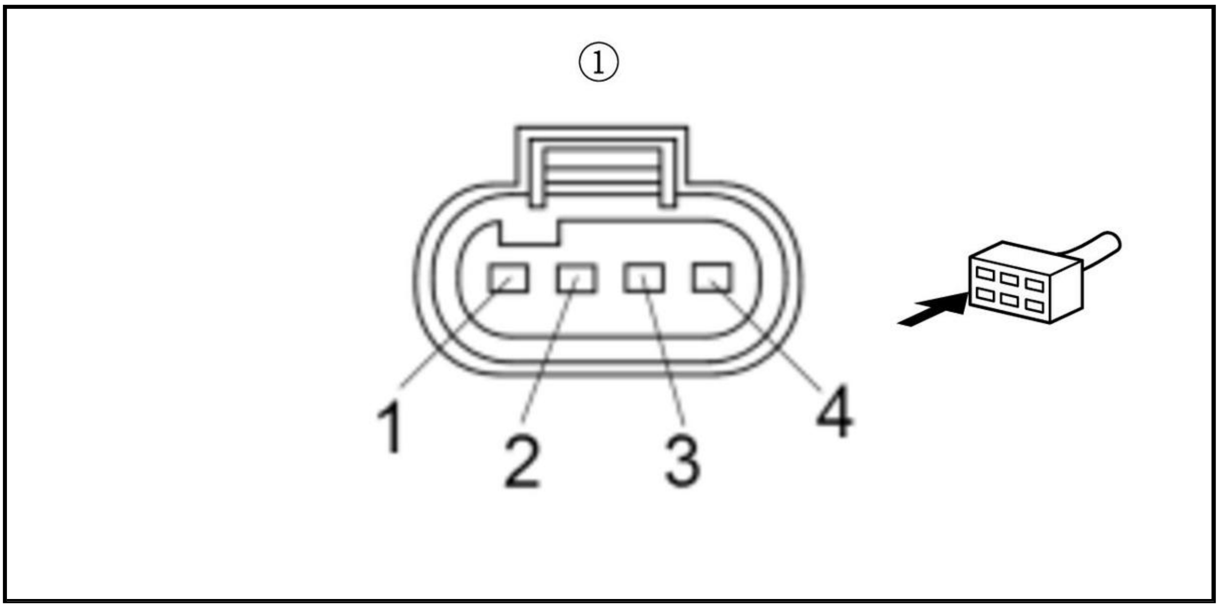
4. Open wire check (+B FR FOG/VMP line)

-1. Disconnect the following connector.

Shutter grille (lower) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Shutter grille (lower) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

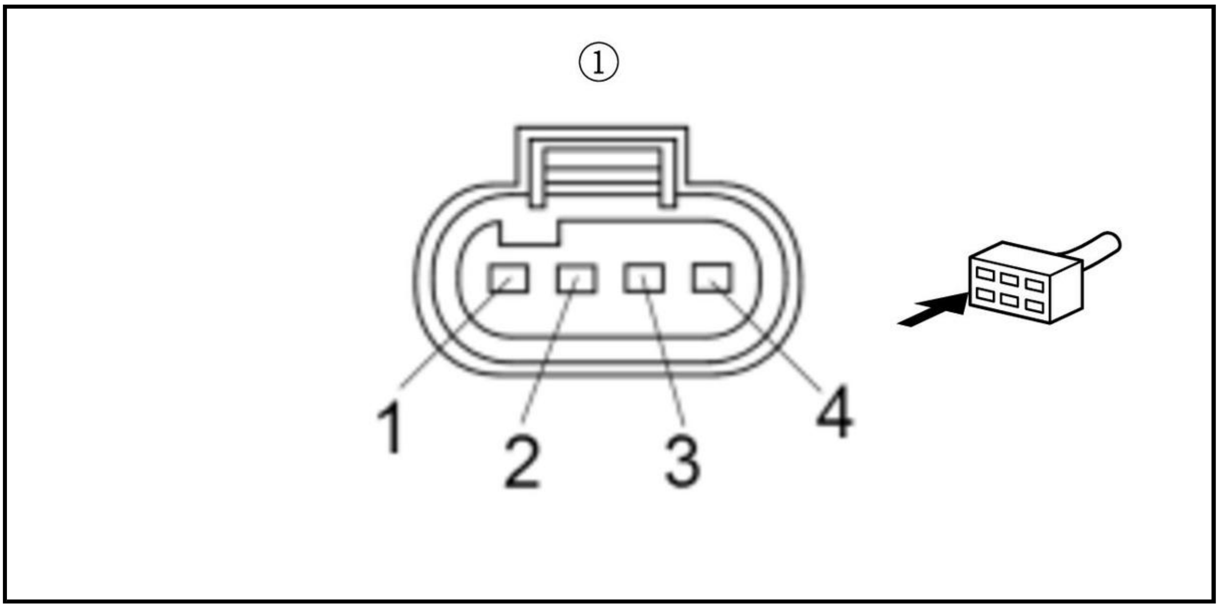
NO

Repair an open in the +B FR FOG/VMP wire between the shutter grille (lower) and the **No. A22 fuse** .

5. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Shutter grille (lower) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Replace the shutter grille (lower) .

NO

Repair an open in the GND wire between the shutter grille (lower) and G251.

DTC P05AF (2.4 L ENGINE) (2017 2018 2019)

DTC P05AF : Shutter Grille Assembly (Lower) Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P05AF Shutter Grille Assembly (Lower) Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine, then let it idle.

   -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Lower shutter grill block error	Normal	B	B	B
Lower shutter grill initial learning error	Completed	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille (lower) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   Go to step 2.

2. Shutter grille condition check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Inspect the lower shutter grille for any damage or foreign materials caught in the shutter assembly.

   Is the shutter grille OK?

   YES

   Go to step 3.

NO

Remove the foreign material or replace the shutter grille (lower) .

3. Shorted wire check (+B FR FOG line)

-1. Check the following fuse.

Fuse	No. A22 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the +B FR FOG wire between shutter grille (lower) and the No. A22 (15 A) fuse. Also replace the No. A22 (15 A) fuse.

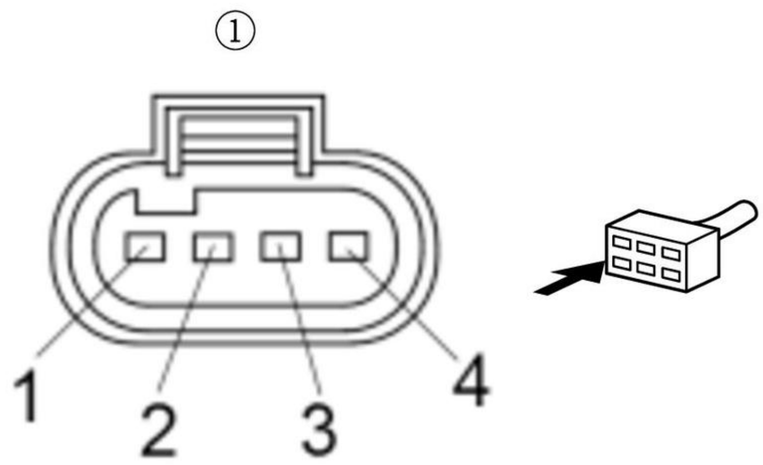
4. Open wire check (+B FR FOG line)

-1. Disconnect the following connector.

Shutter grille (lower) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Shutter grille (lower) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

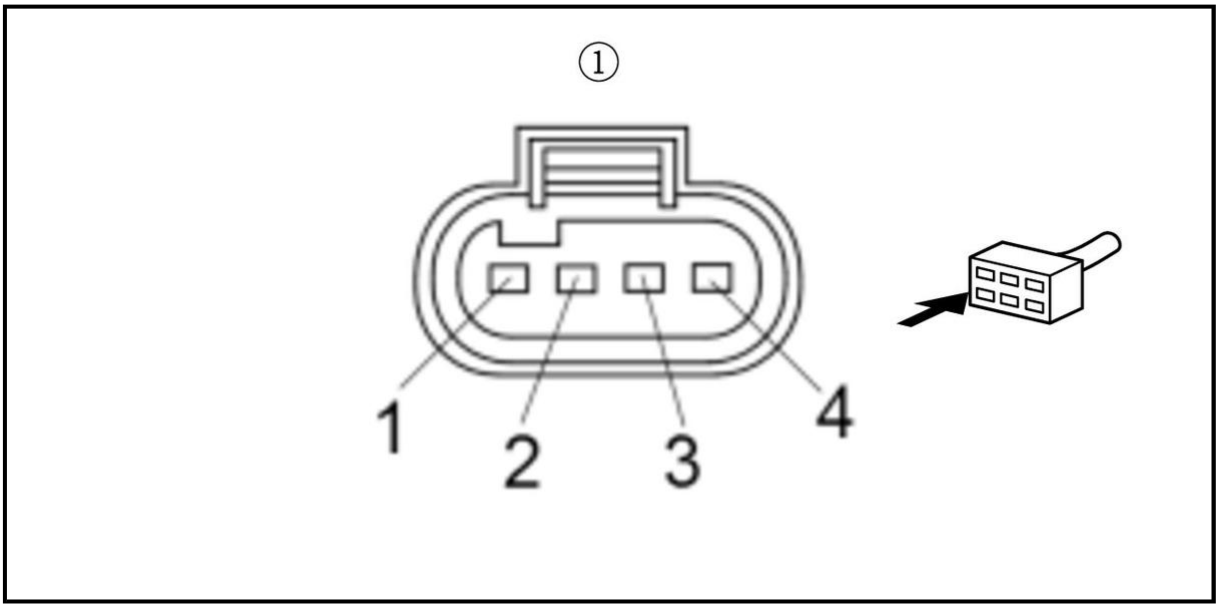
NO

Repair an open in the +B FR FOG wire between the shutter grille (lower) and the No. A22 (15 A) fuse in the under-hood fuse/relay box.

5. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Shutter grille (lower) 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the shutter grille (lower) .

NO

Repair an open in the GND wire between the shutter grille (lower) and G251.

DTC P0600 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC P0600 : PCM Serial Communication Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0600 PCM Serial Communication Failure	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle 5 seconds or more.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0600 PCM Serial Communication Failure	B	B

Is DTC P0600 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0602 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC P0602 : PCM Programming Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is indicated when the PCM update procedure is not completed.
- Do not turn the vehicle to the other than ON mode while updating the PCM. If you do, the PCM can be damaged.

DTC Description	Confirmed DTC	Pending DTC
P0602 PCM Programming Error	B	B

DTC (PGM-FI)

1. Problem verification (update)

-1. **Update the PCM** .

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0602 PCM Programming Error	B	B

Is DTC P0602 indicated?

YES

Replace the PCM .

NO

Update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0602 (PGM-FI SYSTEM (2.4 L ENGINE)) (2017 2018 2019)

DTC P0602 : PCM Programming Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is indicated when the PCM update procedure is not completed.
- Do not turn the vehicle to the other than ON mode while updating the PCM. If you do, the PCM can be damaged.

DTC Description	Confirmed DTC	Pending DTC
P0602 ECM/PCM Programming Error	B	B

DTC (PGM-FI)

1. Problem verification (update)

   -1. **Update the PCM** .

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0602 ECM/PCM Programming Error	B	B

   Is DTC P0602 indicated?

   YES

   Replace the PCM .

   NO

   Update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0607 (2.4 L ENGINE) (2017 2018 2019)

DTC P0607 : PCM Internal Circuit Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- DTC P0607 is stored at the same time as any of DTC P1xxx caused by the PCM internal failure. Troubleshoot those DTCs indicated at the same time as DTC P0607 first, then recheck for P0607.

DTC Description	Confirmed DTC	Pending DTC
P0607 PCM Internal Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any of DTC P1xxx indicated at the same time as DTC P0607?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 1-2 and recheck. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P060A (1.5 L ENGINE)

DTC P060A : PCM Internal Control Module Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P060A PCM Internal Control Module Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P060A PCM Internal Control Module Malfunction	B	B

Is DTC P060A indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P060A (2.4 L ENGINE) (2017 2018 2019)

DTC P060A : PCM Internal Control Module Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P060A PCM Internal Control Module Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P060A PCM Internal Control Module Malfunction	B	B

   Is DTC P060A indicated?

   YES

   The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

   NO

   Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0615 (1.5 L ENGINE)

DTC P0615 : Starter Cut Relay Diagnosis Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0615 Starter Cut Relay Diagnosis Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Try to start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0615 Starter Cut Relay Diagnosis Circuit Malfunction	B	B

   Is DTC P0615 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F3 Starter Cut Relay 1 Control Circuit Low Voltage	B	B
P16F4 Starter Cut Relay 2 Control Circuit Low Voltage	B	B

Are DTC P16F3 and P16F4 indicated?

YES

Go to the troubleshooting for DTC **P16F3** and **P16F4** .

NO

Go to step 3.

3. Determine possible failure area (START DIAG line, others)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Try to start the engine.

Does the engine start?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (START DIAG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

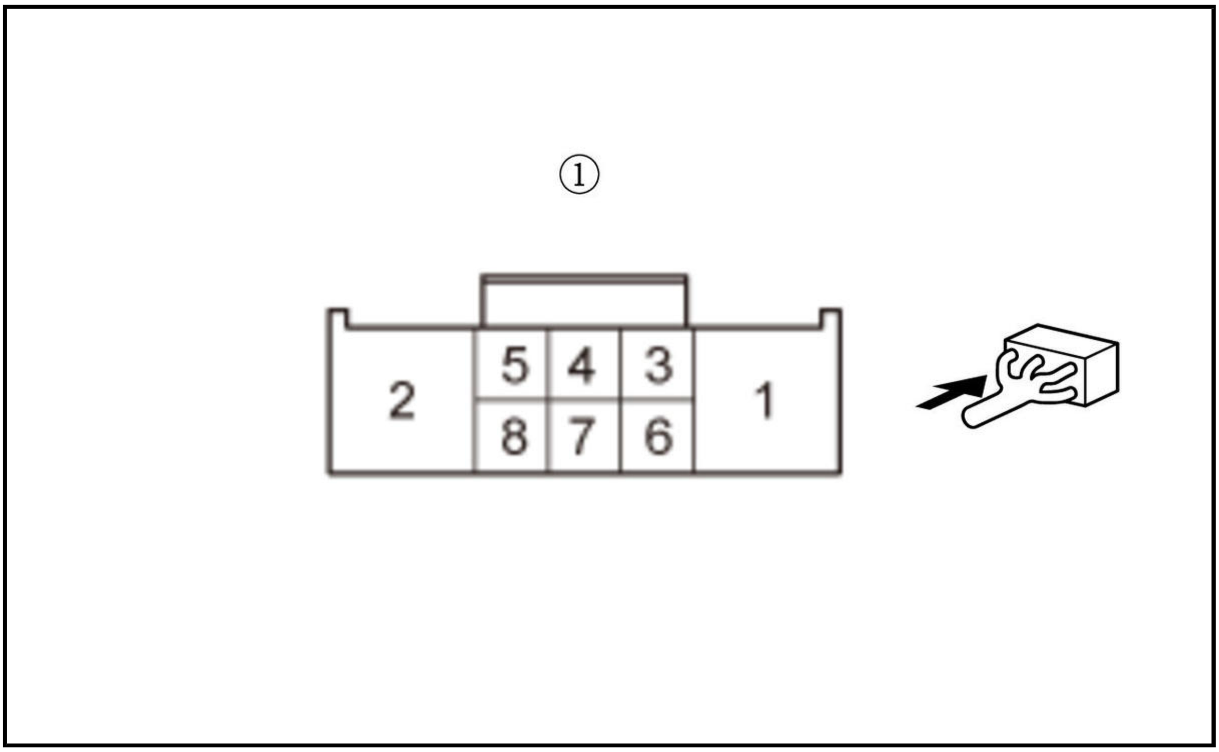
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
Relay circuit board connector A (8P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board connector A (8P): disconnected
	PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 8: ①
Test point 2	**PCM connector A (50P) No. 19**



Is there continuity?

YES

The START DIAG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the START DIAG wire between the PCM (A19) and the relay circuit board.

5. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D20 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 6.

NO

Check for a short in the IG1 STARTER CUT wire between the No. D20 (10 A) fuse and the relay circuit board. If the wire is OK, **replace the under-dash fuse/relay box** . Also replace the No. D20 (10 A) fuse.

6. Open wire check (IG1 STARTER CUT line)

-1. Disconnect the following connectors.

Under-dash fuse/relay box connector C (27P)
Relay circuit board connector B (6P)

-2. Connect terminals A and B with a jumper wire.

Terminal A	Under-dash fuse/relay box connector C (27P) (female terminals) No. 23: ①
Terminal B	Body ground

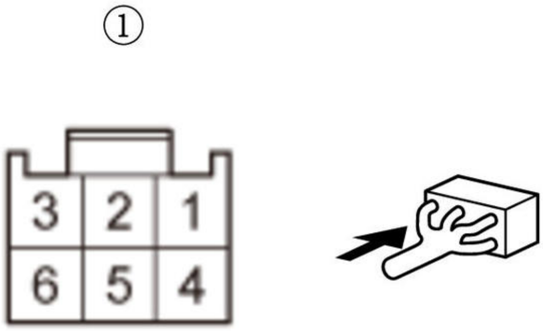
Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board connector B (6P): disconnected
B	Under-dash fuse/relay box connector C (27P): disconnected
B	Under-dash fuse/relay box connector C (27P) No. 23: jumped to body ground
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 7.

NO

Repair an open in the IG1 STARTER CUT wire between the relay circuit board and the under-dash fuse/relay box.

7. Relay circuit board check

   -1. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Replace the under-dash fuse/relay box .

   NO

   Replace the relay circuit board .

DTC P0615 (2.4 L ENGINE) (2017 2018 2019)

DTC P0615 : Starter Cut Relay Diagnosis Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0615 Starter Cut Relay Diagnosis Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Try to start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0615 Starter Cut Relay Diagnosis Circuit Malfunction	B	B

   Is DTC P0615 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F3 Starter Cut Relay 1 Control Circuit Low Voltage	B	B
P16F4 Starter Cut Relay 2 Control Circuit Low Voltage	B	B

Are DTC P16F3 and P16F4 indicated?

YES

Go to the troubleshooting for DTC **P16F3** and **P16F4** .

NO

Go to step 3.

3. Determine possible failure area (START DIAG line, others)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Try to start the engine.

Does the engine start?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (START DIAG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

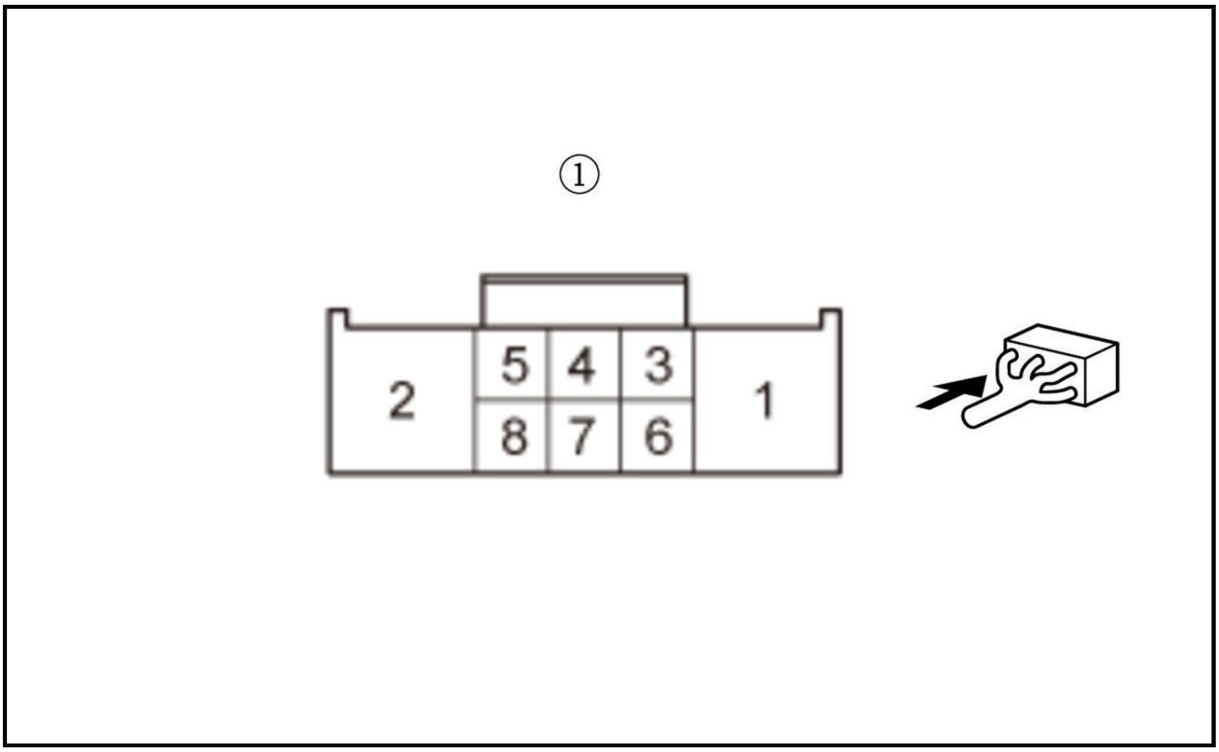
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (51P)
Relay circuit board connector A (8P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Relay circuit board connector A (8P): disconnected PCM connector A (51P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 8: ①
Test point 2	**PCM connector A (51P) No. 47**



Is there continuity?

YES

The START DIAG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the START DIAG wire between the PCM (A47) and the relay circuit board.

5. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D20 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 6.

NO

Check for a short in the IG1STARTER CUT wire between the No. D20 (10 A) fuse and the relay circuit board. If the wire is OK, **replace the under-dash fuse/relay box** . Also replace the No. D20 (10 A) fuse.

6. Open wire check (IG1 STARTER CUT line)

-1. Disconnect the following connectors.

Under-dash fuse/relay box connector C (27P)
Relay circuit board connector B (6P)

-2. Connect terminals A and B with a jumper wire.

Terminal A	Under-dash fuse/relay box connector C (27P) (female terminals) No. 23: ①
Terminal B	Body ground

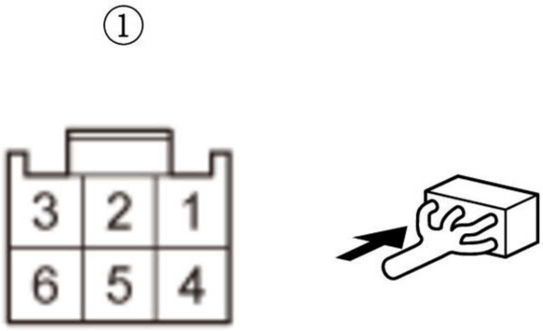
-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board connector B (6P): disconnected
B	Under-dash fuse/relay box connector C (27P): disconnected
B	Under-dash fuse/relay box connector C (27P) No. 23: jumped to body ground
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 7.

NO

Repair an open in the IG1 STARTER CUT wire between the relay circuit board and the under-dash fuse/relay box.

7. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Replace the under-dash fuse/relay box .

NO

Replace the relay circuit board .

DTC P0616 (1.5 L ENGINE)

DTC P0616 : Starter Cut Relay Diagnosis Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0616 Starter Cut Relay Diagnosis Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
STARTER CUT RELAY	Less than 2.2	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 3.

NO

Replace the relay circuit board .

3. Shorted wire check (START DIAG line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board: removed
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 19**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair a short in the START DIAG wire between the PCM (A19) and the relay circuit board.

DTC P0616 (2.4 L ENGINE) (2017 2018 2019)

DTC P0616 : Starter Cut Relay Diagnosis Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0616 Starter Cut Relay Diagnosis Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
STARTER CUT RELAY	Less than 1.29	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 3.

NO

Replace the relay circuit board .

3. Shorted wire check (START DIAG line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (51P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board: removed
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 47**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair a short in the START DIAG wire between the PCM (A47) and the relay circuit board.

DTC P0617 (1.5 L ENGINE)

DTC P0617 : Starter Cut Relay Diagnosis Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0617 Starter Cut Relay Diagnosis Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
STARTER CUT RELAY	More than 3.2	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Shorted wire check (START DIAG line to power)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   -2. Disconnect the following connector.

PCM connector A (50P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Relay circuit board: removed
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 19**
Test point 2	Body ground

Is there about 0.1 V or less?

YES

The START DIAG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short to power in the START DIAG wire between the PCM (A19) and the relay circuit board.

DTC P0617 (2.4 L ENGINE) (2017 2018 2019)

DTC P0617 : Starter Cut Relay Diagnosis Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0617 Starter Cut Relay Diagnosis Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
STARTER CUT RELAY	More than 4.67	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 3.

NO

Replace the relay circuit board .

3. Shorted wire check (START DIAG line to power)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (51P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Relay circuit board: removed
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 47**
Test point 2	Body ground

Is there about 0.1 V or less?

YES

The START DIAG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short to power in the START DIAG wire between the PCM (A47) and the relay circuit board.

DTC P061B (1.5 L ENGINE)

DTC P061B : PCM Internal Malfunction (Torque Calculation)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P061B PCM Internal Malfunction (Torque Calculation)	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, then let it idle.

-5. Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameter.

- Engine speed
- APP Sensor A/B

On-board Snapshot

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P061B PCM Internal Malfunction (Torque Calculation)	B	B

Is DTC P061B indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC TROUBLESHOOTING

DTC P0171 (2.4 L ENGINE) (2017 2018 2019)

DTC P0171 : Fuel System Too Lean

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- Do not clear the DTC or reset the PCM before beginning this troubleshooting procedure until instructed to clear it. Clearing the DTC or resetting the PCM can delete valuable diagnostic information, even if the on-board snapshot and the freeze data are saved.
- Inspect for aftermarket fuel system and engine components before beginning troubleshooting.
- If any of the DTCs listed below are stored at the same time as DTC P0171, troubleshoot those DTCs first, then recheck for P0171.

  P0010, P0011: VTC system

  P0087, P0088, P0191: Fuel rail pressure sensor

  P006A, P0101, P0102, P0103: MAF sensor

  P0105, P0107, P0108, P2073, P2074: MAP sensor

  P0130, P0133, P1172, P2195, P2237, P2238, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0443: EVAP canister purge valve

  P2648, P2649: VTEC system

DTC Description	Confirmed DTC	Pending DTC
P0171 Fuel System Too Lean	B	B

DTC (PGM-FI)

1. Problem verification - Idle

   -1. Start the engine and let it idle without load (in P or N).

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

   Do the current condition (s) match the threshold?

YES

The AF FB (ST FUEL TRIM) is too high at idle. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK at idle. Go to step 2.

2. Problem verification - On-board Snapshot

-1. Review the on-board snapshot and record the value of the parameters below when the AF FB (ST FUEL TRIM) was at its highest point.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

On-board Snapshot

-2. Drive the vehicle according to the conditions determined above.

Signal	**Current conditions**	
	Values	**Unit**
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
REL TP SENSOR	B	B
APP SENSOR	B	B

-3. Check the parameter (s) below with the HDS while driving.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The AF FB (ST FUEL TRIM) is too high under the conditions above. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK under the same conditions as the on-board snapshot. The system is normal at this time.

3. Check for debris in MAF sensor

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the MAF sensor/IAT sensor** .

-3. Check for lint, bugs, and other foreign objects in the sensor.

Is there debris in the MAF sensor/IAT sensor?

YES

Remove the debris from the MAF sensor/IAT sensor and then use a vacuum cleaner to remove any debris from the air cleaner housing.

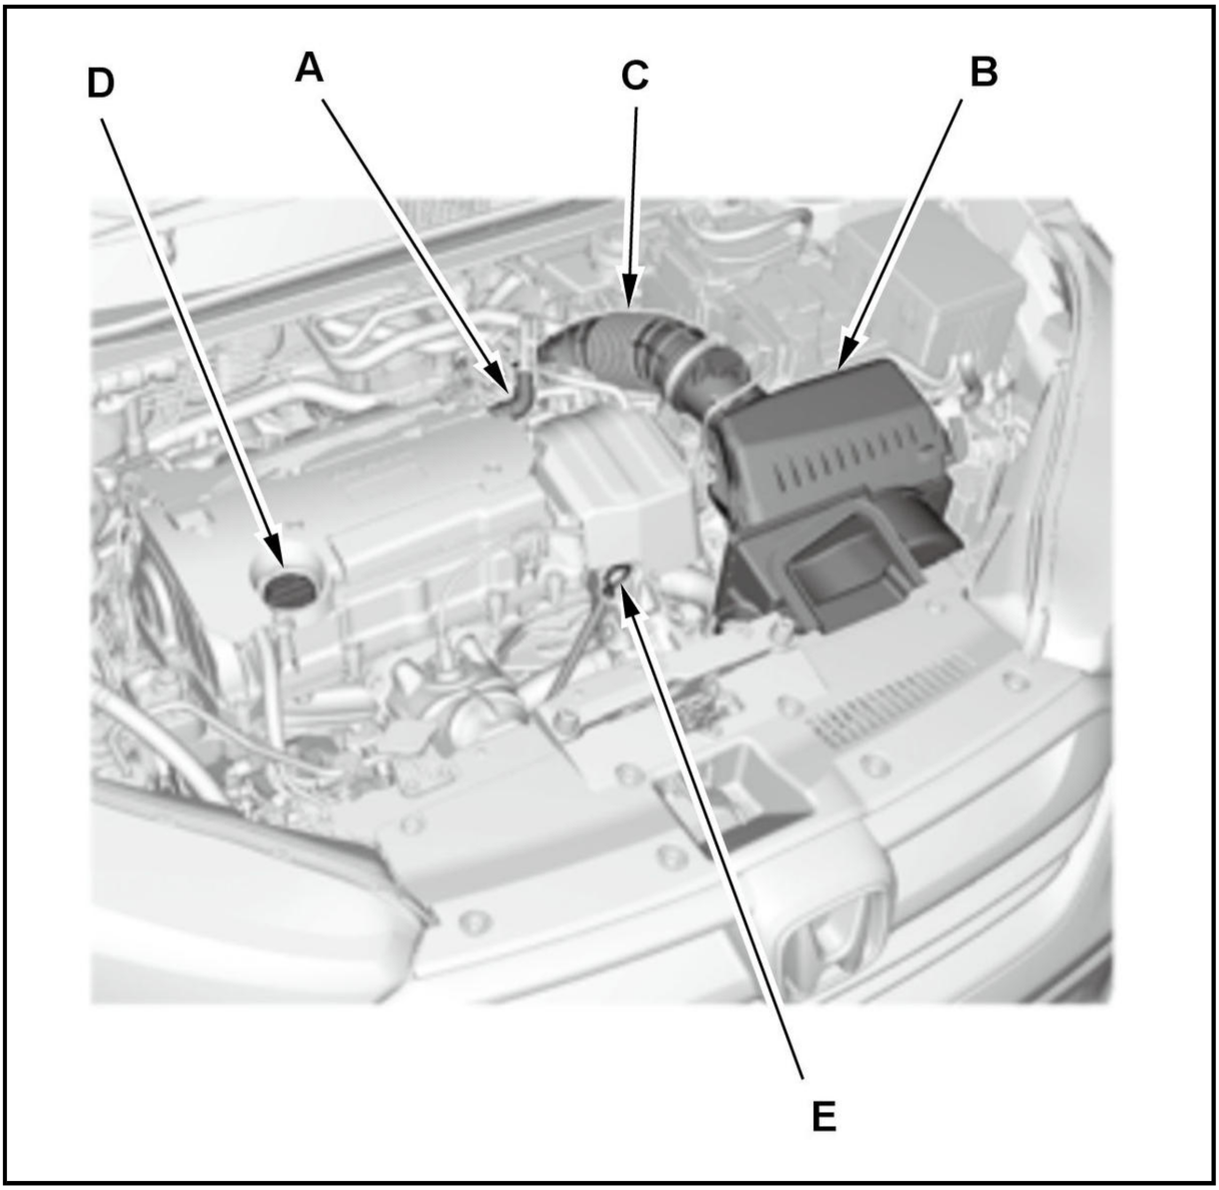
NO

Reinstall the MAF sensor/IAT sensor . Go to step 4.

4. Check for disconnected or damaged components:

   Visually inspect each of the components below for disconnected hoses, cracks, or damage:

   - Crankcase breather hose (A)
   - Air cleaner housing (B)
   - Intake air duct (C)
   - Oil cap (D) and dipstick (E)



Are any components disconnected or damaged?

YES

Repair as necessary.

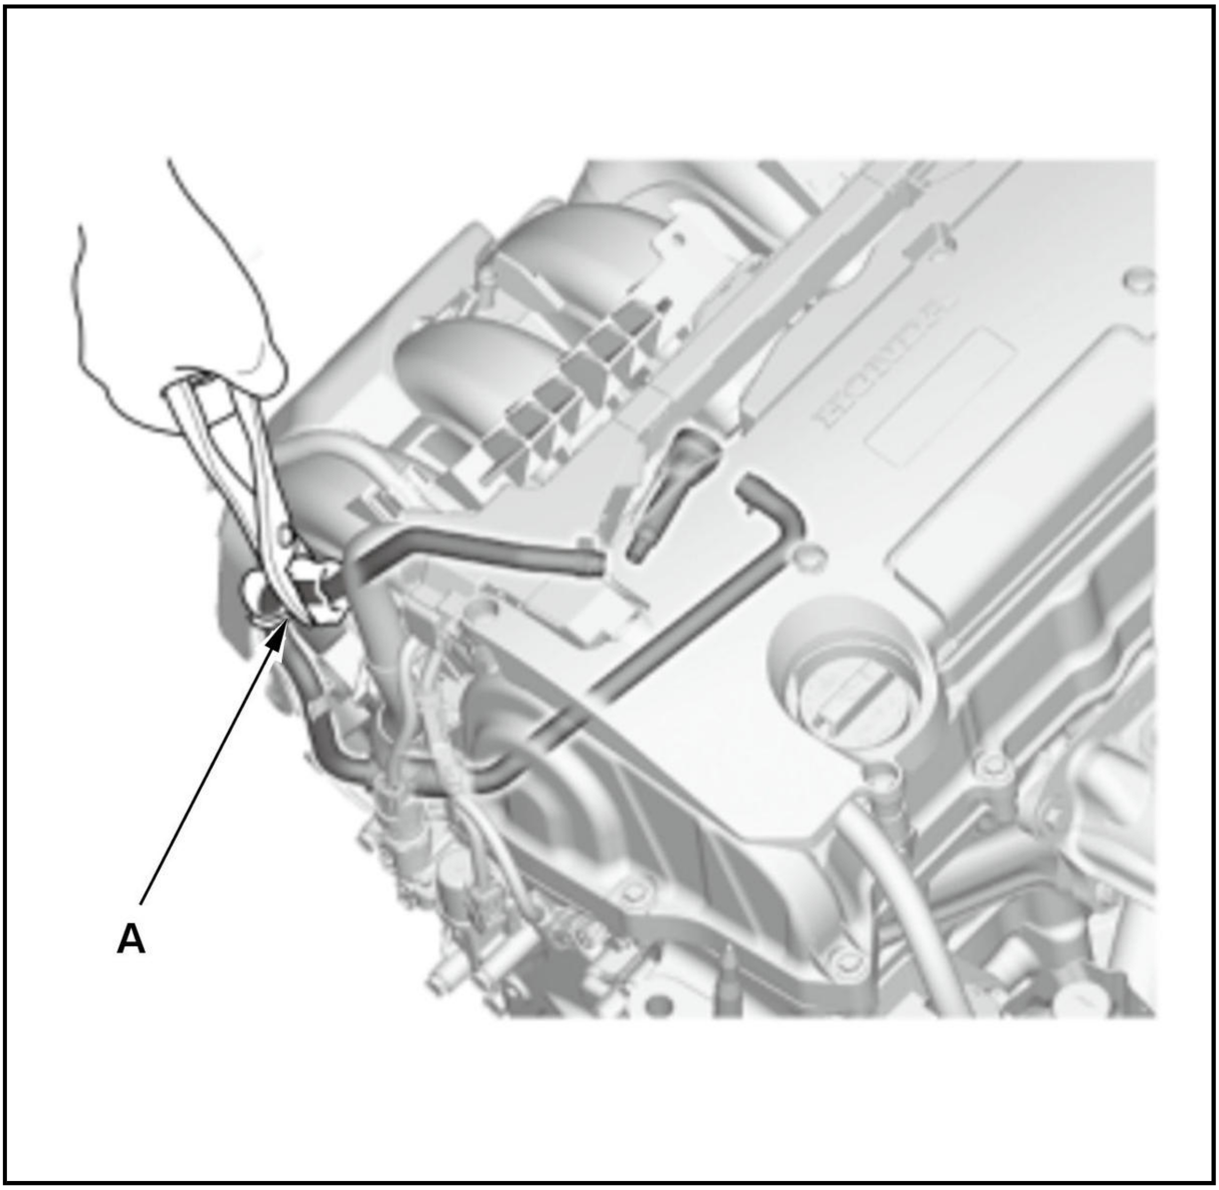
NO

Go to step 5.

5. Check PCV system

-1. Continue to let the engine idle.

-2. Pinch the PCV vacuum hose (A).



-3. Check the parameter (s) below with the HDS with the vacuum hose pinched.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold?

YES

The PCV system is not leaking. Go to step 6.

NO

There is a leak in the PCV system. Check the vacuum hoses for leaks and repair as needed.

6. Check for Intake manifold vacuum leaks

-1. Disconnect the intake air duct from the air cleaner housing.

-2. Connect a large intake manifold adapter cone into the intake air duct from the OTC LeakMaster evaporative emissions system tester kit.

-3. Use the OTC LeakMaster evaporative emissions system tester to direct smoke into the intake manifold.

Inspect each of the areas below for signs of leaks:

- Intake manifold and gaskets
- Throttle body and gasket
- Air intake ducting
- All vacuum and air hoses

Are there any leaks?

YES

Repair the vacuum leak.

NO

Reconnect any disconnected components, then go to step 7.

7. Check MAF sensor reading

-1. Continue to let the engine idle.

-2. Make sure the following conditions are met:

- ECT Sensor 1 above 158 deg. F (70 deg. C)
- Transmission in P or N
- All engine and electrical loads turned off

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-3. Monitor the ENGINE SPEED in the DATA LIST with the HDS, then hold the engine speed at 2, 500 rpm with the accelerator pedal held steady.

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B

-4. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	6.5-9.1	g/s	B	B

Do the current condition (s) match the threshold?

YES

The MAF sensor read value is OK. Go to step 8.

NO

The MAF sensor read value is incorrect. Inspect for a cracked, damaged, or incorrectly installed air cleaner assembly. If OK, **replace the MAF sensor/IAT sensor** .

8. Check fuel pressure (low pressure side)

 -1. Check the fuel pressure under the conditions when the AF FB (ST FUEL TRIM) is 1.33 or more.

Signal	Current conditions	
	Values	Unit
AF FB (ST FUEL TRIM)	B	B

 Is the fuel pressure within a specified range of **fuel pressure test?**

 YES

 The fuel pressure (low pressure side) is OK. Go to step 9.

 NO

 Check the correct power supply and ground for the fuel pump and if both are OK, **replace the fuel tank unit** .

9. Check fuel pressure (high pressure side)

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Turn the vehicle to the ON mode.

 -3. Clear the DTC with the HDS.

 -4. Start the engine.

 -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

 -6. Select the DI FUEL PRESSURE TEST in the INSPECTION MENU with the HDS.

 DI FUEL PRESSURE TEST

 Does the HDS indicate NORMAL?

 YES

 The fuel pressure (high pressure side) is OK. Go to step 10.

 NO

 Go to the troubleshooting for **DTC P0087** and **DTC P0088** .

10. Replace fuel:**NOTE:** There is an increased likelihood of a fuel related issue if the lean condition appeared shortly after refueling. The MIL DIST (MIL Distance) value in the DATA LIST in combination with the fuel level may help you make this determination.

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. **Drain the fuel from the fuel tank** , then refill the fuel tank with known-good fuel.

 -3. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 1.33 or more.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

On-board Snapshot

Signal	Current conditions	
	Values	**Unit**
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
REL TP SENSOR	B	B
APP SENSOR	B	B

-4. Start the engine.

-5. Check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The fuel is not the cause of the high AF FB (ST FUEL TRIM) value. Go to step 11.

NO

The fuel was causing the high AF FB (ST FUEL TRIM) value.

11. Replace A/F sensor (Sensor 1)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Replace the A/F sensor (Sensor 1) with a known-good sensor.

-3. Start the engine.

-4. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 1.33 or more.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

On-board Snapshot

Signal	Current conditions	
	Values	**Unit**
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
REL TP SENSOR	B	B
APP SENSOR	B	B

-5. Check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The A/F sensor (Sensor 1) is not the cause of the high AF FB (ST FUEL TRIM) value. Reinstall the original A/F sensor, then go to step 12.

NO

The A/F sensor (Sensor 1) was causing the high AF FB (ST FUEL TRIM) value. **Replace the original A/F sensor (Sensor 1)** .

12. Replace injectors

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Replace the injectors with known-good injectors.

-3. Start the engine.

-4. Operate the vehicle under the same conditions where AF FB (ST FUEL TRIM) was 1.33 or more.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

On-board Snapshot

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
REL TP SENSOR	B	B
APP SENSOR	B	B

-5. Check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The injectors are not the cause of the high AF FB (ST FUEL TRIM) value. **Substitute a known-good PCM** , then recheck.

NO

The injectors were causing the high AF FB (ST FUEL TRIM) value. Replace all injectors as a set .

DTC P0171, P2187 (1.5 L ENGINE)

DTC P0171 : Fuel System Too Lean **DTC P2187** : Fuel System Too Lean at Idle

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- Do not clear the DTC or reset the PCM before beginning this troubleshooting procedure until instructed to clear it. Clearing the DTC or resetting the PCM can delete valuable diagnostic information, even if the on-board snapshot is saved.
- Inspect for aftermarket fuel system and engine components before beginning troubleshooting.
- If any of the DTCs listed below are stored at the same time as DTC P0171 and/or P2187, troubleshoot those DTCs first, then recheck for P0171 or P2187.

  P0010, P0011, P0013, P0014: VTC system

  P0087, P0088: Fuel rail pressure sensor

  P006A, P0100, P0101: MAF sensor

  P0107, P0108: MAP sensor

  P0130, P0133, P1172, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270, P2A01: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0443: EVAP canister purge valve

  P2279: Intake air leakage

DTC Description	Confirmed DTC	Pending DTC
P0171 Fuel System Too Lean	B	B
P2187 Fuel System Too Lean at Idle	B	B

DTC (PGM-FI)

1. Problem verification - Idle

   -1. Start the engine and let it idle without load (in P or N).

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

   Do the current condition (s) match the threshold?

   YES

The AF FB (ST FUEL TRIM) is too high at idle. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK at idle. Go to step 2.

2. Problem verification - On-board Snapshot

-1. Review the on-board snapshot and record the value of the parameters below when the AF FB (ST FUEL TRIM) was at its highest point.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

On-board Snapshot

-2. Drive the vehicle according to the conditions determined above.

Signal	**Current conditions**	
	Values	**Unit**
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
REL TP SENSOR	B	B
APP SENSOR	B	B

-3. Check the parameter (s) below with the HDS while driving.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The AF FB (ST FUEL TRIM) is too high under the conditions above. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK under the same conditions as the on-board snapshot. The system is normal at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Check for debris in MAF sensor

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the MAF sensor/IAT sensor 1** .

-3. Check for lint, bugs, and other foreign objects in the sensor.

Is there debris in MAF sensor/IAT sensor 1?

YES

Remove the debris from the MAF sensor/IAT sensor 1 and then use a vacuum cleaner to remove any debris from the air cleaner housing.

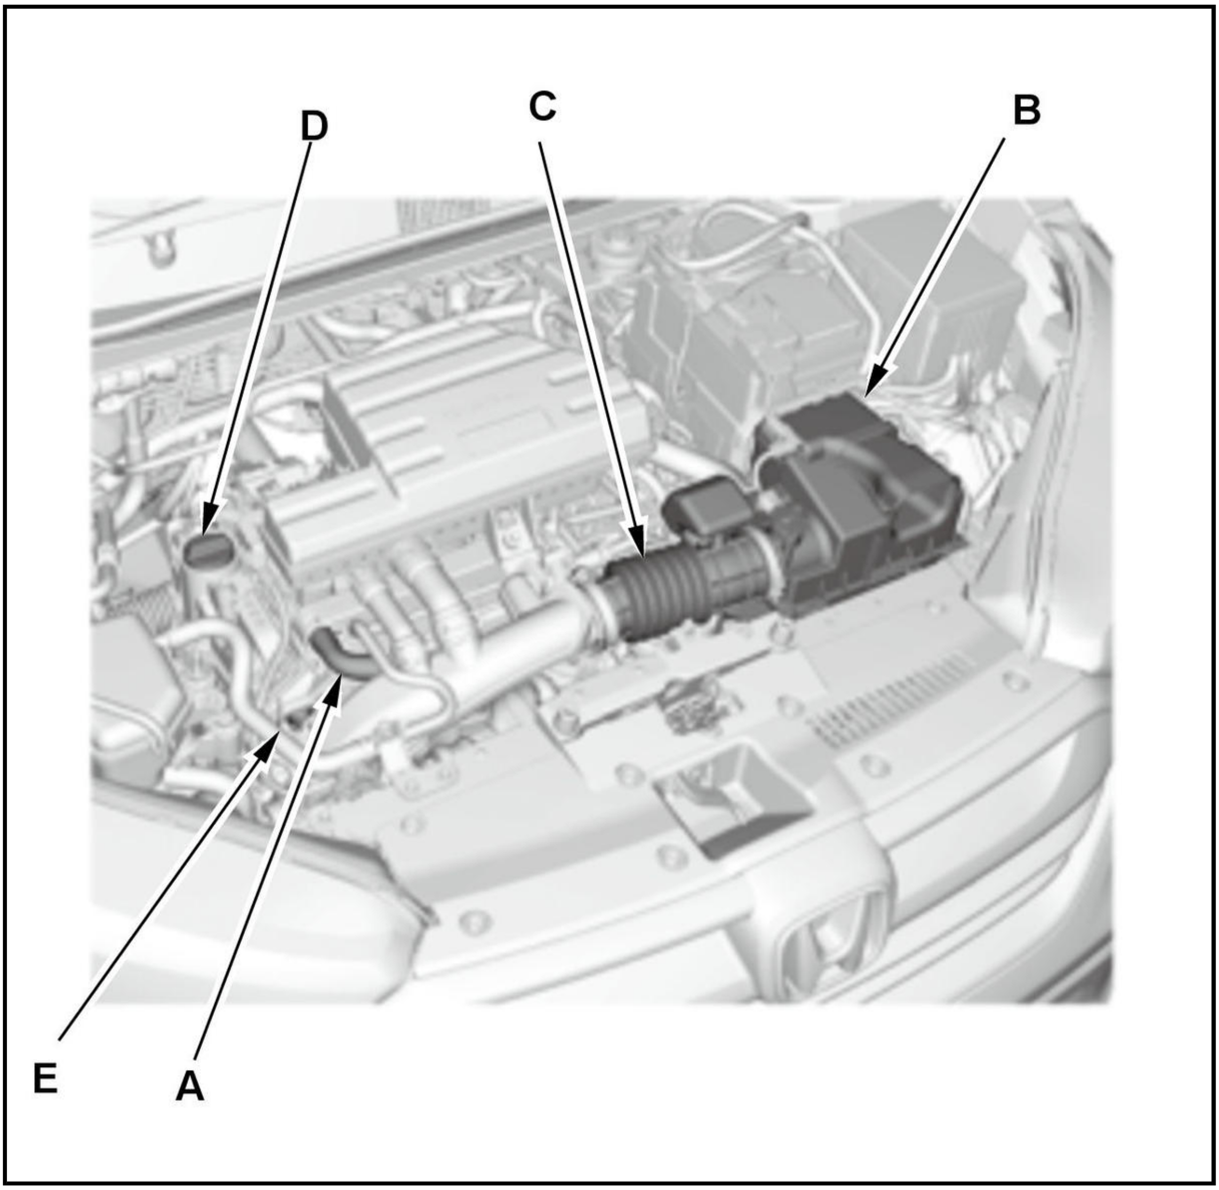
NO

Reinstall the MAF sensor/IAT sensor 1 . Go to step 4.

4. Check for disconnected or damaged components:

   Visually inspect each of the components below for disconnected hoses, cracks, or damage:

   - Crankcase breather hose (A)
   - Air cleaner housing (B)
   - Intake air duct (C)
   - Oil cap (D) and dipstick (E)



Are any components disconnected or damaged?

YES

Repair as necessary.

NO

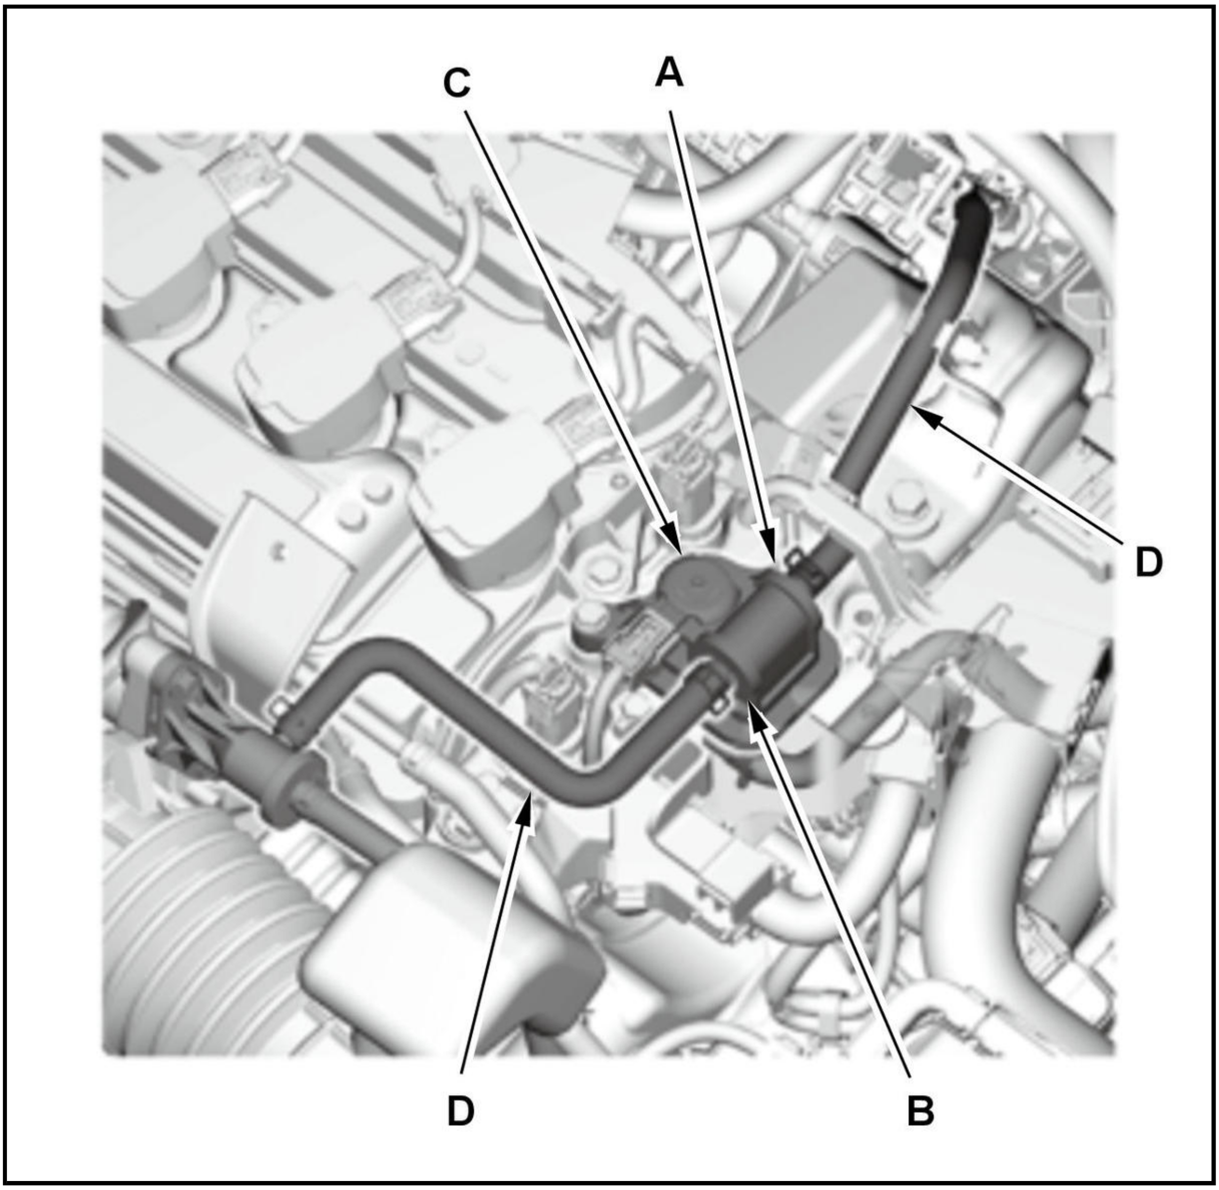
Go to step 5.

5. Check EVAP canister purge line:

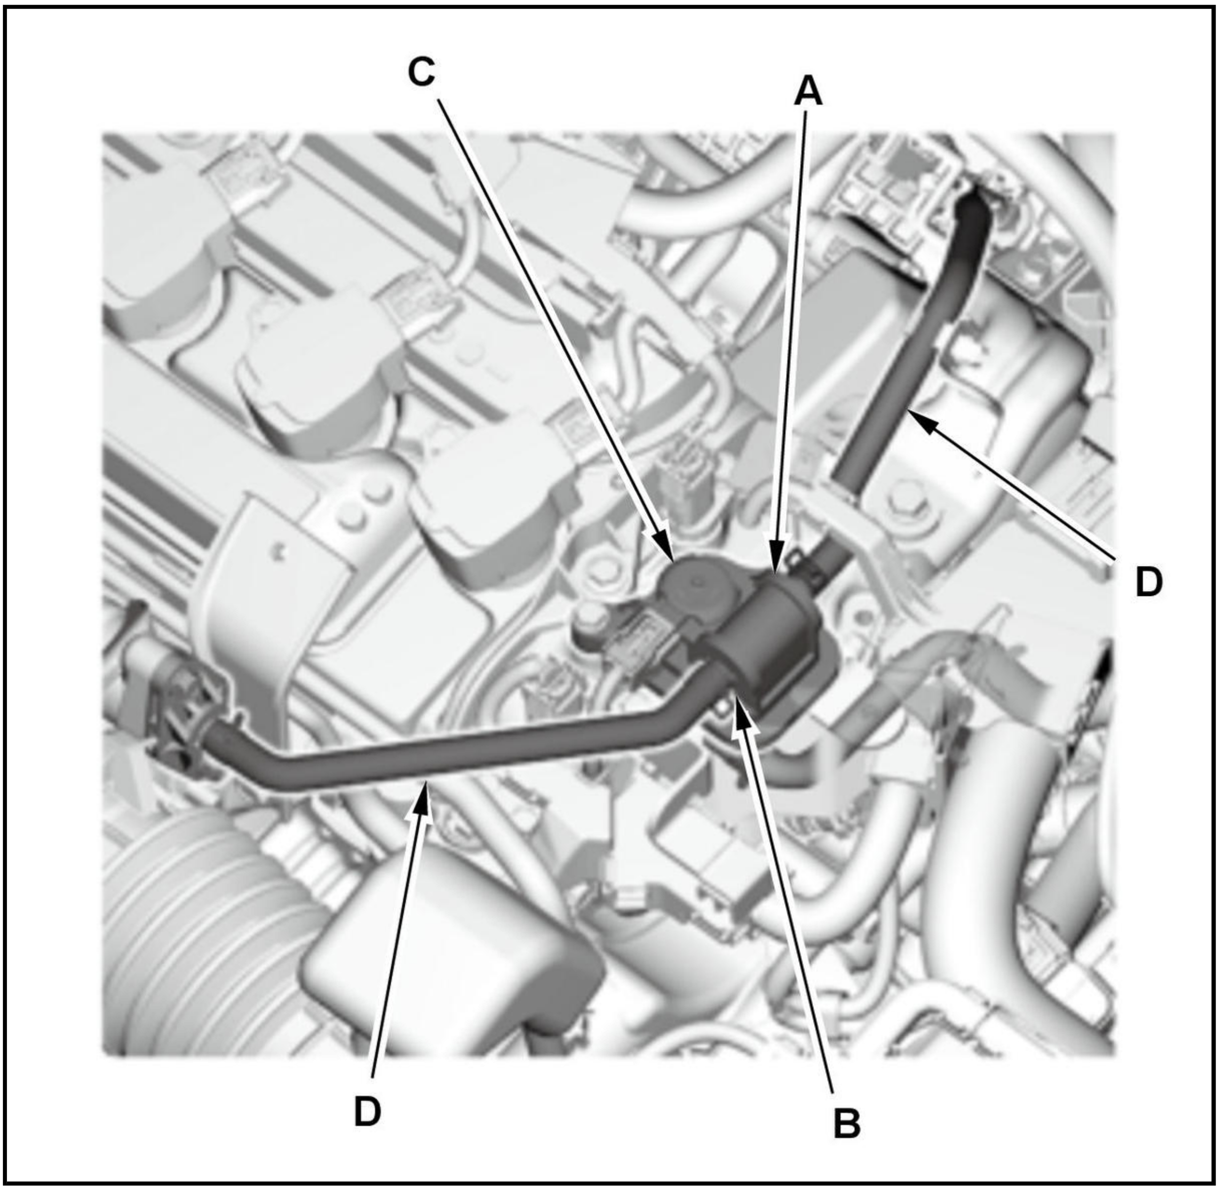
Visually inspect each of the components below for disconnected hoses, cracks, or damage:

- Non-return valve A (A) (built into the EVAP canister purge valve)
- Non-return valve B (B) (built into the EVAP canister purge valve)
- EVAP canister purge valve (C)
- Hose (D)

USA and Canada models



Mexico models



Are any components disconnected or damaged?

YES

Repair the connection or replace the damaged part (s).

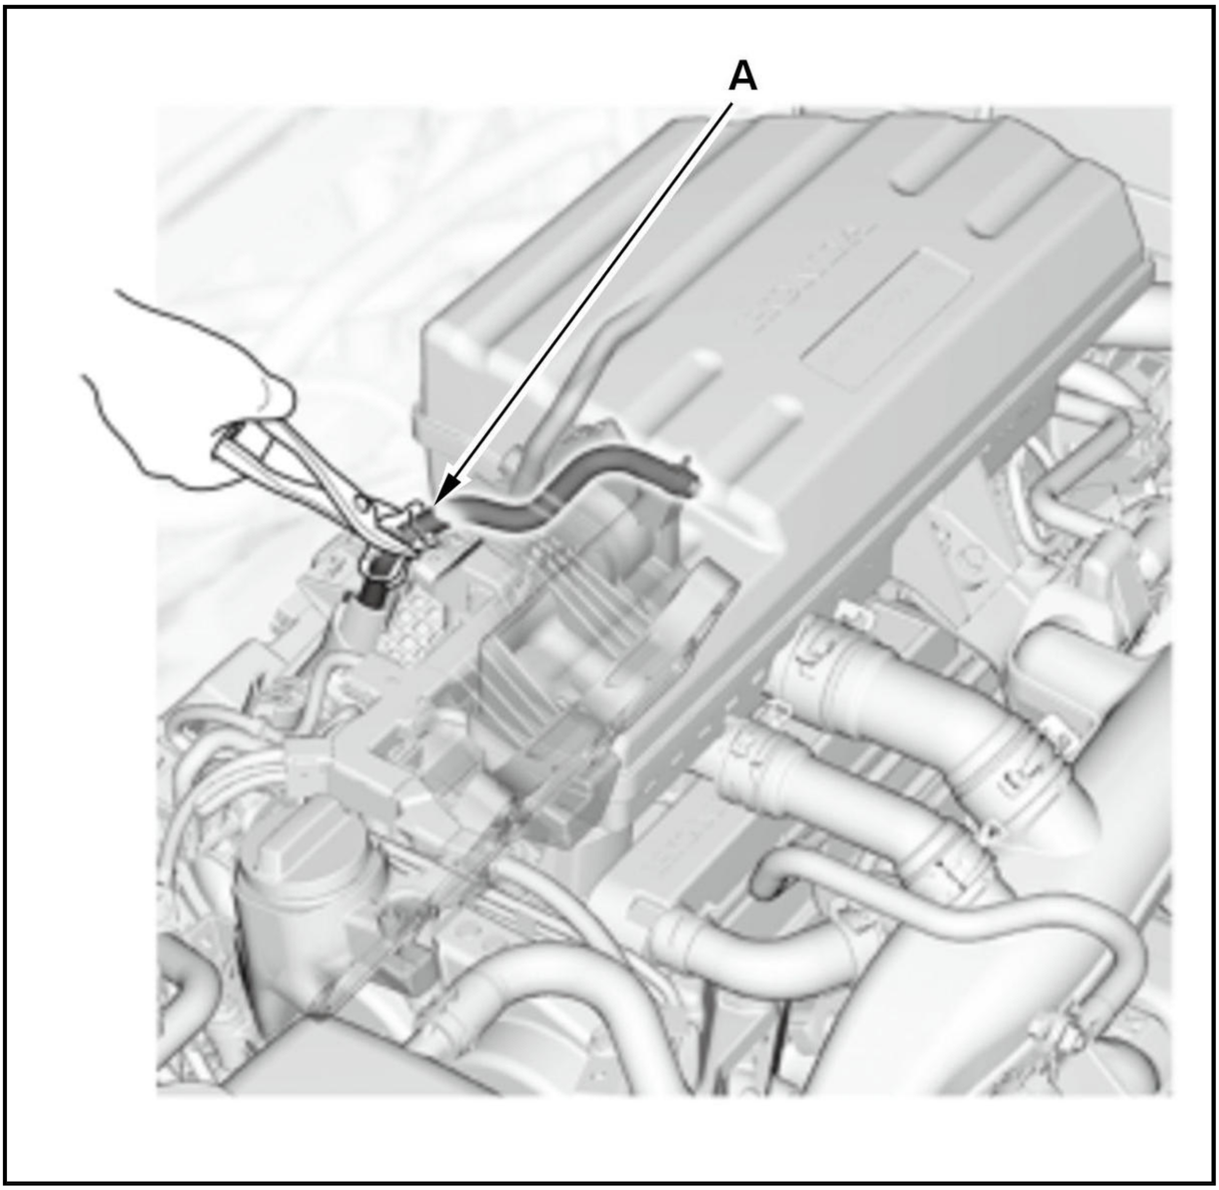
NO

Go to step 6.

6. Check PCV system

   -1. Continue to let the engine idle.

   -2. Gently pinch the PCV vacuum hose (A).



-3. Check the parameter (s) below with the HDS with the vacuum hose pinched.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold?

YES

The PCV system is not leaking. Go to step 7.

NO

There is a leak in the PCV system. Check the vacuum hoses for leaks and repair as needed.

7. Check for Intake manifold vacuum leaks

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the intake air duct from the air cleaner housing.

-3. Connect a large intake manifold adapter cone into the intake air duct from the OTC LeakMaster evaporative emissions system tester kit.

-4. Use the OTC LeakMaster evaporative emissions system tester to direct smoke into the intake manifold.

Inspect each of the areas below for signs of leaks:

- Intake manifold and gaskets
- Throttle body and gasket
- Air intake ducting
- All vacuum and air hoses

Are there any leaks?

YES

Repair the vacuum leak.

NO

Reconnect any disconnected components, then go to step 8.

8. Check MAF sensor reading

-1. Start the engine and let it idle.

-2. Make sure the following conditions are met:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in P or N
- All engine and electrical loads turned off

Signal	**Current conditions**	
	Values	**Unit**
ECT SENSOR 1	B	B

-3. Monitor the ENGINE SPEED in the DATA LIST with the HDS, then hold the engine speed at 2, 500 rpm with the accelerator pedal held steady.

Signal	**Current conditions**	
	Values	**Unit**
ENGINE SPEED	B	B

-4. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
MAF SENSOR	4.1-5.7	g/s	B	B

Do the current condition (s) match the threshold?

YES

Go to step 9.

NO

The MAF sensor read value is incorrect. Inspect for a cracked, damaged, or incorrectly installed air cleaner assembly. If OK, **replace the MAF sensor/IAT sensor 1** .

9. Check fuel pressure (low pressure side)

   -1. **Check the fuel pressure** under the conditions when the AF FB (ST FUEL TRIM) is 1.33 or more.

Signal	Current conditions	
	Values	Unit
AF FB (ST FUEL TRIM)	B	B

   Is the fuel pressure within a specified range of **fuel pressure test?**

   YES

   Go to step 10.

   NO

   Check the correct power supply and ground for the fuel pump and if both are OK, **replace the fuel tank unit** .

10. Check fuel pressure (high pressure side)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode.

   -5. Start the engine.

   -6. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -7. Select the DI Fuel Pressure Test in the INSPECTION MENU with the HDS.

   DI FUEL PRESSURE TEST

   Does the HDS indicate NORMAL?

   YES

   Go to step 11.

   NO

   Go to the troubleshooting for **DTC P0087** and **DTC P0088** .

11. Replace fuel:**NOTE:** There is an increased likelihood of a fuel related issue if the lean condition appeared shortly after refueling. The MIL DIST (MIL Distance) value in the DATA LIST in combination with the fuel level may help you make this determination.

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Drain the fuel from the fuel tank** , then refill the fuel tank with known-good fuel.

   -3. Start the engine.

-4. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 1.33 or more.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

On-board Snapshot

Signal	**Current conditions**	
	Values	**Unit**
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

-5. Check the parameter (s) below with the HDS while driving.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The fuel is not the cause of the high AF FB (ST FUEL TRIM) value. Go to step 12.

NO

The fuel was causing the high AF FB (ST FUEL TRIM) value.

12. Replace A/F sensor (Sensor 1)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Replace the A/F sensor (Sensor 1) with a known-good sensor** .

-3. Start the engine.

-4. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 1.33 or more.

ENGINE SPEED	B

-5. Check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The A/F sensor (Sensor 1) is not the cause of the high AF FB (ST FUEL TRIM) value. Reinstall the original A/F sensor (Sensor 1), then go to step 13.

NO

The A/F sensor (Sensor 1) was causing the high AF FB (ST FUEL TRIM) value. **Replace the original A/F sensor (Sensor 1)** .

13. Replace injectors

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Replace the injectors with known-good injectors** .

-3. Start the engine.

-4. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 1.33 or more.

-5. Check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	More than 1.33	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The injectors are not the cause of the high AF FB (ST FUEL TRIM) value. **Substitute a known-good PCM** .

NO

The injectors were causing the high AF FB (ST FUEL TRIM) value. **Replace all injectors as a set** .

DTC P0172 (1.5 L ENGINE)

DTC P0172 : Fuel System Too Rich

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Do not clear the DTC or reset the PCM before beginning this troubleshooting procedure until instructed to clear it. Clearing the DTC or resetting the PCM can delete valuable diagnostic information, even if the on-board snapshot is saved.
- Inspect for aftermarket fuel system and engine components before beginning troubleshooting.
- If any of the DTCs listed below are stored at the same time as P0172, troubleshoot those DTCs first, then recheck for P0172.

  P0010, P0011, P0013, P0014: VTC system

  P0087, P0088: Fuel rail pressure sensor

  P006A, P0100, P0101: MAF sensor

  P0107, P0108: MAP sensor

  P0130, P0133, P1172, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270, P2A01: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0443: EVAP canister purge valve

  P2279: Intake air leakage

DTC Description	Confirmed DTC	Pending DTC
P0172 Fuel System Too Rich	B	B

DTC (PGM-FI)

1. Problem verification - Idle

   -1. Start the engine, and let it idle without load (in P or N).

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	Less than 0.80	B	B	B

Do the current condition (s) match the threshold?

YES

The AF FB (ST FUEL TRIM) is too low at idle. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK at idle. Go to step 2.

2. Problem verification - On-board Snapshot

-1. Review the on-board snapshot and record the value of the parameters below when the AF FB (ST FUEL TRIM) was at its lowest point.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

On-board Snapshot

-2. Drive the vehicle according to the conditions determined above.

Signal	**Current conditions**	
	Values	**Unit**
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
REL TP SENSOR	B	B
APP SENSOR	B	B

-3. Check the parameter (s) below with the HDS while driving.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST FUEL TRIM)	Less than 0.80	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The AF FB (ST FUEL TRIM) is too low under the conditions above. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK under the same conditions as the on-board snapshot. The system is normal at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Check fuel pressure (low pressure side)

-1. Start the engine, and let it idle.

-2. **Check the fuel pressure** under the conditions when the AF FB (ST FUEL TRIM) is 0.80 or less.

Signal	Current conditions	
	Values	Unit
AF FB (ST FUEL TRIM)	B	B

Is the fuel pressure within a specified range of fuel pressure test?

YES

The fuel pressure (low pressure side) is not the cause of the low AF FB (ST FUEL TRIM) value. Go to step 4.

NO

Replace the fuel tank unit .

4. Check fuel pressure (high pressure side)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -6. Select the DI FUEL PRESSURE TEST in the INSPECTION MENU with the HDS.

   DI FUEL PRESSURE TEST

   Does the HDS indicate NORMAL?

   YES

   Go to step 5.

   NO

   Go to the troubleshooting for **DTC P0087** and **DTC P0088** .

5. Replace fuel:**NOTE:** There would be an increased likelihood of a fuel related issue if the rich condition appeared shortly after refueling. The MIL DIST (MIL Distance) value in the DATA LIST in combination with the fuel level may help you make this determination.

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Drain the fuel from the fuel tank** , then refill the fuel tank with known-good fuel.

   -3. Start the engine, and let it idle.

   -4. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 0.80 or less.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

On-board Snapshot

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
REL TP SENSOR	B	B
APP SENSOR	B	B

-5. Check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	Less than 0.80	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The fuel is not the cause of the low AF FB (ST FUEL TRIM) value. Go to step 6.

NO

The fuel was causing the low AF FB (ST FUEL TRIM) value.

6. Check MAF sensor reading

-1. Continue to let the engine idle.

-2. Make sure the following conditions are met:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in P or N
- All engine and electrical loads turned off

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-3. Monitor the ENGINE SPEED in the DATA LIST with the HDS, then hold the engine speed at 2, 500 rpm with the accelerator pedal held steady.

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B

-4. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	4.1-5.7	g/s	B	B

Do the current condition (s) match the threshold?

YES

Go to step 7.

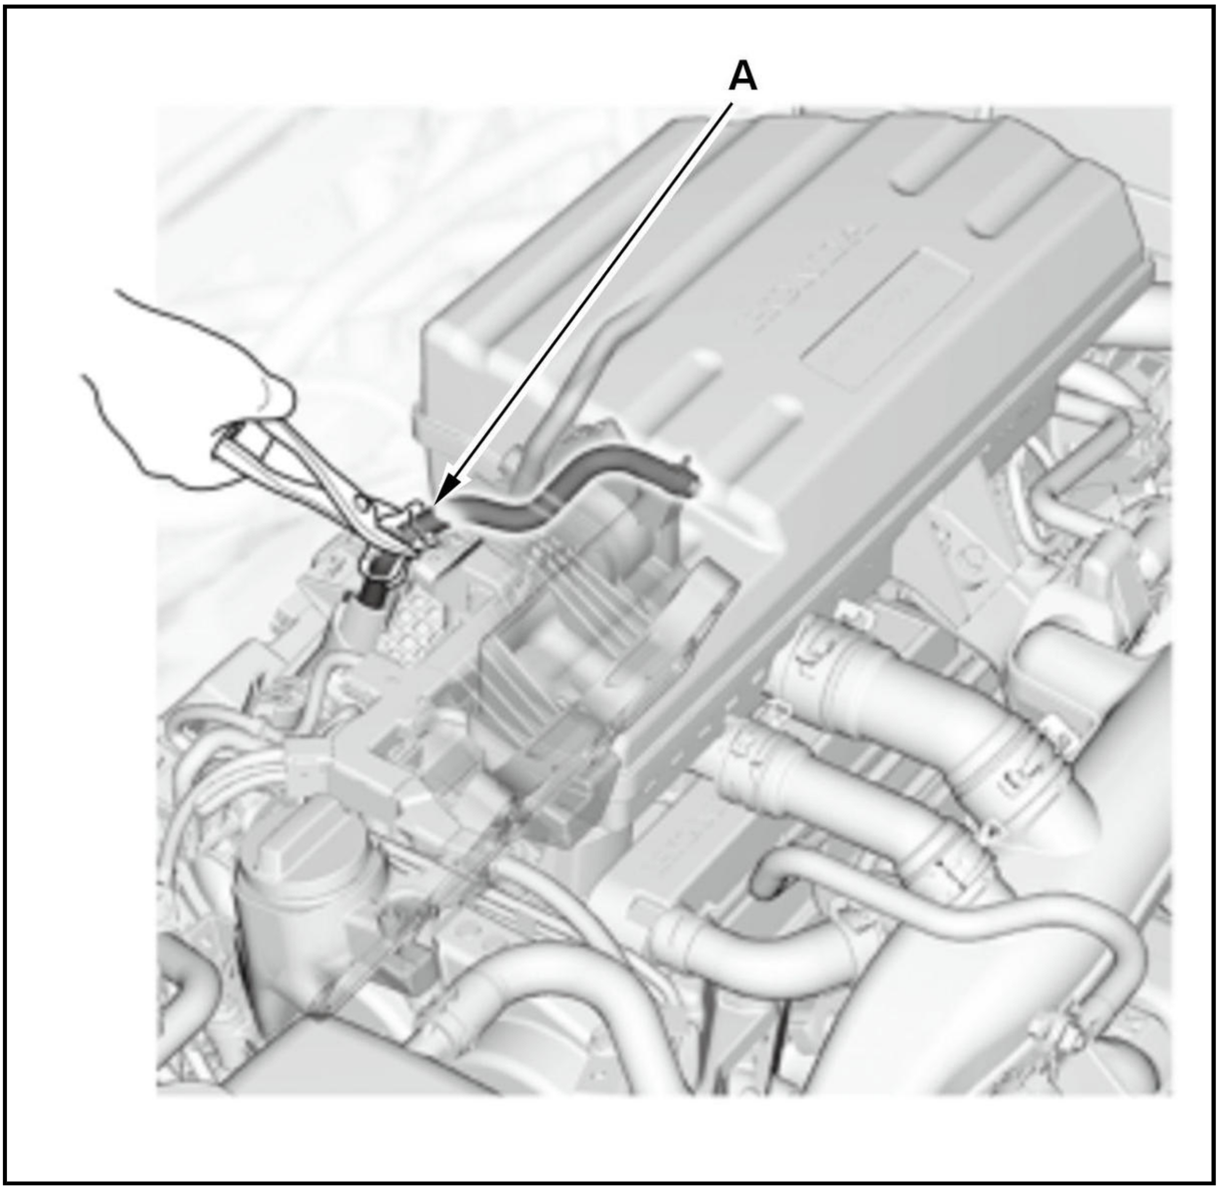
NO

The MAF sensor read value is incorrect. Inspect for a cracked, damaged, or incorrectly installed air cleaner assembly. If OK, **replace the MAF sensor/IAT sensor 1** .

7. Check engine oil

-1. Continue to let the engine idle.

-2. Gently pinch the PCV vacuum hose (A).



-3. Check the parameter (s) below with the HDS with the vacuum hose pinched.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	Less than 0.80	B	B	B

Do the current condition (s) match the threshold?

YES

Go to step 8.

NO

The engine oil is contaminated. Determine the cause of the contaminated oil (faulty injectors, etc.), then **replace the engine oil** and **oil filter** .

8. EVAP canister purge valve check

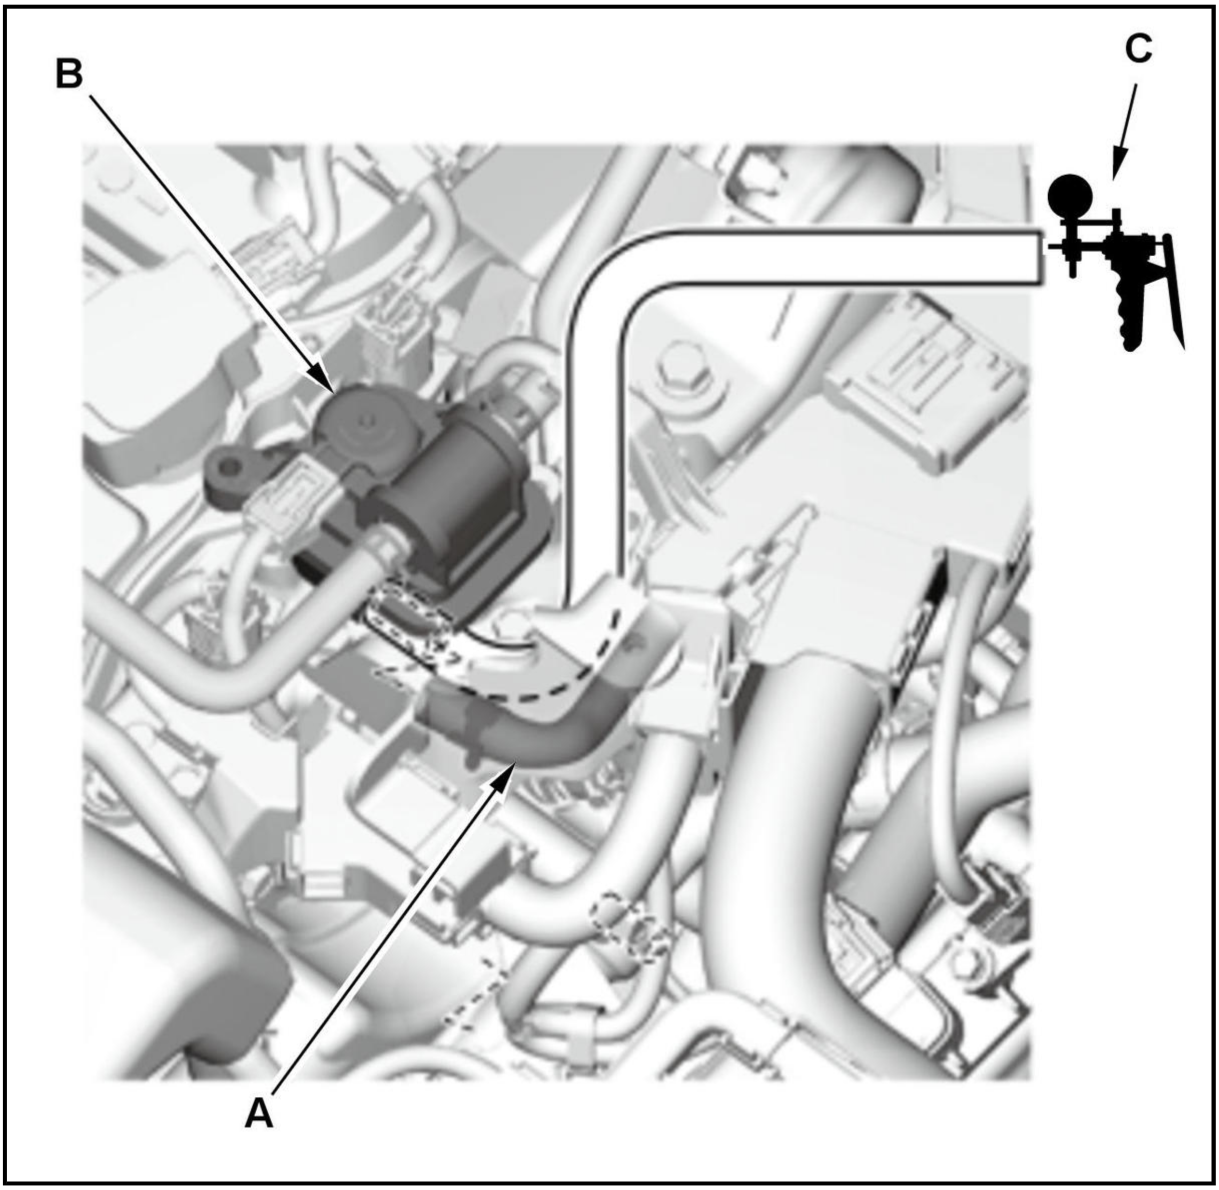
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP canister purge valve 2P connector

-3. **Remove the EVAP canister purge valve** with its vacuum hose connected.

-4. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 inHg (C) to the purge valve.



-5. Start the engine.

Does the vacuum pump indicate vacuum?

YES

When the climate is warm, fuel vapor from the canister line to the fuel tank enters intake manifold, enriching mixture (excessively rich), causing the engine to stall in some cases. If needed, **replace the EVAP canister purge valve** .

NO

Go to step 9.

9. Replace A/F sensor (Sensor 1)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Replace the A/F sensor (Sensor 1) with a known-good sensor** .

-3. Start the engine, and let it idle.

-4. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 0.80 or less.

	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	Less than 0.80	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The injectors are not the cause of the low AF FB (ST FUEL TRIM) value. **Substitute a known-good PCM** , then recheck.

NO

The injectors were causing the low AF FB (ST FUEL TRIM) value. **Replace all injectors as a set** .

DTC P0172 (2.4 L ENGINE) (2017 2018 2019)

DTC P0172 : Fuel System Too Rich

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Do not clear the DTC or reset the PCM before beginning this troubleshooting procedure until instructed to clear it. Clearing the DTC or resetting the PCM can delete valuable diagnostic information, even if the on-board snapshot and the freeze data are saved.
- Inspect for aftermarket fuel system and engine components before beginning troubleshooting.
- If any of the DTCs listed below are stored at the same time as P0172, troubleshoot those DTCs first, then recheck for P0172.

P0010, P0011: VTC system

P0087, P0088, P0191: Fuel rail pressure sensor

P006A, P0101, P0102, P0103: MAF sensor

P0105, P0107, P0108, P2073, P2074: MAP sensor

P0130, P0133, P1172, P2195, P2237, P2238, P2252, P2A00: A/F sensor (Sensor 1)

P0134, P0135: A/F sensor (Sensor 1) heater

P0137, P0138, P0139, P2270: Secondary HO2S (Sensor 2)

P0141: Secondary HO2S (Sensor 2) heater

P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

P0443: EVAP canister purge valve

P2648, P2649: VTEC system

DTC Description	Confirmed DTC	Pending DTC
P0172 Fuel System Too Rich	B	B

DTC (PGM-FI)

1. Problem verification - Idle

   -1. Start the engine, and let it idle without load (in P or N).

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	Less than 0.79	B	B	B

   Do the current condition (s) match the threshold?

   YES

   The AF FB (ST FUEL TRIM) is too low at idle. Go to step 3.

   NO

   The AF FB (ST FUEL TRIM) is OK at idle. Go to step 2.

2. Problem verification - On-board Snapshot

   -1. Review the on-board snapshot and record the value of the parameters below when the AF FB (ST FUEL TRIM) was at its lowest point.

ENGINE SPEED	B
VEHICLE SPEED	B
REL TP SENSOR	B
APP SENSOR	B

   On-board Snapshot

   -2. Drive the vehicle according to the conditions determined above.

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B

Signal	Current conditions

VEHICLE SPEED	B	B
REL TP SENSOR	B	B
APP SENSOR	B	B

-3. Check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The AF FB (ST FUEL TRIM) is too low under the conditions above. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK under the same conditions as the on-board snapshot. The system is normal at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Check fuel pressure (low pressure side)

-1. Start the engine, and let it idle.

-2. Check the fuel pressure under the conditions when the AF FB (ST FUEL TRIM) is 0.79 or less.

Signal	Current conditions	
	Values	Unit
AF FB (ST FUEL TRIM)	B	B

Is the fuel pressure within a specified range of **fuel pressure test?**

YES

The fuel pressure (low pressure side) is not the cause of the low AF FB (ST FUEL TRIM) value. Go to step 4.

NO

Replace the fuel tank unit .

4. Check fuel pressure (high pressure side)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Select the DI FUEL PRESSURE TEST in the INSPECTION MENU with the HDS.

DI FUEL PRESSURE TEST

Does the HDS indicate NORMAL?

YES

The fuel pressure (high pressure side) is OK. Go to step 5.

NO

Go to the troubleshooting for DTC P0087 and DTC P0088 .

5. Replace fuel:**NOTE:** There would be an increased likelihood of a fuel related issue if the rich condition appeared shortly after refueling. The MIL DIST (MIL Distance) value in the DATA LIST in combination with the fuel level may help you make this determination.

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Drain the fuel from the fuel tank , then refill the fuel tank with known-good fuel.

   -3. Start the engine, and let it idle.

   -4. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 0.79 or less.

-5. Check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The fuel is not the cause of the low AF FB (ST FUEL TRIM) value. Go to step 6.

NO

The fuel was causing the low AF FB (ST FUEL TRIM) value.

6. Check MAF sensor reading

   -1. Continue to let the engine idle.

-2. Make sure the following conditions are met:

- ECT Sensor 1 above 158 deg. F (70 deg. C)
- Transmission in P or N
- All engine and electrical loads turned off

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-3. Monitor the ENGINE SPEED in the DATA LIST with the HDS, then hold the engine speed at 2, 500 rpm with the accelerator pedal held steady.

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B

-4. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	6.5-9.1	g/s	B	B

Do the current condition (s) match the threshold?

YES

The MAF sensor read value is OK. Go to step 7.

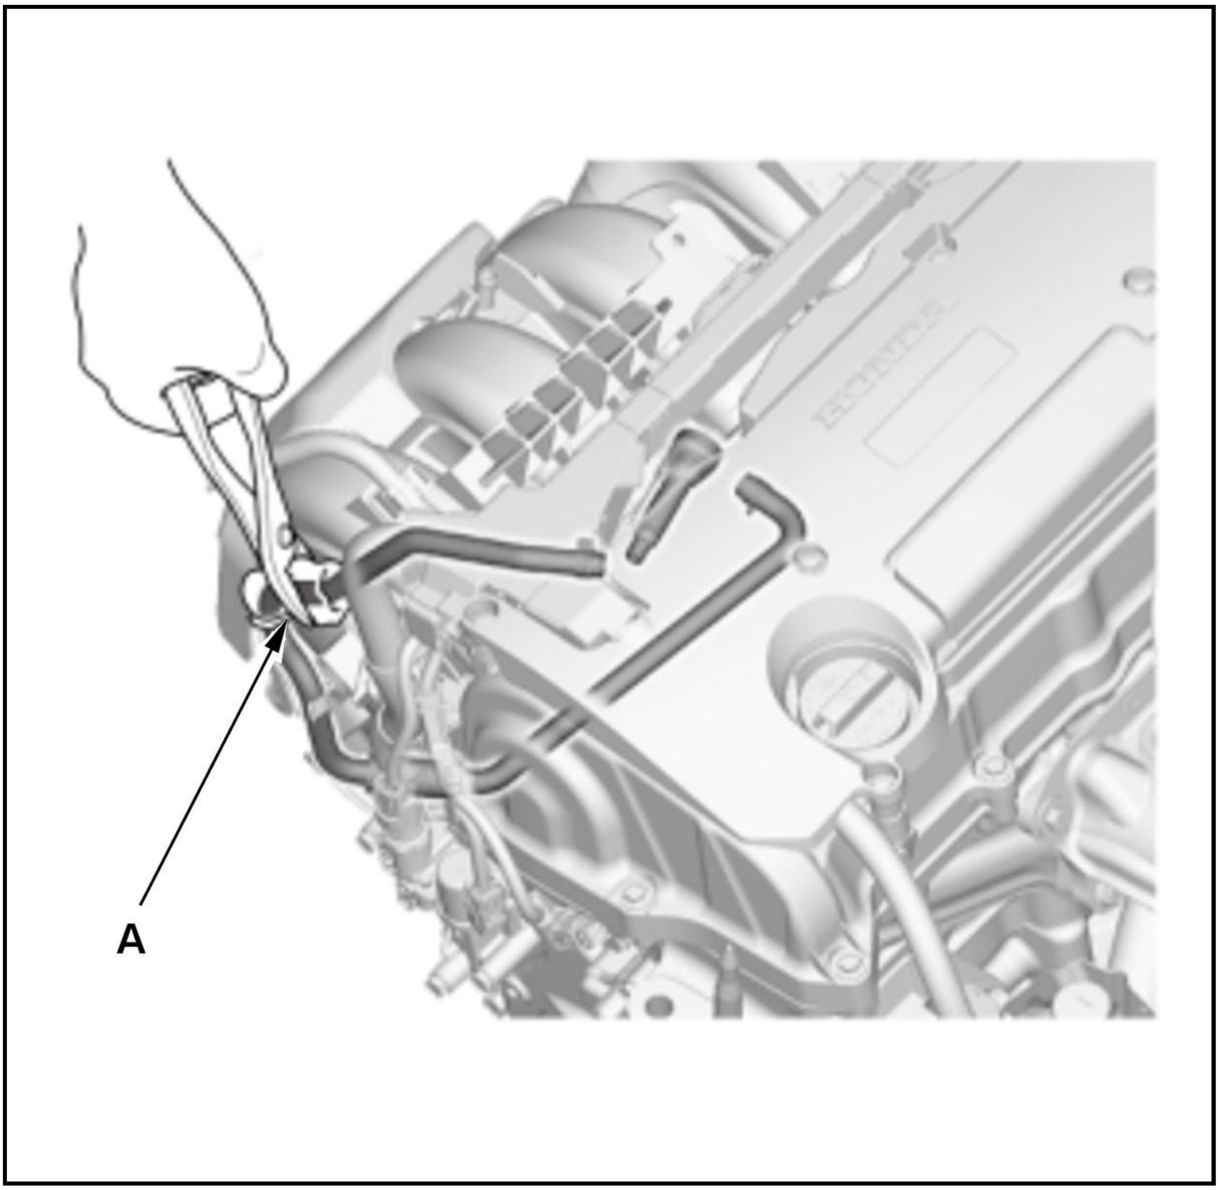
NO

The MAF sensor read value is incorrect. Inspect for a cracked, damaged, or incorrectly installed air cleaner assembly. If OK, **replace the MAF sensor/IAT sensor** .

7. Check engine oil

-1. Continue to let the engine idle.

-2. Gently pinch the PCV vacuum hose (A).



-3. Check the parameter (s) below with the HDS with the vacuum hose pinched.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST FUEL TRIM)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold?

YES

The engine oil is OK. Go to step 8.

NO

The engine oil is contaminated. Determine the cause of the contaminated oil (faulty injectors, etc.), then **replace the engine oil** and **oil filter** .

8. EVAP canister purge valve check

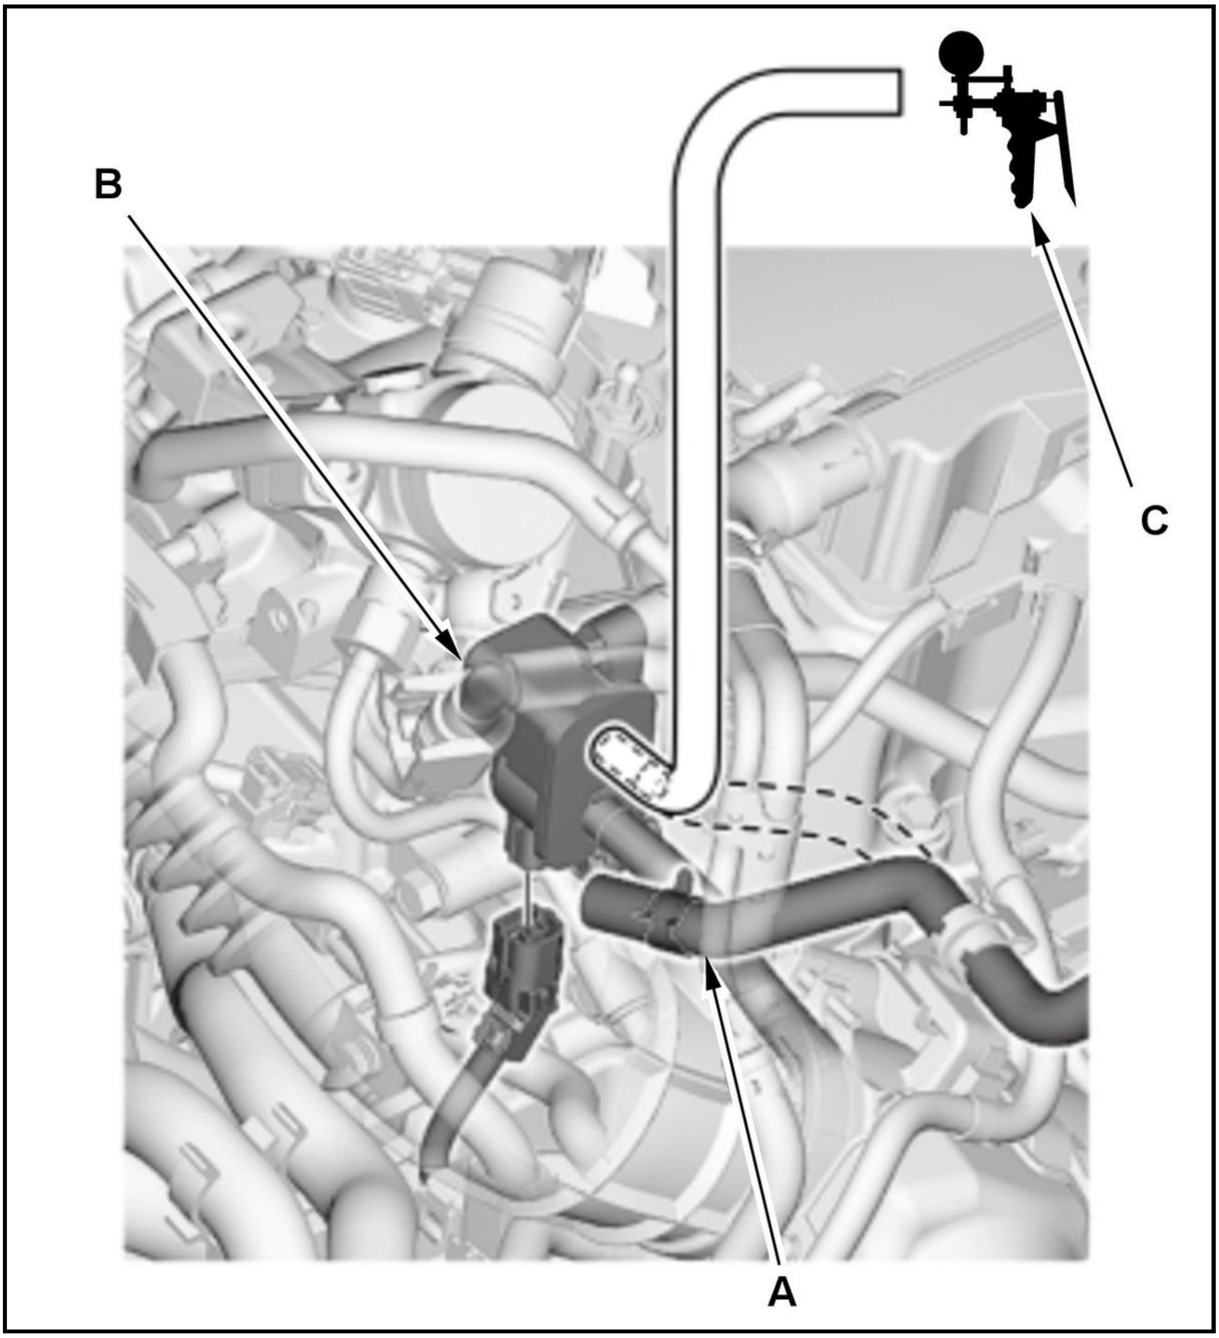
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the high pressure fuel pump cover and the fuel bracket.

-3. Disconnect the following connector.

EVAP canister purge valve 2P connector

-4. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 inHg (C) to the purge valve.



-5. Start the engine.

Does the vacuum pump indicate vacuum?

YES

When the climate is warm, fuel vapor from the canister line to the fuel tank enters intake manifold, enriching mixture (excessively rich), causing the engine to stall in some cases. If needed, **replace the EVAP canister purge valve** .

NO

Go to step 9.

9. Replace A/F sensor (Sensor 1)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Replace the A/F sensor (Sensor 1) with a known-good sensor .

-3. Start the engine, and let it idle.

-4. Operate the vehicle under the same conditions where the AF FB (ST FUEL TRIM) was 0.79 or less.

	Values	Unit	Values	Unit
AF FB (ST FUEL TRIM)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The injectors are not the cause of the low AF FB (ST FUEL TRIM) value. **Substitute a known-good PCM** , then recheck.

NO

The injectors were causing the low AF FB (ST FUEL TRIM) value. **Replace all injectors as a set** .

DTC P0191 (2.4 L ENGINE) (2018 2019)

DTC P0191 : Fuel Rail Pressure Sensor Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0191 Fuel Rail Pressure Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode and wait 6 seconds.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 0.22	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	More than 4.89	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 7.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the fuel rail pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (PF line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Fuel rail pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 0.22	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (PF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

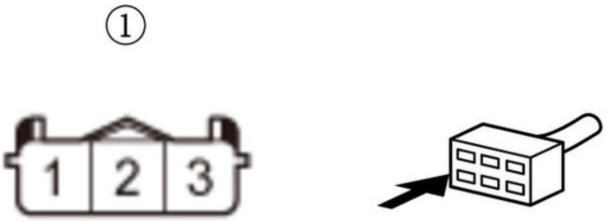
-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PF wire between the PCM (C46) and the fuel rail pressure sensor.

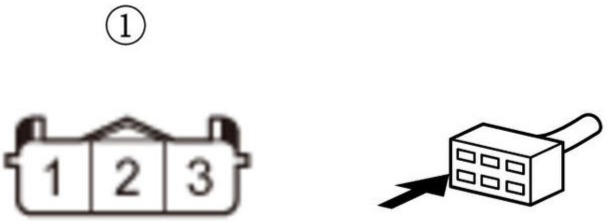
NO

The PF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (fuel rail pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Fuel rail pressure sensor 3P connector: disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the fuel rail (fuel rail pressure sensor) .

NO

Go to step 6.

6. Open wire check (VCC1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

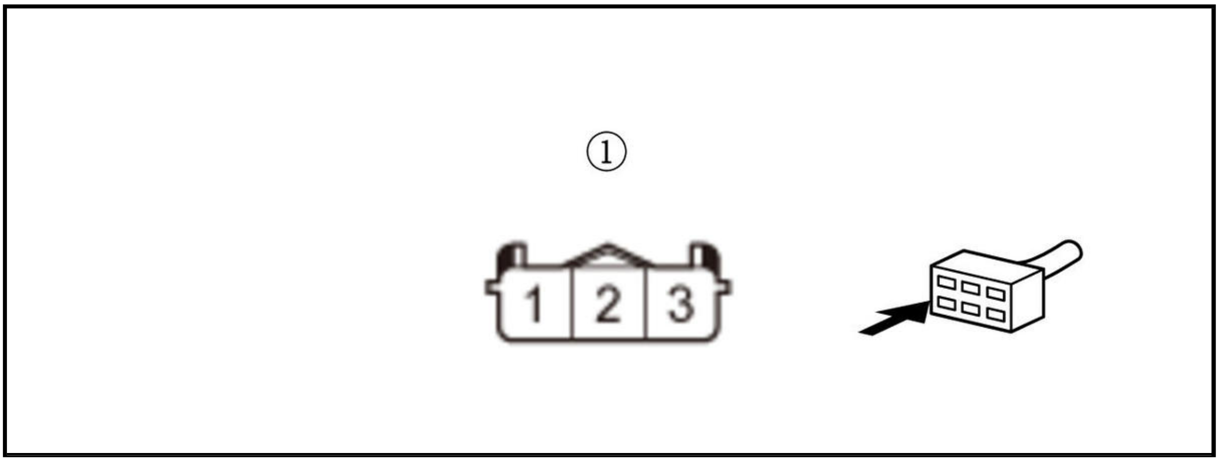
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	PCM connector C (51P) No. 41



Is there continuity?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC1 wire between the PCM (C41) and the fuel rail pressure sensor.

7. Determine possible failure area (fuel rail pressure sensor, others)

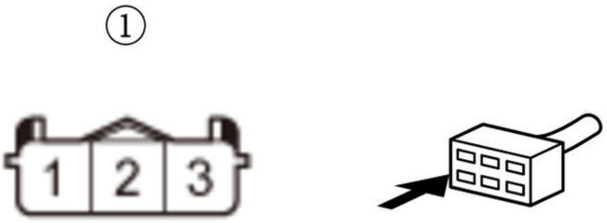
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Fuel rail pressure sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Fuel rail pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
FUEL PRESSURE CONVERTED FROM PF SENSOR	More than 4.89	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 8.

NO

Replace the fuel rail (fuel rail pressure sensor) .

8. Determine possible failure area (SG1 line, others)

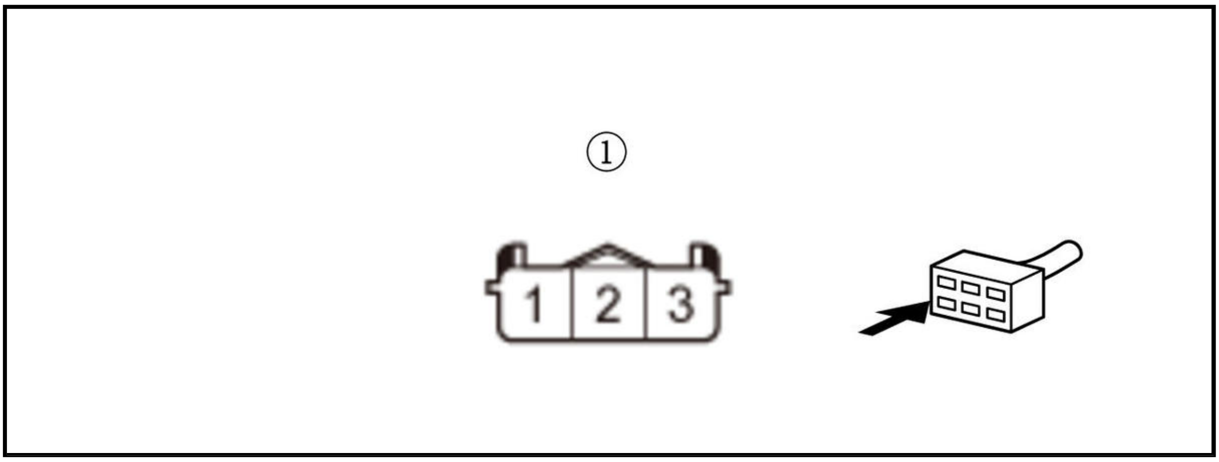
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the fuel rail pressure sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Fuel rail pressure sensor 3P connector: disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

The SG1 wire is OK. Go to step 9.

NO

Go to step 10.

9. Open wire check (PF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

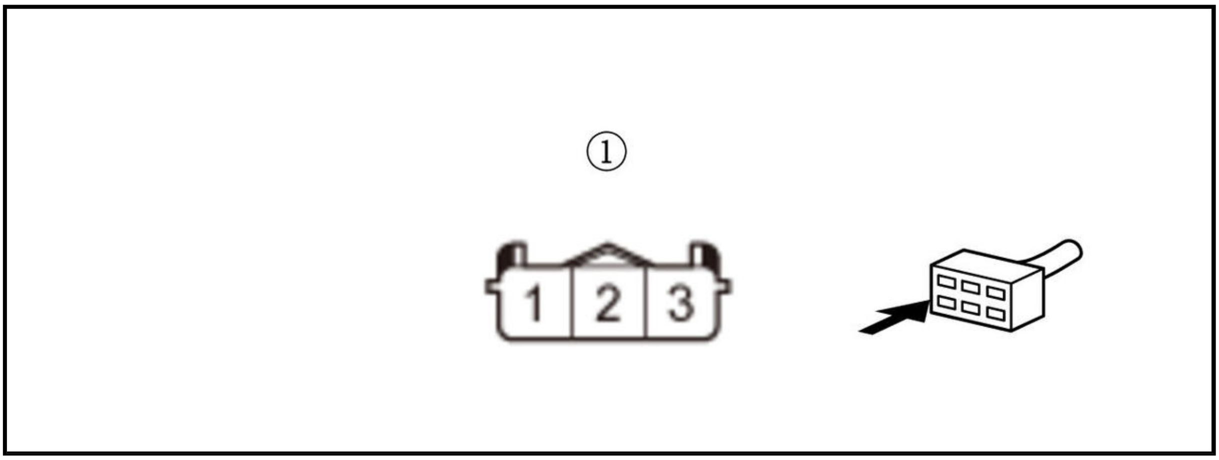
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 46**



Is there continuity?

YES

The PF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the PF wire between the PCM (C46) and the fuel rail pressure sensor.

10. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

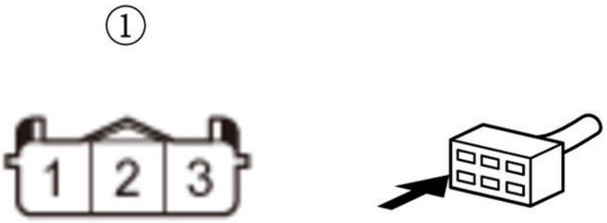
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector C (51P) No. 42**



Is there continuity?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (C42) and the fuel rail pressure sensor.

DTC P0192 (1.5 L ENGINE)

DTC P0192 : Fuel Rail Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0192 Fuel Rail Pressure Sensor Circuit Low Voltage	B	B

1. Problem verification

   -1. Turn the vehicle to the ON mode and wait 2 seconds.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 0.31	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the fuel rail pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (PF line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Fuel rail pressure sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 0.31	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Shorted wire check (PF line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

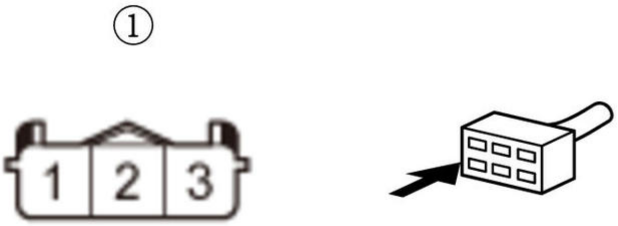
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PF wire between the PCM (E72) and the fuel rail pressure sensor.

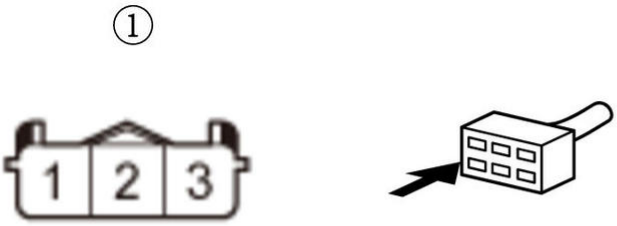
NO

The PF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Determine possible failure area (fuel rail pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Fuel rail pressure sensor 3P connector: disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the fuel rail (fuel rail pressure sensor) .

NO

Go to step 5.

5. Open wire check (VCC1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

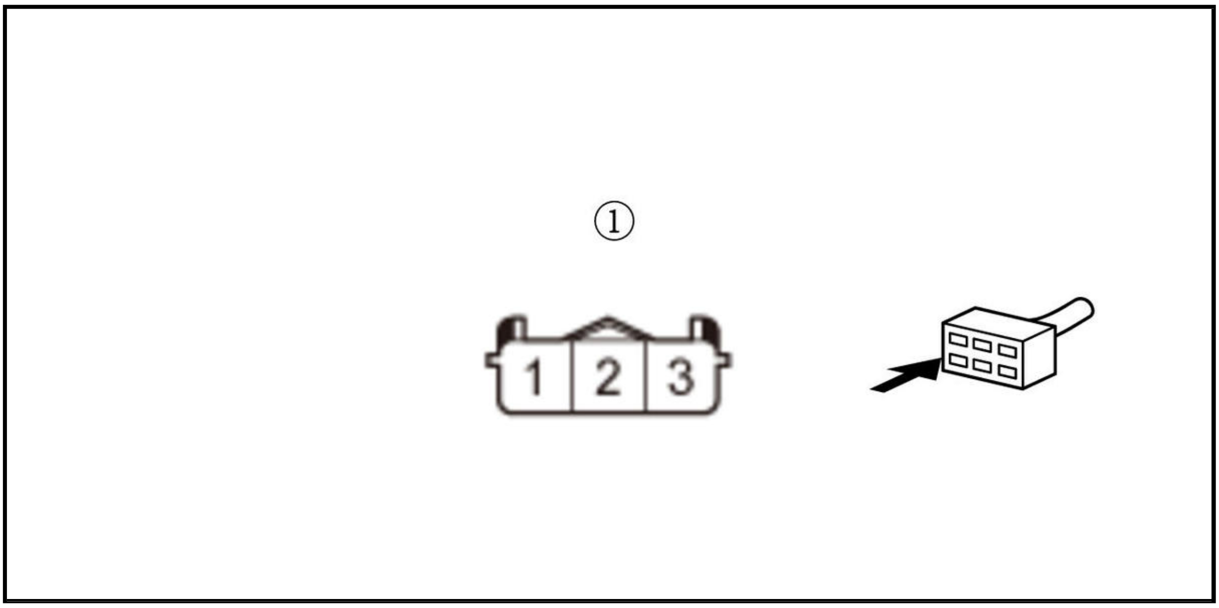
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 70**



Is there continuity?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC1 wire between the PCM (E70) and the fuel rail pressure sensor.

DTC P0192 (2.4 L ENGINE) (2017 2018 2019)

DTC P0192 : Fuel Rail Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0192 Fuel Rail Pressure Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode and wait 2 seconds.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 0.31	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the fuel rail pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (PF line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Fuel rail pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
FUEL PRESSURE CONVERTED FROM PF SENSOR	Less than 0.31	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (PF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

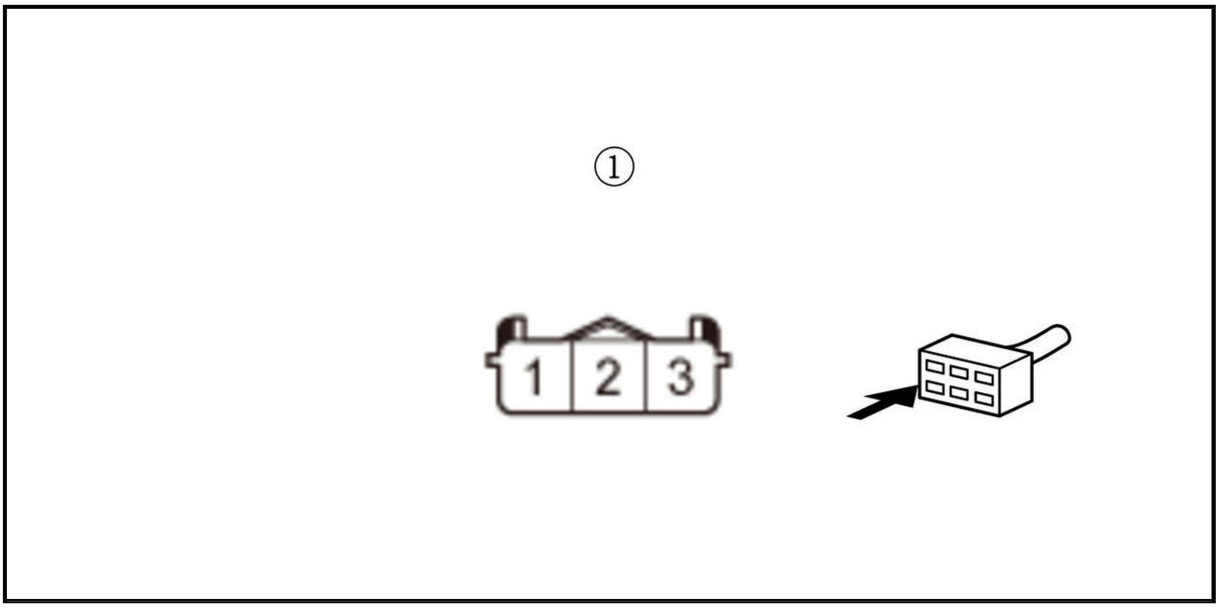
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the PF wire between the PCM (C46) and the fuel rail pressure sensor.

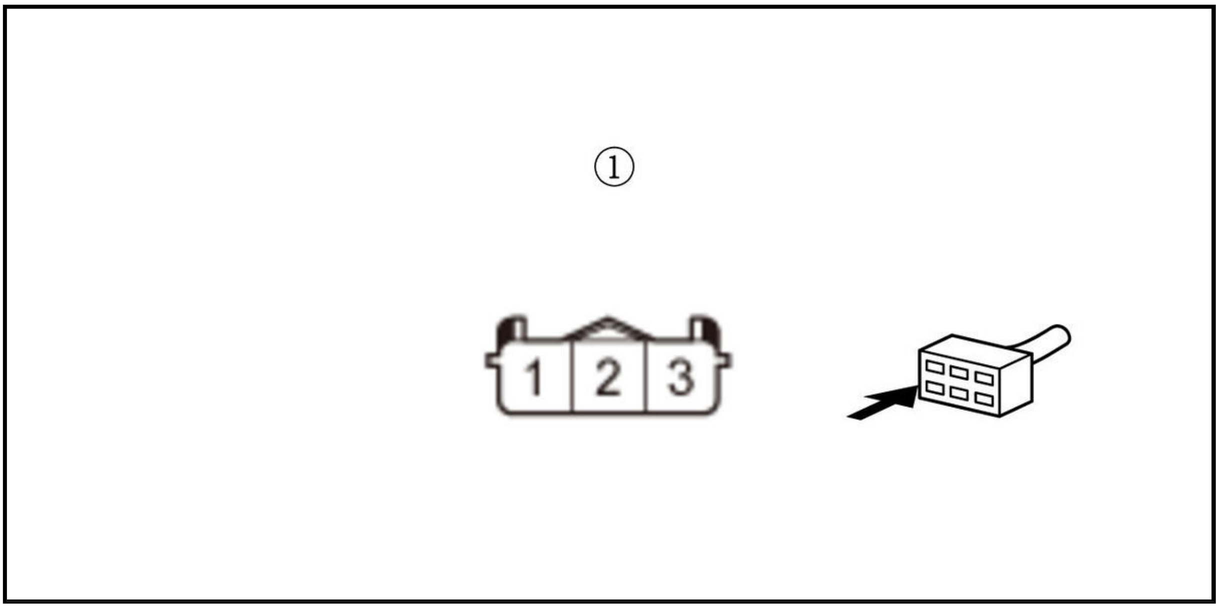
NO

The PF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

4. Determine possible failure area (fuel rail pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Fuel rail pressure sensor 3P connector: disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the fuel rail (fuel rail pressure sensor) .

NO

Go to step 5.

5. Open wire check (VCC1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

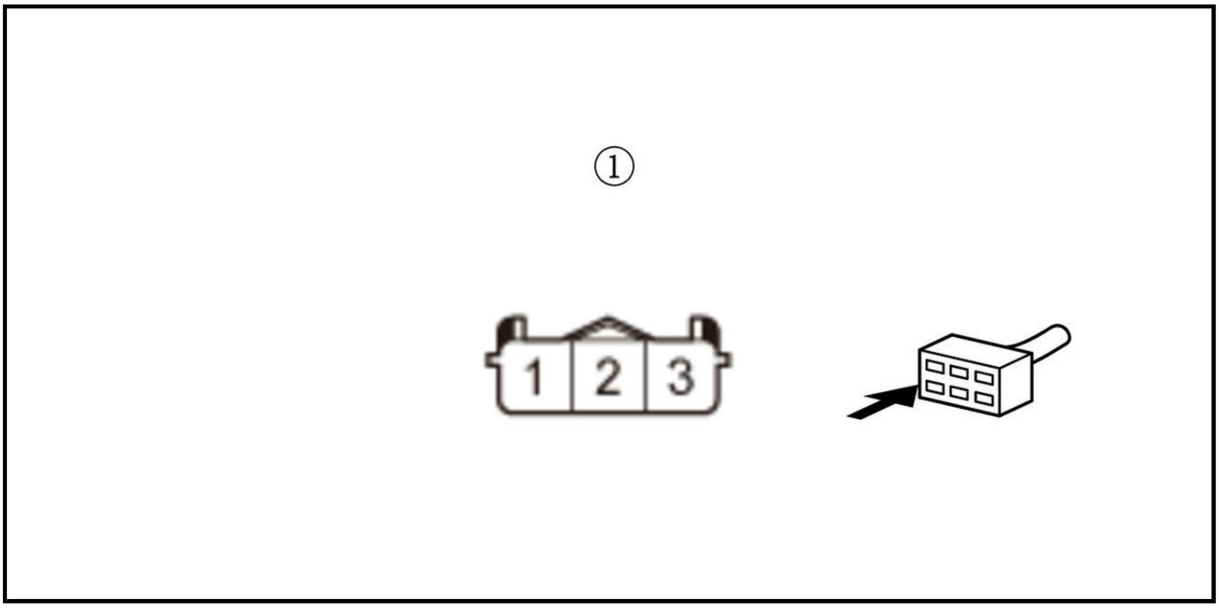
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector C (51P) No. 41**



Is there continuity?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VCC1 wire between the PCM (C41) and the fuel rail pressure sensor.

DTC P0193 (1.5 L ENGINE)

DTC P0193 : Fuel Rail Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0193 Fuel Rail Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode, and wait 2 seconds.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	More than 4.89	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the fuel rail pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (fuel rail pressure sensor, others)

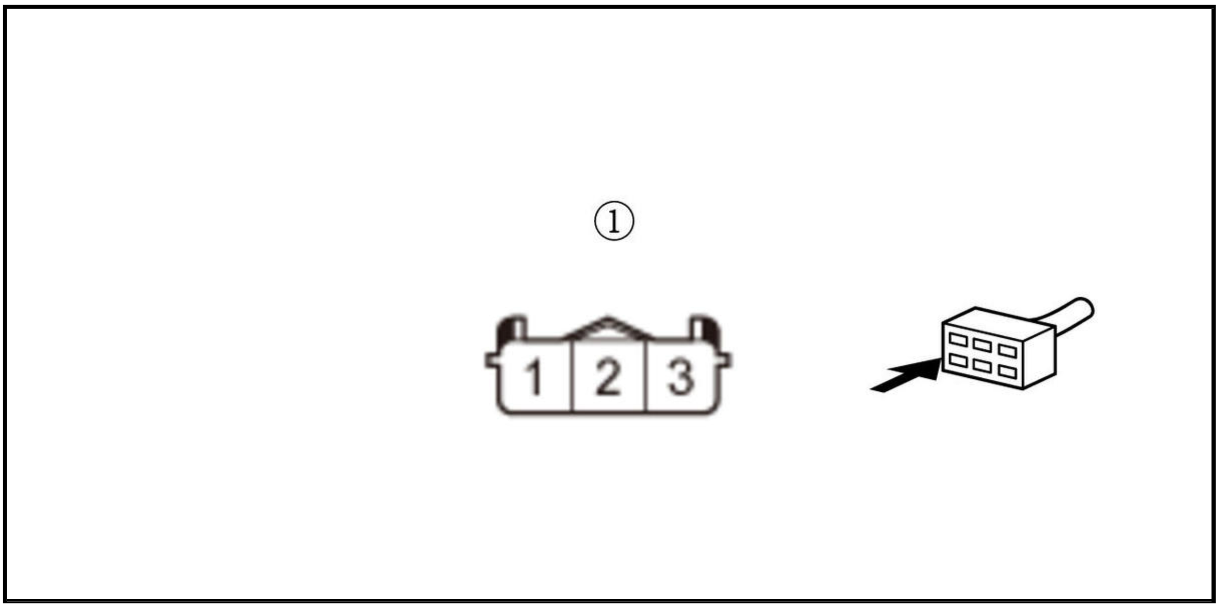
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Fuel rail pressure sensor 3P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Fuel rail pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	More than 4.89	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the fuel rail (fuel rail pressure sensor) .

3. Determine possible failure area (SG1 line, others)

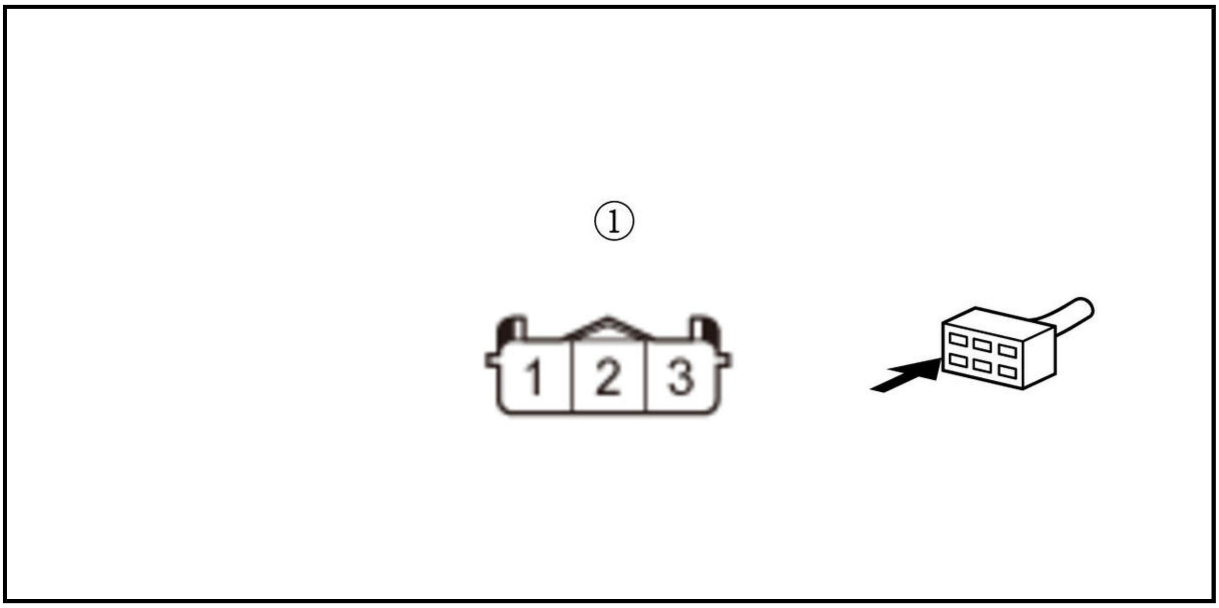
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the fuel rail pressure sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Fuel rail pressure sensor 3P connector: disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (PF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

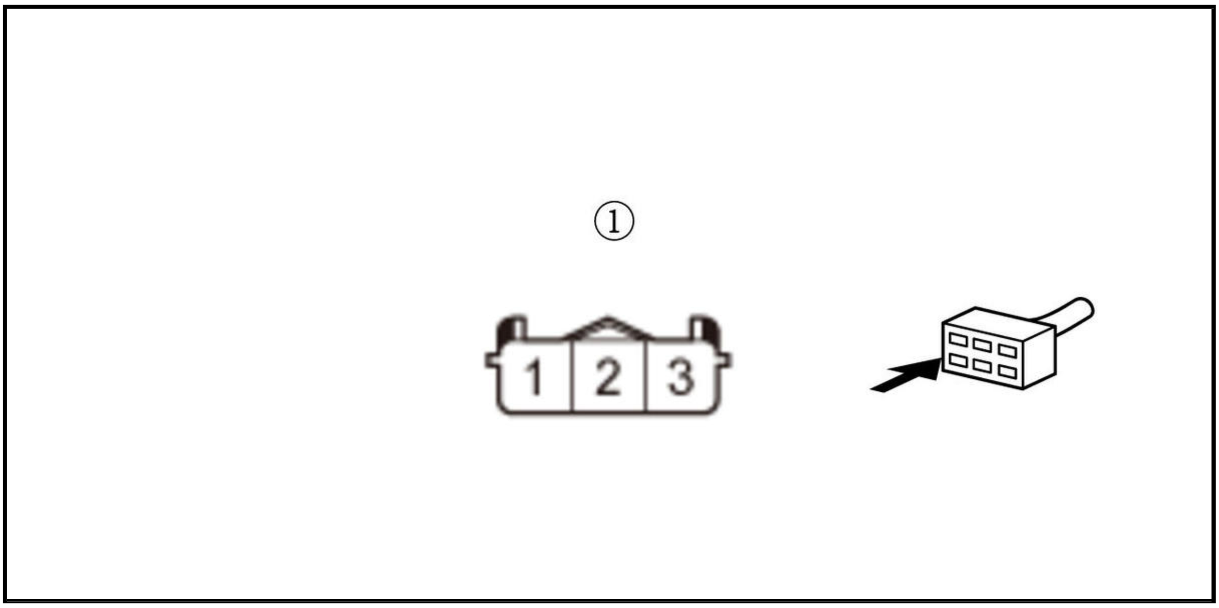
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 72**



Is there continuity?

YES

The PF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the PF wire between the PCM (E72) and the fuel rail pressure sensor.

5. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

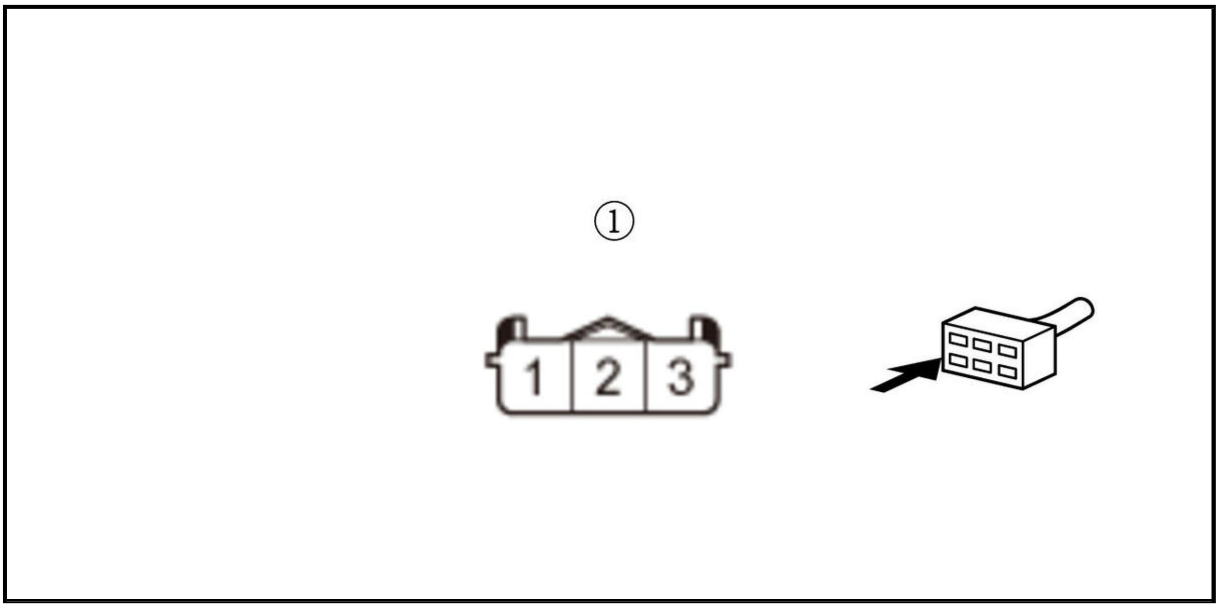
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 71**



Is there continuity?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (E71) and the fuel rail pressure sensor.

DTC P0193 (2.4 L ENGINE) (2017 2018 2019)

DTC P0193 : Fuel Rail Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0193 Fuel Rail Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode, and wait 2 seconds.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	More than 4.89	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the fuel rail pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (fuel rail pressure sensor, others)

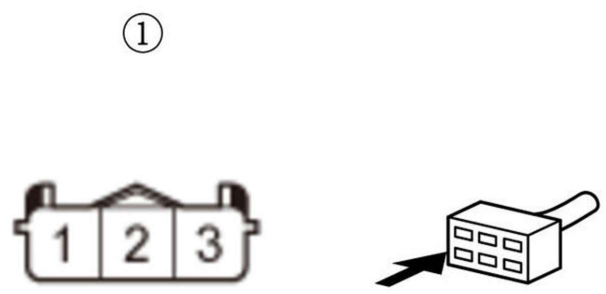
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Fuel rail pressure sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Fuel rail pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FUEL PRESSURE CONVERTED FROM PF SENSOR	More than 4.89	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the fuel rail (fuel rail pressure sensor) .

3. Determine possible failure area (SG1 line, others)

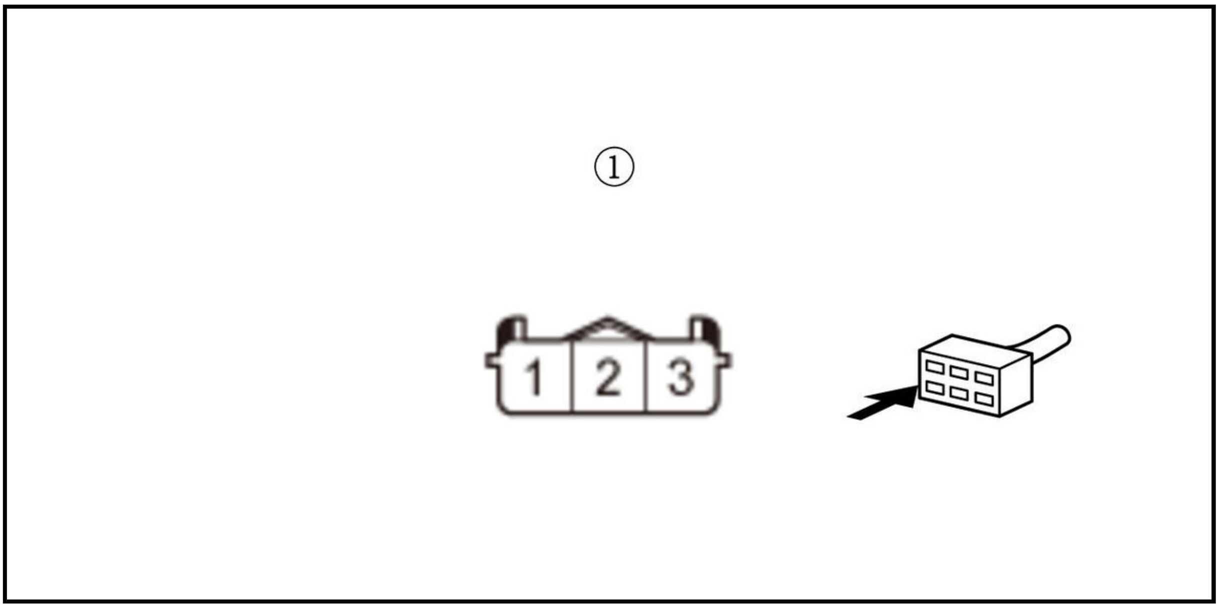
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the fuel rail pressure sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Fuel rail pressure sensor 3P connector: disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Fuel rail pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

The SG1 wire is OK. Go to step 4.

NO

Go to step 5.

4. Open wire check (PF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

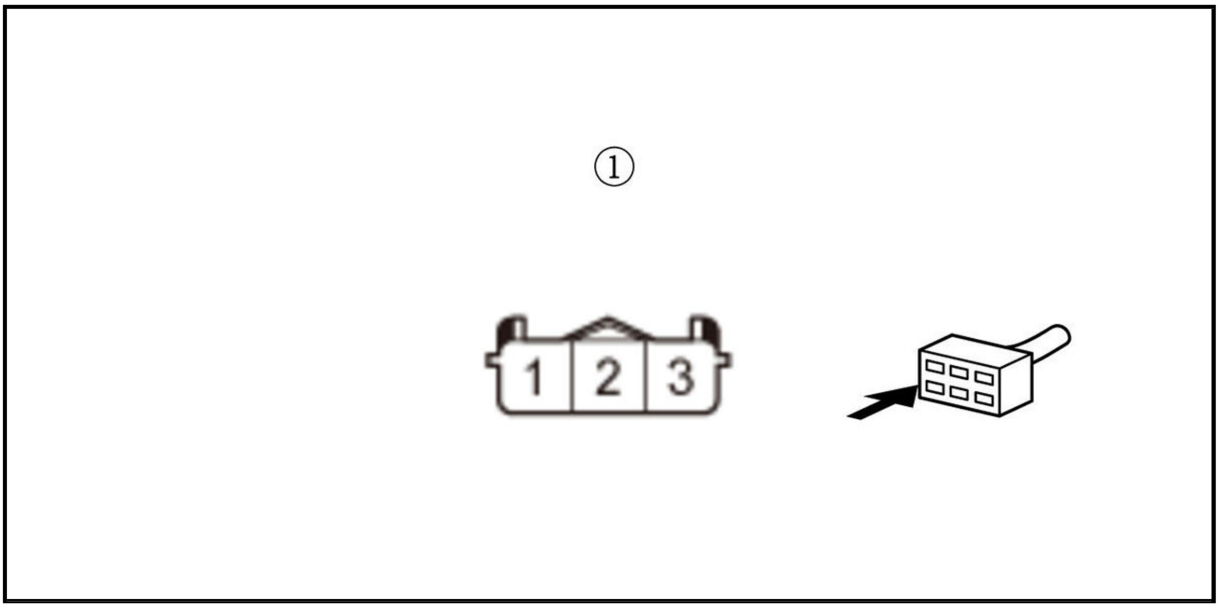
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector No. 1
Test point 2	**PCM connector C (51P) No. 46**



Is there continuity?

YES

The PF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the PF wire between the PCM (C46) and the fuel rail pressure sensor.

5. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

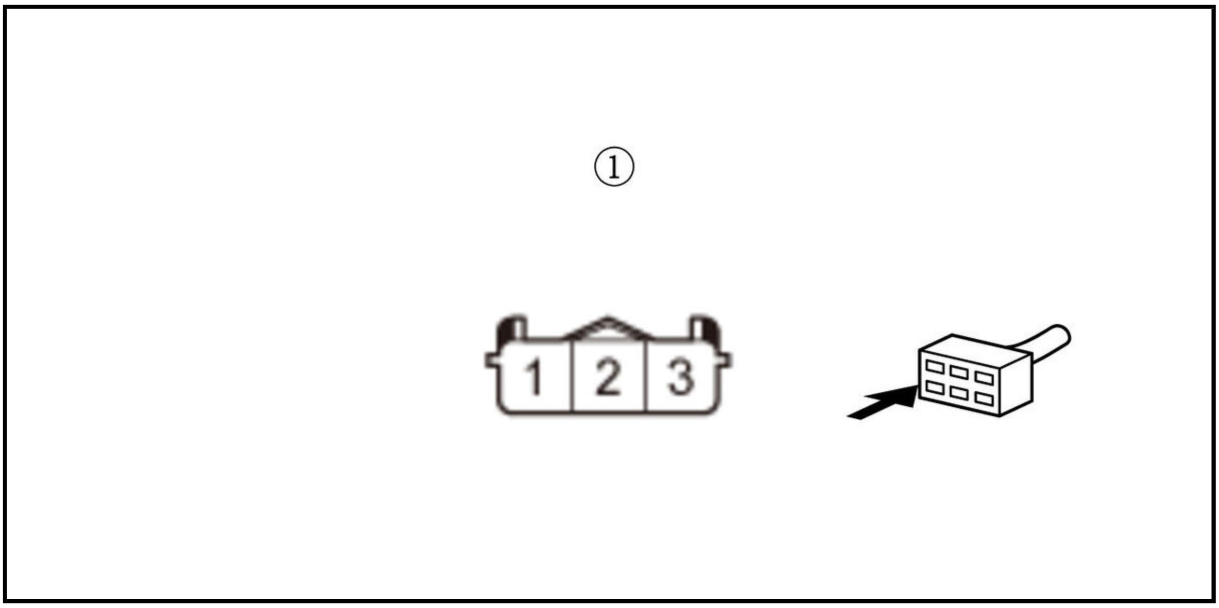
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel rail pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Fuel rail pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector C (51P) No. 42**



Is there continuity?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Repair an open in the SG1 wire between the PCM (C42) and the fuel rail pressure sensor.

DTC P0201, P0204 (1.5 L ENGINE)

DTC P0201 : No. 1 Cylinder Injector Circuit Malfunction **DTC P0204** : No. 4 Cylinder Injector Circuit Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0201 No. 1 Cylinder Injector Circuit Malfunction	B	B
P0204 No. 4 Cylinder Injector Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine (If the engine does not start, crank the engine for 20 seconds).

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0201 No. 1 Cylinder Injector Circuit Malfunction	B	B
P0204 No. 4 Cylinder Injector Circuit Malfunction	B	B

Is DTC P0201 and/or P0204 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the injector and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Engine starting check

-1. Try to start the engine.

Does the engine start?

YES

Go to step 11.

NO

Go to step 3.

3. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the injector relay** .

-3. **Test the injector relay** .

Is the relay OK?

YES

Go to step 4.

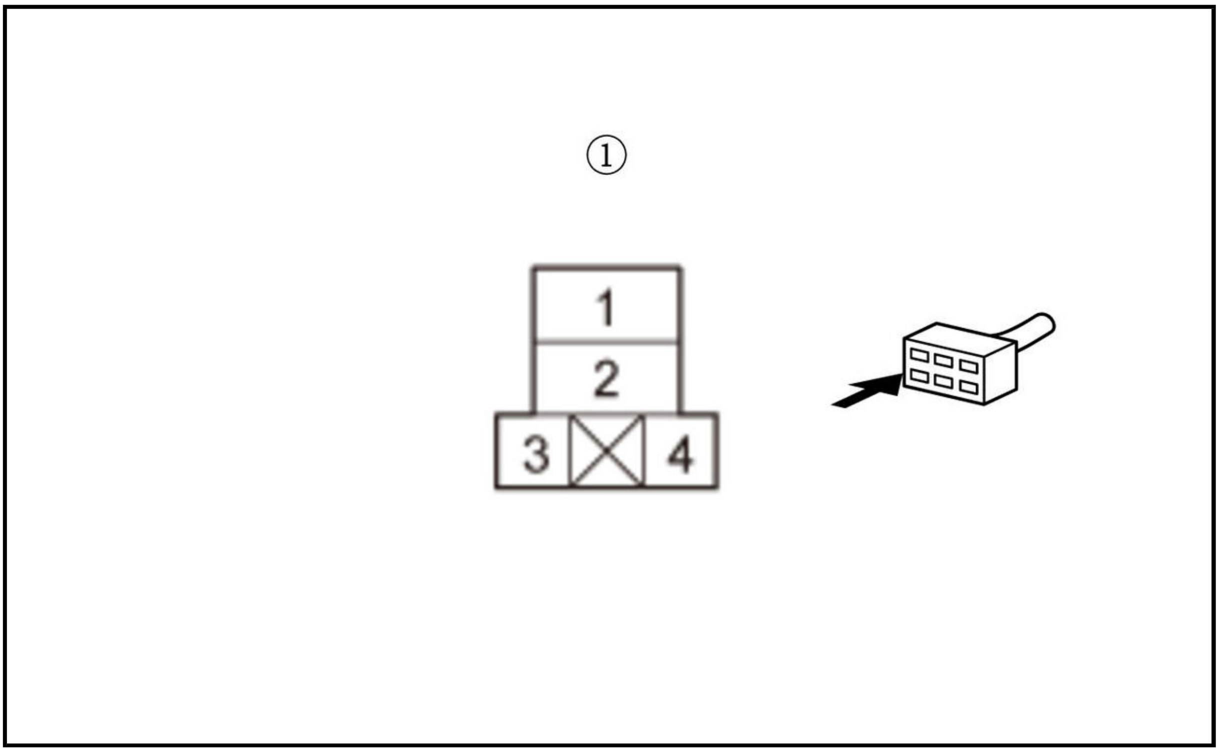
NO

Replace the injector relay.

4. Open wire check (+B IGP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B IGP wire is OK. Go to step 6.

NO

Go to step 5.

5. Fuse check 1

-1. Check the following fuse.

Fuse	No. A7 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Repair an open in the +B IGP wire between the No. A7 (15 A) fuse and the injector relay.

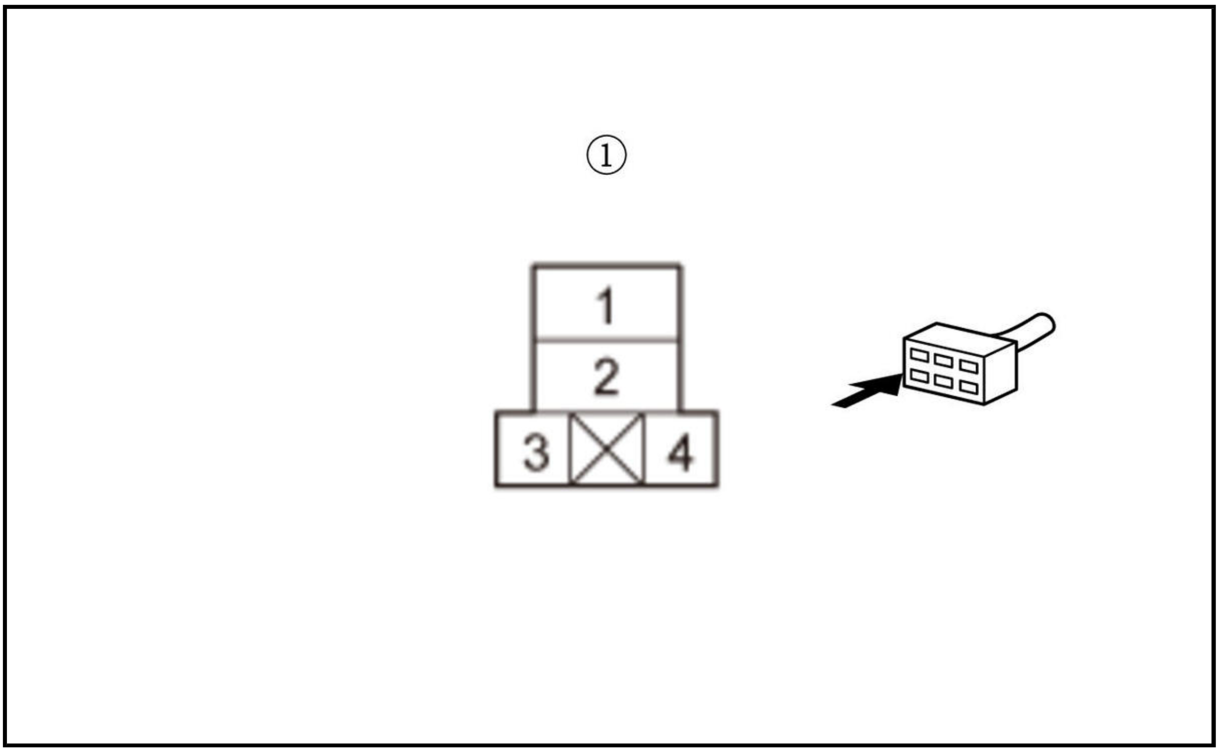
NO

Repair a short in the +B IGP wire between the No. A7 (15 A) fuse and the injector relay. Also replace the No. A7 (15 A) fuse.

6. Open wire check (+B INJ line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B INJ wire is OK. Go to step 8.

NO

Go to step 7.

7. Fuse check

-1. Check the following fuse.

Fuse	No. A10 (20 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Repair an open in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay.

NO

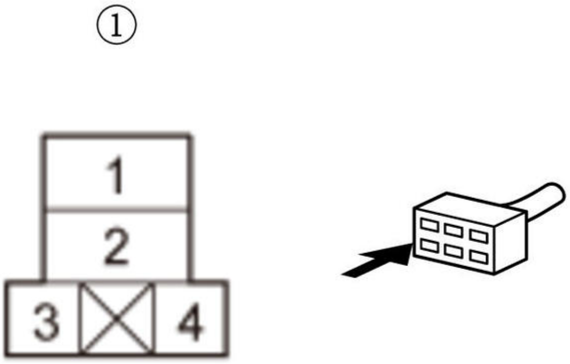
Repair a short in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. Also replace the No. A10 (20 A) fuse.

8. Determine possible failure area (FI MAIN RLY CL- line, others)

-1. Turn the vehicle to ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Injector relay 4P socket (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 10.

NO

Go to step 9.

9. Open wire check (FI MAIN RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

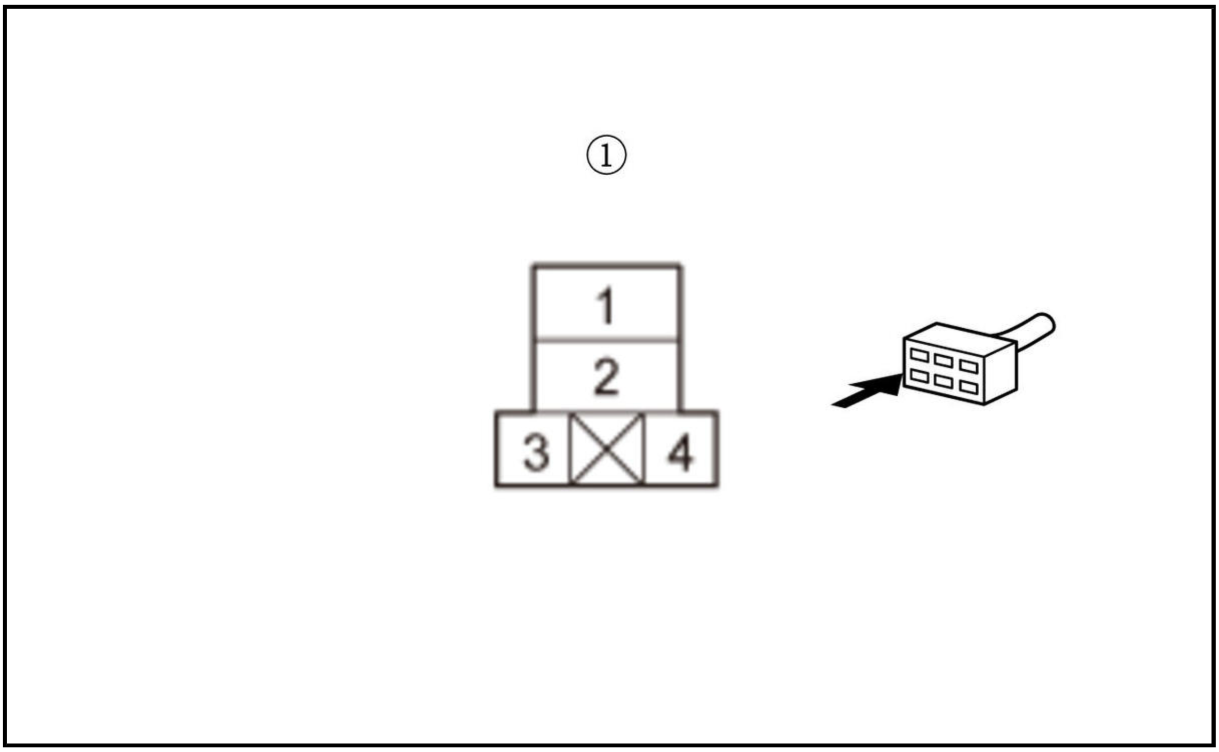
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected PCM connector A (50P): disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (50P) No. 5**



Is there continuity?

YES

The FI MAIN RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

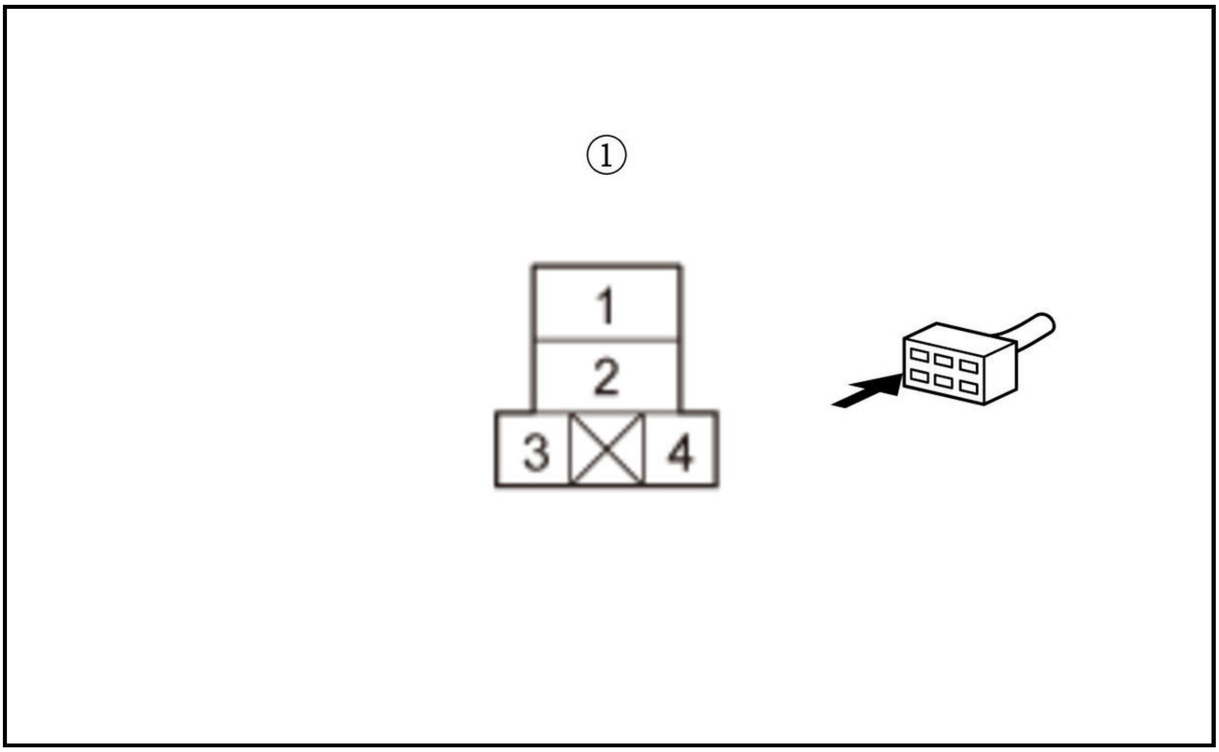
Repair an open in the FI MAIN RLY CL- wire between the PCM (A5) and the injector relay.

10. Open wire check (INJ RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Injector relay 4P socket (female terminals) No. 1: ①
Terminal B	Injector relay 4P socket (female terminals) No. 2: ①



-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (50P)

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
	Injector relay 4P socket No. 1 and No. 2: jumped
	PCM connector A (50P): disconnected
Test point 1	PCM connector A (50P) No. 1 and No. 2
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 11.

NO

Repair an open in the INJ RLY OUT wire between the PCM (A1, A2) and the injector relay.

11. DTC check

-1. Check the indicated DTC in step 1.

Is DTC P0201 indicated?

YES

Go to step 12.

NO

Go to step 20.

12. Open wire check (INJH1 line, INJL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reinstall the injector relay.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector E (80P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 3**
Test point 2	**PCM connector E (80P) No. 15**

Is there continuity?

YES

Go to step 15.

NO

Go to step 13.

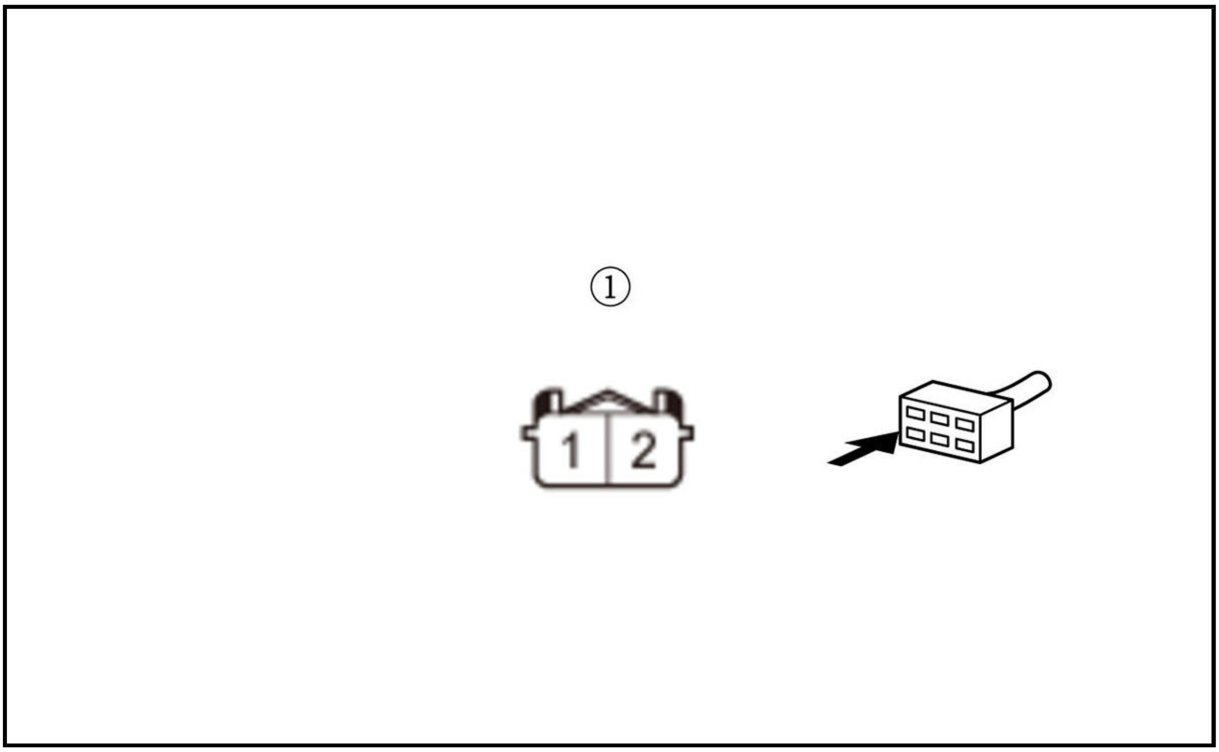
13. Open wire check (INJH1 line)

-1. Disconnect the following connector.

No. 1 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	No. 1 injector 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 15**



Is there continuity?

YES

Go to step 14.

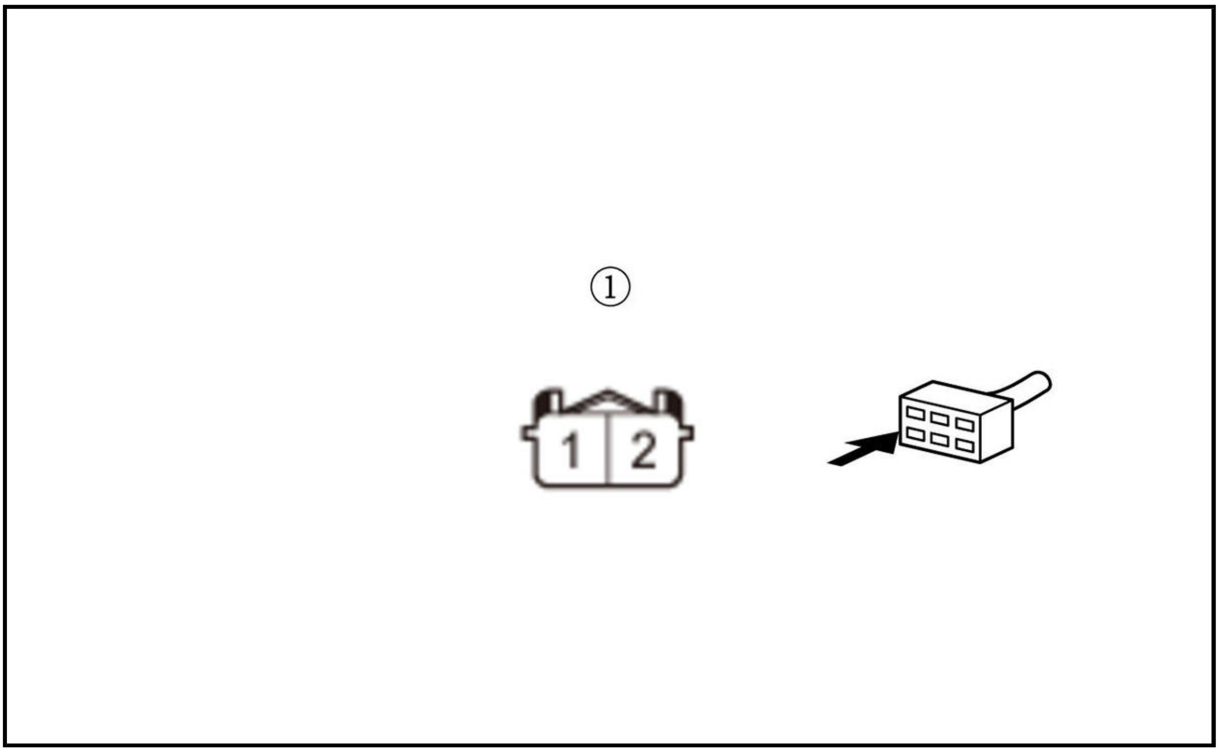
NO

Repair an open in the INJH1 wire between the PCM (E15) and the No. 1 injector.

14. Open wire check (INJL1 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	No. 1 injector 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 3**



Is there continuity?

YES

The INJL1 wire is OK. **Replace the No. 1 injector** .

NO

Repair an open in the INJL1 wire between the PCM (E3) and the No. 1 injector.

15. Shorted wire check (INJH1 line to power)

-1. Disconnect the following connector.

No. 1 injector 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 15**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJH1 wire between the PCM (E15) and the No. 1 injector.

NO

Go to step 16.

16. Shorted wire check (INJL1 line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode PCM connector A (50P): disconnected PCM connector E (80P): disconnected No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 3**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJL1 wire between the PCM (E3) and the No. 1 injector.

NO

Go to step 17.

17. Shorted wire check (INJH1 line to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (50P): disconnected PCM connector E (80P): disconnected No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 15**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the INJH1 wire between the PCM (E15) and the No. 1 injector.

NO

Go to step 18.

18. Shorted wire check (INJL1 line to ground)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (50P): disconnected PCM connector E (80P): disconnected No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the INJL1 wire between the PCM (E3) and the No. 1 injector.

NO

Go to step 19.

19. Shorted wire check (INJH4 line)

-1. Disconnect the following connector.

No. 4 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 1 injector 2P connector: disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJH4 wire between the PCM (E2) and the No. 4 injector.

NO

The INJH4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

20. Open wire check (INJH4 line, INJL4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reinstall the injector relay.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector E (80P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 2**
Test point 2	**PCM connector E (80P) No. 16**

Is there continuity?

YES

The INJH4 and INJL4 wires are not open. Go to step 23.

NO

Go to step 21.

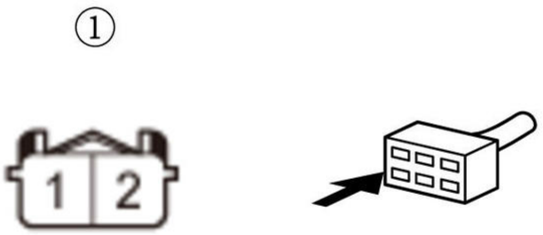
21. Open wire check (INJH4 line)

-1. Disconnect the following connector.

No. 4 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	No. 4 injector 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 2**



Is there continuity?

YES

Go to step 22.

NO

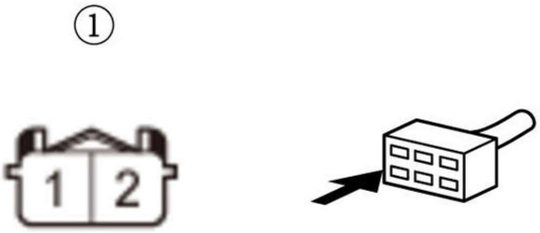
Repair an open in the INJH4 wire between the PCM (E2) and the No. 4 injector.

22. Open wire check (INJL4 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	No. 4 injector 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 16**



Is there continuity?

YES

The INJL4 wire is OK. **Replace the No. 4 injector** .

NO

Repair an open in the INJL4 wire between the PCM (E16) and the No. 4 injector.

23. Shorted wire check (INJH4 line to power)

-1. Disconnect the following connector.

No. 4 injector 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 2**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJH4 wire between the PCM (E2) and the No. 4 injector.

NO

Go to step 24.

24. Shorted wire check (INJL4 line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 16**

Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJL4 wire between the PCM (E16) and the No. 4 injector.

NO

Go to step 25.

25. Shorted wire check (INJH4 line to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the INJH4 wire between the PCM (E2) and the No. 4 injector.

NO

Go to step 26.

26. Shorted wire check (INJL4 line to ground)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 16**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the INJL4 wire between the PCM (E16) and the No. 4 injector.

NO

Go to step 27.

27. Shorted wire check (INJH1 line)

-1. Disconnect the following connector.

No. 1 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (50P): disconnected PCM connector E (80P): disconnected No. 4 injector 2P connector: disconnected No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 15**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJH1 wire between the PCM (E15) and the No. 1 injector.

NO

The INJH1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0201, P0204 (2.4 L ENGINE) (2017 2018 2019)

DTC P0201 : No. 1 Cylinder Injector Circuit Malfunction **DTC P0204** : No. 4 Cylinder Injector Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0201 No. 1 Cylinder Injector Circuit Malfunction	B	B
P0204 No. 4 Cylinder Injector Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine (If the engine does not start, crank the engine for 20 seconds).

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0201 No. 1 Cylinder Injector Circuit Malfunction	B	B
P0204 No. 4 Cylinder Injector Circuit Malfunction	B	B

Is DTC P0201 or P0204 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the injector and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Engine starting check

-1. Try to start the engine.

Does the engine start?

YES

Go to step 10.

NO

Go to step 3.

3. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the injector relay** .

-3. **Test the injector relay** .

Is the relay OK?

YES

The injector relay is OK. Go to step 4.

NO

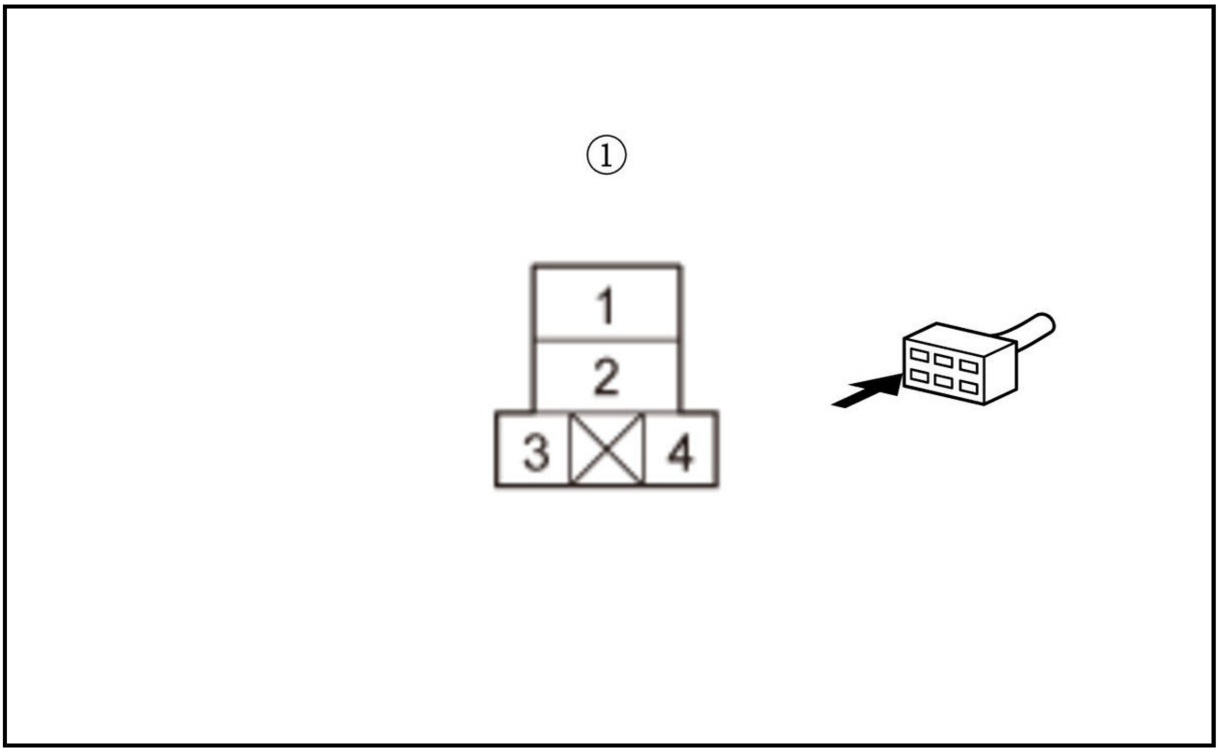
Replace the injector relay.

4. Open wire check (FI MAIN RLY OUT line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The FI MAIN RLY OUT wire is OK. Go to step 5.

NO

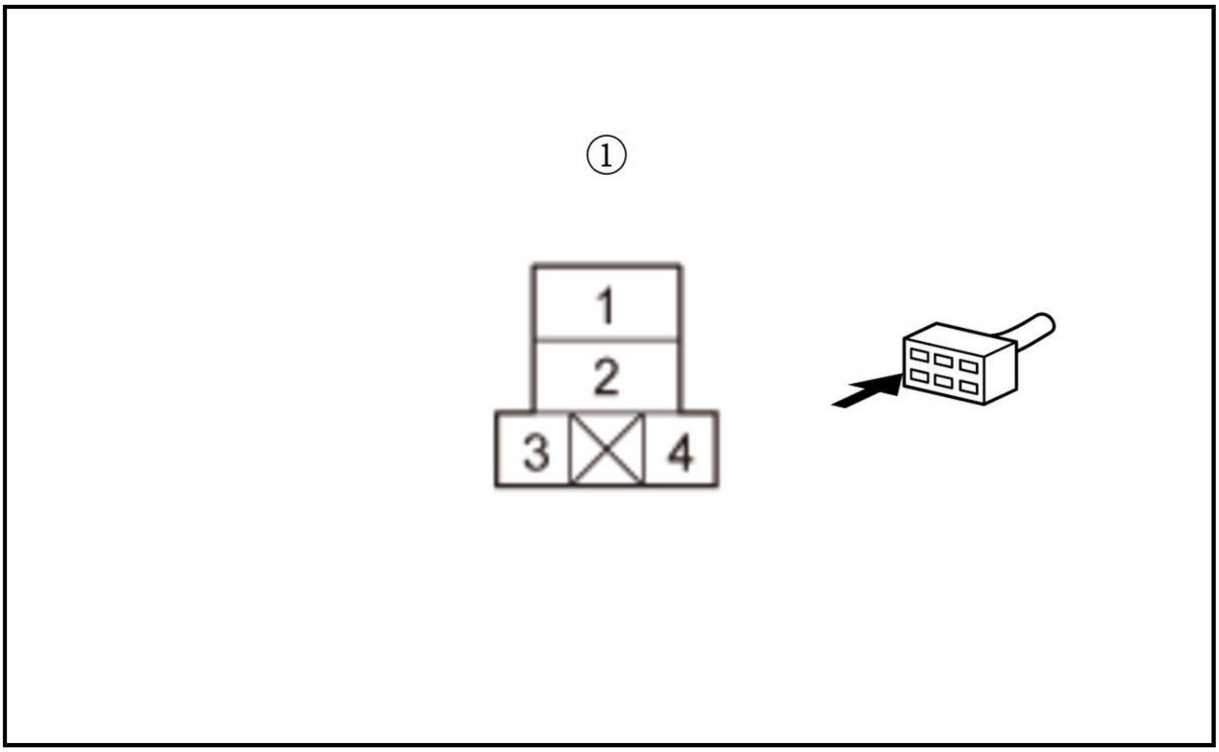
Repair an open in the FI MAIN RLY OUT wire between PGM-FI main relay 1 and the injector relay.

5. Open wire check (+B INJ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B INJ wire is OK. Go to step 7.

NO

Go to step 6.

6. Fuse check

-1. Check the following fuse.

Fuse	No. A10 (20 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Repair an open in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. If needed, replace the under-hood fuse/relay box .

NO

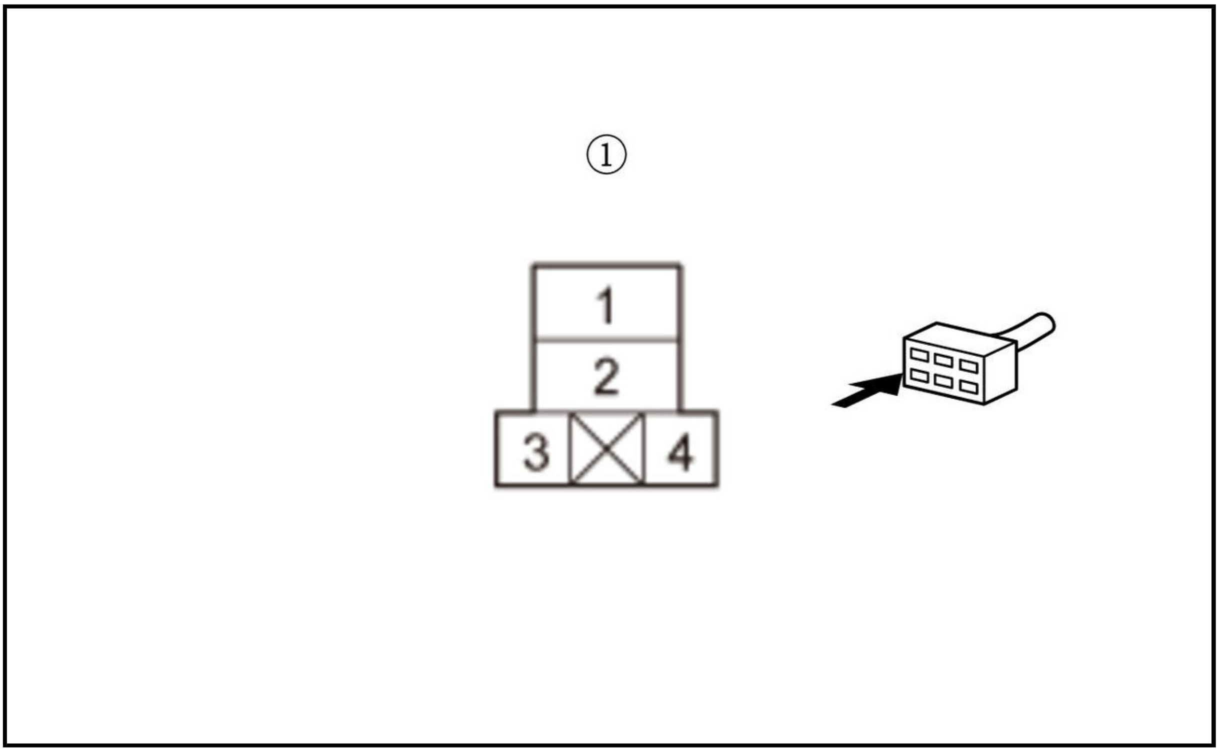
Repair a short in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. If needed, replace the under-hood fuse/relay box . Also replace the No. A10 (20 A) fuse.

7. Determine possible failure area (INJ RLY CL- line, others)

-1. Turn the vehicle to ON mode, and measure the voltage between test points 1 and 2 momentarily.

Test condition	Momentarily after ON mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①

Test point 2	Injector relay 4P socket (female terminals) No. 4: ①



Is there battery voltage momentarily?

YES

Go to step 9.

NO

Go to step 8.

8. Open wire check (INJ RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

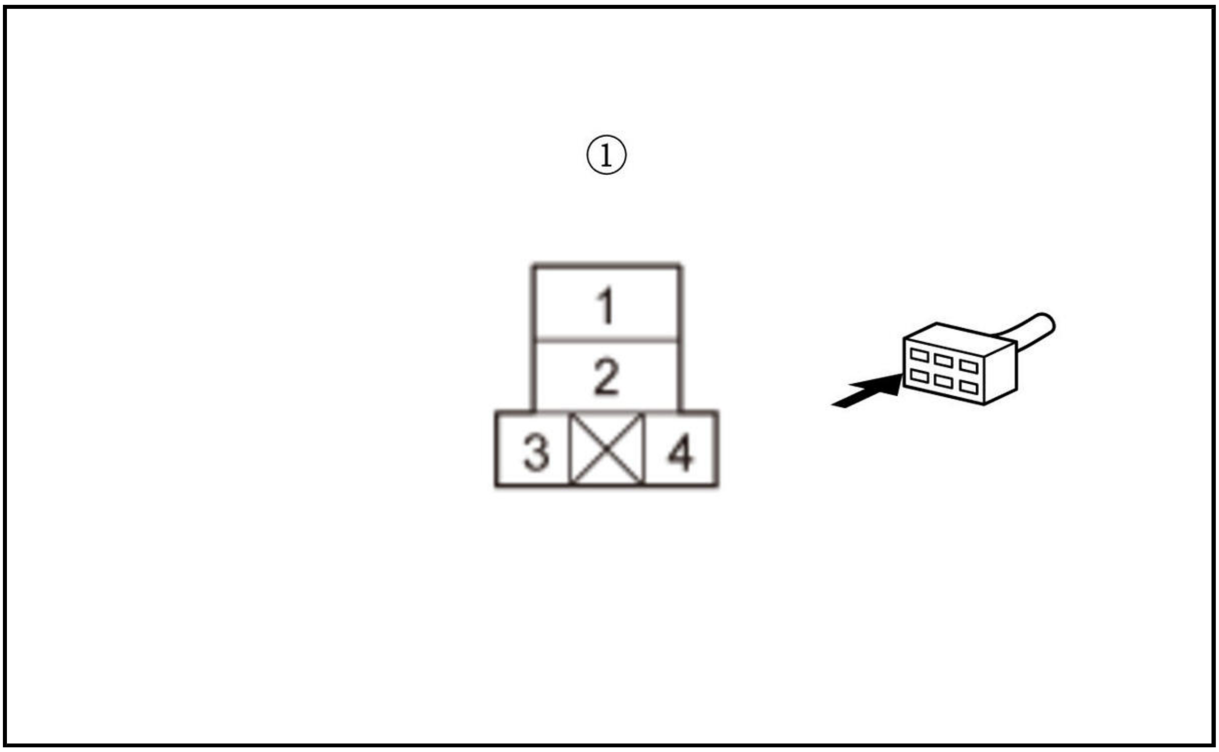
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
	PCM connector A (51P): disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (51P) No. 15**



Is there continuity?

YES

The INJ RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

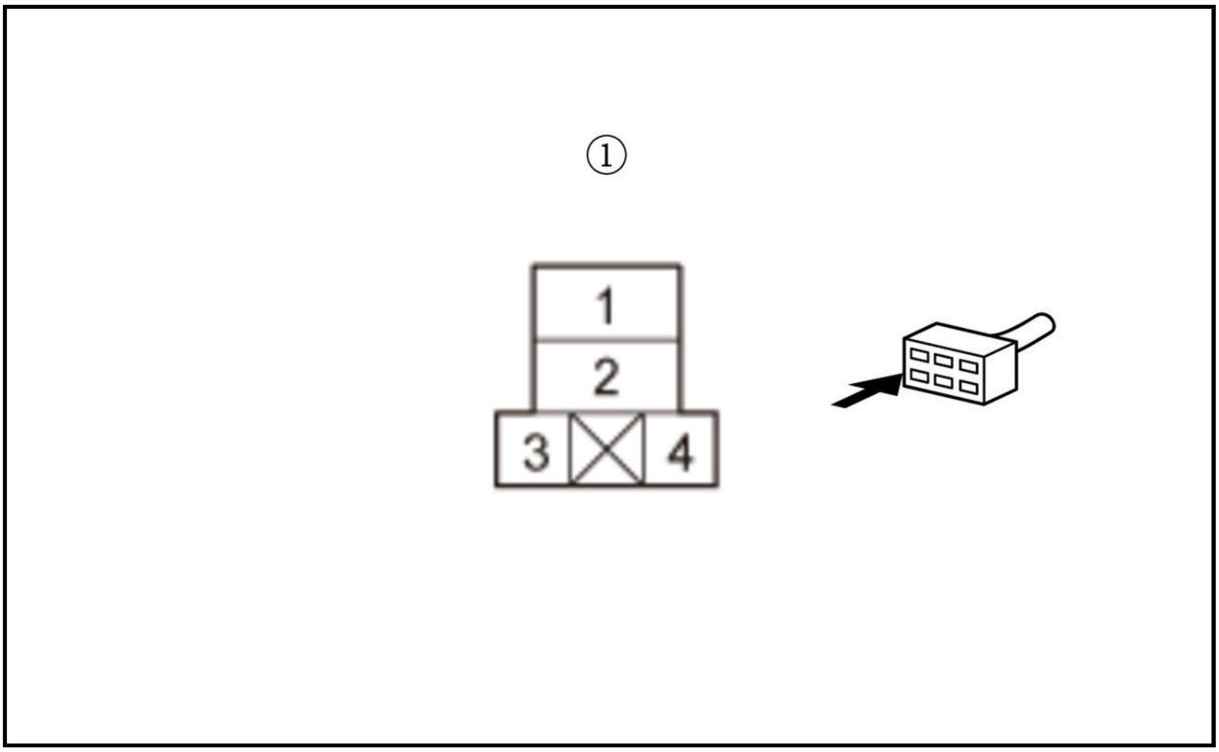
Repair an open in the INJ RLY CL- wire between the PCM (A15) and the injector relay.

9. Open wire check (INJ RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Injector relay 4P socket (female terminals) No. 1: ①
Terminal B	Injector relay 4P socket (female terminals) No. 2: ①



-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (51P)

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
	Injector relay 4P socket terminal No. 1 and No. 2: jumped
	PCM connector A (51P): disconnected
Test point 1	PCM connector A (51P) No. 6
Test point 2	Body ground

Test point 1	PCM connector A (51P) No. 7
Test point 2	Body ground

Are there battery voltage?

YES

The INJ RLY OUT wire is OK. Go to step 10.

NO

Repair an open in the INJ RLY OUT wire between the PCM (A6, A7) and the injector relay.

10. DTC check

-1. Check the indicated DTC in step 1.

Is DTC P0201 indicated?

YES

Go to step 11.

NO

Go to step 19.

11. Open wire check (INJ H1, INJ L1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reinstall the injector relay.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector B (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 1**
Test point 2	**PCM connector B (51P) No. 2**

Is there continuity?

YES

The INJ H1 and INJ L1 wires are not open. Go to step 14.

NO

Go to step 12.

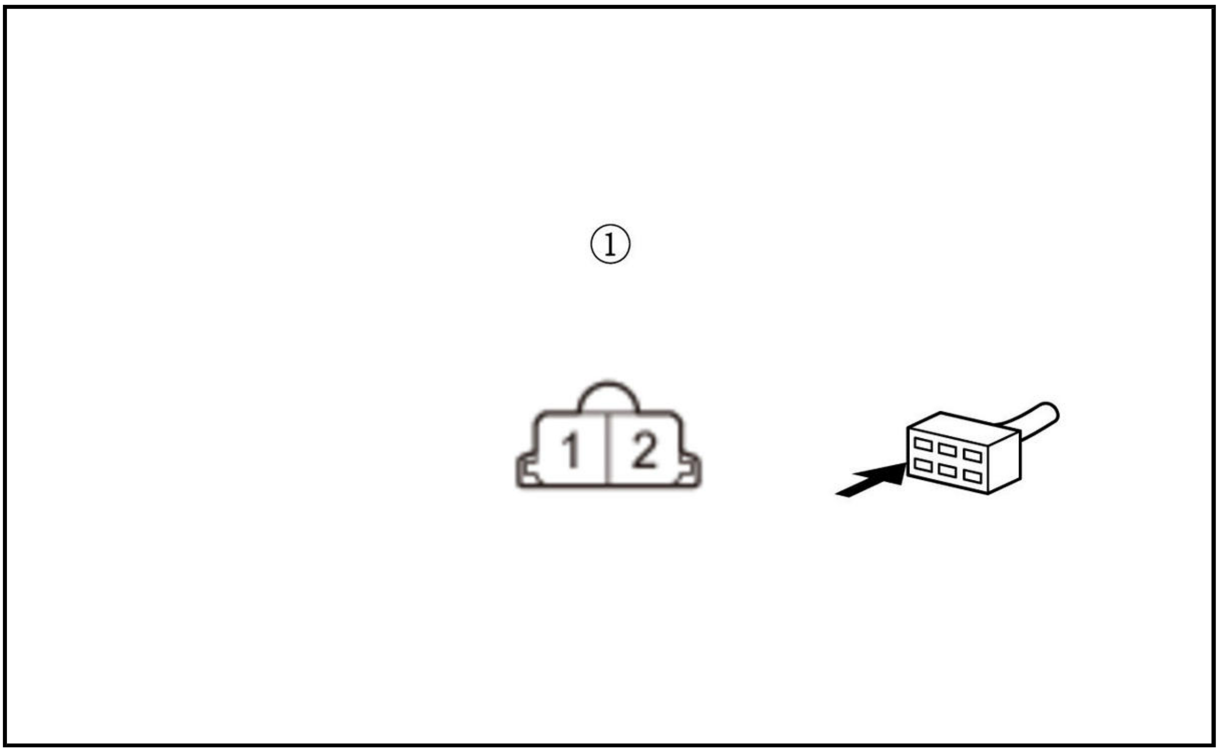
12. Open wire check (INJ H1 line)

-1. Disconnect the following connector.

No. 1 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	No. 1 injector 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector B (51P) No. 1**



Is there continuity?

YES

The INJ H1 wire is OK. Go to step 13.

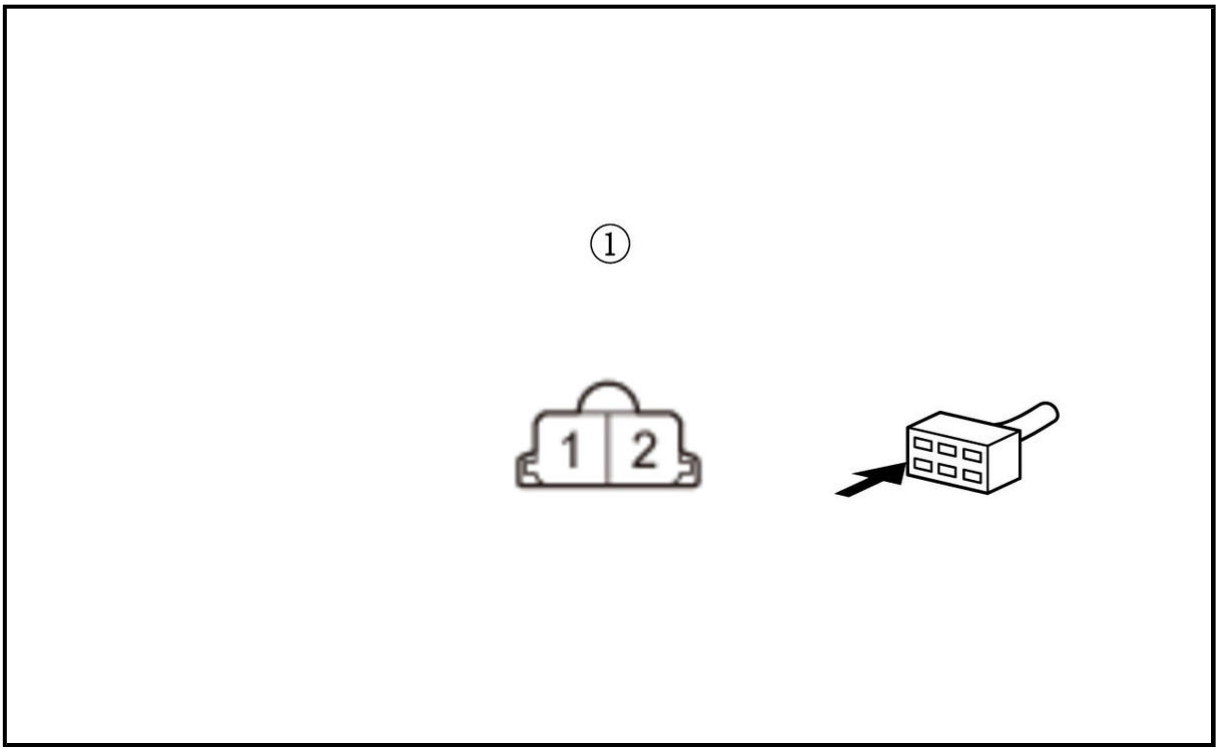
NO

Repair an open in the INJ H1 wire between the PCM (B1) and the No. 1 injector.

13. Open wire check (INJ L1 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	No. 1 injector 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector B (51P) No. 2**



Is there continuity?

YES

The INJ L1 wire is OK. **Replace the No. 1 injector** .

NO

Repair an open in the INJ L1 wire between the PCM (B2) and the No. 1 injector.

14. Shorted wire check (INJ H1 line to power)

-1. Disconnect the following connector.

No. 1 injector 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 1**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJ H1 wire between the PCM (B1) and the No. 1 injector.

NO

Go to step 15.

15. Shorted wire check (INJ L1 line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 2**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJ L1 wire between the PCM (B2) and the No. 1 injector.

NO

Go to step 16.

16. Shorted wire check (INJ H1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ H1 wire between the PCM (B1) and the No. 1 injector.

NO

The INJ H1 wire is OK. Go to step 17.

17. Shorted wire check (INJ L1)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 1 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ L1 wire between the PCM (B2) and the No. 1 injector.

NO

The INJ L1 wire is OK. Go to step 18.

18. Shorted wire check (INJ H4 line)

-1. Disconnect the following connector.

No. 4 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 1 injector 2P connector: disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ H4 wire between the PCM (B3) and the No. 4 injector.

NO

The INJH4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

19. Open wire check (INJ H4, INJ L4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reinstall the injector relay.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector B (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 3**
Test point 2	**PCM connector B (51P) No. 4**

Is there continuity?

YES

The INJ H4 and INJ L4 wires are not open. Go to step 22.

NO

Go to step 20.

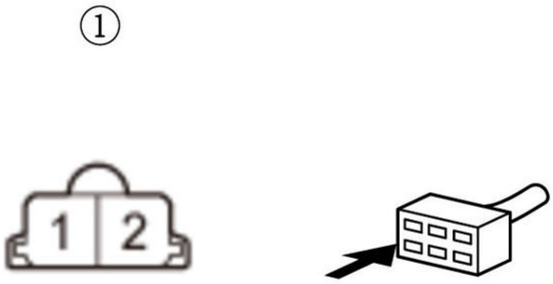
20. Open wire check (INJ H4 line)

-1. Disconnect the following connector.

No. 4 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 4 injector 2P connector: disconnected
Test circuit	INJ H4
Test point 1	No. 4 injector 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector B (51P) No. 3**



Is there continuity?

YES

The INJ H4 wire is OK. Go to step 21.

NO

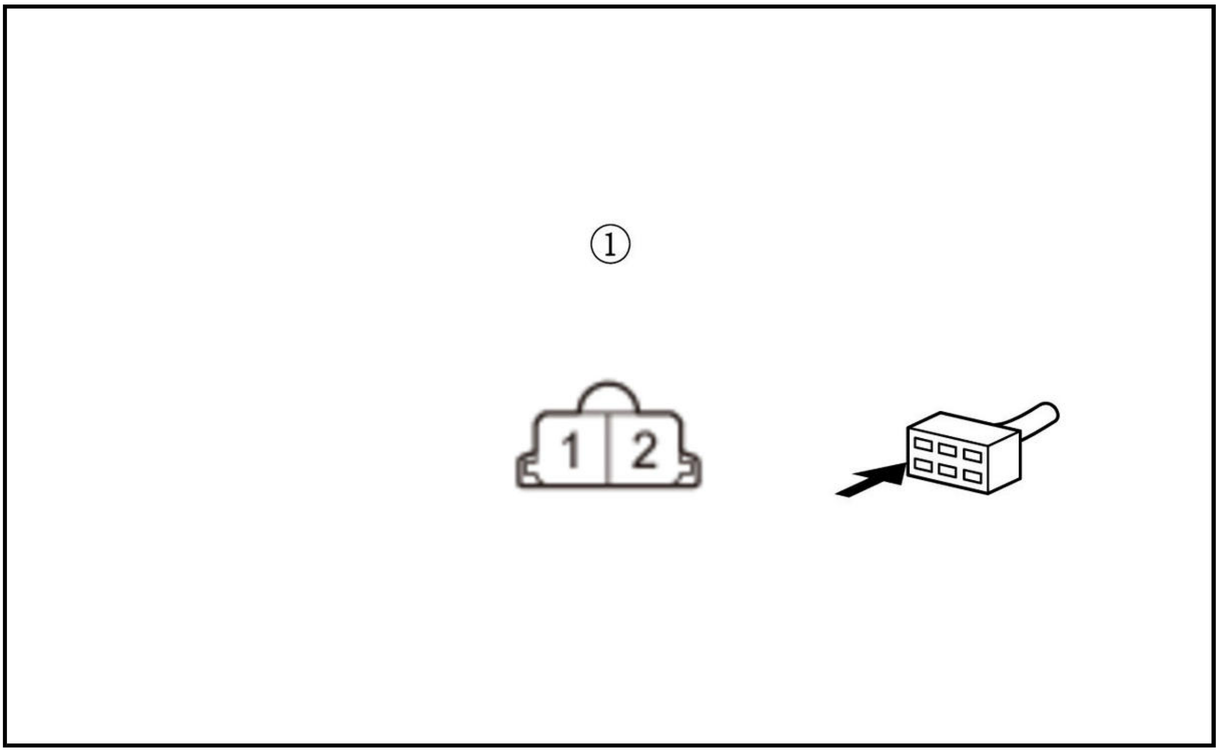
Repair an open in the INJ H4 wire between the PCM (B3) and the No. 4 injector.

21. Open wire check (INJ L4 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	No. 4 injector 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector B (51P) No. 4**



Is there continuity?

YES

The INJ L4 wire is OK. **Replace the No. 4 injector** .

NO

Repair an open in the INJ L4 wire between the PCM (B4) and the No. 4 injector.

22. Shorted wire check (INJ H4 line to power)

-1. Disconnect the following connector.

No. 4 injector 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 3**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the INJ H4 wire between the PCM (B3) and the No. 4 injector.

NO

Go to step 23.

23. Shorted wire check (INJ L4 line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 4**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the INJ L4 wire between the PCM (B4) and the No. 4 injector.

NO

Go to step 24.

24. Shorted wire check (INJ H4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ H4 wire between the PCM (B3) and the No. 4 injector.

NO

The INJ H4 wire is OK. Go to step 25.

25. Shorted wire check (INJ L4)

-1. Check for continuity between test points 1 and 2.

Test condition	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected

	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 4**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ L4 wire between the PCM (B4) and the No. 4 injector.

NO

The INJ L4 wire is OK. Go to step 26.

26. Shorted wire check (INJ H1 line)

-1. Disconnect the following connector.

No. 1 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 1 injector 2P connector: disconnected
	No. 4 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ H1 wire between the PCM (B1) and the No. 1 injector.

NO

The INJH1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0202, P0203 (1.5 L ENGINE)

DTC P0202 : No. 2 Cylinder Injector Circuit Malfunction **DTC P0203** : No. 3 Cylinder Injector Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0202 No. 2 Cylinder Injector Circuit Malfunction	B	B
P0203 No. 3 Cylinder Injector Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine (If the engine does not start, crank the engine for 20 seconds).

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0202 No. 2 Cylinder Injector Circuit Malfunction	B	B
P0203 No. 3 Cylinder Injector Circuit Malfunction	B	B

Is DTC P0202 and/or P0203 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the injector and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Engine starting check

-1. Try to start the engine.

Does the engine start?

YES

Go to step 11.

NO

Go to step 3.

3. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the injector relay** .

-3. **Test the injector relay** .

Is the relay OK?

YES

Go to step 4.

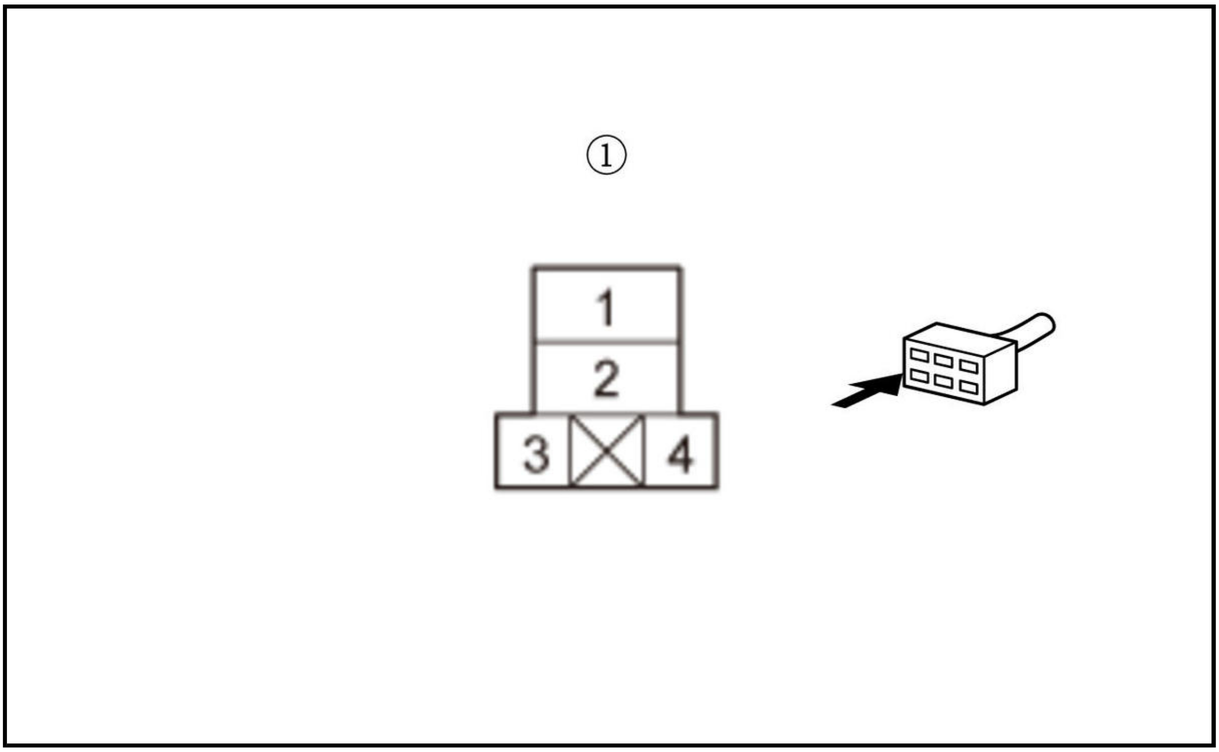
NO

Replace the injector relay.

4. Open wire check (+B IGP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B IGP wire is OK. Go to step 6.

NO

Go to step 5.

5. Fuse check 1

-1. Check the following fuse.

Fuse	No. A7 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Repair an open in the +B IGP wire between the No. A7 (15 A) fuse and the injector relay.

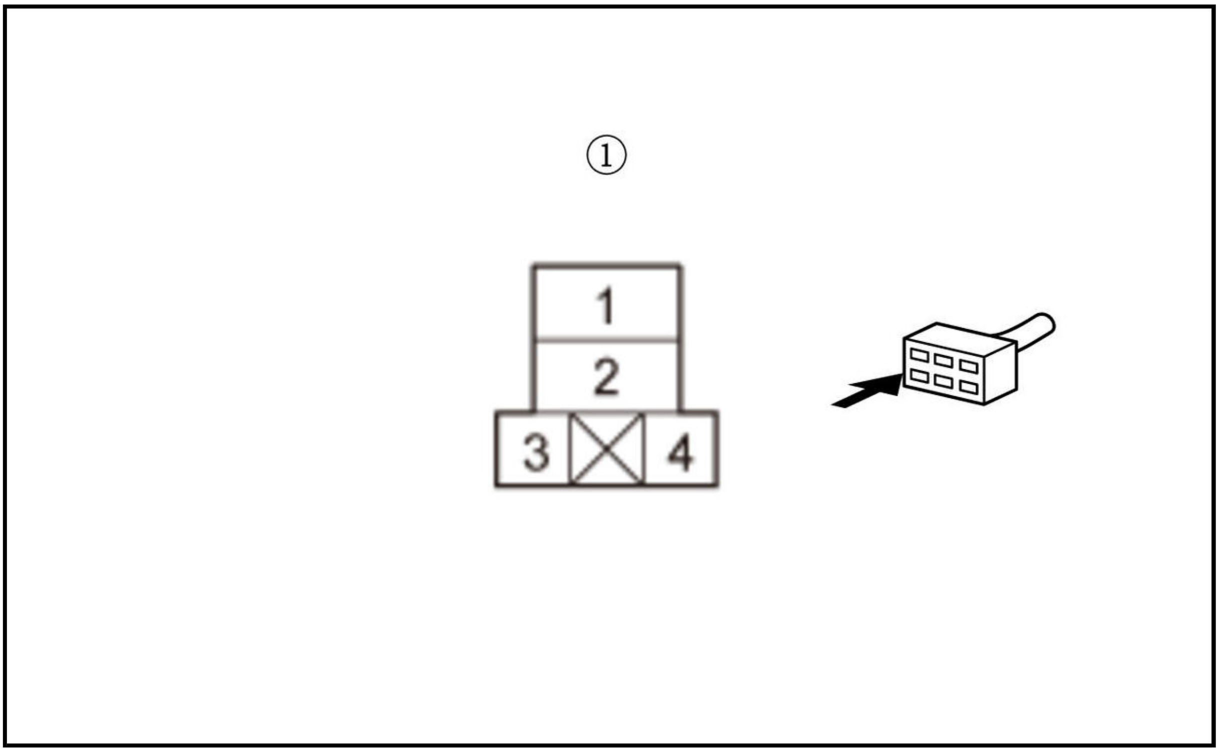
NO

Repair a short in the +B IGP wire between the No. A7 (15 A) fuse and the injector relay. Also replace the No. A7 (15 A) fuse.

6. Open wire check (+B INJ line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B INJ wire is OK. Go to step 8.

NO

Go to step 7.

7. Fuse check

   -1. Check the following fuse.

Fuse	No. A10 (20 A)
Location	Under-hood fuse/relay box

   Is the fuse OK?

   YES

   Repair an open in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay.

   NO

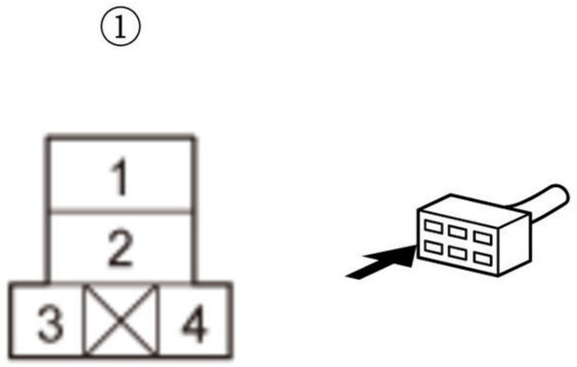
   Repair a short in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. Also replace the No. A10 (20 A) fuse.

8. Determine possible failure area (FI MAIN RLY CL- line, others)

   -1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Injector relay 4P socket (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 10.

NO

Go to step 9.

9. Open wire check (FI MAIN RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

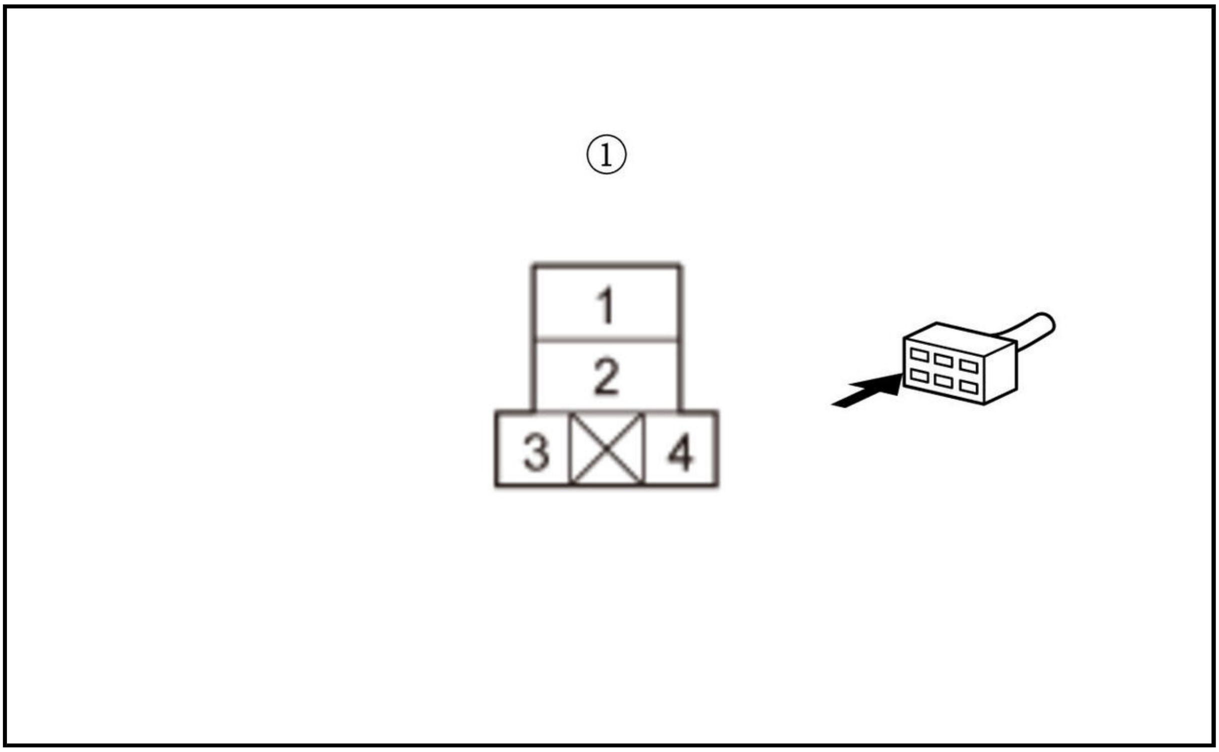
-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected PCM connector A (50P): disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 4: ①

Test point 2	**PCM connector A (50P) No. 5**



Is there continuity?

YES

The FI MAIN RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

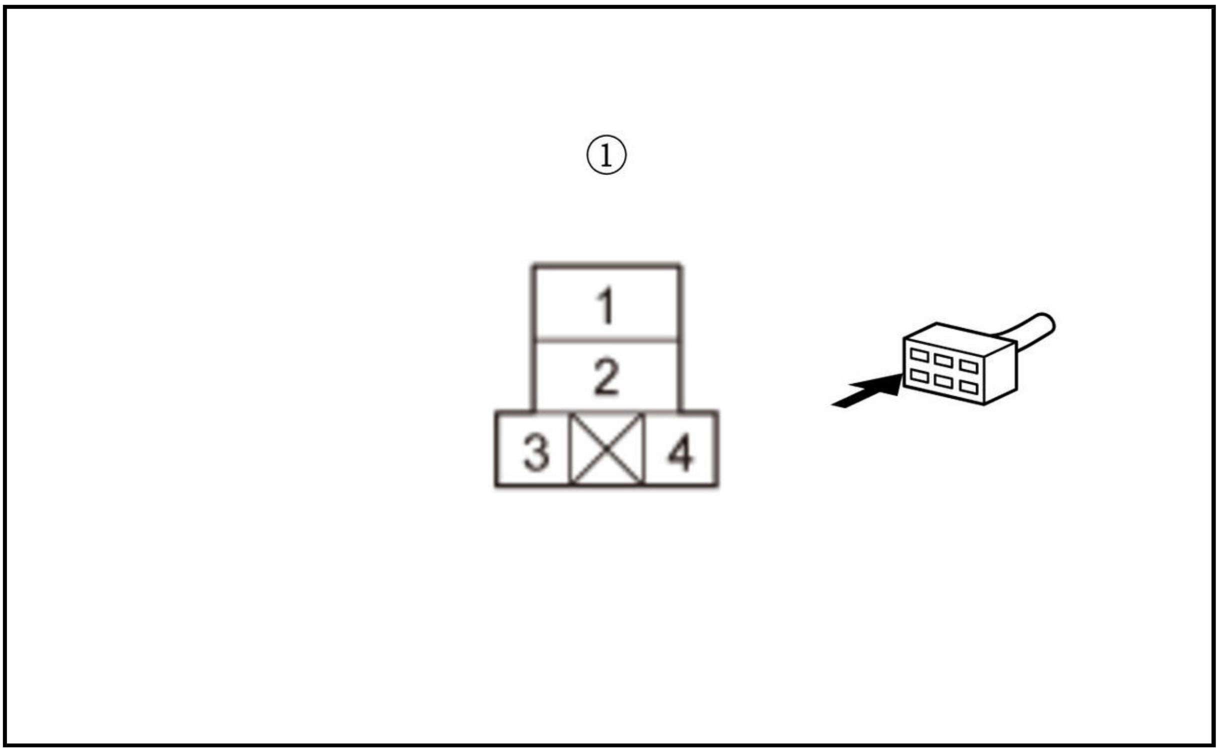
Repair an open in the FI MAIN RLY CL- wire between the PCM (A5) and the injector relay.

10. Open wire check (INJ RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Injector relay 4P socket (female terminals) No. 1: ①
Terminal B	Injector relay 4P socket (female terminals) No. 2: ①



-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (50P)

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected Injector relay 4P socket No. 1 and No. 2: jumped PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 1 and No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 11.

NO

Repair an open in the INJ RLY OUT wire between the PCM (A1, A2) and the injector relay.

11. DTC check

-1. Check the indicated DTC in step 1.

Is DTC P0202 indicated?

YES

Go to step 12.

NO

Go to step 20.

12. Open wire check (INJH2 line, INJL2 line)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Reinstall the injector relay.

    -3. Jump the SCS line with the HDS, and wait more than 1 minute.

    -4. Disconnect the following connector.

    PCM connector E (80P)

    -5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 5**
Test point 2	**PCM connector E (80P) No. 17**

Is there continuity?

YES

Go to step 15.

NO

Go to step 13.

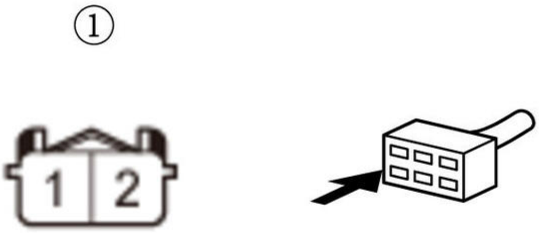
13. Open wire check (INJH2 line)

    -1. Disconnect the following connector.

    No. 2 injector 2P connector

    -2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	No. 2 injector 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 5**



Is there continuity?

YES

Go to step 14.

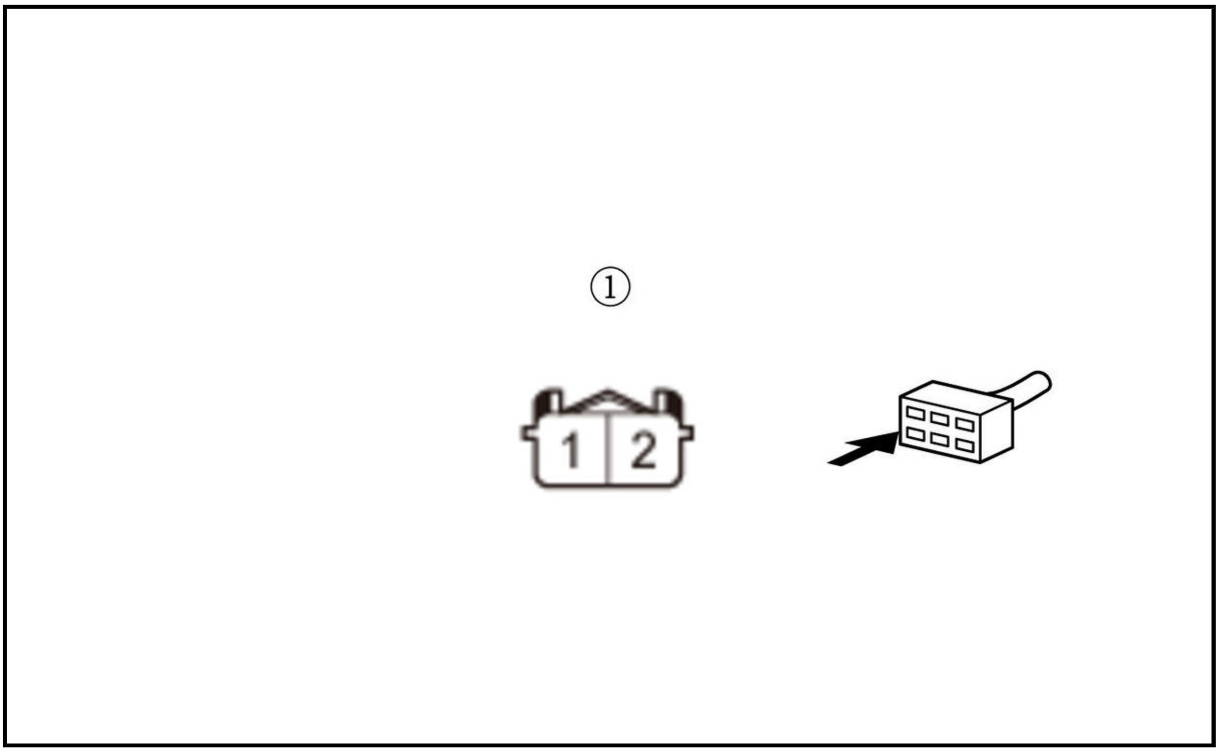
NO

Repair an open in the INJH2 wire between the PCM (E5) and the No. 2 injector.

14. Open wire check (INJL2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	No. 2 injector 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 17**



Is there continuity?

YES

The INJL2 wire is OK. **Replace the No. 2 injector** .

NO

Repair an open in the INJL2 wire between the PCM (E17) and the No. 2 injector.

15. Shorted wire check (INJH2 line to power)

-1. Disconnect the following connector.

No. 2 injector 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 5**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJH2 wire between the PCM (E5) and the No. 2 injector.

NO

Go to step 16.

16. Shorted wire check (INJL2 line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 17**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJL2 wire between the PCM (E17) and the No. 2 injector.

NO

Go to step 17.

17. Shorted wire check (INJH2 line to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 5**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the INJH2 wire between the PCM (E5) and the No. 2 injector.

NO

Go to step 18.

18. Shorted wire check (INJL2 line to ground)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 17**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the INJL2 wire between the PCM (E17) and the No. 2 injector.

NO

Go to step 19.

19. Shorted wire check (INJH3 line)

-1. Disconnect the following connector.

No. 3 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 2 injector 2P connector: disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJH3 wire between the PCM (E6) and the No. 3 injector.

NO

The INJH3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

20. Open wire check (INJH3 line, INJL3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reinstall the injector relay.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector E (80P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 4**
Test point 2	**PCM connector E (80P) No. 6**

Is there continuity?

YES

Go to step 23.

NO

Go to step 21.

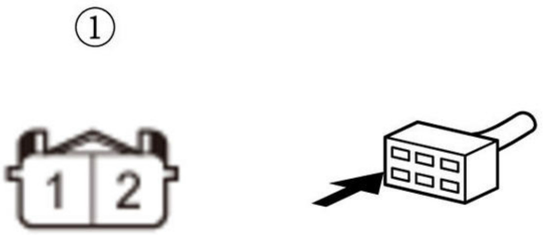
21. Open wire check (INJH3 line)

-1. Disconnect the following connector.

No. 3 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	No. 3 injector 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 6**



Is there continuity?

YES

Go to step 22.

NO

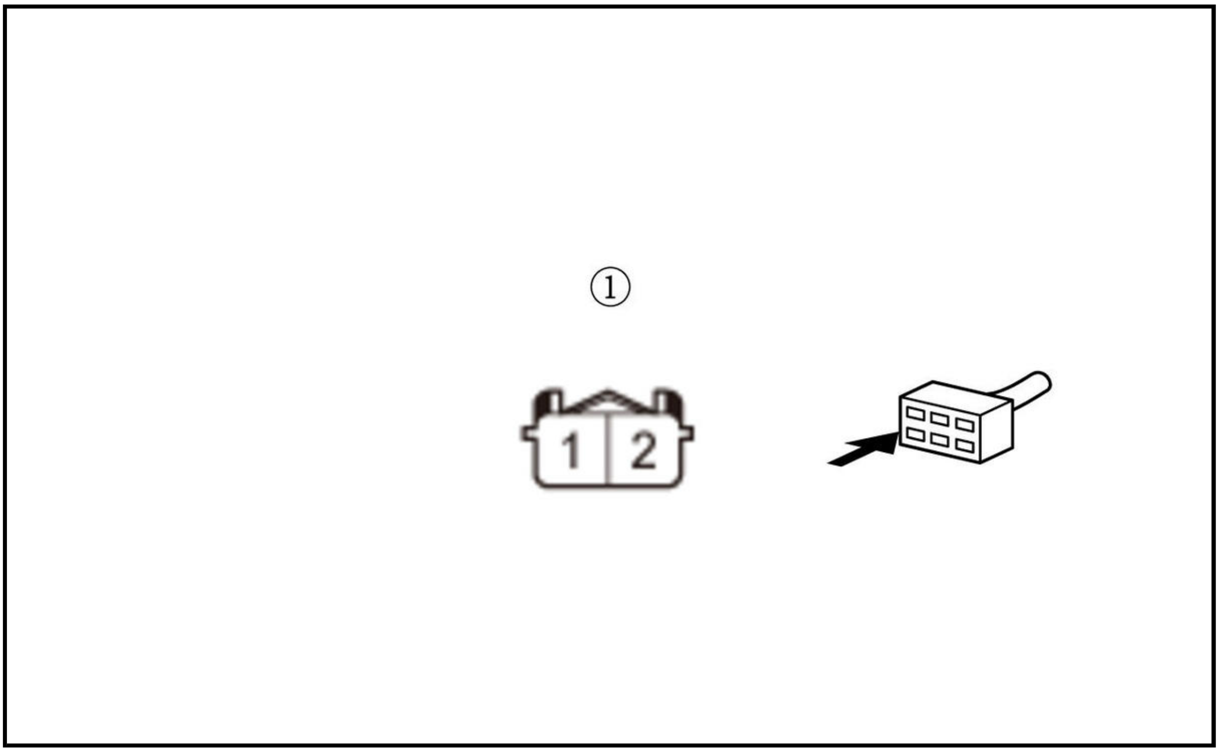
Repair an open in the INJH3 wire between the PCM (E6) and the No. 3 injector.

22. Open wire check (INJL3 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	No. 3 injector 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 4**



Is there continuity?

YES

The INJL3 wire is OK. **Replace the No. 3 injector** .

NO

Repair an open in the INJL3 wire between the PCM (E4) and the No. 3 injector.

23. Shorted wire check (INJH3 line to power)

-1. Disconnect the following connector.

No. 3 injector 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 6**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJH3 wire between the PCM (E6) and the No. 3 injector.

NO

Go to step 24.

24. Shorted wire check (INJL3 line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 4**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJL3 wire between the PCM (E4) and the No. 3 injector.

NO

Go to step 25.

25. Shorted wire check (INJH3 line to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the INJH3 wire between the PCM (E6) and the No. 3 injector.

NO

Go to step 26.

26. Shorted wire check (INJL3 line to ground)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 4**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the INJL3 wire between the PCM (E4) and the No. 3 injector.

NO

Go to step 27.

27. Shorted wire check (INJH2 line)

-1. Disconnect the following connector.

No. 2 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (50P): disconnected PCM connector E (80P): disconnected No. 3 injector 2P connector: disconnected No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 5**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJH2 wire between the PCM (E5) and the No. 2 injector.

NO

The INJH2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0202, P0203 (2.4 L ENGINE) (2017 2018 2019)

DTC P0202 : No. 2 Cylinder Injector Circuit Malfunction **DTC P0203** : No. 3 Cylinder Injector Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0202 No. 2 Cylinder Injector Circuit Malfunction	B	B
P0203 No. 3 Cylinder Injector Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine (If the engine does not start, crank the engine for 20 seconds).

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0202 No. 2 Cylinder Injector Circuit Malfunction	B	B
P0203 No. 3 Cylinder Injector Circuit Malfunction	B	B

Is DTC P0202 and/or P0203 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the injector and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Engine starting check

   -1. Try to start the engine.

   Does the engine start?

   YES

   Go to step 10.

   NO

   Go to step 3.

3. Relay check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the injector relay** .

   -3. **Test the injector relay** .

   Is the relay OK?

   YES

   The injector relay is OK. Go to step 4.

   NO

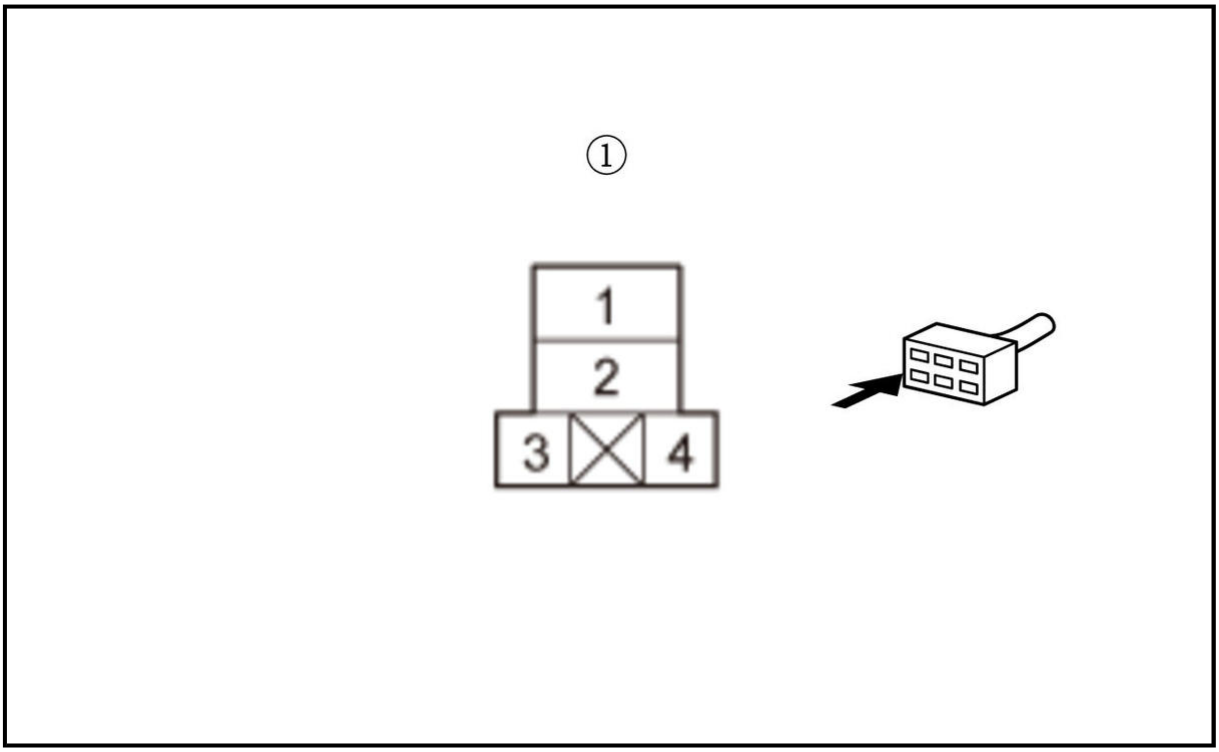
   Replace the injector relay.

4. Open wire check (FI MAIN RLY OUT line)

   -1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The FI MAIN RLY OUT wire is OK. Go to step 5.

NO

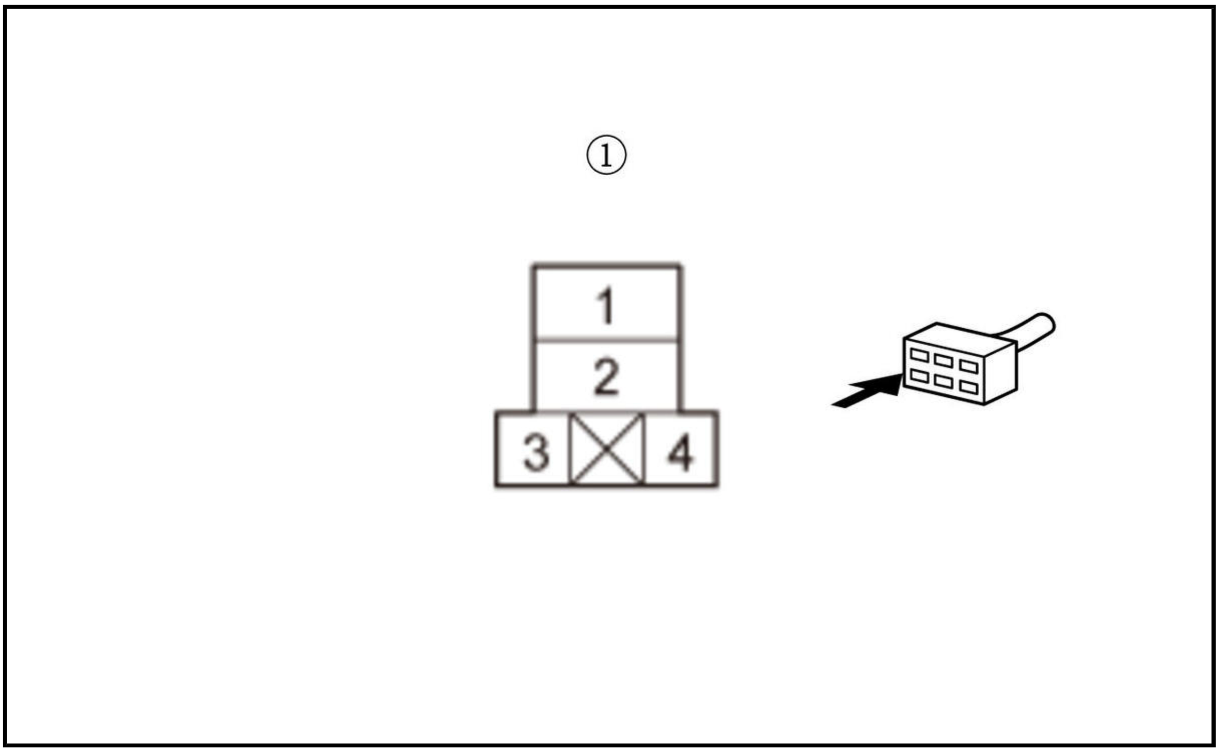
Repair an open in the FI MAIN RLY OUT wire between PGM-FI main relay 1 and the injector relay.

5. Open wire check (+B INJ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B INJ wire is OK. Go to step 7.

NO

Go to step 6.

6. Fuse check

-1. Check the following fuse.

Fuse	No. A10 (20 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Repair an open in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. If needed, replace the under-hood fuse/relay box .

NO

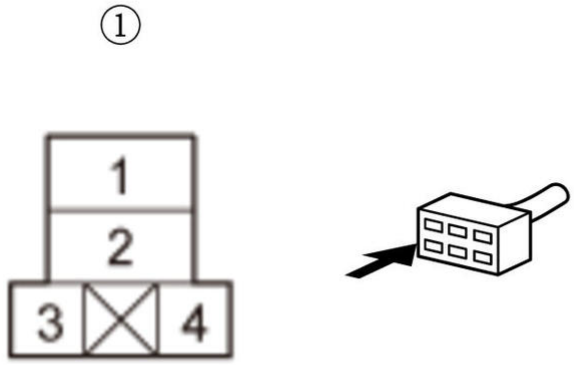
Repair a short in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. If needed, replace the under-hood fuse/relay box . Also replace the No. A10 (20 A) fuse.

7. Determine possible failure area (INJ RLY CL- line, others)

-1. Turn the vehicle to the ON mode, and measure the voltage between test points 1 and 2 momentarily.

Test condition	Momentarily after ON mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①

Test point 2	Injector relay 4P socket (female terminals) No. 4: ①



Is there battery voltage momentarily?

YES

Go to step 9.

NO

Go to step 8.

8. Open wire check (INJ RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

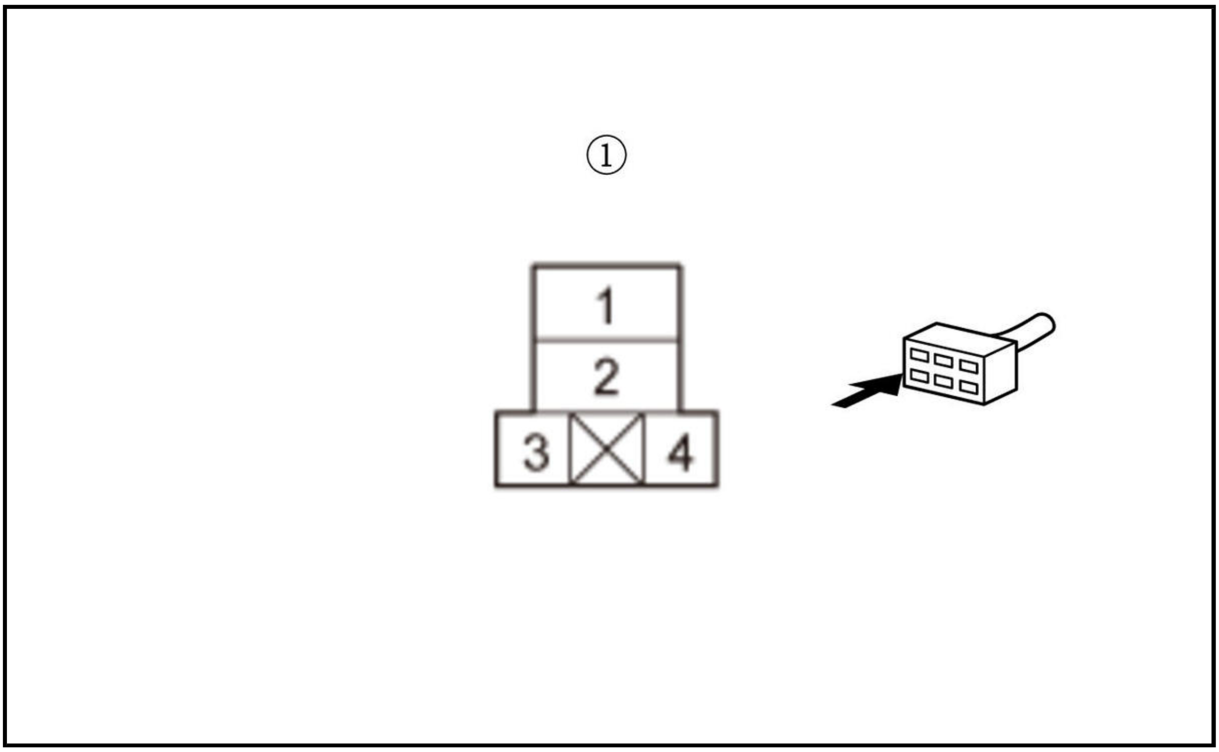
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
	PCM connector A (51P): disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (51P) No. 15**



Is there battery voltage?

YES

The INJ RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

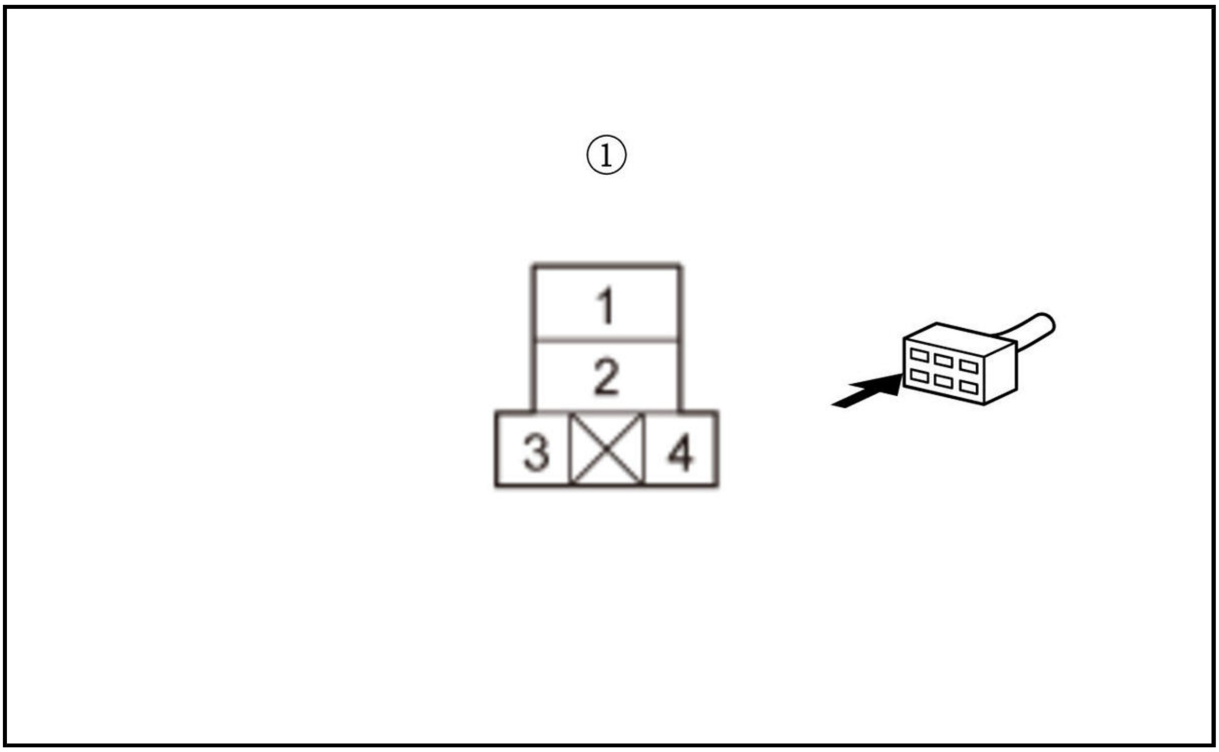
Repair an open in the INJ RLY CL- wire between the PCM (A15) and the injector relay.

9. Open wire check (INJ RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Injector relay 4P socket (female terminals) No. 1: ①
Terminal B	Injector relay 4P socket (female terminals) No. 2: ①



-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (51P)

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
	Injector relay 4P socket terminal No. 1 and No. 2: jumped
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 6**
Test point 2	Body ground

Test point 1	**PCM connector A (51P) No. 7**
Test point 2	Body ground

Are there battery voltage?

YES

The INJ RLY OUT wire is OK. Go to step 10.

NO

Repair an open in the INJ RLY OUT wire between the PCM (A6, A7) and the injector relay.

10. DTC check

-1. Check the indicated DTC in step 1.

Is DTC P0202 indicated?

YES

Go to step 11.

NO

Go to step 19.

11. Open wire check (INJ H2, INJ L2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Install the injector relay.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector B (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 5**
Test point 2	**PCM connector B (51P) No. 6**

Is there continuity?

YES

The INJ H2 and INJ L2 wires are not open. Go to step 14.

NO

Go to step 12.

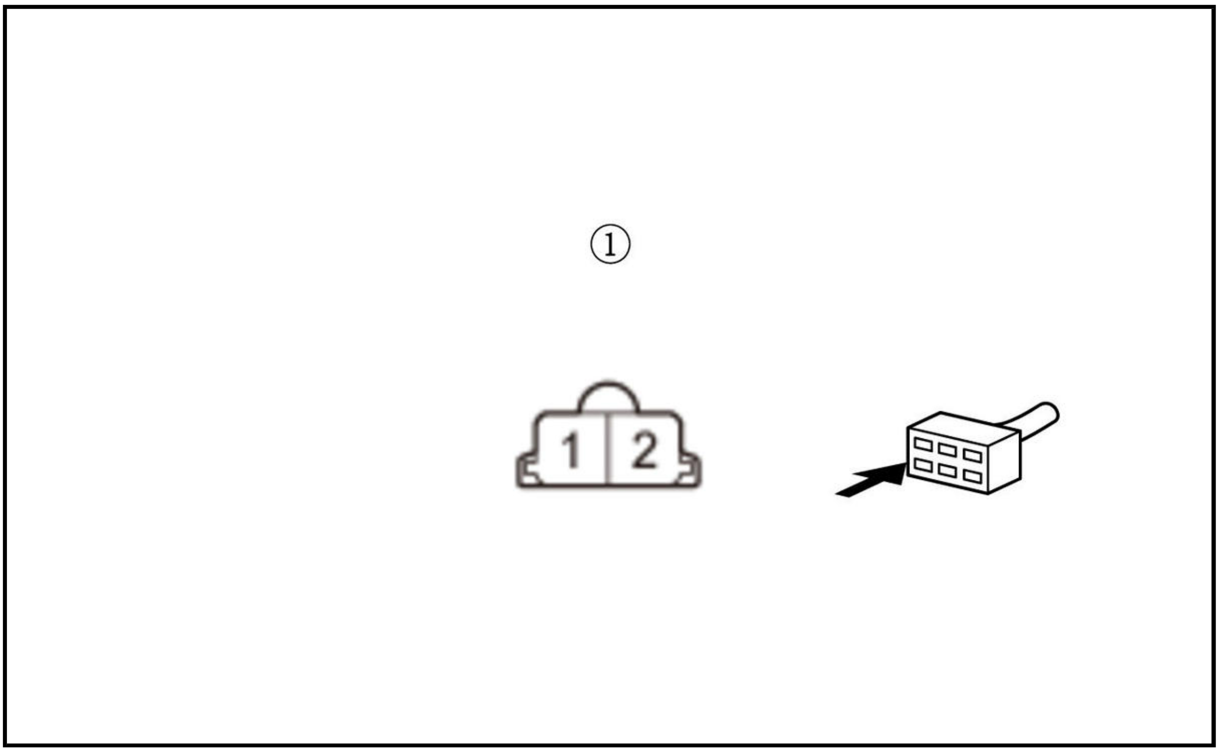
12. Open wire check (INJ H2 line)

-1. Disconnect the following connector.

No. 2 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	No. 2 injector 2P connector No. 2
Test point 2	**PCM connector B (51P) No. 5**



Is there continuity?

YES

The INJ H2 wire is OK. Go to step 13.

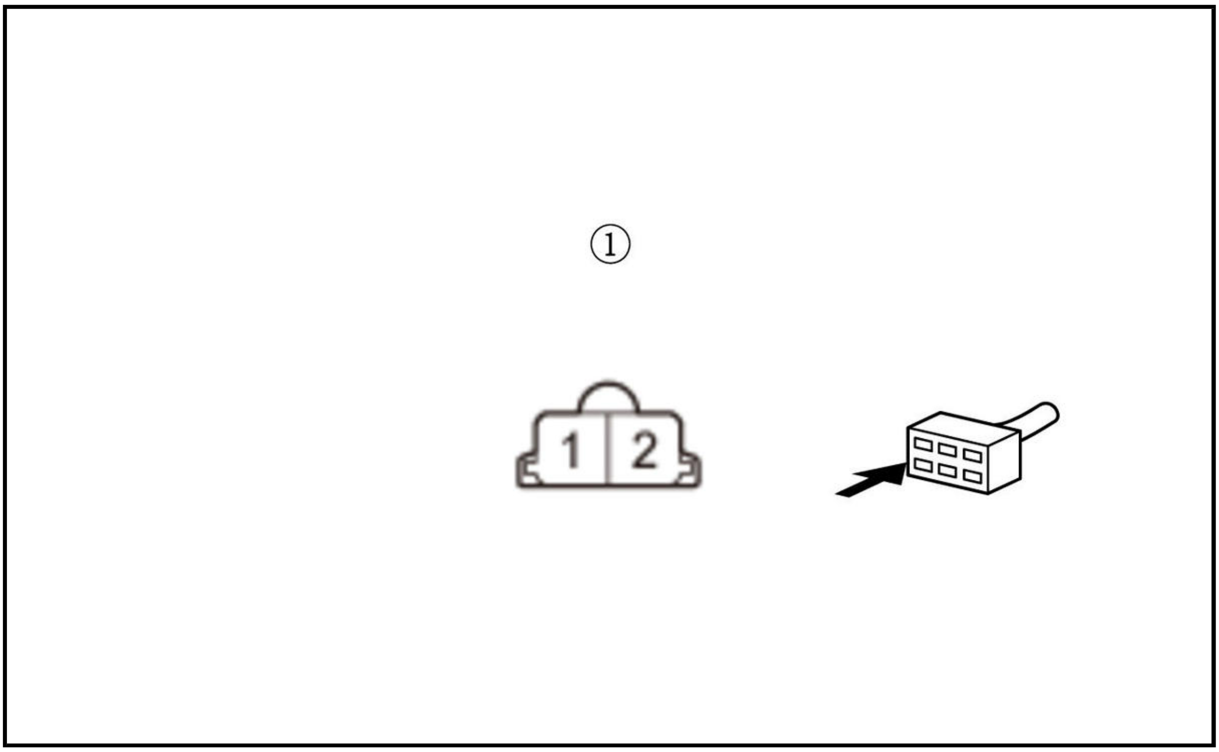
NO

Repair an open in the INJ H2 wire between the PCM (B5) and the No. 2 injector.

13. Open wire check (INJ L2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	No. 2 injector 2P connector No. 1
Test point 2	**PCM connector B (51P) No. 6**



Is there continuity?

YES

The INJ L2 wire is OK. **Replace the No. 2 injector** .

NO

Repair an open in the INJ L2 wire between the PCM (B6) and the No. 2 injector.

14. Shorted wire check (INJ H2 line to power)

-1. Disconnect the following connector.

No. 2 injector 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 5**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJ H2 wire between the PCM (B5) and the No. 2 injector.

NO

Go to step 15.

15. Shorted wire check (INJ L2 line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode PCM connector A (51P): disconnected PCM connector B (51P): disconnected No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 6**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the INJ L2 wire between the PCM (B6) and the No. 2 injector.

NO

Go to step 16.

16. Shorted wire check (INJ H2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (51P): disconnected PCM connector B (51P): disconnected No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 5**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ H2 wire between the PCM (B5) and the No. 2 injector.

NO

The INJ H2 wire is OK. Go to step 17.

17. Shorted wire check (INJ L2)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (51P): disconnected PCM connector B (51P): disconnected No. 2 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ L2 wire between the PCM (B6) and the No. 2 injector.

NO

The INJ L2 wire is OK. Go to step 18.

18. Shorted wire check (INJ H3 line)

-1. Disconnect the following connector.

No. 3 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 2 injector 2P connector: disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ H3 wire between the PCM (B7) and the No. 3 injector.

NO

The INJH3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

19. Open wire check (INJ H3, INJ L3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Install the injector relay.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector B (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 7**
Test point 2	**PCM connector B (51P) No. 8**

Is there continuity?

YES

The INJ H3 and INJ L3 wires are not open. Go to step 22.

NO

Go to step 20.

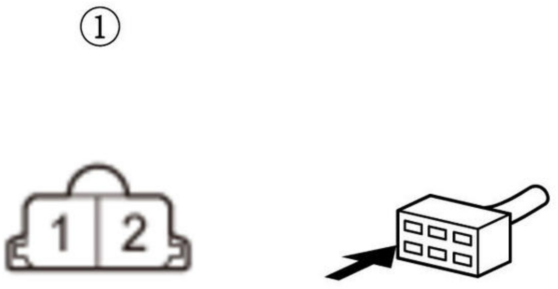
20. Open wire check (INJ H3 line)

-1. Disconnect the following connector.

No. 3 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	No. 3 injector 2P connector No. 2
Test point 2	**PCM connector B (51P) No. 7**



Is there continuity?

YES

The INJ H3 wire is OK. Go to step 21.

NO

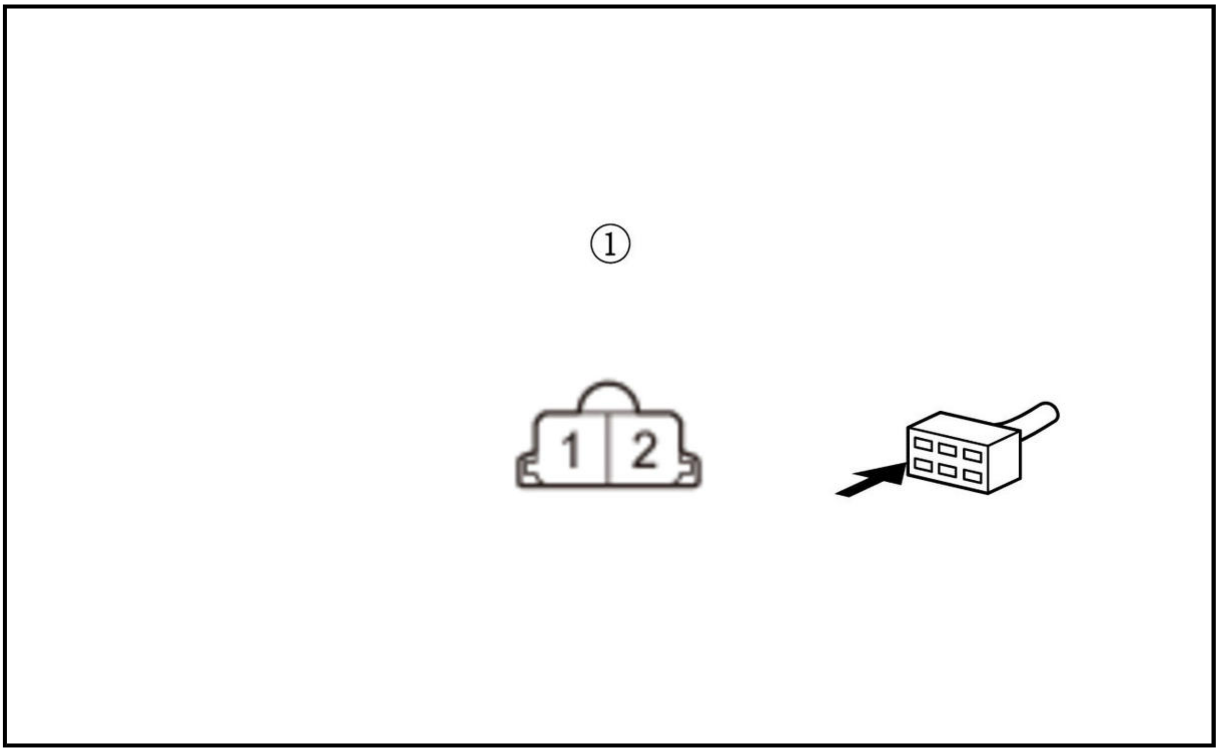
Repair an open in the INJ H3 wire between the PCM (B7) and the No. 3 injector.

21. Open wire check (INJ L3 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	No. 3 injector 2P connector No. 1
Test point 2	**PCM connector B (51P) No. 8**



Is there continuity?

YES

The INJ L3 wire is OK. **Replace the No. 3 injector** .

NO

Repair an open in the INJ L3 wire between the PCM (B8) and the No. 3 injector.

22. Shorted wire check (INJ H3 line to power)

-1. Disconnect the following connector.

No. 3 injector 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 7**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the INJ H3 wire between the PCM (B7) and the No. 3 injector.

NO

Go to step 23.

23. Shorted wire check (INJ L3 line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 8**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the INJ L3 wire between the PCM (B8) and the No. 3 injector.

NO

Go to step 24.

24. Shorted wire check (INJ H3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	**PCM connector B (51P) No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ H3 wire between the PCM (B7) and the No. 3 injector.

NO

The INJ H3 wire is OK. Go to step 25.

25. Shorted wire check (INJ L3)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 3 injector 2P connector: disconnected

Test point 1	PCM connector B (51P) No. 8
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ L3 wire between the PCM (B8) and the No. 3 injector.

NO

The INJ L3 wire is OK. Go to step 26.

26. Shorted wire check (INJ H2 line)

-1. Disconnect the following connector.

No. 2 injector 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	No. 2 injector 2P connector: disconnected
	No. 3 injector 2P connector: disconnected
Test point 1	PCM connector B (51P) No. 5
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the INJ H2 wire between the PCM (B5) and the No. 2 injector.

NO

The INJH2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0221 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0221 : TP Sensor B Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0221 TP Sensor B Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR B	Less than 0.48	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR B	More than 4.61	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 7.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (THL2 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

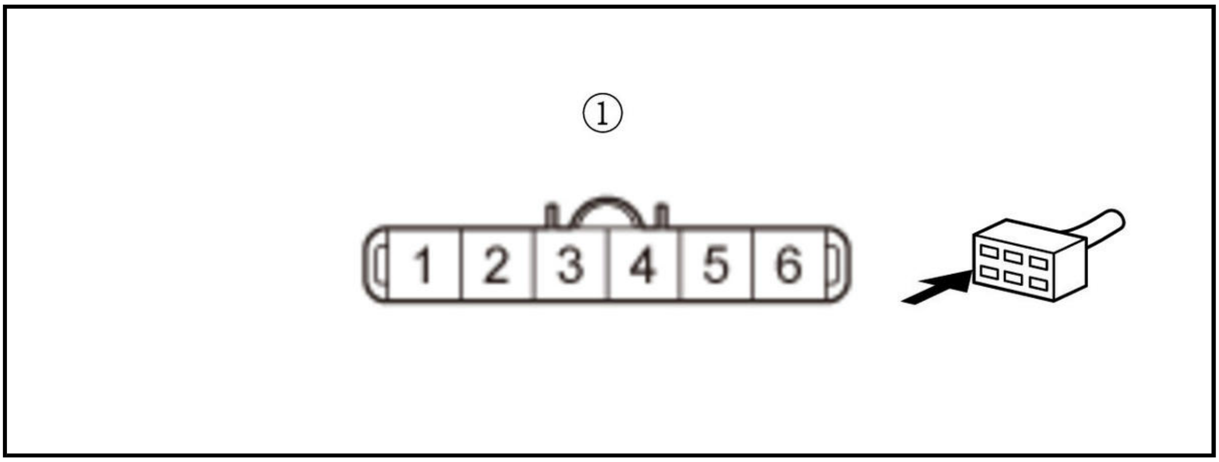
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the THL2 wire between the PCM (E51) and the throttle body.

NO

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

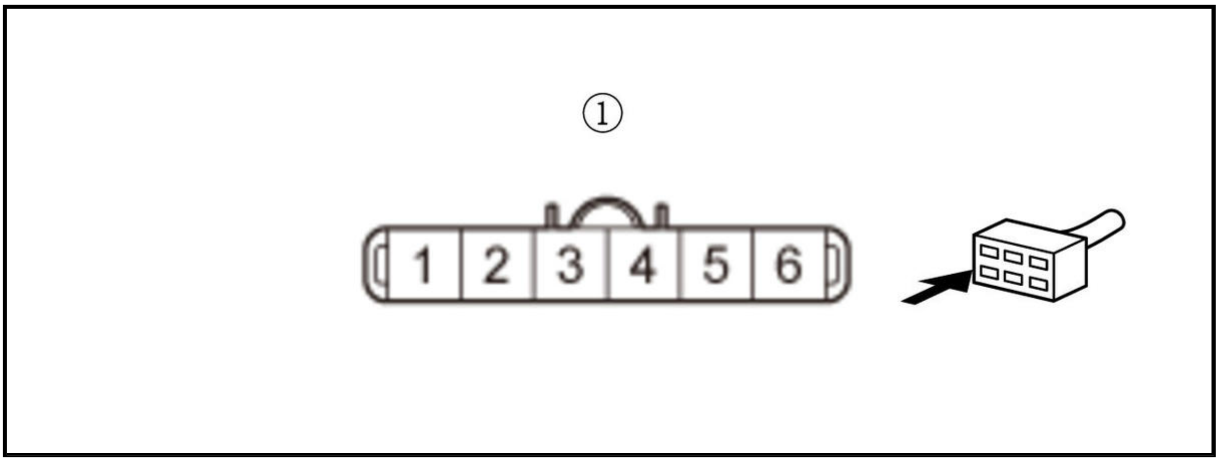
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 6.

6. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

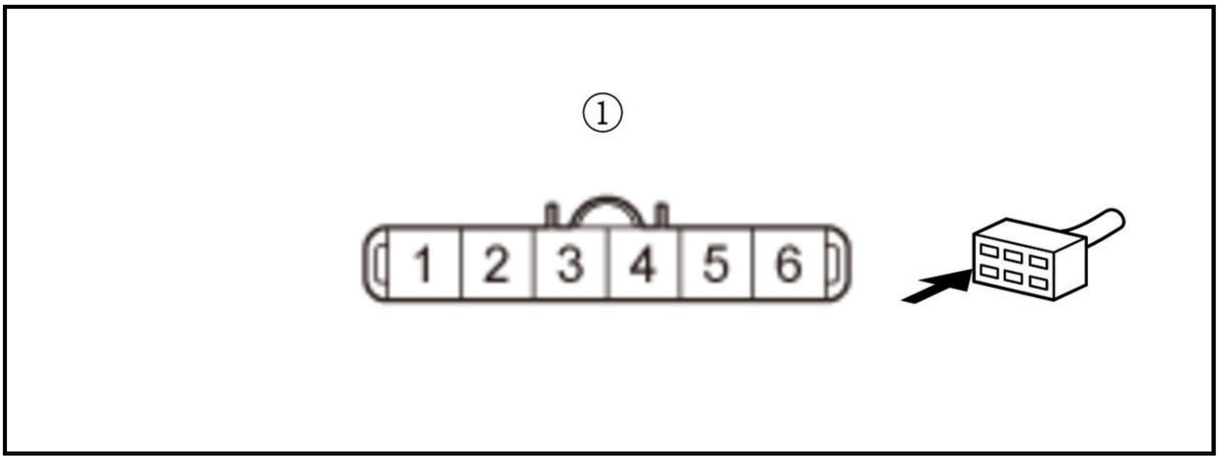
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 75**



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 wire between the PCM (E75) and the throttle body.

7. Determine possible failure area (SG3 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 10.

NO

Go to step 8.

8. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

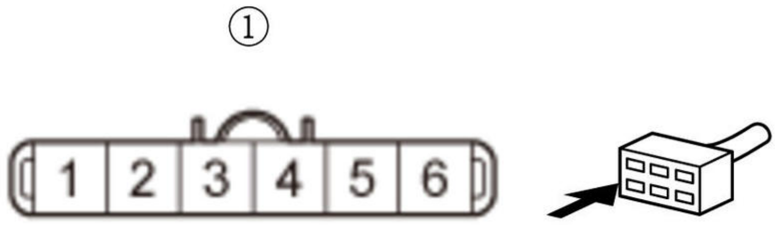
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 9.

9. Open wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

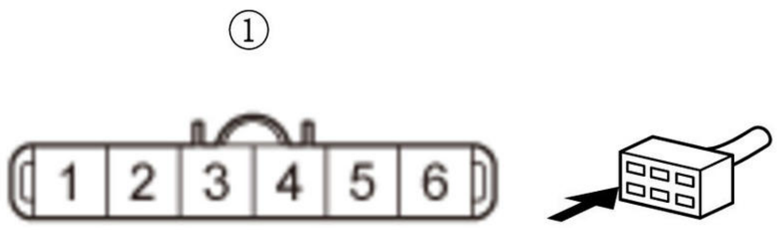
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 51**



Is there continuity?

YES

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the THL2 wire between the PCM (E51) and the throttle body.

10. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

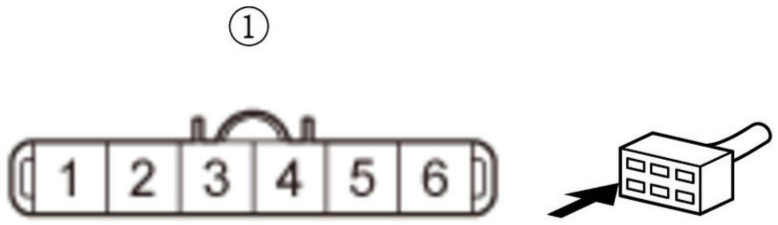
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	PCM connector E (80P) No. 76



Is there continuity?

YES

The SG5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the SG3 wire between the PCM (E76) and the throttle body.

DTC P0221 (2.4 L ENGINE) (2018 2019)

DTC P0221 : TP Sensor B Out of Range

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0221 TP Sensor B Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR B	Less than 1.24	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR B	More than 4.73	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 7.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (THL2 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

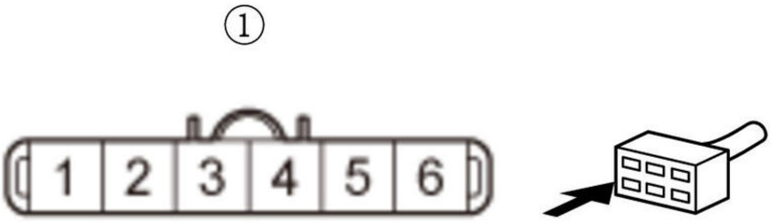
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the THL2 wire between the PCM (B47) and the throttle body.

NO

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

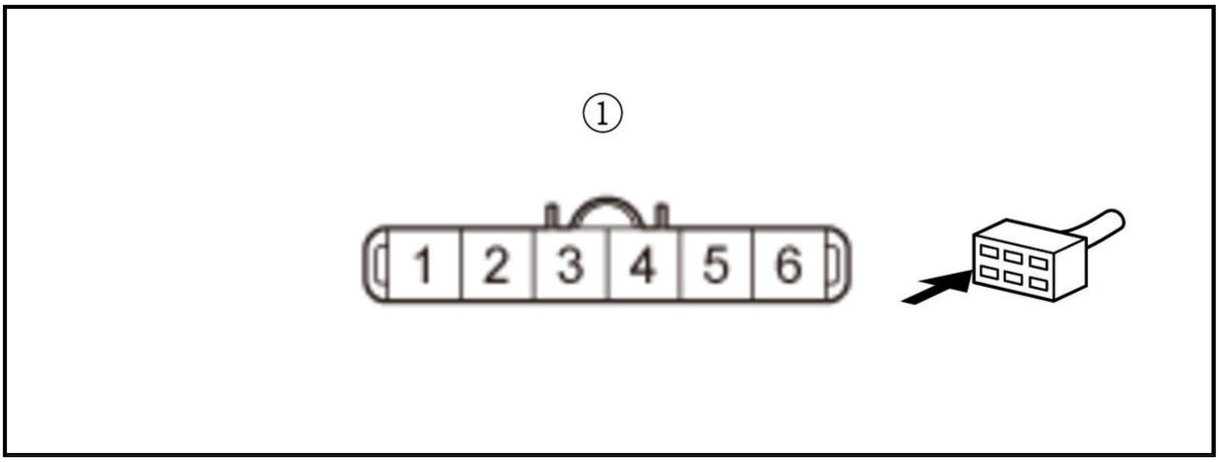
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 6.

6. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

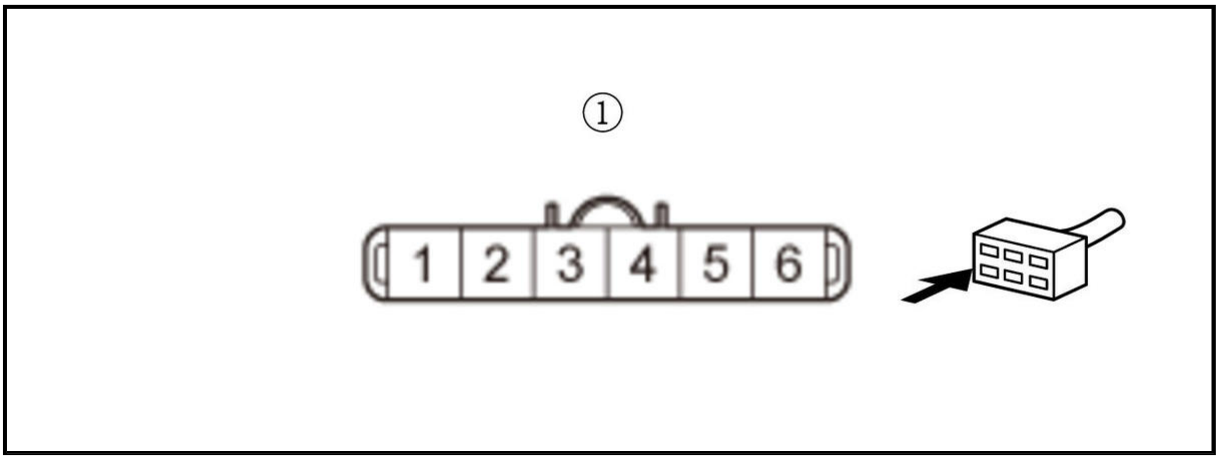
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	PCM connector B (51P) No. 48



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 wire between the PCM (B48) and the throttle body.

7. Determine possible failure area (SG3 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 10.

NO

Go to step 8.

8. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

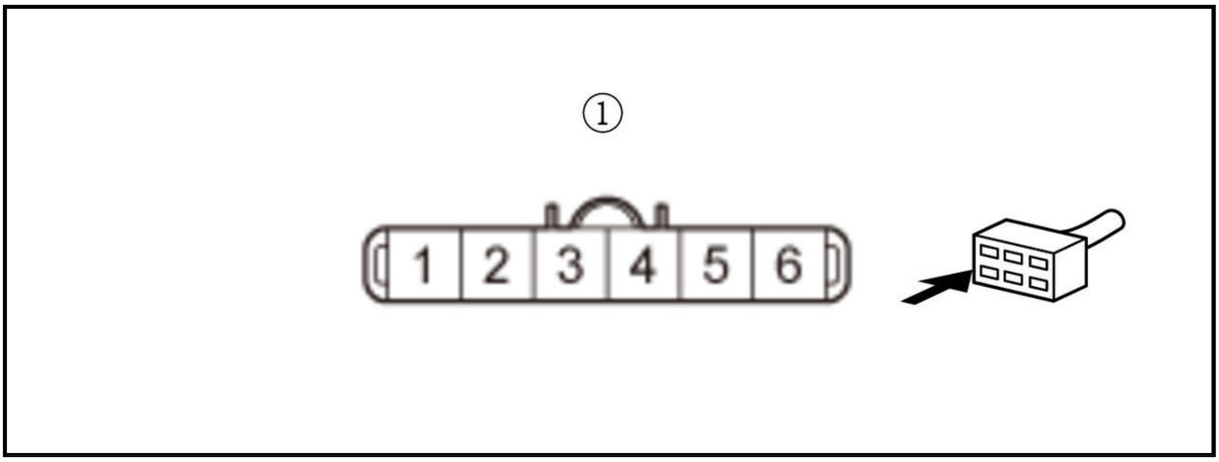
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 9.

9. Open wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

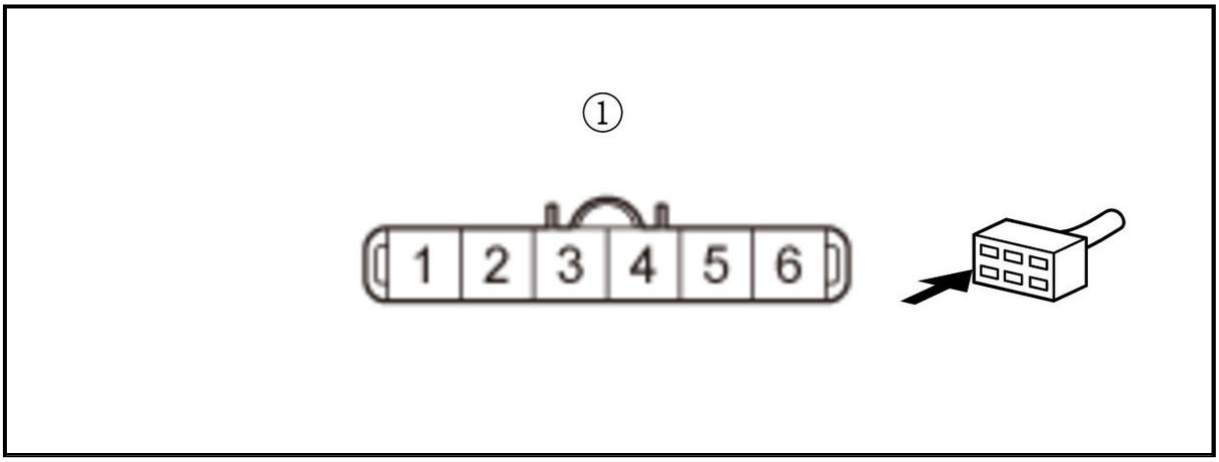
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	**PCM connector B (51P) No. 47**



Is there continuity?

YES

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the THL2 wire between the PCM (B47) and the throttle body.

10. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

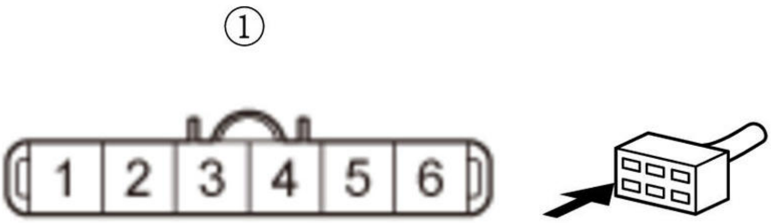
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	PCM connector B (51P) No. 49



Is there continuity?

YES

The SG5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the SG3 wire between the PCM (B49) and the throttle body.

DTC P0222 (1.5 L ENGINE)

DTC P0222 : TP Sensor B Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0222 TP Sensor B Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
TP SENSOR B	Less than 0.3	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (THL2 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0122 TP Sensor A Circuit Low Voltage	B	B
P0222 TP Sensor B Circuit Low Voltage	B	B

Are DTC P0122 and P0222 indicated at the same time?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

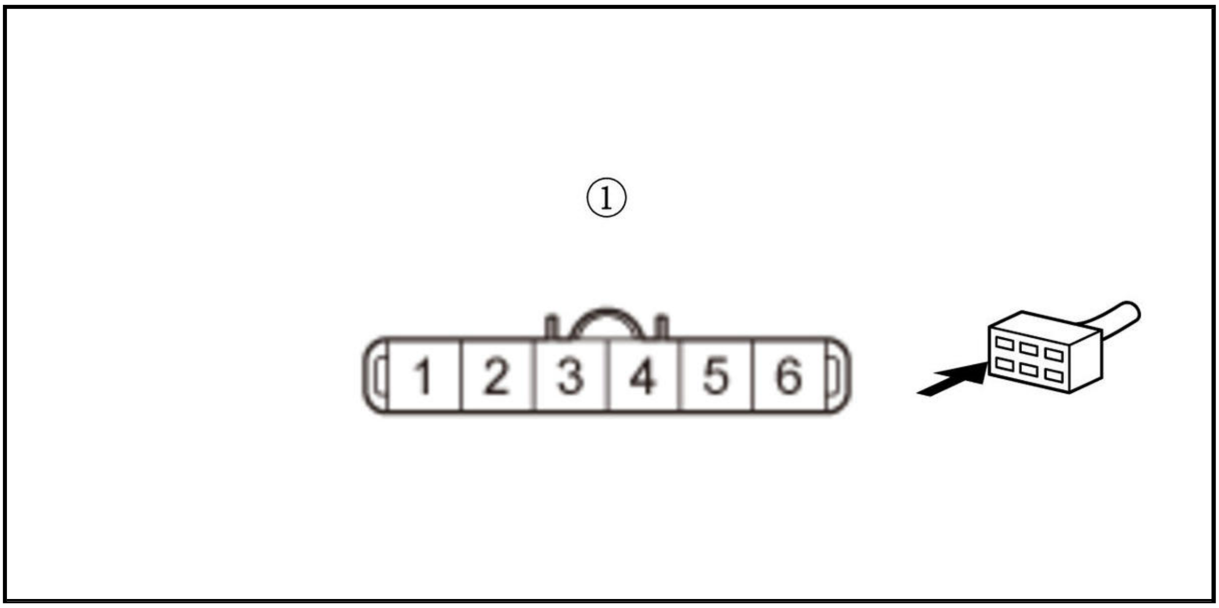
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the THL2 wire between the PCM (E51) and the throttle body.

NO

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Determine possible failure area (VCC3 line, throttle body)

-1. Turn the vehicle to the OFF (LOCK) mode.

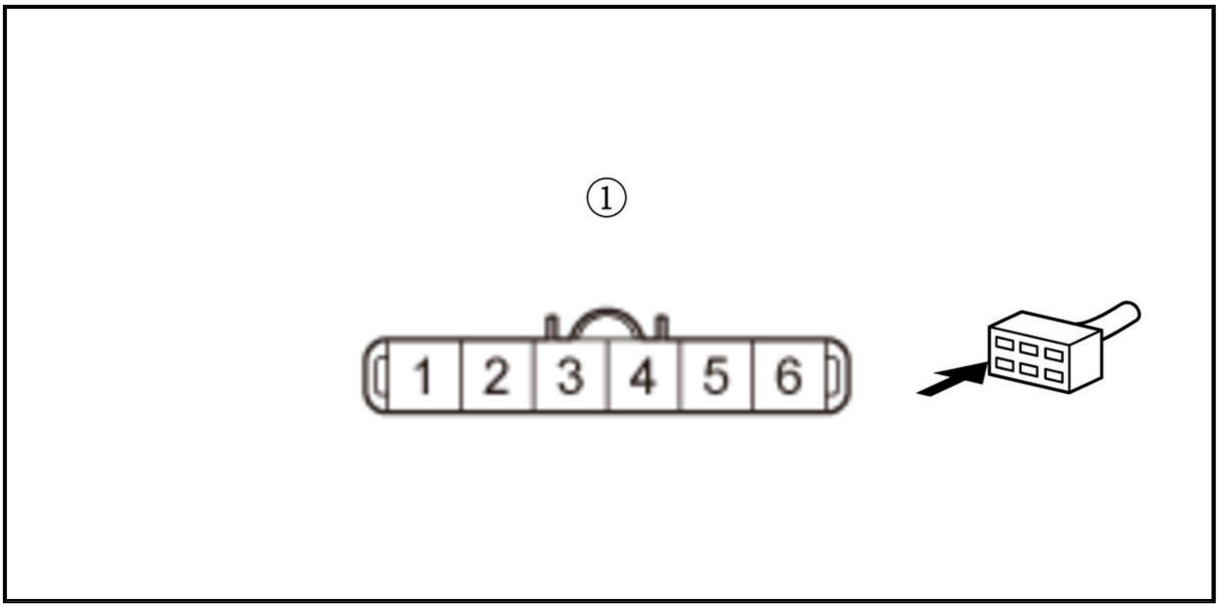
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 5.

5. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

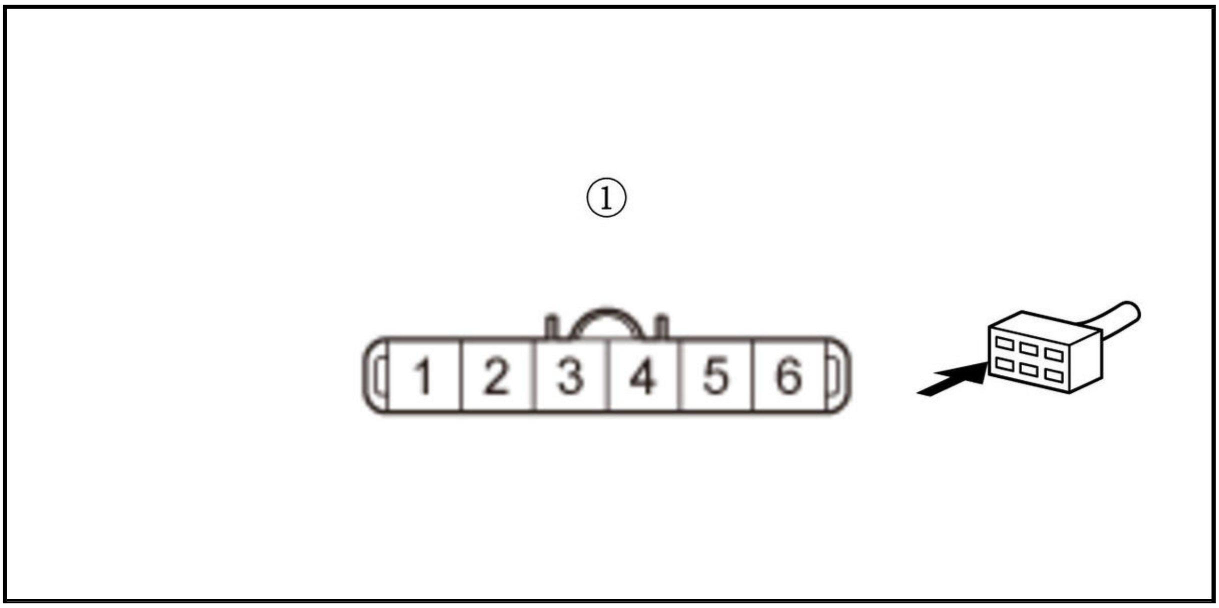
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 75**



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 wire between the PCM (E75) and the throttle body.

DTC P0222 (2.4 L ENGINE) (2017 2018 2019)

DTC P0222 : TP Sensor B Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0222 TP Sensor B Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR B	Less than 0.3	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (THL2 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0122 TP Sensor A Circuit Low Voltage	B	B
P0222 TP Sensor B Circuit Low Voltage	B	B

Are DTC P0122 and P0222 indicated at the same time?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

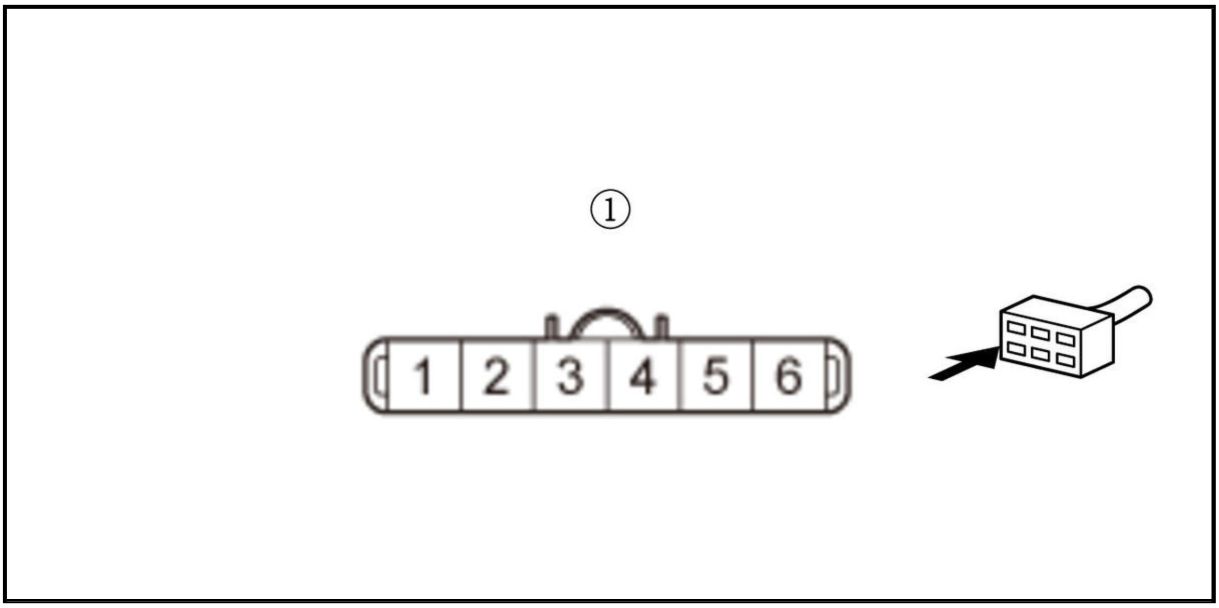
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the THL2 wire between the PCM (B47) and the throttle body.

NO

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

4. Determine possible failure area (VCC3 line, throttle body)

-1. Turn the vehicle to the OFF (LOCK) mode.

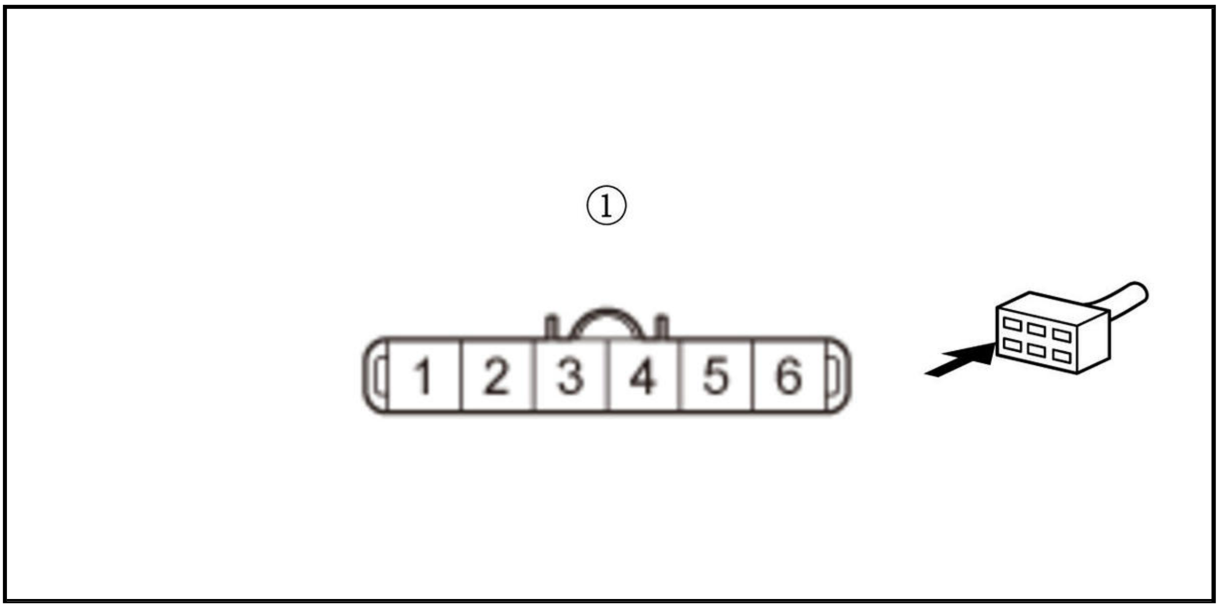
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 5.

5. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

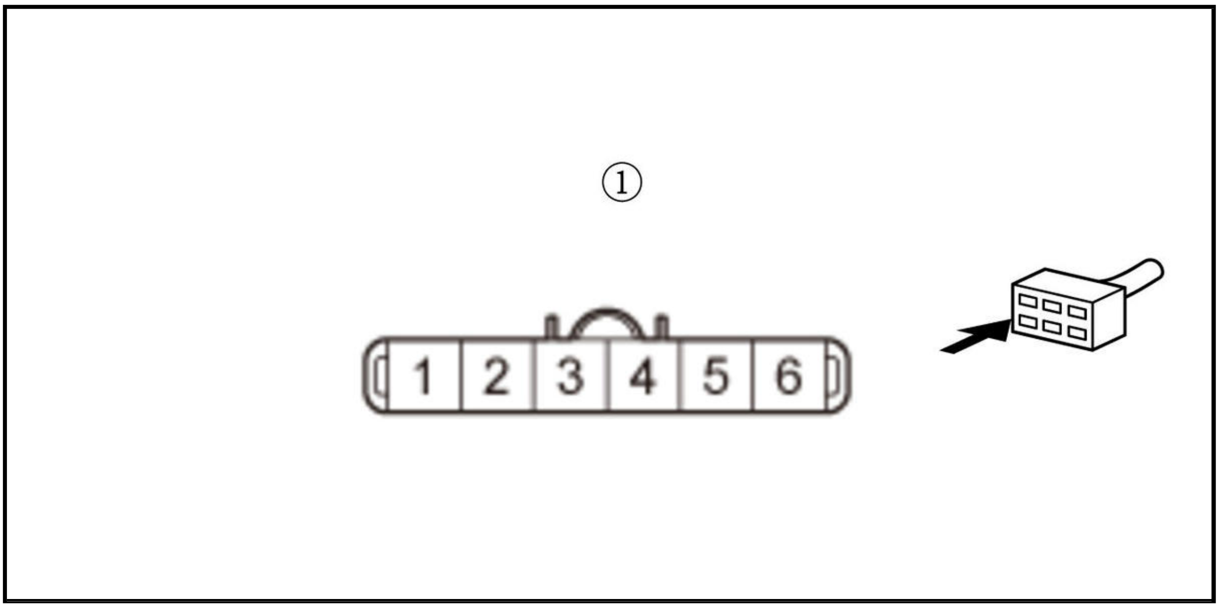
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	PCM connector B (51P) No. 48



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 wire between the PCM (B48) and the throttle body.

DTC P0223 (1.5 L ENGINE)

DTC P0223 : TP Sensor B Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0223 TP Sensor B Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR B	More than 4.8	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (SG3 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0123 TP Sensor A Circuit High Voltage	B	B
P0223 TP Sensor B Circuit High Voltage	B	B

Are DTC P0123 and P0223 indicated at the same time?

YES

Go to step 5.

NO

Go to step 3.

3. Determine possible failure area (THL2 line, throttle body)

-1. Turn the vehicle to the OFF (LOCK) mode.

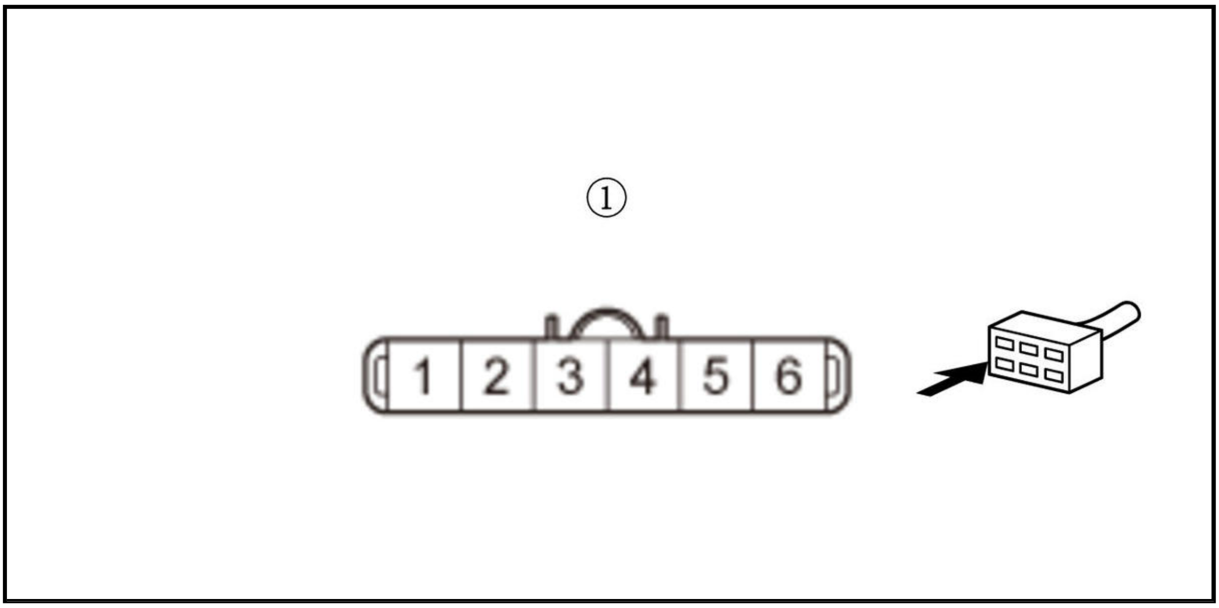
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 4.

4. Open wire check (THL2 line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

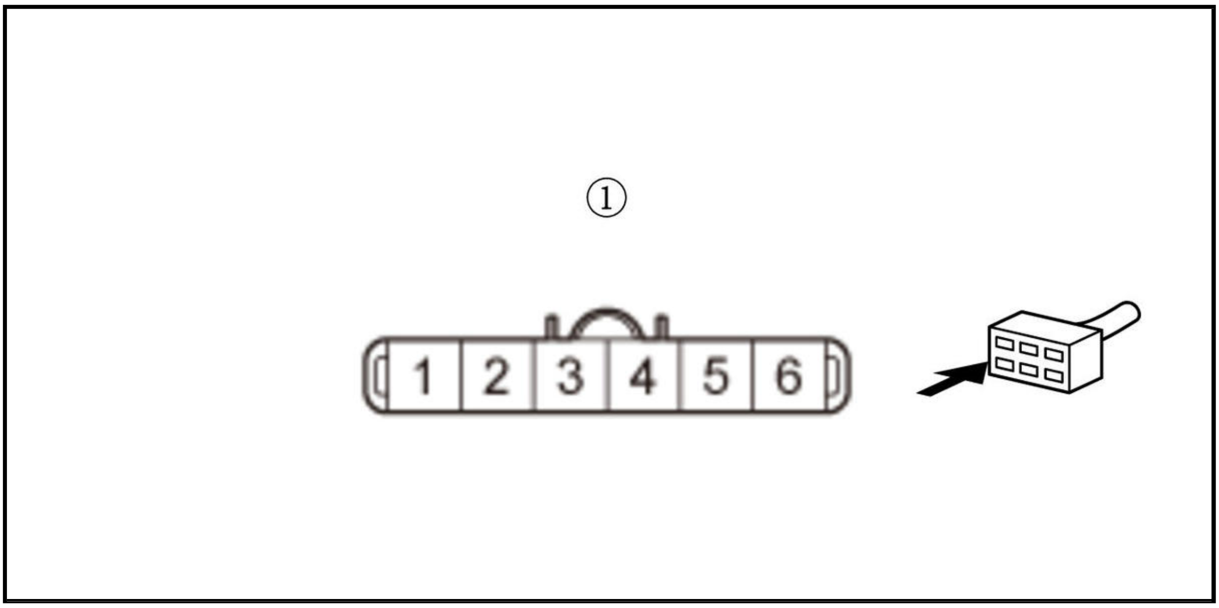
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector E (80P)

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 51**



Is there continuity?

YES

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the THL2 wire between the PCM (E51) and the throttle body.

5. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

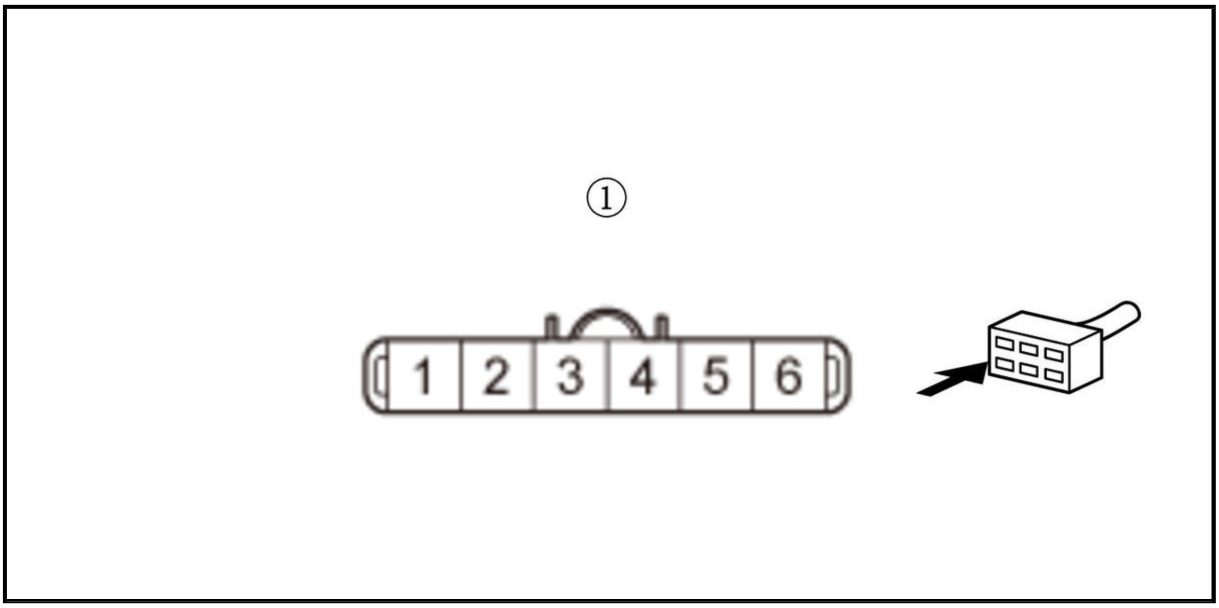
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 76**



Is there continuity?

YES

The SG3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG3 wire between the PCM (E76) and the throttle body.

DTC P0223 (2.4 L ENGINE) (2017 2018 2019)

DTC P0223 : TP Sensor B Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0223 TP Sensor B Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP SENSOR B	More than 4.8	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (SG3 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
TP SENSOR B	More than 4.8	V	B	B

Are DTC P0123 and P0223 indicated at the same time?

YES

Go to step 5.

NO

Go to step 3.

3. Determine possible failure area (THL2 line, throttle body)

-1. Turn the vehicle to the OFF (LOCK) mode.

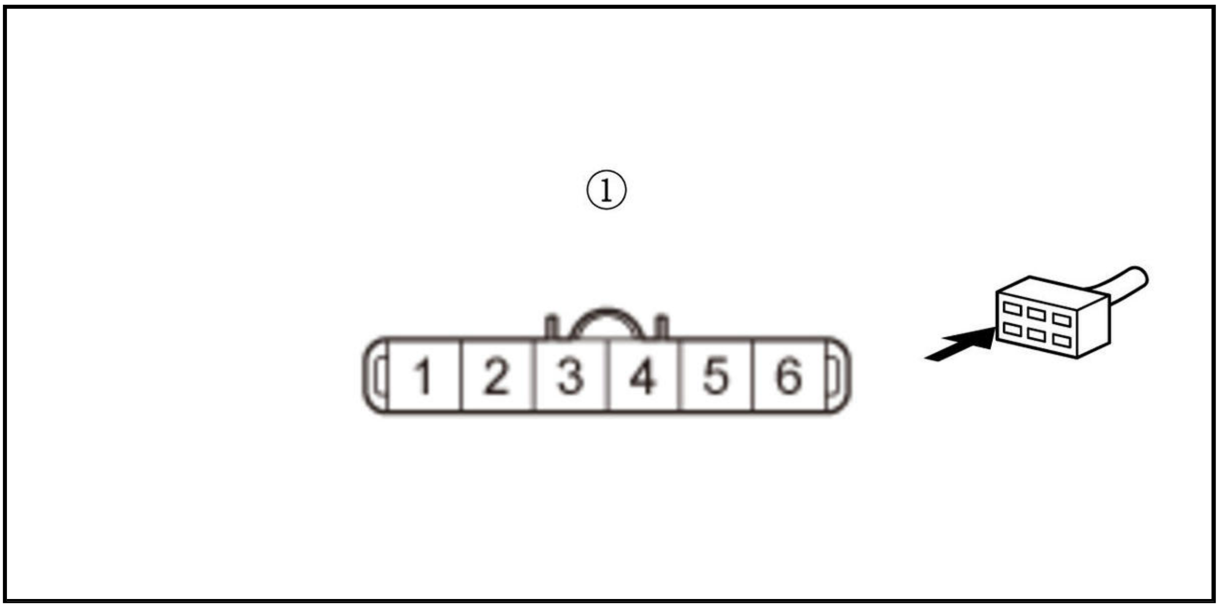
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 4.

4. Open wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

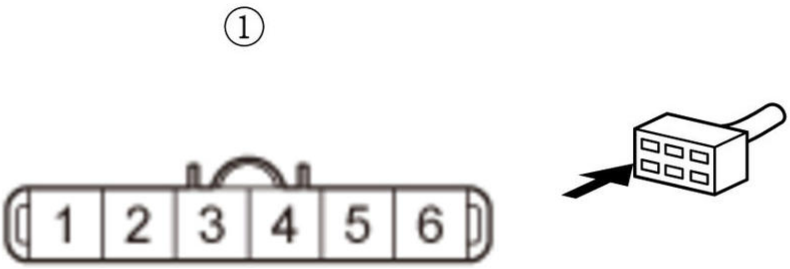
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	PCM connector B (51P) No. 47



Is there continuity?

YES

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Repair an open in the THL2 wire between the PCM (B47) and the throttle body.

5. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

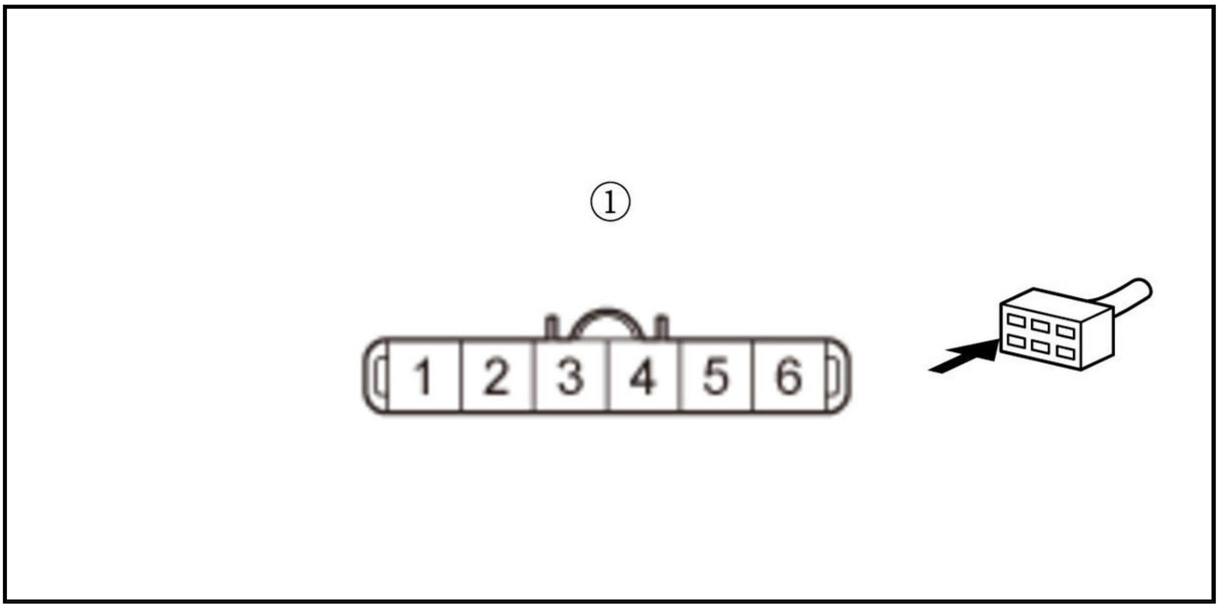
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector B (51P) No. 49**



Is there continuity?

YES

The SG3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SG3 wire between the PCM (B49) and the throttle body.

DTC P0234 (1.5 L ENGINE)

DTC P0234 : Turbocharger Overboost Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are stored at the same time as DTC P0234, troubleshoot those DTCs first, then recheck for P0234.

  P0107, P0108: MAP sensor

  P0237, P0238: Turbocharger boost sensor

DTC Description	Confirmed DTC	Pending DTC
P0234 Turbocharger Overboost Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

   -6. Test-drive the vehicle under the same conditions with the on-board snapshot of this DTC is recorded.

Signal	Current conditions	
	Values	Unit
VEHICLE SPEED	B	B
ECT SENSOR 1	B	B
MAP SENSOR (HI RES)	B	B
TC BOOST PRESSURE	B	B
ENGINE SPEED	B	B

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0234 Turbocharger Overboost Problem	B	B

   Is DTC P0234 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Turbocharger wastegate control actuator check

   -1. Select the Electric Waste Gate in the INSPECTION MENU with the HDS.

   ELECTRIC WASTE GATE

   Visually inspect the operation of the turbocharger wastegate control actuator.

   Does the turbocharger wastegate control actuator operate?

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the turbocharger .

DTC P0235 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0235 : Turbocharger Boost Sensor Out of Range

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0235 Turbocharger Boost Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TC BOOST PRESSURE SENSOR	Less than 0.37	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger boost sensor and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Determine possible failure area (P3 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Turbocharger boost sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TC BOOST PRESSURE SENSOR	Less than 0.37	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 5.

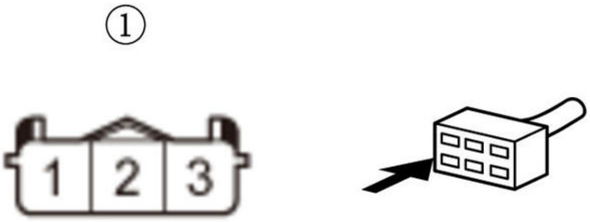
NO

Go to step 3.

3. Determine possible failure area (turbocharger boost sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger boost sensor 3P connector: disconnected
Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 1: ①
Test point 2	Turbocharger boost sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the turbocharger boost sensor .

NO

Go to step 4.

4. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

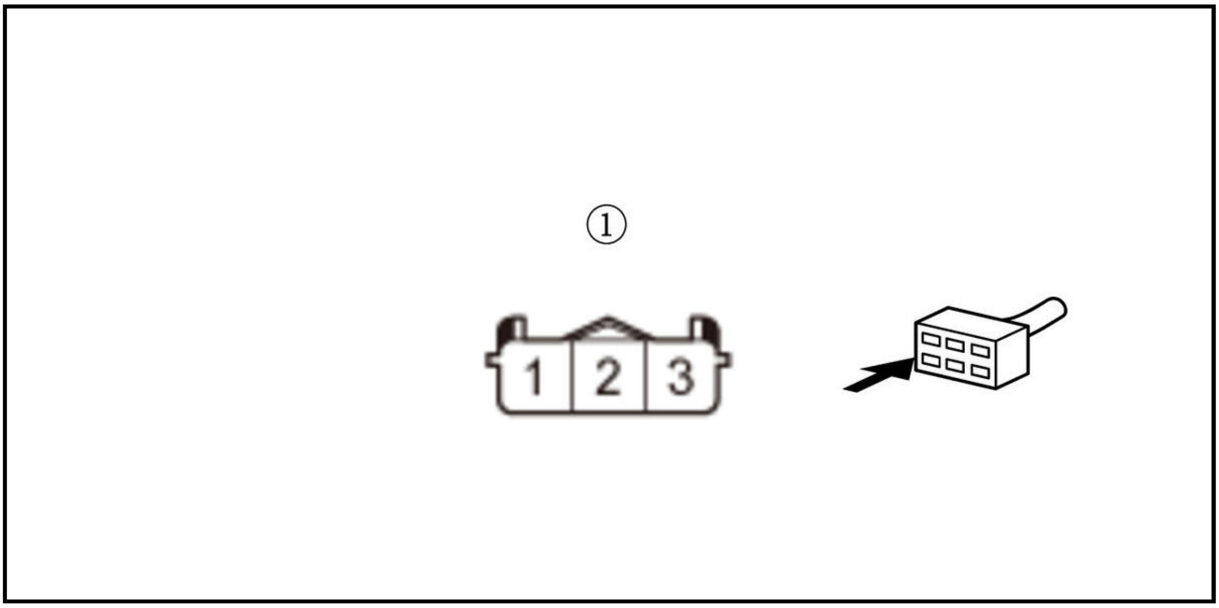
-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger boost sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected

Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there continuity?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC2 wire between the PCM (E77) and the turbocharger boost sensor.

5. Shorted wire check (P3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

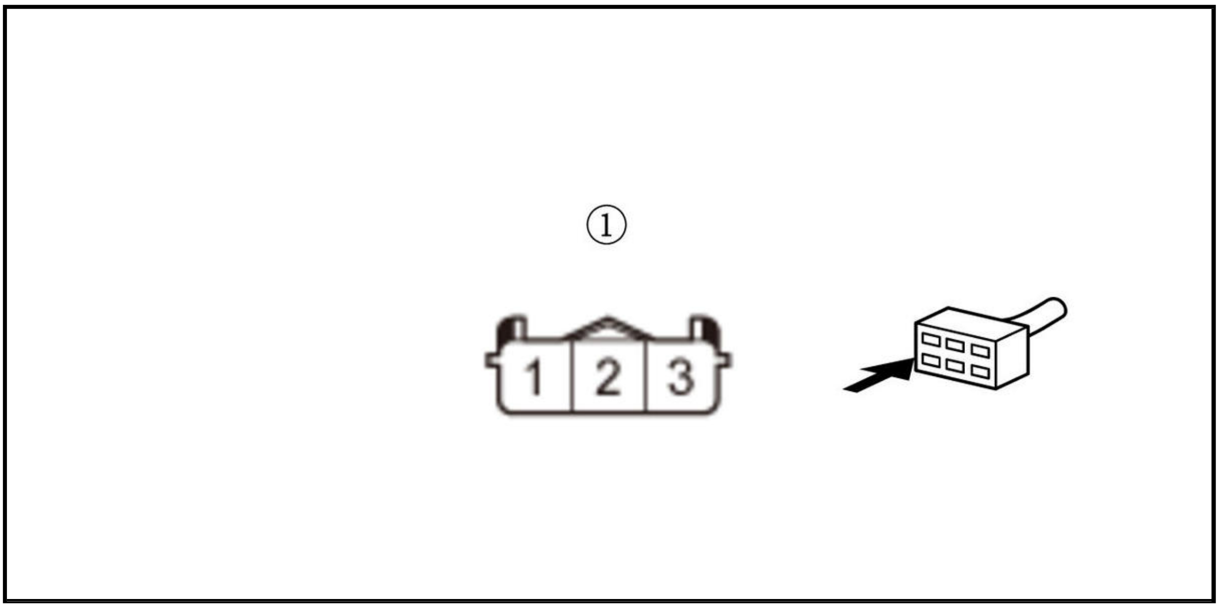
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger boost sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the P3 wire between the PCM (E57) and the turbocharger boost sensor.

NO

The P3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0236 (1.5 L ENGINE)

DTC P0236 : Turbocharger Boost Sensor Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0236 Turbocharger Boost Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle at least 6 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0236 Turbocharger Boost Sensor Circuit Range/Performance Problem	B	B

Is DTC P0236 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at turbocharger boost sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Turbocharger boost sensor check 1

   -1. Check the parameters below with the HDS.

Signal	Current conditions	
	Values	Unit
TC BOOST PRESSURE	B	B
BARO SENSOR	B	B

   -2. Compare the value of TC BOOST PRESSURE to the BARO SENSOR.

   Is the difference in value between the sensors 26.7 kPa (7.9 inHg, 200 mmHg) or more?

   YES

   Replace the turbocharger boost sensor .

   NO

   Go to step 3.

3. Turbocharger boost sensor check 2

   -1. Note the value of TC BOOST PRESSURE in the DATA LIST with the HDS.

   -2. Start the engine.

   -3. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -4. Hold the engine speed at 4, 500 rpm without load.

   -5. Check the parameter below with the HDS.

Signal	Current conditions	
	Values	Unit
TC BOOST PRESSURE	B	B

   Does the value change 0.67 kPa (0.2 inHg, 5 mmHg) or more?

   YES

   Go to step 4.

   NO

   Replace the turbocharger boost sensor .

4. Problem verification (test-drive):

Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- ENGINE SPEED
- VEHICLE SPEED
- REL TP SENSOR
- CLV (calculated load value)
- APP SENSOR

On-board Snapshot

-2. Monitor the OBD STATUS for DTC P0236 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0236 Turbocharger Boost Sensor Circuit Range/Performance Problem	B

Does the HDS indicate FAILED?

YES

Replace the turbocharger boost sensor .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at turbocharger boost sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

DTC P0237 (1.5 L ENGINE)

DTC P0237 : Turbocharger Boost Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0237 Turbocharger Boost Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TC BOOST PRESSURE SENSOR	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger boost sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (P3 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Turbocharger boost sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TC BOOST PRESSURE SENSOR	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

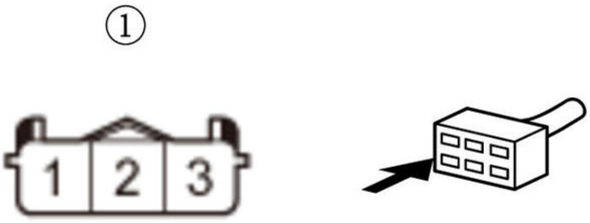
NO

Go to step 3.

3. Determine possible failure area (turbocharger boost sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger boost sensor 3P connector: disconnected
Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 1: ①
Test point 2	Turbocharger boost sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the turbocharger boost sensor .

NO

Go to step 4.

4. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

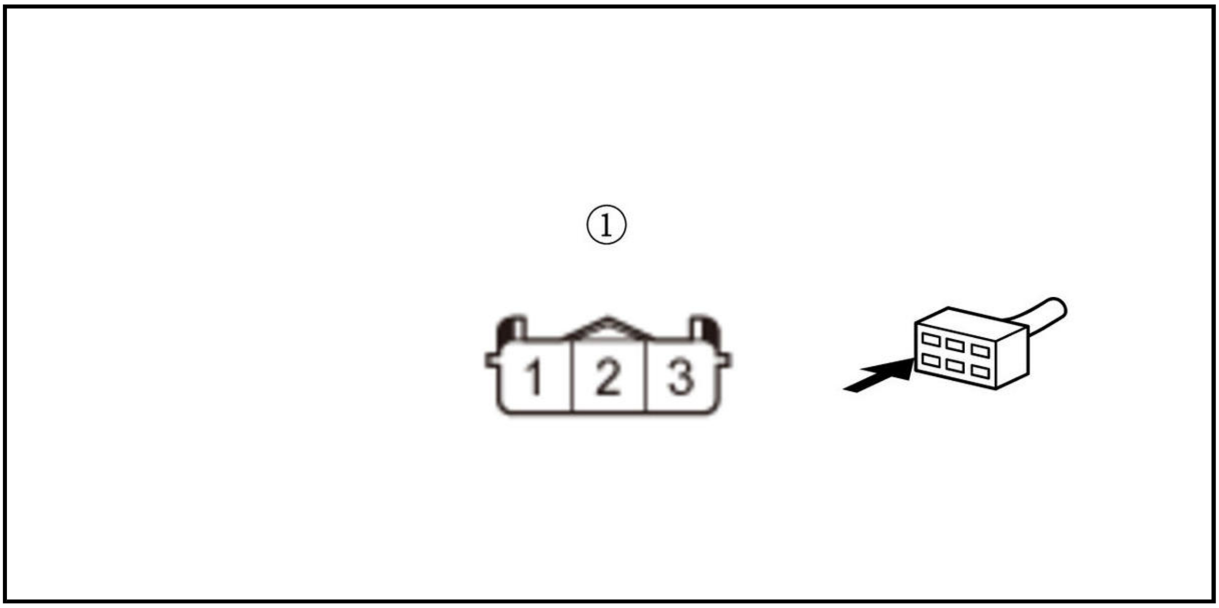
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger boost sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 3: ①
Test point 2	PCM connector E (80P) No. 77



Is there continuity?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the VCC2 wire between the PCM (E77) and the turbocharger boost sensor.

5. Shorted wire check (P3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

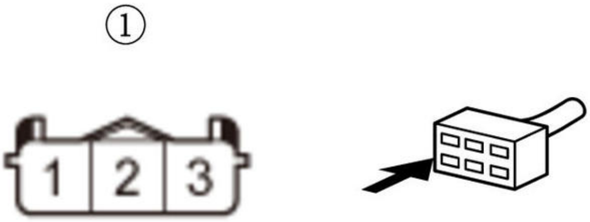
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger boost sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the P3 wire between the PCM (E57) and the turbocharger boost sensor.

NO

The P3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0238 (1.5 L ENGINE)

DTC P0238 : Turbocharger Boost Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0238 Turbocharger Boost Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
TC BOOST PRESSURE SENSOR	More than 4.49	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger boost sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (turbocharger boost sensor, others)

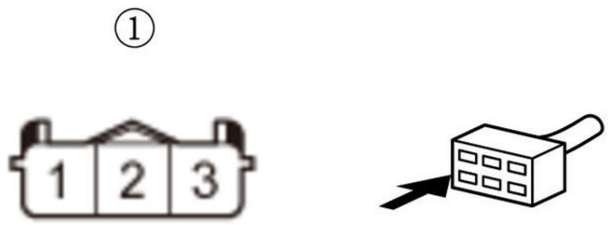
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Turbocharger boost sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Turbocharger boost sensor 3P connector (female terminals) No. 1: ①
Terminal B	Turbocharger boost sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TC BOOST PRESSURE SENSOR	More than 4.49	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the turbocharger boost sensor .

3. Determine possible failure area (SG2 line, others)

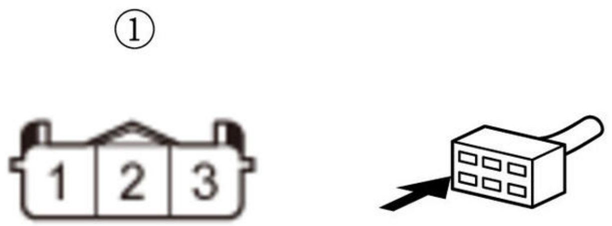
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the turbocharger boost sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger boost sensor 3P connector: disconnected
Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 1: ①
Test point 2	Turbocharger boost sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

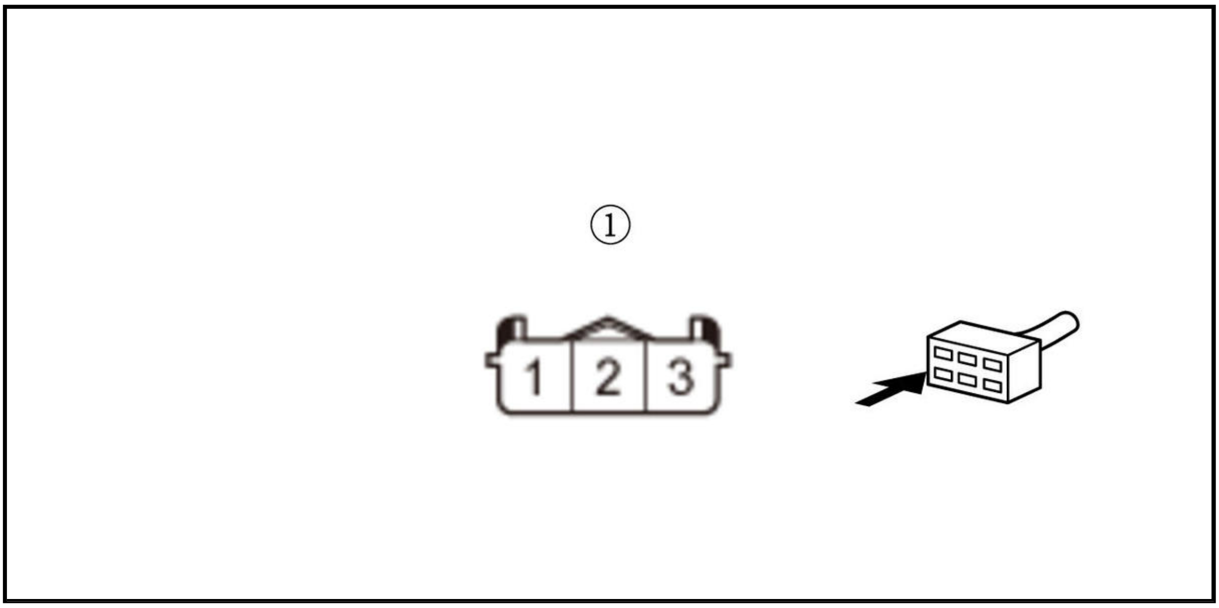
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger boost sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and the turbocharger boost sensor.

5. Open wire check (P3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

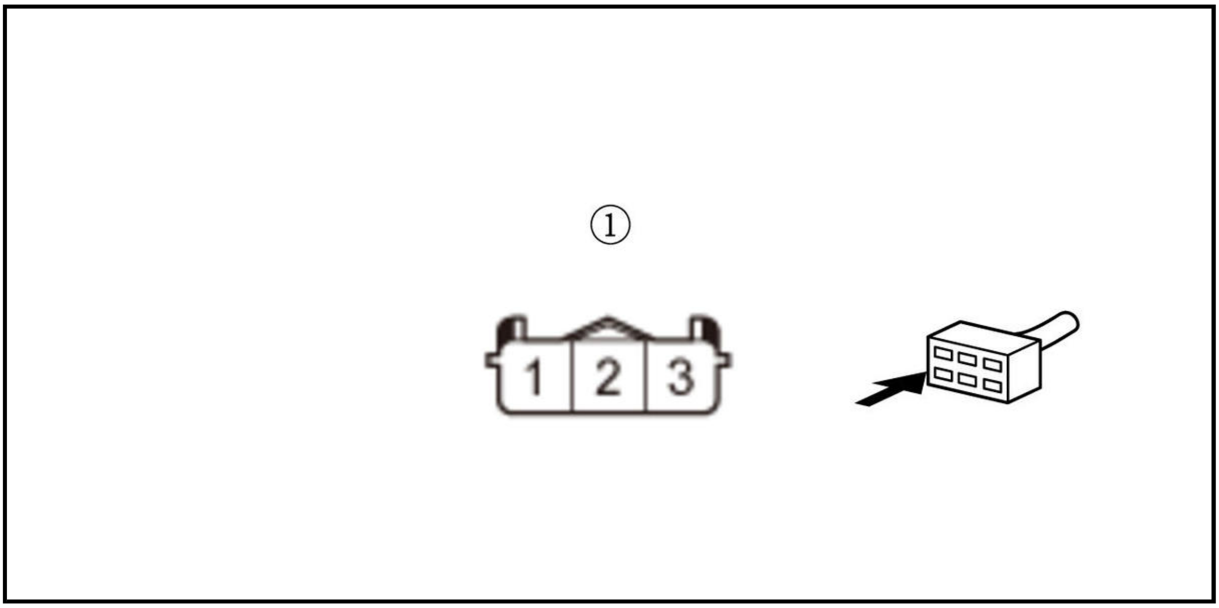
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger boost sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger boost sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 57**



Is there continuity?

YES

The P3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the P3 wire between the PCM (E57) and the turbocharger boost sensor.

DTC P023D (1.5 L ENGINE)

DTC P023D : Turbocharger Boost Sensor/MAP Sensor Incorrect Correlation

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P023D is indicated alone, do the troubleshooting for DTC P0236, P2073, and P2074 using the on-board snapshot for P023D.
- If any of the DTCs listed below are indicated at the same time as DTC P023D, troubleshoot those DTCs first, then recheck for P023D.

  P0236: Turbocharger boost sensor

  P2073, P2074: MAP sensor

DTC Description	Confirmed DTC	Pending DTC
P023D Turbocharger Boost Sensor/MAP Sensor Incorrect Correlation	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0236 Turbocharger Boost Sensor Circuit Range/Performance Problem	B	B
P2073 MAP Sensor Signal Higher Than Expected	B	B
P2074 MAP Sensor Signal Lower Than Expected	B	B
P023D Turbocharger Boost Sensor/MAP Sensor Incorrect Correlation	B	B

Are DTC P0236, P2073, or P2074 and P023D indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC P0236**, **DTC P2073** , and **DTC P2074** .

DTC P027E (1.5 L ENGINE) (2020 2021)

DTC P027E : Cold Start Air Fuel Ratio Control System Command Lean

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P027E Cold Start Air Fuel Ratio Control System Command Lean Bank1	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

   -3. Clear the DTC with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode.

   -5. Start the engine, and let it idle for 10 seconds or more.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P027E Cold Start Air Fuel Ratio Control System Command Lean Bank1	B	B

Is DTC P027E indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P027F (1.5 L ENGINE) (2020 2021)

DTC P027F : Cold Start Air Fuel Ratio Control System Command Rich

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P027F Cold Start Air Fuel Ratio Control System Command Rich	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Start the engine, and let it idle for 10 seconds or more.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P027F Cold Start Air Fuel Ratio Control System Command Rich	B	B

Is DTC P027F indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0299 (1.5 L ENGINE)

DTC P0299 : Turbocharger Underboost Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0299 Turbocharger Underboost Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

   -6. Test-drive the vehicle under the same conditions with the on-board snapshot of this DTC is recorded.

Signal	Current conditions	
	Values	Unit
VEHICLE SPEED	B	B
ECT SENSOR 1	B	B
MAP SENSOR (HI RES)	B	B
TC BOOST PRESSURE	B	B
ENGINE SPEED	B	B

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0299 Turbocharger Underboost Problem	B	B

   Is DTC P0299 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Air cleaner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Inspect the air cleaner element** .

Is the air cleaner element clogged?

YES

Replace the air cleaner element .

NO

Go to step 3.

3. Check for leak or damage components

   -1. Check for leak or damage parts through the intake air duct to the throttle body.

   Are the parts OK?

   YES

   Go to step 4.

   NO

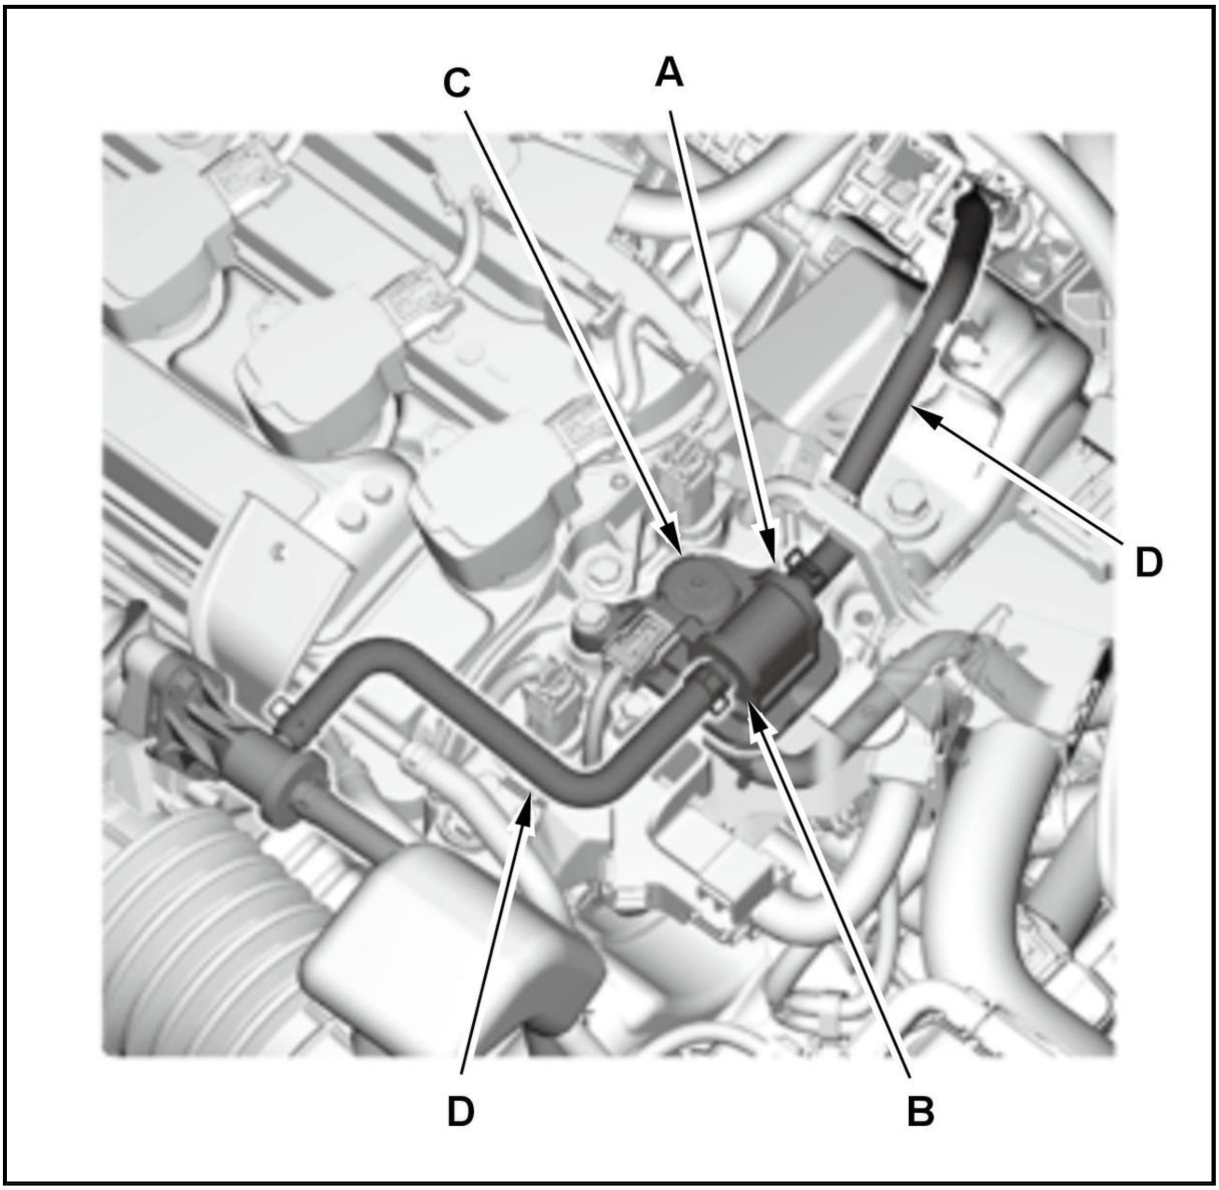
   Repair or replace the damaged parts.

4. Check for EVAP canister purge line:

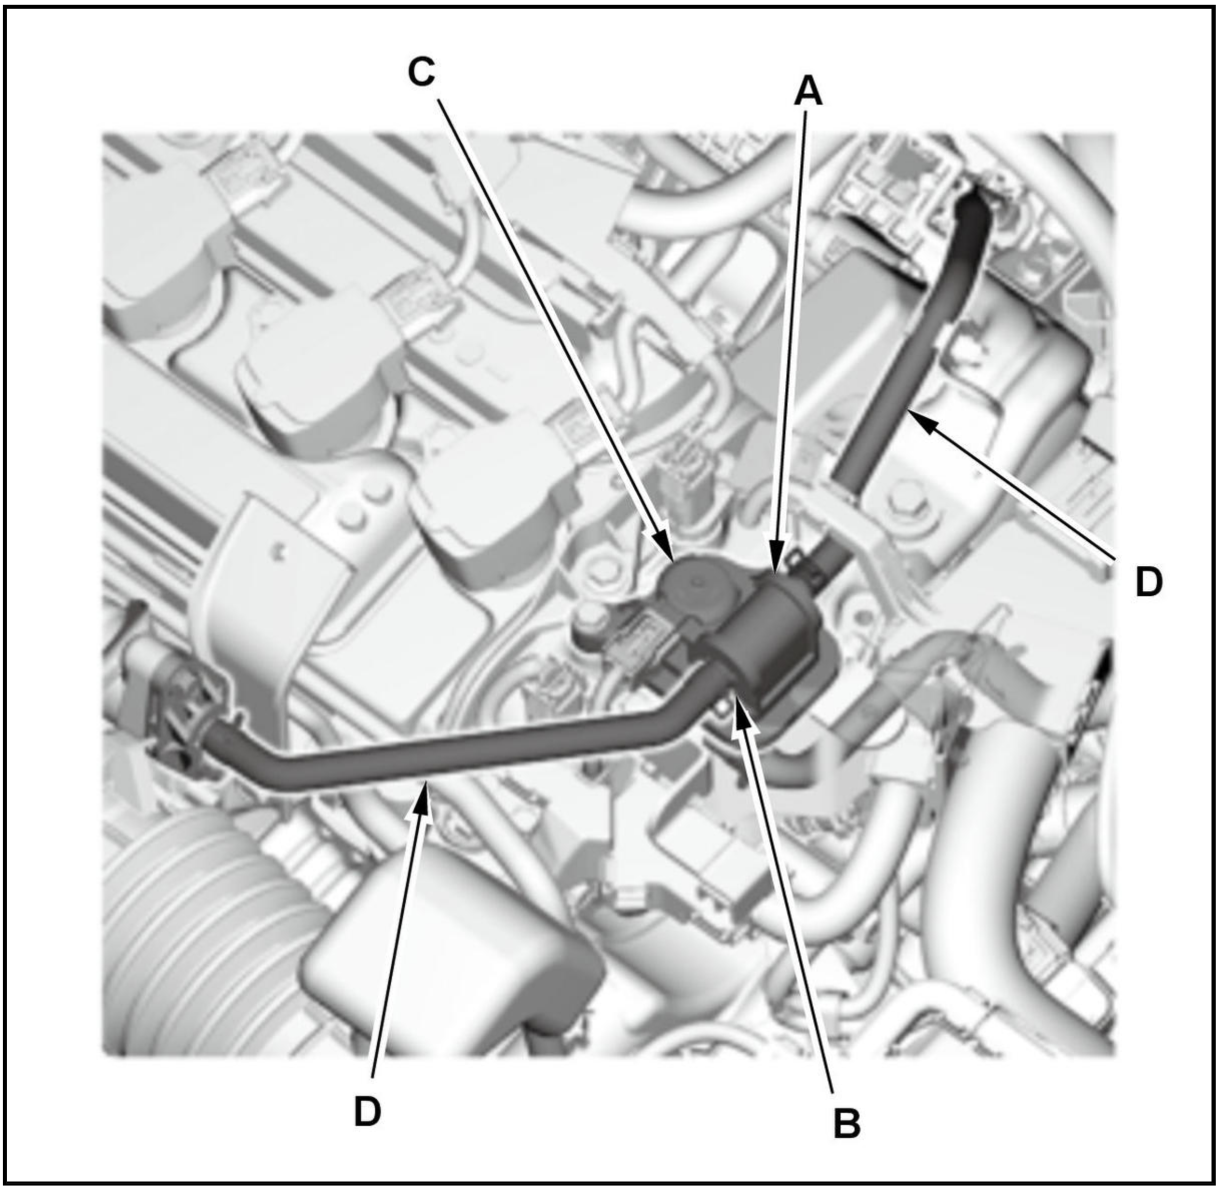
   Visually inspect each of the components below for disconnected hoses, cracks, or damage:

   - Non-return valve A (A) (built into the EVAP canister purge valve)
   - Non-return valve B (B) (built into the EVAP canister purge valve)
   - EVAP canister purge valve (C)
   - Hose (D)

   USA and Canada models



Mexico models



Are any components disconnected or damaged?

YES

Repair the connection or replace the damaged part (s).

NO

Go to step 5.

5. Check for EVAP canister purge valve

   -1. **Inspect the EVAP canister purge valve** .

   Is the EVAP canister purge valve OK?

   YES

   Go to step 6.

   NO

   Replace the EVAP canister purge valve .

6. Turbocharger bypass control solenoid valve operation check

-1. Turn the vehicle to the ON mode.

-2. Select the TC BYPASS CONTROL SOL. V TEST in the INSPECTION MENU with the HDS.

TC BYPASS CONTROL SOL. V. TEST

Is there a clicking noise from the turbocharger bypass solenoid valve?

YES

Go to step 7.

NO

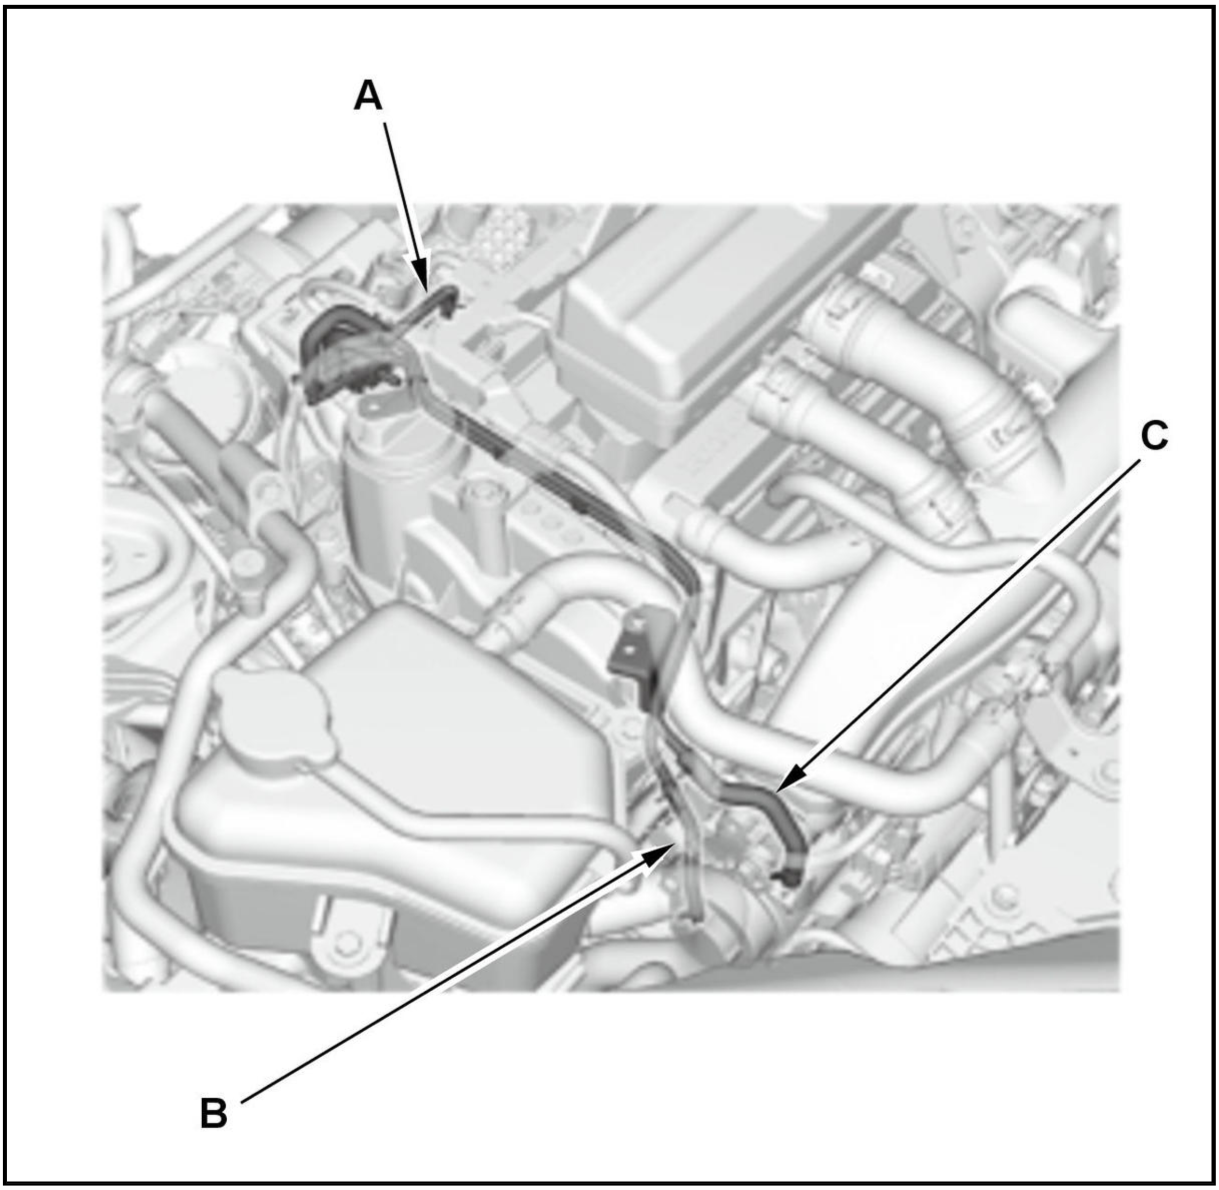
Replace the turbocharger bypass control solenoid valve .

7. Check for turbocharger bypass control valve control line

-1. Turn the vehicle to the OFF (LOCK) mode.

Visually inspect each of the components below for disconnected hoses, blockage, or damage:

- Hose (A) between the turbocharger bypass control solenoid valve and the intake manifold
- Hose (B) between the turbocharger bypass control solenoid valve and the turbocharger bypass control valve
- Hose (C) between turbocharger bypass control solenoid valve and the turbocharger joint



Are any components disconnected, blockage, or damaged?

YES

Repair the connection or replace the damaged part (s).

NO

Go to step 8.

8. Turbocharger bypass control solenoid valve check

   -1. **Inspect the turbocharger bypass control solenoid valve** .

   Is the solenoid valve OK?

   YES

   Go to step 9.

   NO

   Replace the turbocharger bypass control solenoid valve .

9. Turbocharger bypass control valve check

-1. Inspect the turbocharger bypass control valve .

Is the valve OK?

YES

Go to step 10.

NO

Replace the turbocharger joint .

10. Turbocharger wastegate control actuator check

-1. Select the ELECTRIC WASTE GATE in the INSPECTION MENU with the HDS.

ELECTRIC WASTE GATE

Visually inspect the operation of the turbocharger wastegate control actuator.

Does the turbocharger wastegate control actuator operate?

1. **YES**

    - Check for clogging or damaged in these parts.
    -
        - -

          Turbocharger
        - -

          Catalytic converter
    - Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

   NO

   Replace the turbocharger .

DTC P0300, P0301, P0302, P0303, P0304 (1.5 L ENGINE)

DTC P0300 : Random Misfire Detected **DTC P0301** : No. 1 Cylinder Misfire Detected **DTC P0302** : No. 2 Cylinder Misfire Detected **DTC P0303** : No. 3 Cylinder Misfire Detected **DTC P0304** : No. 4 Cylinder Misfire Detected

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If the misfire is frequent enough to trigger detection of increased emissions during two consecutive driving cycles, the MIL will come on, and DTC P0300 (and some combination of P0301 through P0304) will be stored.
- If the misfire is frequent enough to damage the catalyst, the MIL will flash whenever the misfire occurs, and DTC P0300 (and some combination of P0301 through P0304) will be stored. When the misfire stops, the MIL will remain on.
- Troubleshoot the following DTCs first, if any of them were stored along with the random misfire DTC (s) (Because parts can sometimes fail without setting DTC's you should also do a physical inspection of the systems listed below):

P0087, P0088: Fuel rail pressure sensor

P006A, P0100, P0101: MAF sensor

P0107, P0108, P2073, P2074: MAP sensor

P0171, P0172, P2187: Fuel system

P0335, P0339: CKP sensor

P0340, P0344: CMP sensor A

P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

P0506, P0507: Idle control system

P2623: High pressure fuel pump

DTC Description	Confirmed DTC	Pending DTC
P0300 Random Misfire Detected	B	B
P0301 No. 1 Cylinder Misfire Detected	B	B
P0302 No. 2 Cylinder Misfire Detected	B	B
P0303 No. 3 Cylinder Misfire Detected	B	B
P0304 No. 4 Cylinder Misfire Detected	B	B

DTC (PGM-FI)

1. Problem verification - Idle

-1. Record the ONBOARD SNAPSHOT with the HDS.

-2. Start the engine, and let it idle.

-3. Monitor these parameters in the DATA LIST:

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Are the misfire counts increasing on any cylinder at idle?

YES

The engine is misfiring at idle, go to step 2.

NO

The engine does not misfire at idle, go to step 3.

2. Determine Affected Cylinders

-1. Continue to monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Are the misfire counts generally isolated to a single cylinder?

1. **YES**

   The misfire is isolated to a single cylinder.

   - If the misfire counts are increasing every engine revolution (completely inactive cylinder), go to Single Cylinder Continuous Misfire at Idle troubleshooting on step 6.
   - If the misfire counts are increasing every few engine revolutions (partially inactive cylinder), go to Single Cylinder Non-Continuous Misfire at Idle troubleshooting on step 21.

   NO

   The misfire affects multiple cylinders.

   - If the misfire counts are increasing every engine revolution (completely inactive cylinder), go to Multiple Cylinder Continuous Misfire at Idle troubleshooting on step 30.
   - If the misfire counts are increasing every few engine revolutions (partially inactive cylinder), go to Multiple Cylinder Non-Continuous Misfire at Idle troubleshooting on step 48.

3. Problem verification - Static Load

-1. Increase the engine speed to 3, 500 rpm.

-2. Hold the engine speed steady, and monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Are the misfire counts increasing on any cylinder?

YES

The engine is misfiring under load. Go to step 4.

NO

The engine does not misfire under a static load. Go to step 5.

4. Determine Affected Cylinders

-1. Continue to monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B

Signal	Current conditions	
	Values	Unit
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B

Signal	Current conditions	
	Values	Unit
CYL4 MISFIRE	B	B

Are misfire counts generally isolated to a single cylinder?

YES

The misfire is isolated to a single cylinder, go to Single Cylinder Misfire. Under Load troubleshooting on step 56.

NO

The misfire affects multiple cylinders, go to Multiple Cylinder Misfire. Under Load troubleshooting on step 62.

5. Problem verification - On-board Snapshot

-1. Open the ONBOARD SNAPSHOT with the HDS.

-2. Scroll through the snapshot, and find when the MISFIRE value begins to increase.

-3. Record the value of these parameters as the MISFIRE value increases:

Signal	Values	Unit
ECT SENSOR 1	B	deg. F
ENGINE SPEED	B	RPM
VEHICLE SPEED	B	MPH
MAP SENSOR	B	V
TP SENSOR	B	V

On-board Snapshot

-4. Drive the vehicle according to the conditions you identified above while monitoring the misfire counts.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
MAP SENSOR	B	B
TP SENSOR	B	B

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Are the misfire counts increasing on any cylinder?

YES

The engine is misfiring under the specific operating conditions above.

- If the misfire occurred when the engine was cold, go to Misfire When Cold troubleshooting on step 68.
- If the misfire occurred when the engine was loaded, go to step 4.

NO

Intermittent failure; the engine is not misfiring at this time.**NOTE:** If the misfire cannot be reproduced, there is a possibility that the problem may have been caused by poor quality fuel. The problem may have disappeared after refueling with fresh fuel. The MIL DIST (MIL Distance) value in the Data List in combination with the fuel level may help you make this determination.

6. Check Ignition Coil Spark

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the ignition coil from the problem cylinder** .

-3. Connect a commercially available spark tester between the ignition coil and engine ground.

-4. Start the engine with the ignition coil connected.

Does the ignition coil produce a spark?

YES

The ignition coil wiring is OK. Go to step 14.

NO

There is a problem with the ignition coil, or the ignition coil circuit. Go to step 7.

7. Ignition Coil Check

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Connect a commercially available spark tester between the ignition coil and engine ground.

-3. Start the engine with the ignition coil connected.

Does the ignition coil produce a spark?

YES

The ignition coil has a failure. **Replace the ignition coil** .

NO

There is a problem with the ignition coil circuit. Go to step 8.

8. Check Ignition Coil Power and Ground

-1. Disconnect the ignition coil 3P connector from the problem cylinder.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between ignition coil 3P connector terminals No. 1 (power) and No. 2 (ground).

NOTE: After the vehicle is turned to the OFF (LOCK) mode, this circuit may still show battery voltage for a period of time. This is normal.

Is there battery voltage between the ignition coil power terminal and engine ground?

YES

The power circuit is OK. Repair the open circuit between the ignition coil (3P connector terminal No. 2) and G101.

NO

Repair the open circuit between the ignition coil and the ignition coil relay.

14. Inspect Ignition Coil

-1. Inspect the ignition coil and spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 15.

15. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with one from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 17.

NO

There is a failure in the ignition coil or the spark plug. Go to step 16.

16. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

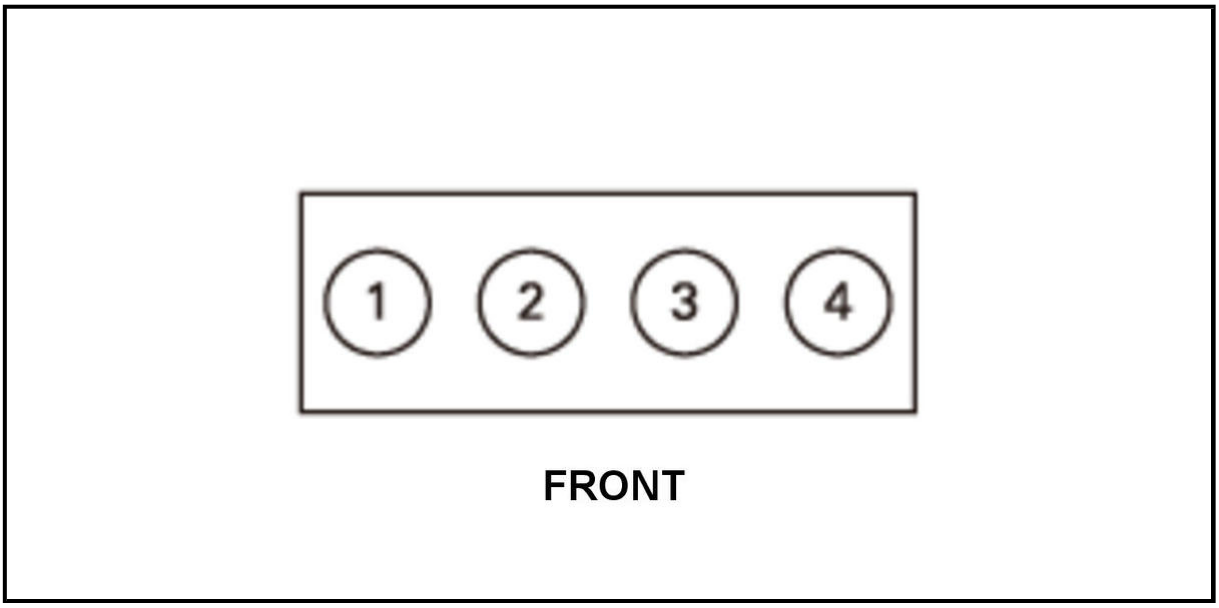
NO

The ignition coil has a failure. **Replace the ignition coil** .

17. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

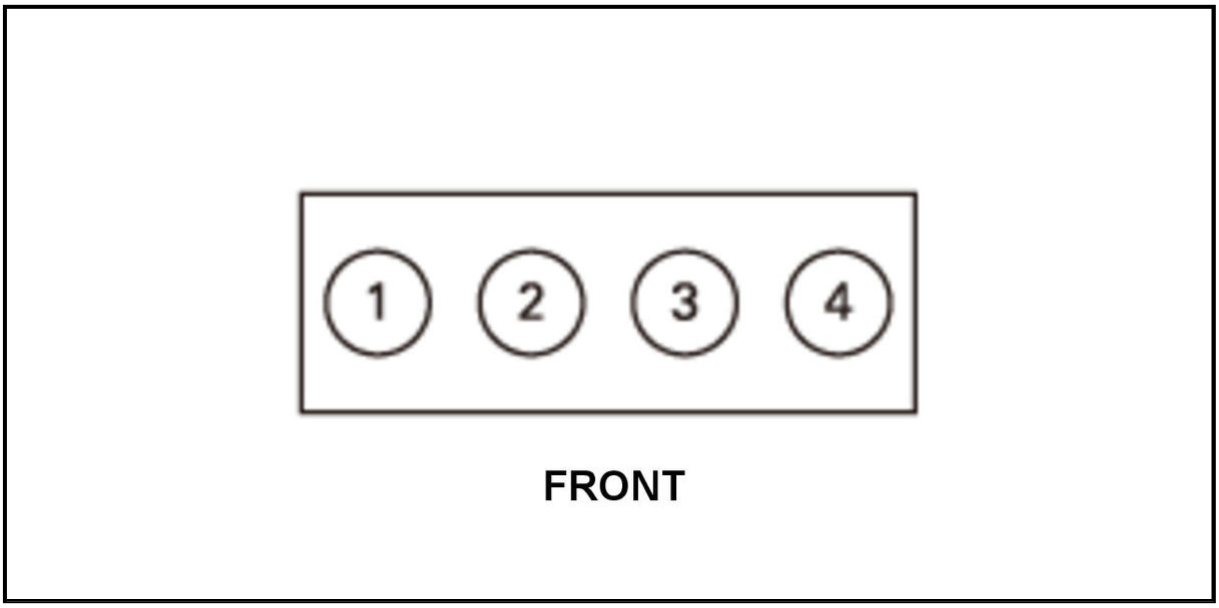
   NO

   The engine compression and the cylinder leakage are normal. Go to step 18.

18. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust valve clearance to specification (cold), then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 19.

19. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B

Signal	Current conditions	
	Values	Unit
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 20.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

20. CKP Pattern Clear/Pattern Learn

-1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

-2. **Select CRANK PATTERN CLEAR, and clear the CKP pattern** .

CRANK PATTERN CLEAR

Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

21. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 22.

22. Inspect Ignition Coil

-1. Inspect the ignition coil and the spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and the spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 23.

23. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 25.

NO

There is a failure in the ignition coil or the spark plug. Go to step 24.

24. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

25. Check MAP Sensor Fluctuation

-1. Start the engine, and let it idle until the cooling fans cycle twice.

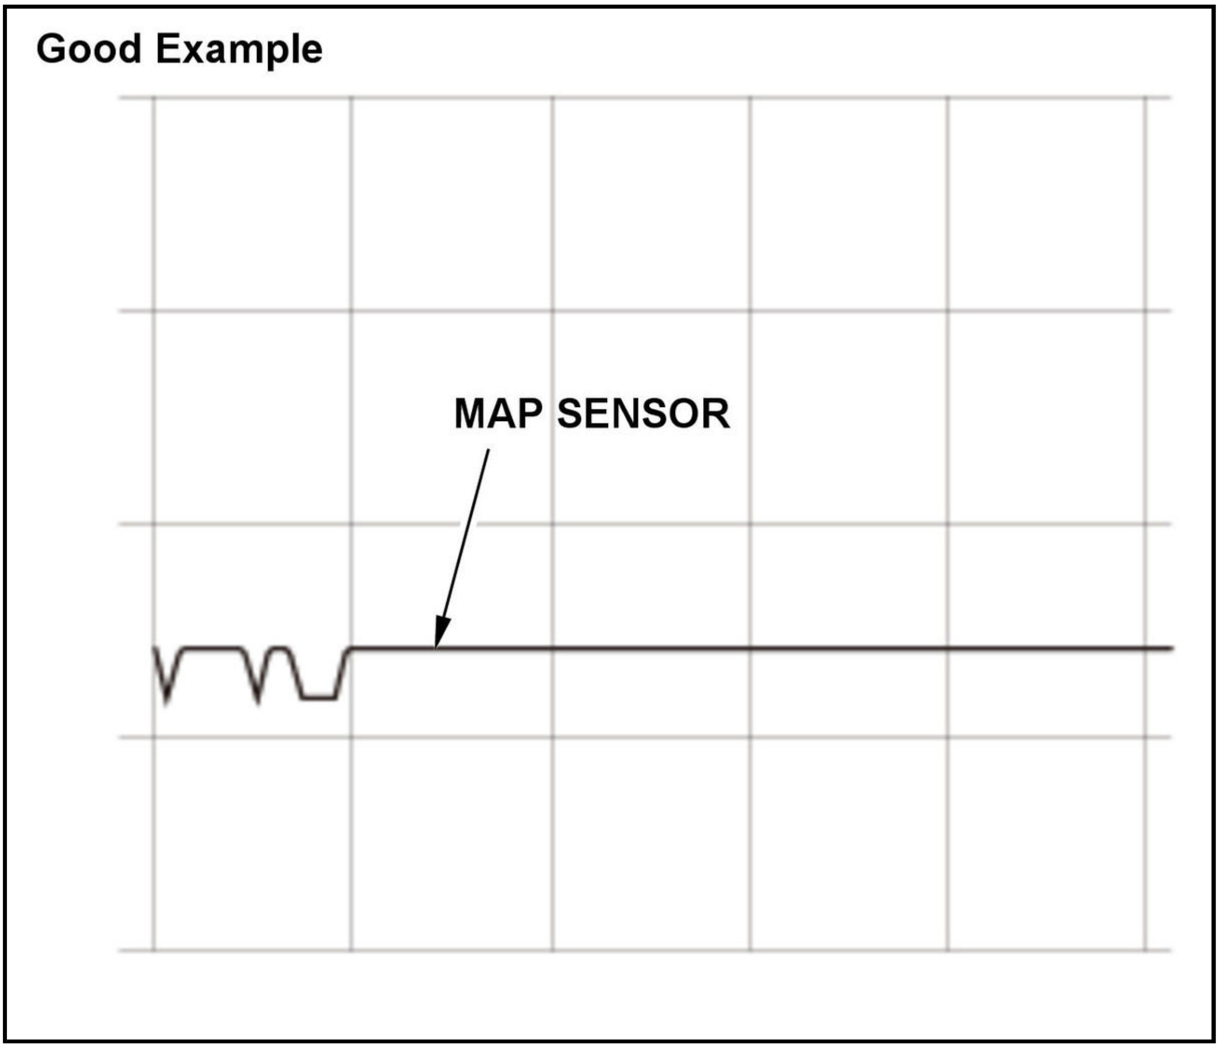
-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

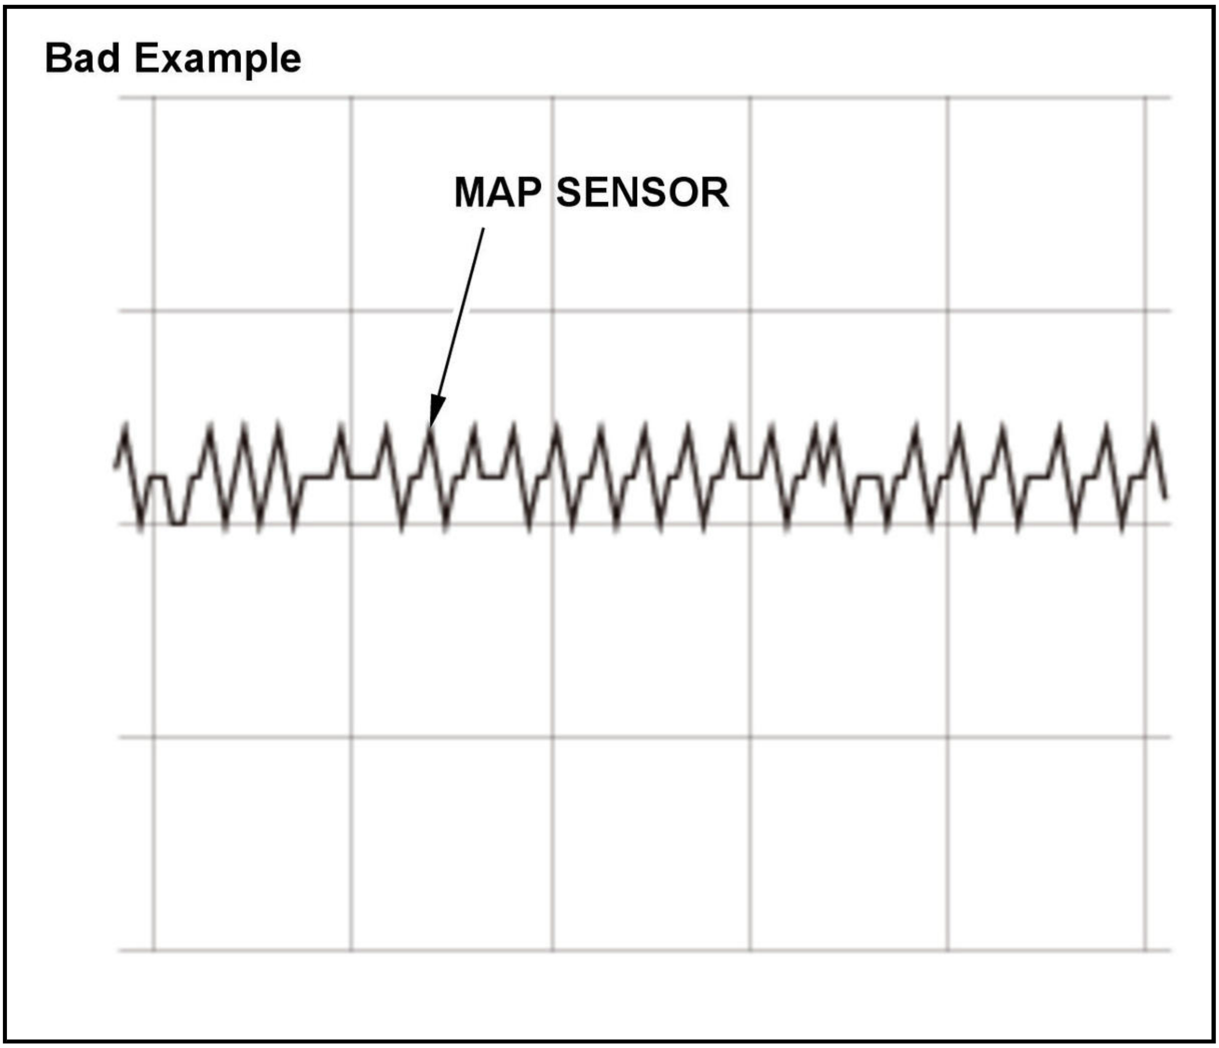
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 26.

NO

The intake manifold vacuum fluctuation is OK. Go to step 29.

26. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg. F (38 deg. C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 27.

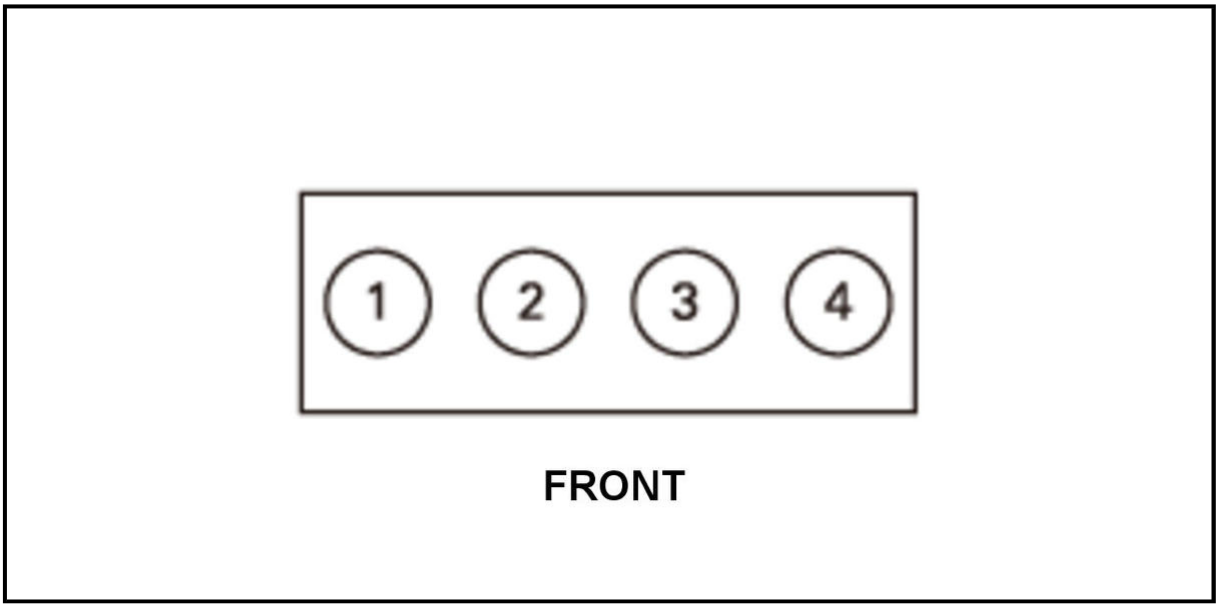
NO

The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

27. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

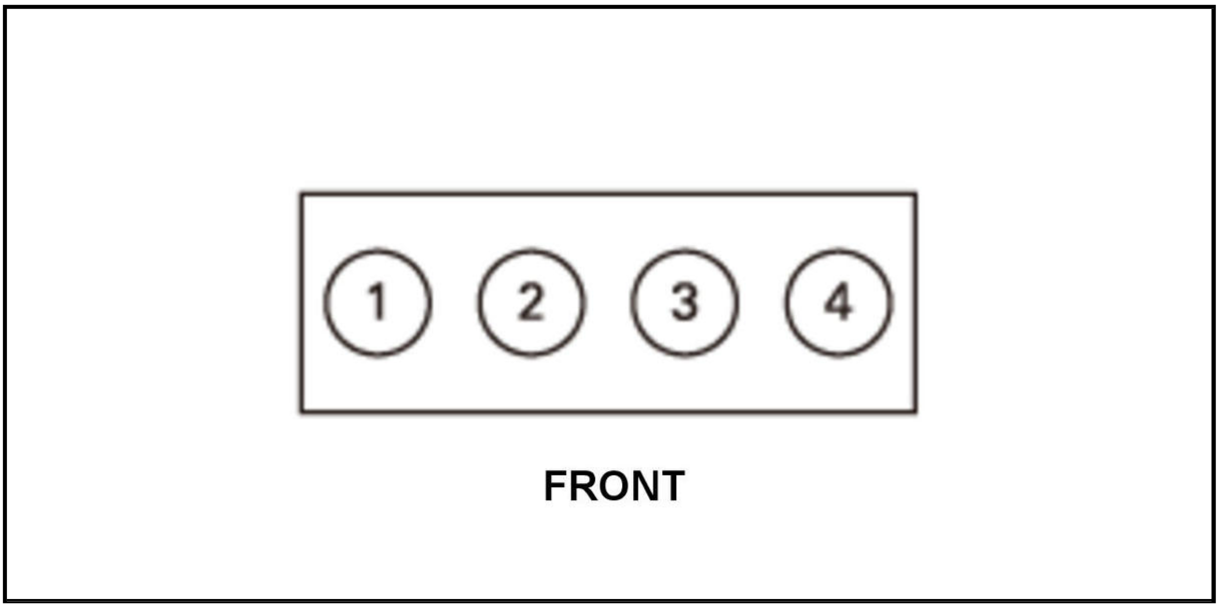
   NO

   The engine compression and the cylinder leakage are normal. Go to step 28.

28. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 29.

29. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. All of the failures have been checked for this type of misfire. Go to step 1 in the Problem verification procedure and ensure you selected the correct troubleshooting procedure.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

30. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 31.

31. Check Ignition Coil Spark

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the ignition coil from the problem cylinder** .

-3. Connect a commercially available spark tester between the ignition coil and engine ground.

-4. Start the engine with the ignition coil connected.

Does the ignition coil produce a spark?

YES

The ignition coil wiring is OK. Go to step 39.

NO

There is a problem with the ignition coil, or the Ignition coil circuit. Go to step 32.

32. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Connect a commercially available spark tester between the ignition coil and engine ground.

-3. Start the engine with the ignition coil connected.

Does the ignition coil produce a spark?

YES

The ignition coil has a failure. **Replace the ignition coil** .

NO

There is a problem with the ignition coil circuit. Go to step 33.

33. Check Ignition Coil Power and Ground

-1. Disconnect the ignition coil 3P connector from the problem cylinder.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between ignition coil 3P connector terminals No. 1 (power) and No. 2 (ground).

NOTE: After the vehicle is turned to the OFF (LOCK) mode, this circuit may still show battery voltage for a period of time. This is normal.

PCM
G101

Is there about 4 V or more?

YES

The ignition coil control circuit is shorted to power. Go to step 35.

NO

The ignition coil control circuit is not shorted to power. Go to step 36.

35. Isolate Ignition Coil Control Short to Power

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the PCM connectors.

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between ignition coil 3P connector terminals No. 3 (Ignition Control) and body ground.

Is there about 4 V or more?

YES

There is a short to power on the ignition coil control circuit. Find and repair the failure.

NO

The PCM is malfunctioning. **Replace the PCM** .

36. Check Ignition Coil Control Open Circuit

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the PCM connectors.

-4. Check for continuity between the ignition coil control terminal at the PCM connector and at the ignition coil 3P connector terminal No. 3.

G101

Is there battery voltage between the ignition coil power terminal and engine ground?

YES

The power circuit is OK. Repair the open circuit between the ignition coil (3P connector terminal No. 2) and G101.

NO

Repair the open circuit between the ignition coil and the ignition coil relay.

39. Inspect Ignition Coil

-1. Inspect the ignition coil and spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 40.

40. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with one from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 42.

NO

There is a failure in the ignition coil or the spark plug. Go to step 41.

41. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

42. Check MAP Sensor Fluctuation

-1. Start the engine, and let it idle until the cooling fans cycle twice.

-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

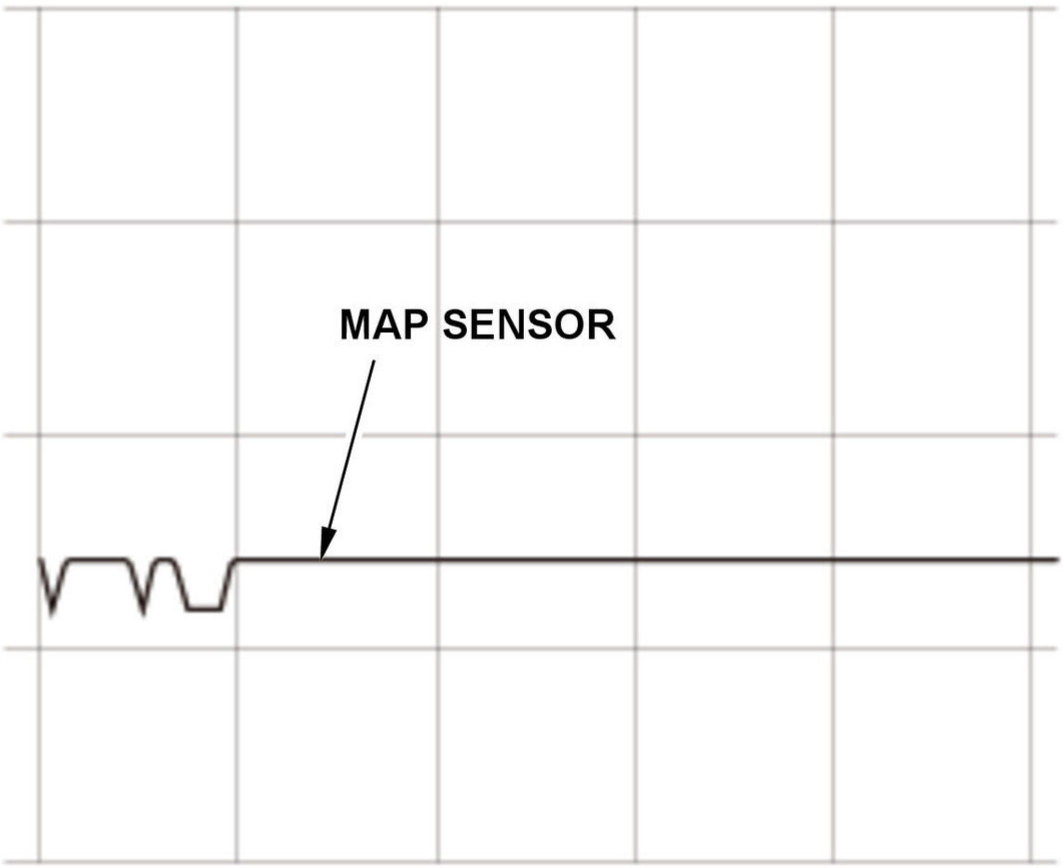
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

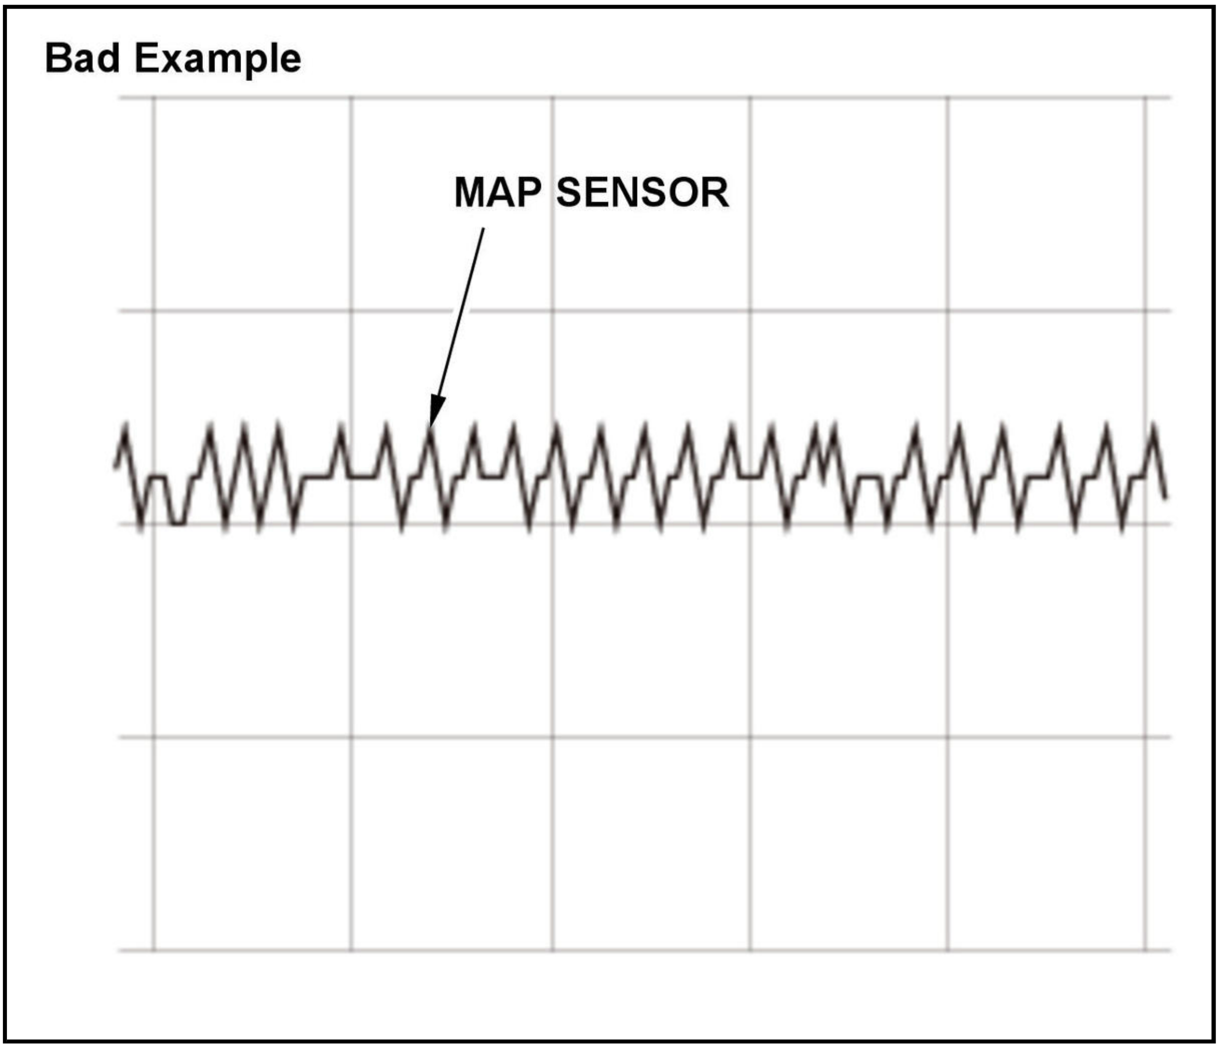
-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.

Good Example





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 43.

NO

The intake manifold vacuum fluctuation is OK. Go to step 46.

43. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg. F (38 deg. C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 44.

NO

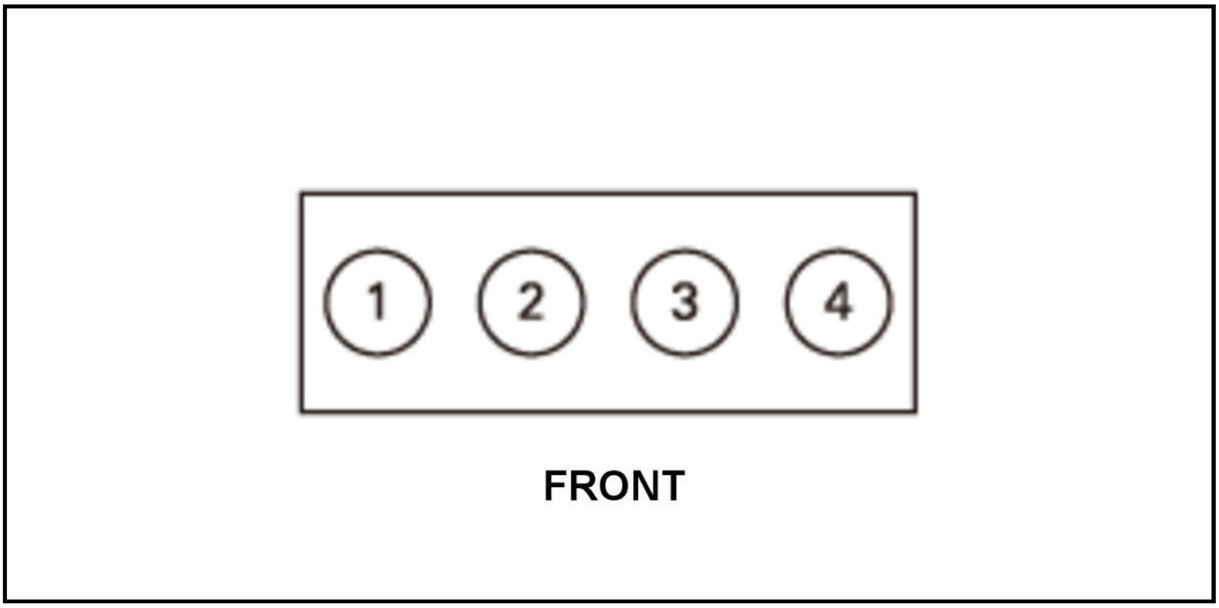
The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

44. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

   NO

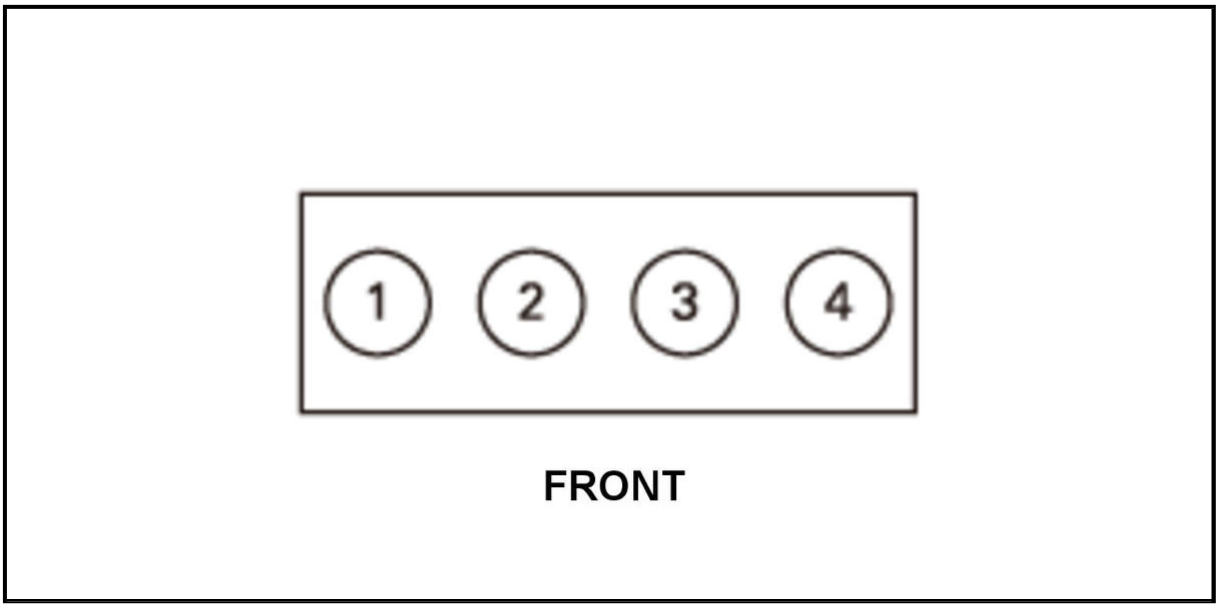
   The engine compression and the cylinder leakage are normal. Go to step 45.

45. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 46.

46. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 47.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

47. CKP Pattern Clear/Pattern Learn

 -1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

 -2. **Select CRANK PATTERN CLEAR, and clear the CKP pattern** .

 CRANK PATTERN CLEAR

 Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts .

 CRANK PATTERN LEARNING

 Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

 Did the misfire counts stay on the problem cylinder?

 YES

 Check for authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

 NO

 The misfire problem has been fixed.

48. Inspect Spark Plug

 -1. **Remove the spark plug from the problem cylinder** .

 -2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

 Does the spark plug show any signs of failure or is it not the correct part number?

 YES

 Replace the spark plug .

 NO

 Go to step 49.

49. Check MAP Sensor Fluctuation

 -1. Start the engine, and let it idle until the cooling fans cycle twice.

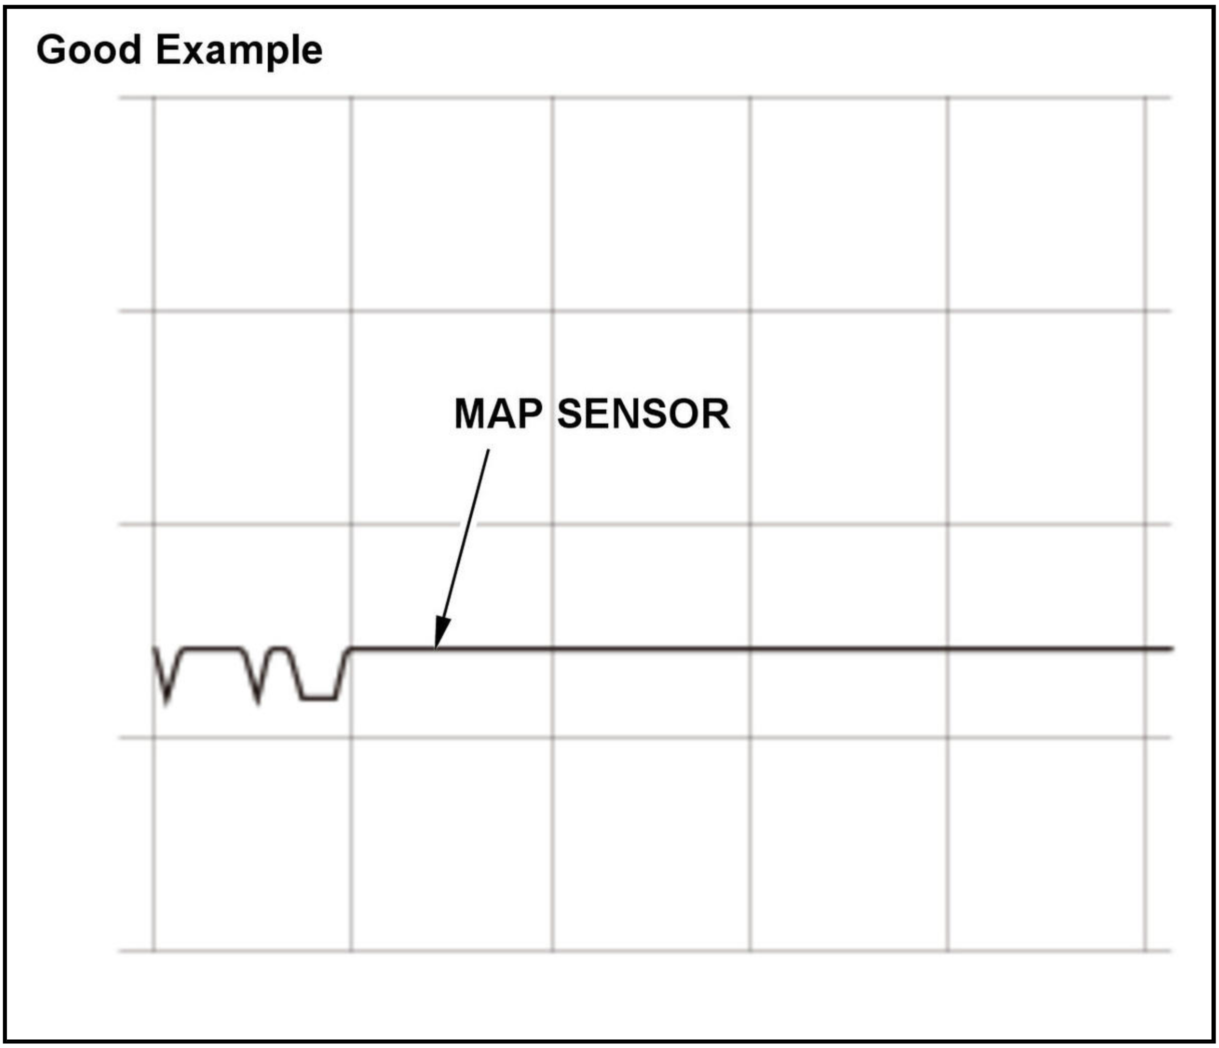
 -2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

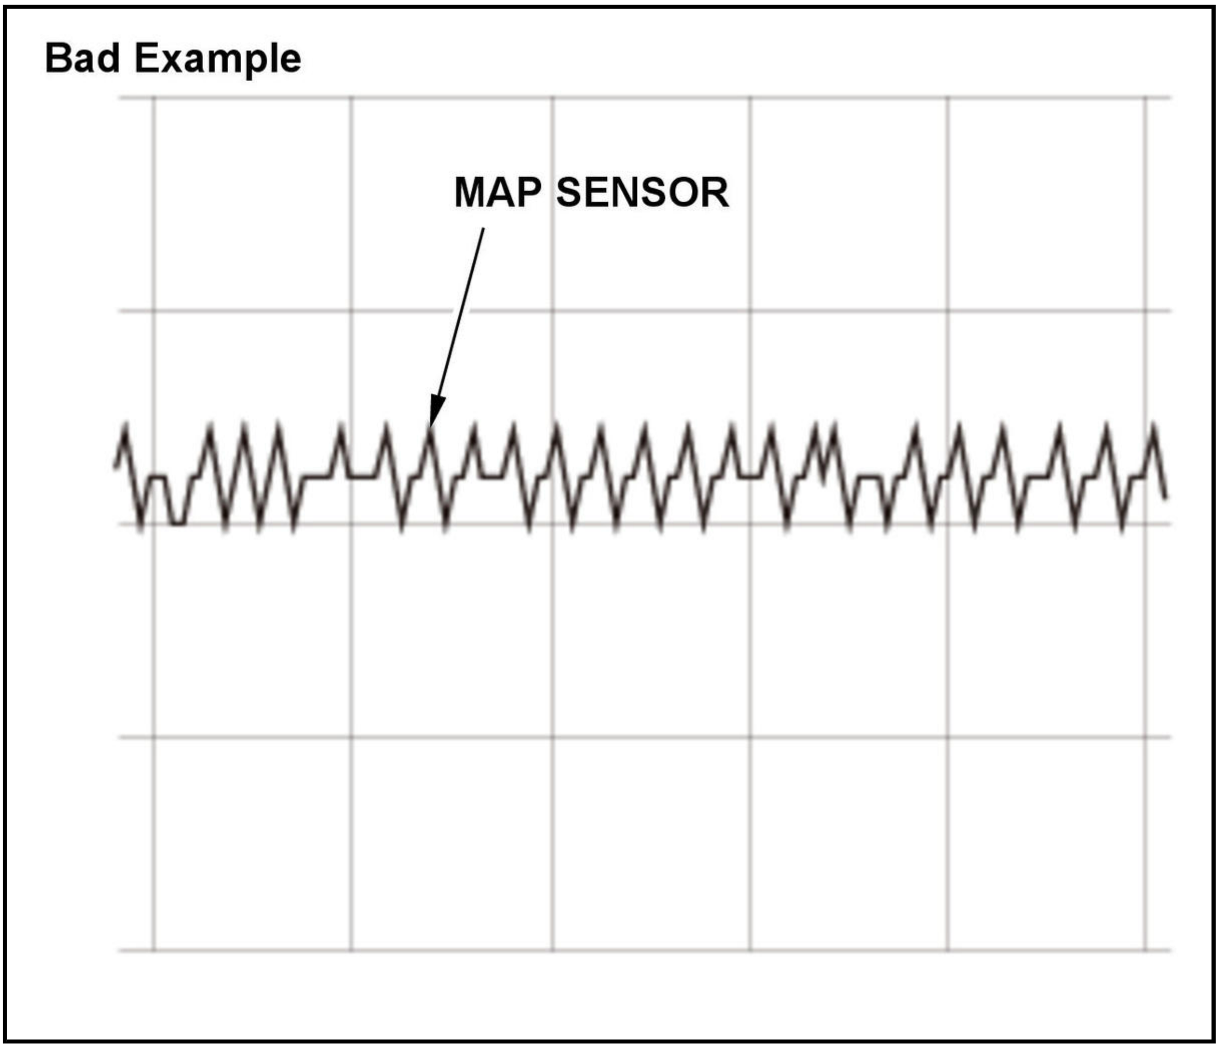
 -3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

 -4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 50.

NO

The intake manifold vacuum fluctuation is OK. Go to step 53.

50. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg. F (38 deg. C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 51.

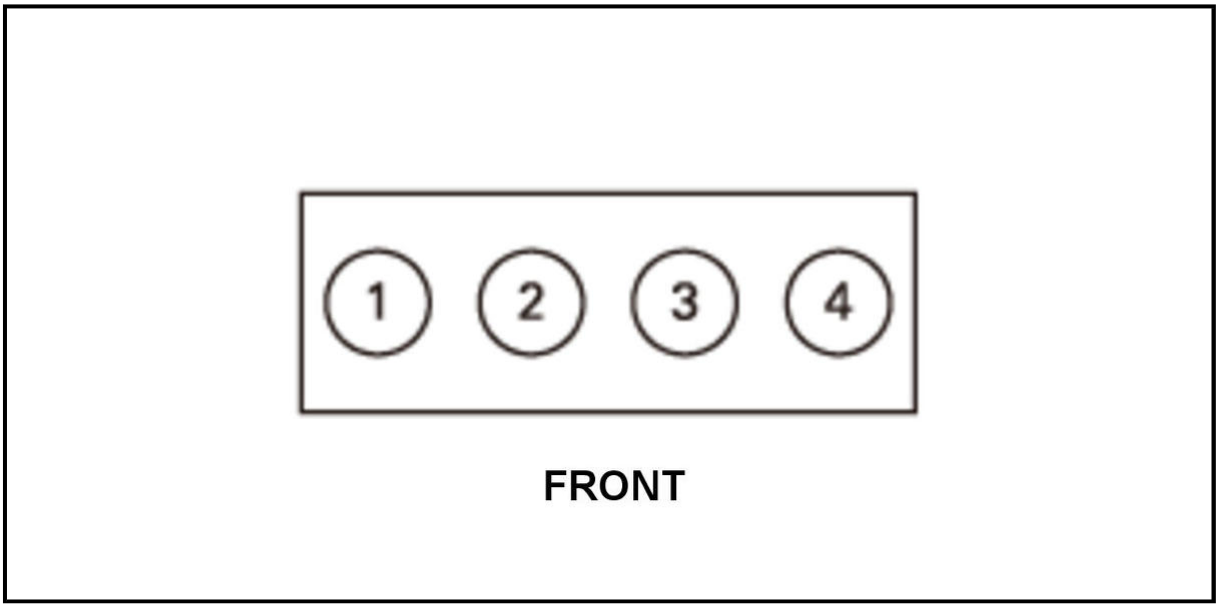
NO

The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

51. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

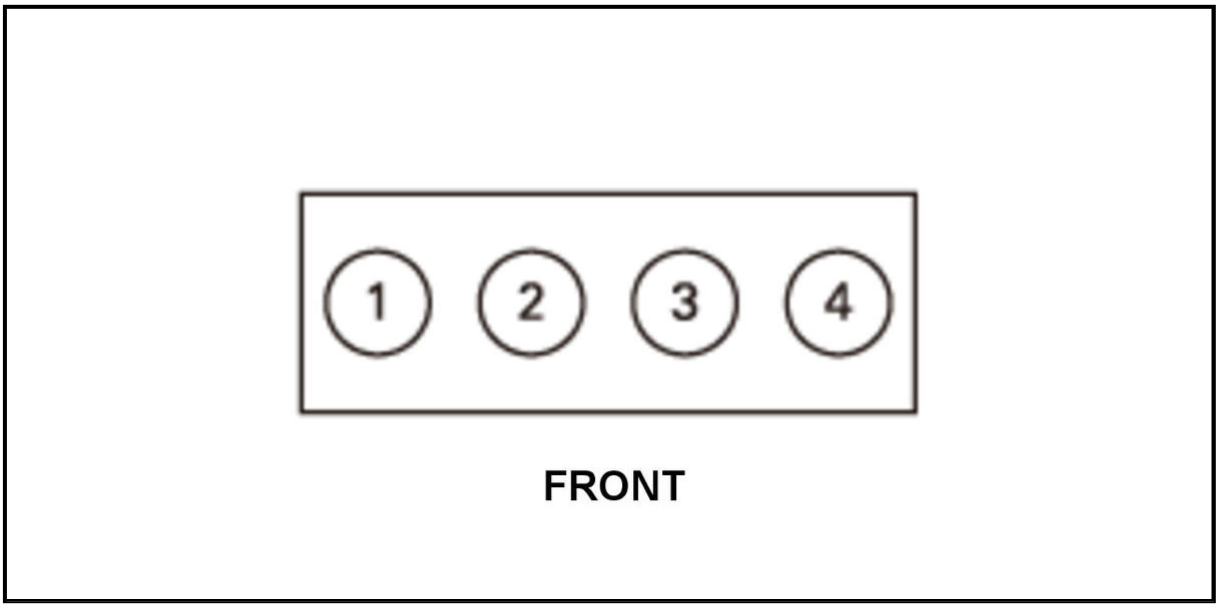
   NO

   The engine compression and the cylinder leakage are normal. Go to step 52.

52. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 53.

53. Check Fuel Pressure

-1. **Relieve the fuel pressure** .

-2. **Attach the fuel pressure gauge set and the fuel pressure gauge** .

-3. Locate and record the fuel pressure specification for your vehicle.

Minimum Pressure (kPa)	Maximum Pressure (kPa)
B	B

-4. Start the engine, and record the fuel pressure under the conditions the misfire was duplicated.

Fuel Pressure (kPa)
B

Is the fuel pressure within specifications?

YES

The fuel pressure is OK. Go to step 54.

NO

Check for pinched or damaged fuel lines. If OK, **replace the fuel tank unit** .

54. Check Fuel Contamination

-1. **Remove the fuel tank unit** .

-2. Inspect for evidence of fuel contamination such as diesel fuel, water, rust, or debris.

NOTE: If the misfire occurred shortly after refueling, the likely cause is poor fuel quality. The MIL DIST (MIL distance) value in the DATA LIST, along with the fuel level, can help you make this determination. Incorrect or contaminated fuel typically affects multiple cylinders. But a problem such as water in the fuel can cause a single cylinder misfire that occurs randomly.

Is there evidence of fuel contamination?

YES

Replace the fuel filter and then drain/refill the fuel tank with known-good fuel.

NO

The fuel system has no signs of fuel contamination. Go to step 55.

55. Check MAF Sensor g/s

-1. Locate and record the MAF SENSOR g/s specification for your vehicle. This can be found in troubleshooting procedure for DTC P0171.

Minimum g/s	Maximum g/s	Specified RPM
B	B	B

Ensure the vehicle meets these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 176 deg. F (80 deg. C)
- Transmission in P or N
- All electrical loads off

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-3. Monitor the ENGINE SPEED in the DATA LIST with the HDS. Raise and hold the engine speed steady at the specified rpm.

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B

-4. While holding the rpm steady, check the MAF SENSOR in the DATA LIST.

Signal	Current conditions	
	Values	Unit
MAF SENSOR	B	B

Is the MAF Sensor g/s value within specifications?

YES

The MAF sensor is reading correctly. **Replace all fuel injectors as a set** .

NO

The MAF sensor is not reading correctly. **Replace MAF sensor/IAT sensor 1** .

56. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 57.

57. Inspect Ignition Coil

-1. Inspect the ignition coil and the spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and the spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 58.

58. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and the spark plug are OK. Go to step 60.

NO

There is a failure in the ignition coil or the spark plug. Go to step 59.

59. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

60. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 61.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

61. CKP Pattern Clear/Pattern Learn

-1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

-2. **Select CRANK PATTERN CLEAR, and clear the CKP pattern** .

CRANK PATTERN CLEAR

Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

62. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 63.

63. Check Fuel Pressure

-1. **Relieve the fuel pressure** .

-2. **Attach the fuel pressure gauge set and the fuel pressure gauge** .

-3. Locate and record the fuel pressure specification for your vehicle.

Minimum Pressure (kPa)	Maximum Pressure (kPa)
B	B

-4. Start the engine, and record the fuel pressure under the conditions the misfire was duplicated.

Fuel Pressure (kPa)
B

Is the fuel pressure within specifications?

YES

The fuel pressure is OK. Go to step 64.

NO

Check for pinched or damaged fuel lines. If OK, **replace the fuel tank unit** .

64. Check Fuel Contamination

-1. **Remove the fuel tank unit** .

-2. Inspect for evidence of fuel contamination such as diesel fuel, water, rust, or debris.

NOTE: If the misfire occurred shortly after refueling, the likely cause is poor fuel quality. The MIL DIST (MIL distance) value in the DATA LIST, along with the fuel level, can help you make this determination. Incorrect or contaminated fuel typically affects multiple cylinders. But a problem such as water in the fuel can cause a single cylinder misfire that occurs randomly.

Is there evidence of fuel contamination?

YES

Replace the fuel filter and then drain/refill the fuel tank with a known-good fuel.

NO

The fuel system has no signs of fuel contamination. Go to step 65.

65. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 66.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

66. Check for Exhaust Restrictions

-1. Reinstall all removed parts, and reconnect all connectors.

-2. Record the MAP SENSOR value while the engine is off.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

-3. Start the engine, and monitor the ENGINE SPEED and MAP SENSOR in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B
ENGINE SPEED	B	B

-4. Raise the engine speed to 3, 500 rpm and hold the throttle steady.

Does the MAP SENSOR read near atmospheric pressure (engine off value)?

YES

There is a restriction in the exhaust system. Check for catalyst damage and repair as necessary.

NO

Go to step 67.

67. CKP Pattern Clear/Pattern Learn

-1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

-2. **Select CRANK PATTERN CLEAR, and clear the CKP pattern** .

CRANK PATTERN CLEAR

Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

68. Check MAP Sensor Fluctuation

-1. Start the engine, and let it idle until the cooling fans cycle twice.

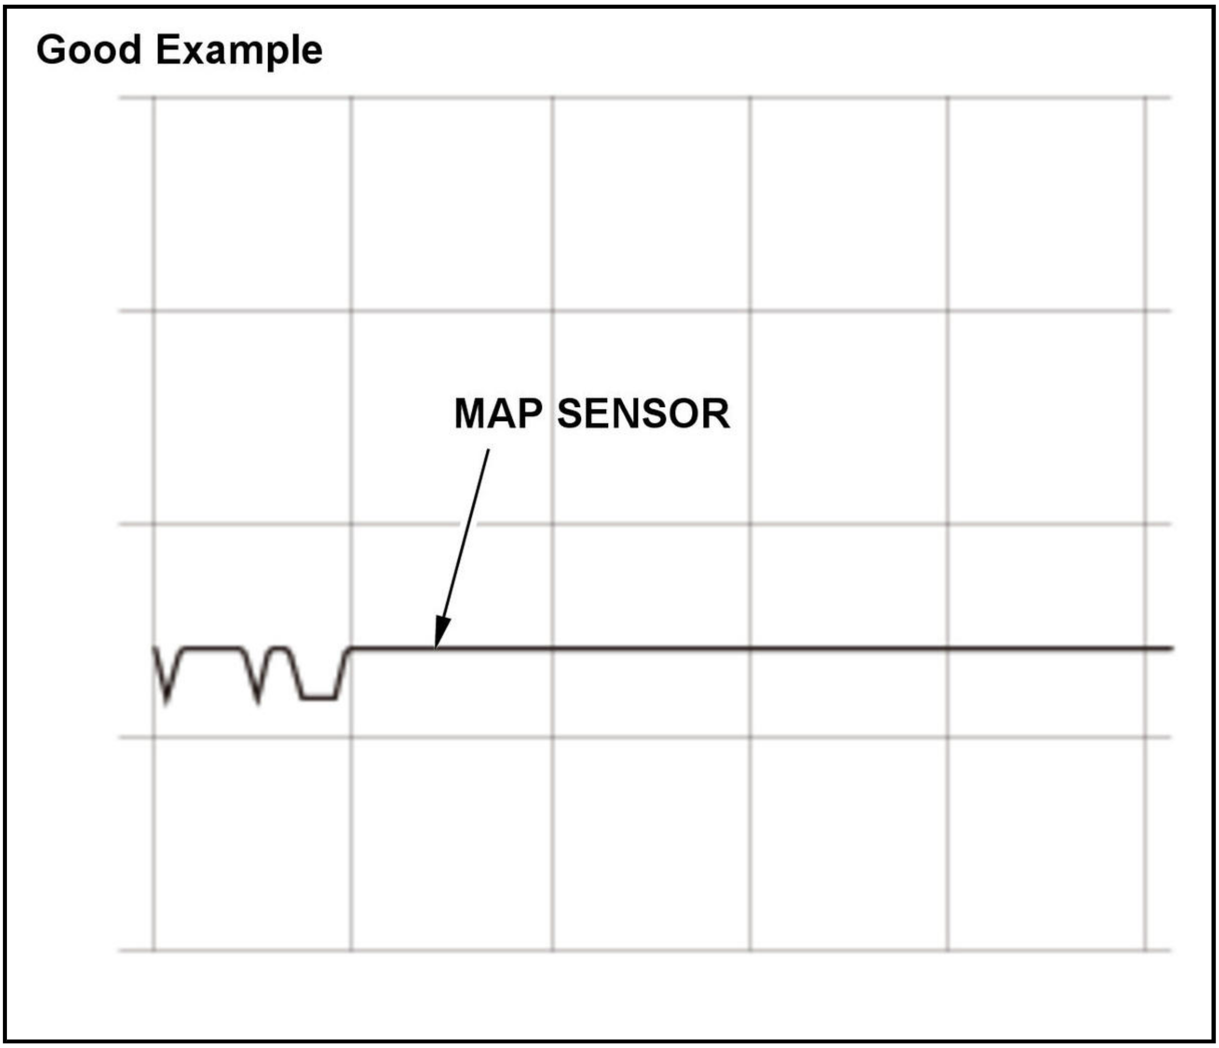
-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

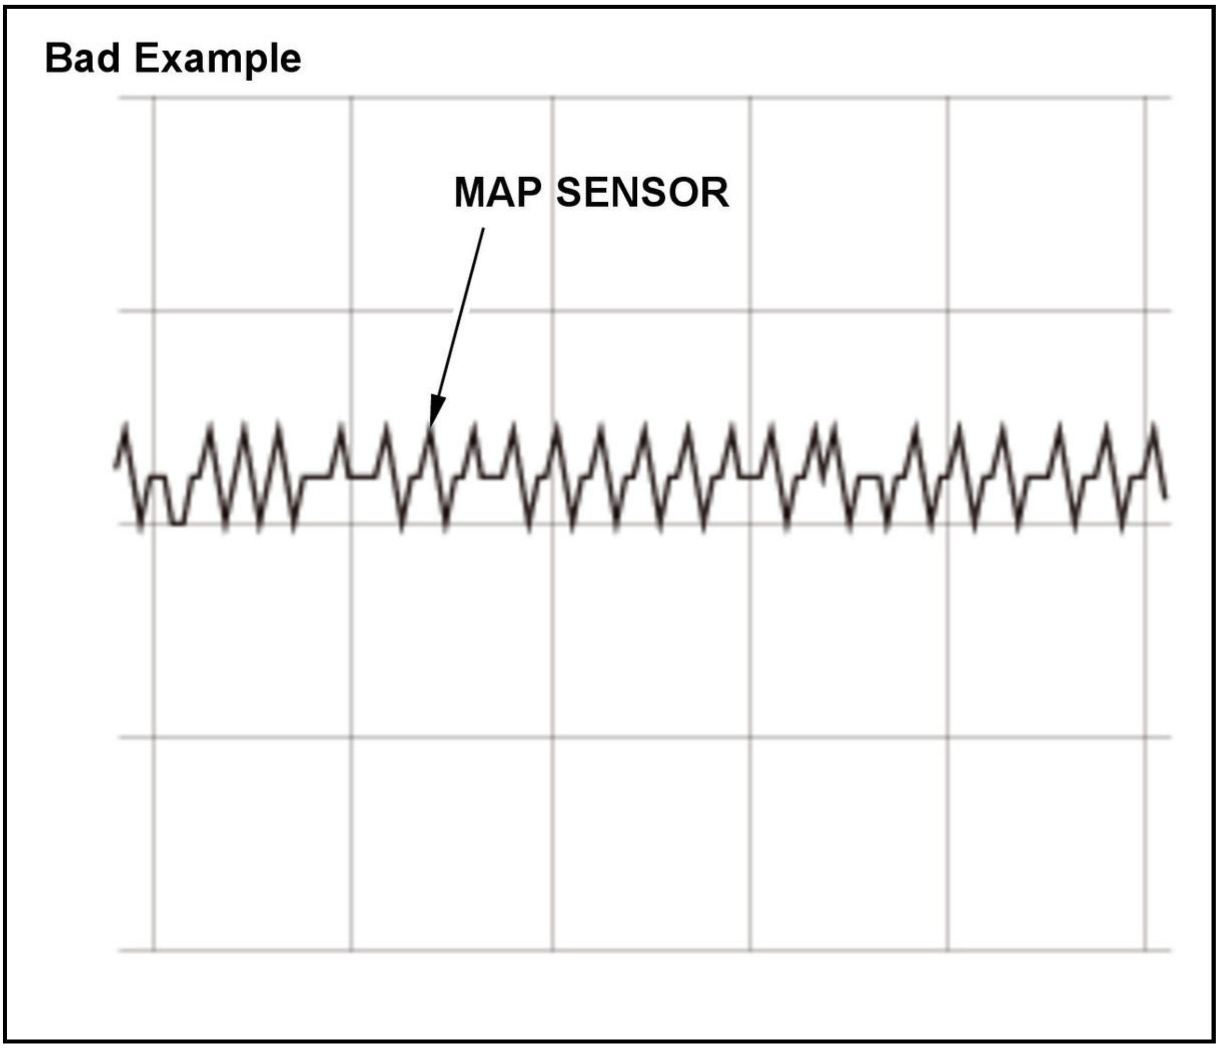
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 69.

NO

The intake manifold vacuum fluctuation is OK. Go to step 72.

69. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg. F (38 deg. C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 70.

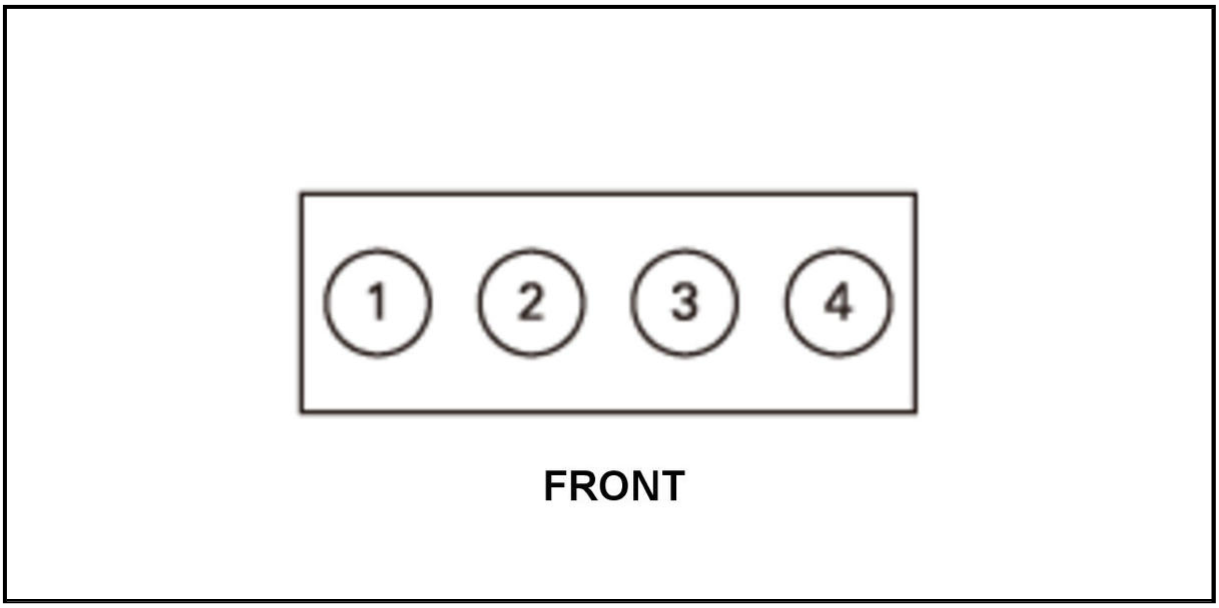
NO

The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

70. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

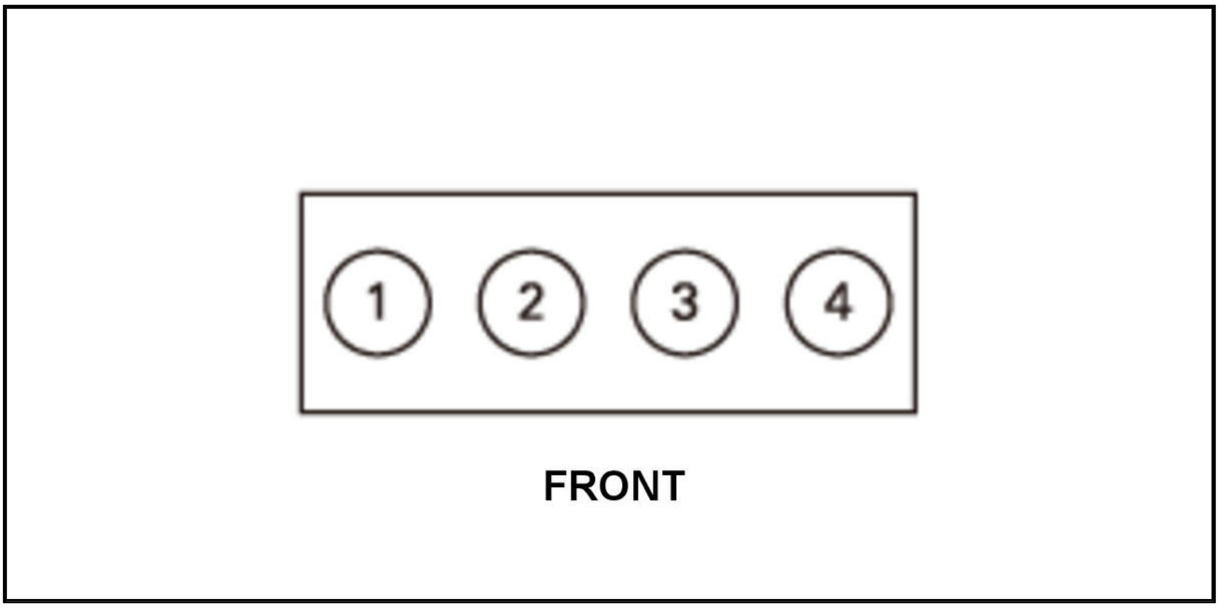
   NO

   The engine compression and the cylinder leakage are normal. Go to step 71.

71. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B

B	Leakage (%)	Leakage Area
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

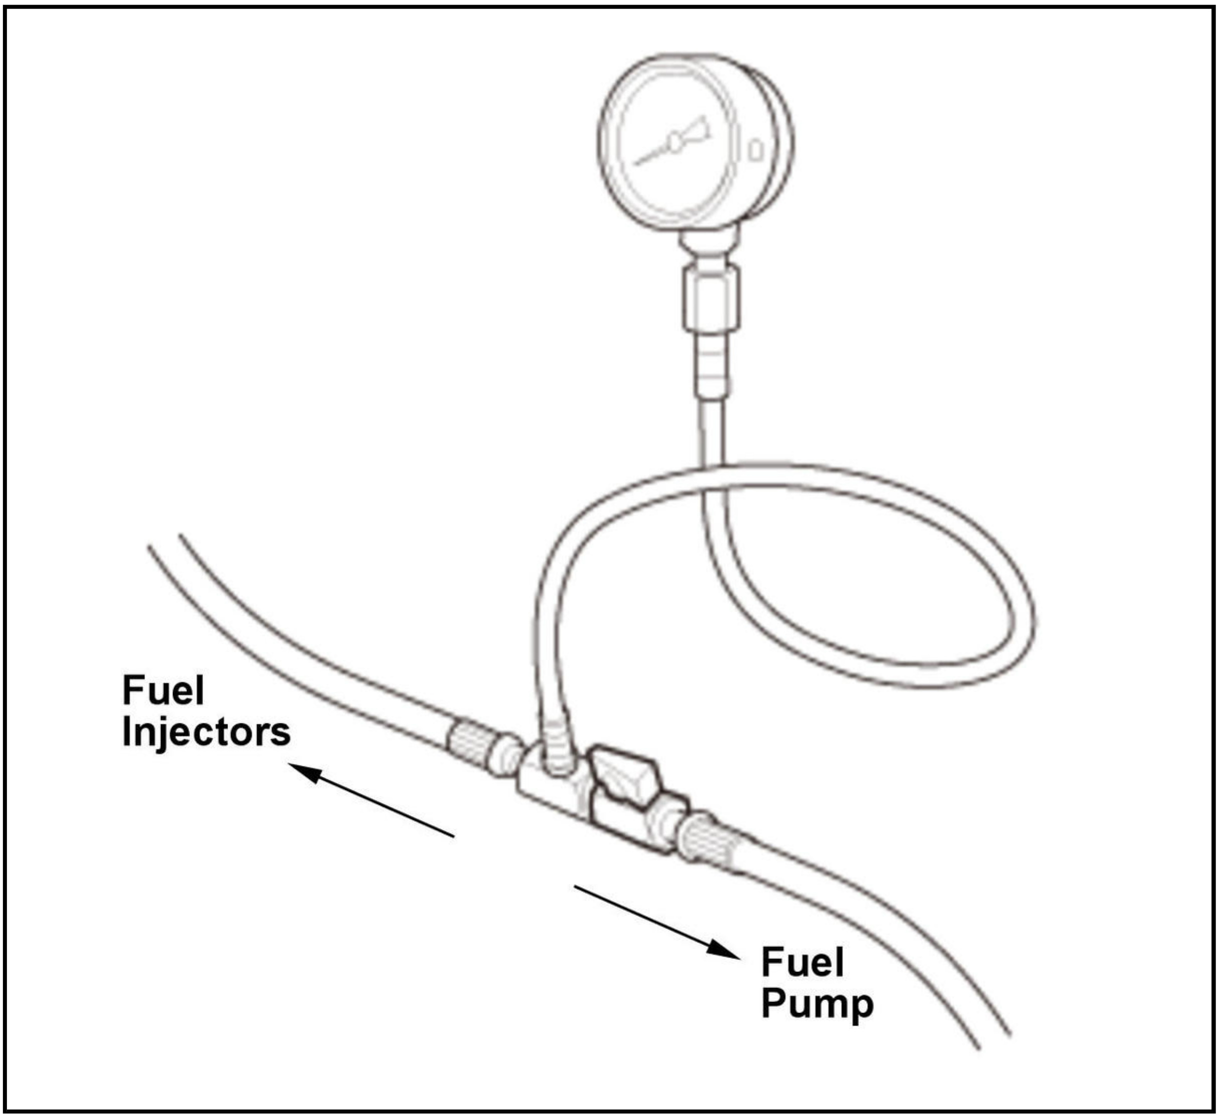
NO

The cylinders are sealing properly. Go to step 72.

72. Check Fuel Injector Leak Down

-1. **Connect the fuel pressure gauge set** .

-2. Ensure that the fuel shut off valve is on the fuel pump side of the pressure gauge.



-3. Start the engine, and then shut it off.

-4. Turn the shut off valve 90 deg. to isolate the pressure between the fuel injectors and the fuel pressure gauge.

-5. Record the initial fuel pressure reading.

-6. Let the vehicle sit for 10 minutes.

-7. Check the fuel pressure.

Does the pressure drop more than 10 PSI within 10 minutes?

YES

The fuel injectors are leaking. **Replace all fuel injectors as a set** .

NO

Go to step 73.

73. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 74.

74. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and the spark plug are OK. Go to step 76.

NO

There is a failure in the ignition coil or the spark plug. Go to step 75.

75. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

76. Engine Carbon Removal

-1. Perform a top engine cleaning following the product manufacturer's instructions.

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay?

YES

The carbon removal procedure did not correct the misfire. **Replace all fuel injectors as a set** .

NO

The carbon removal procedure corrected the misfire.

DTC P0300, P0301, P0302, P0303, P0304 (2.4 L ENGINE) (2017 2018 2019)

DTC P0300 : Random Misfire Detected **DTC P0301** : No. 1 Cylinder Misfire Detected **DTC P0302** : No. 2 Cylinder Misfire Detected **DTC P0303** : No. 3 Cylinder Misfire Detected **DTC P0304** : No. 4 Cylinder Misfire Detected

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the misfire is frequent enough to trigger detection of increased emissions during two consecutive driving cycles, the MIL will come on, and DTC P0300 (and some combination of P0301 through P0304) will be stored.
- If the misfire is frequent enough to damage the catalyst, the MIL will flash whenever the misfire occurs, and DTC P0300 (and some combination of P0301 through P0304) will be stored. When the misfire stops, the MIL will remain on.
- Troubleshoot the following DTCs first, if any of them were stored along with the random misfire DTC (s) (Because parts can sometimes fail without setting DTC's you should also do a physical inspection of the systems listed below):

  P0087, P0088: Fuel rail pressure sensor

  P0102, P0103: MAF sensor

  P0107, P0108, P2073, P2074: MAP sensor

  P0171, P0172: Fuel system

  P0335, P0339: CKP sensor

  P0340, P0344: CMP sensor A

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

P0506, P0507: Idle control system

P2646, P2647, P2648, P2649: VTEC system

P2623: High pressure fuel pump

DTC Description	Confirmed DTC	Pending DTC
P0300 Random Misfire Detected	B	B
P0301 No. 1 Cylinder Misfire Detected	B	B
P0302 No. 2 Cylinder Misfire Detected	B	B
P0303 No. 3 Cylinder Misfire Detected	B	B
P0304 No. 4 Cylinder Misfire Detected	B	B

DTC (PGM-FI)

1. Problem verification - Idle

-1. Record the ONBOARD SNAPSHOT with the HDS.

-2. Start the engine, and let it idle.

-3. Monitor these parameters in the DATA LIST:

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Are the misfire counts increasing on any cylinder at idle?

YES

The engine is misfiring at idle, go to step 2.

NO

The engine does not misfire at idle, go to step 3.

2. Determine Affected Cylinders

-1. Continue to monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Are the misfire counts generally isolated to a single cylinder?

1. **YES**

   The misfire is isolated to a single cylinder.

- If the misfire counts are increasing every engine revolution (completely inactive cylinder), go to Single Cylinder Continuous Misfire at Idle troubleshooting on step 6.
- If the misfire counts are increasing every few engine revolutions (partially inactive cylinder), go to Single Cylinder Non-Continuous Misfire at Idle troubleshooting on step 21.

NO

The misfire affects multiple cylinders.

- If the misfire counts are increasing every engine revolution (completely inactive cylinder), go to Multiple Cylinder Continuous Misfire at Idle troubleshooting on step 30.
- If the misfire counts are increasing every few engine revolutions (partially inactive cylinder), go to Multiple Cylinder Non-Continuous Misfire at Idle troubleshooting on step 48.

3. Problem verification - Static Load

-1. Increase the engine speed to 3, 500 rpm.

-2. Hold the engine speed steady, and monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Are the misfire counts increasing on any cylinder?

YES

The engine is misfiring under load. Go to step 4.

NO

The engine does not misfire under a static load. Go to step 5.

4. Determine Affected Cylinders

-1. Continue to monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B

Signal	Current conditions	
	Values	Unit
CYL4 MISFIRE	B	B

Are misfire counts generally isolated to a single cylinder?

YES

The misfire is isolated to a single cylinder, go to Single Cylinder Misfire. Under Load troubleshooting on step 56.

NO

The misfire affects multiple cylinders, go to Multiple Cylinder Misfire. Under Load troubleshooting on step 63.

5. Problem verification - On-board Snapshot

-1. Open the ONBOARD SNAPSHOT with the HDS.

-2. Scroll through the snapshot, and find when the MISFIRE value begins to increase.

-3. Record the value of these parameters as the MISFIRE value increases:

Signal	Values	Unit
ECT SENSOR 1	B	deg. F
ENGINE SPEED	B	RPM
VEHICLE SPEED	B	MPH
MAP SENSOR	B	V
TP SENSOR	B	V

On-board Snapshot

-4. Drive the vehicle according to the conditions you identified above while monitoring the misfire counts.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
MAP SENSOR	B	B
TP SENSOR	B	B

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Are the misfire counts increasing on any cylinder?

YES

The engine is misfiring under the specific operating conditions above.

- If the misfire occurred when the engine was cold, go to Misfire When Cold troubleshooting on step 70.
- If the misfire occurred when the engine was loaded, go to step 4.

NO

Intermittent failure; the engine is not misfiring at this time.**NOTE:** If the misfire cannot be reproduced, there is a possibility that the problem may have been caused by poor quality fuel. The problem may have disappeared after refueling with fresh fuel. The MIL DIST (MIL Distance) value in the Data List in combination with the fuel level may help you make this determination.

6. Check Ignition Coil Spark

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the ignition coil from the problem cylinder** .

-3. Connect a commercially available spark tester between the ignition coil and engine ground.

-4. Start the engine with the ignition coil connected.

Does the ignition coil produce a spark?

YES

The ignition coil wiring is OK. Go to step 14.

NO

There is a problem with the ignition coil, or the ignition coil circuit. Go to step 7.

7. Ignition Coil Check

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Connect a commercially available spark tester between the ignition coil and engine ground.

-3. Start the engine with the ignition coil connected.

Does the ignition coil produce a spark?

YES

The ignition coil has a failure. **Replace the ignition coil** .

NO

There is a problem with the ignition coil circuit. Go to step 8.

8. Check Ignition Coil Power and Ground

-1. Disconnect the ignition coil 3P connector from the problem cylinder.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between ignition coil 3P connector terminals No. 1 (power) and No. 2 (ground).

NOTE: After the vehicle is turned to the OFF (LOCK) mode, this circuit may still show battery voltage for a period of time. This is normal.

Is there battery voltage between the ignition coil power terminal and engine ground?

YES

The power circuit is OK. Repair the open circuit between the ignition coil (3P connector terminal No. 2) and G101.

NO

Repair the open circuit between the ignition coil and the ignition coil relay.

14. Inspect Ignition Coil

-1. Inspect the ignition coil and spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and spark plug tube. Replace the spark plug tube seals in the cylinder head cover .

NO

Go to step 15.

15. Exchange Spark Plug and Ignition Coil

-1. Exchange the spark plug and the ignition coil with one from a normally operating cylinder .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 17.

NO

There is a failure in the ignition coil or the spark plug. Go to step 16.

16. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

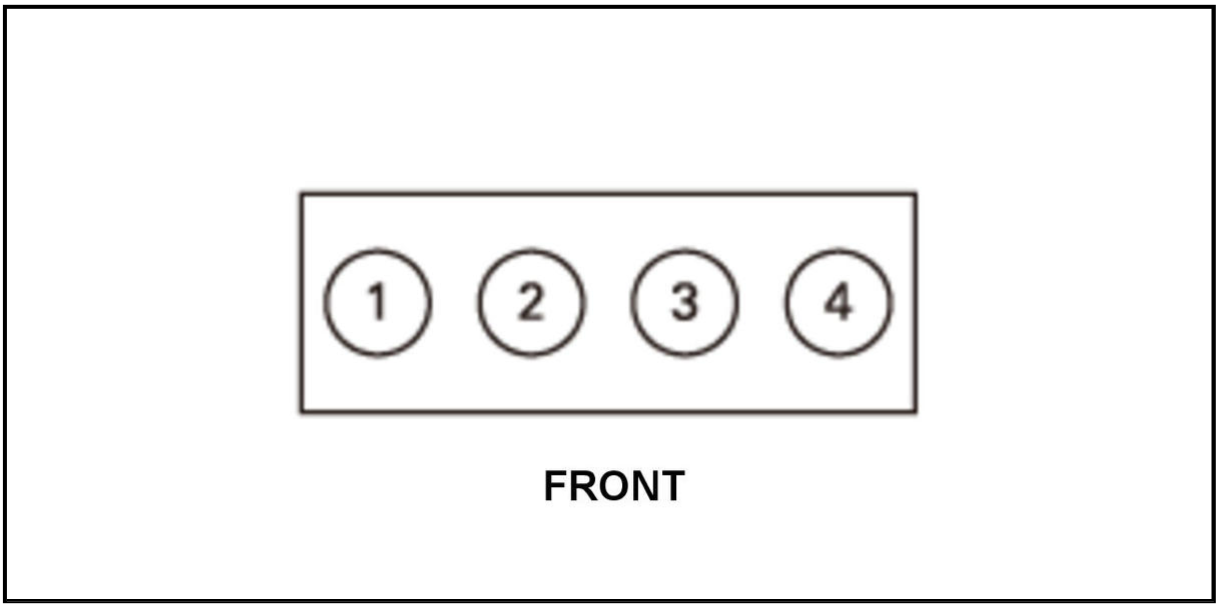
NO

The ignition coil has a failure. **Replace the ignition coil** .

17. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

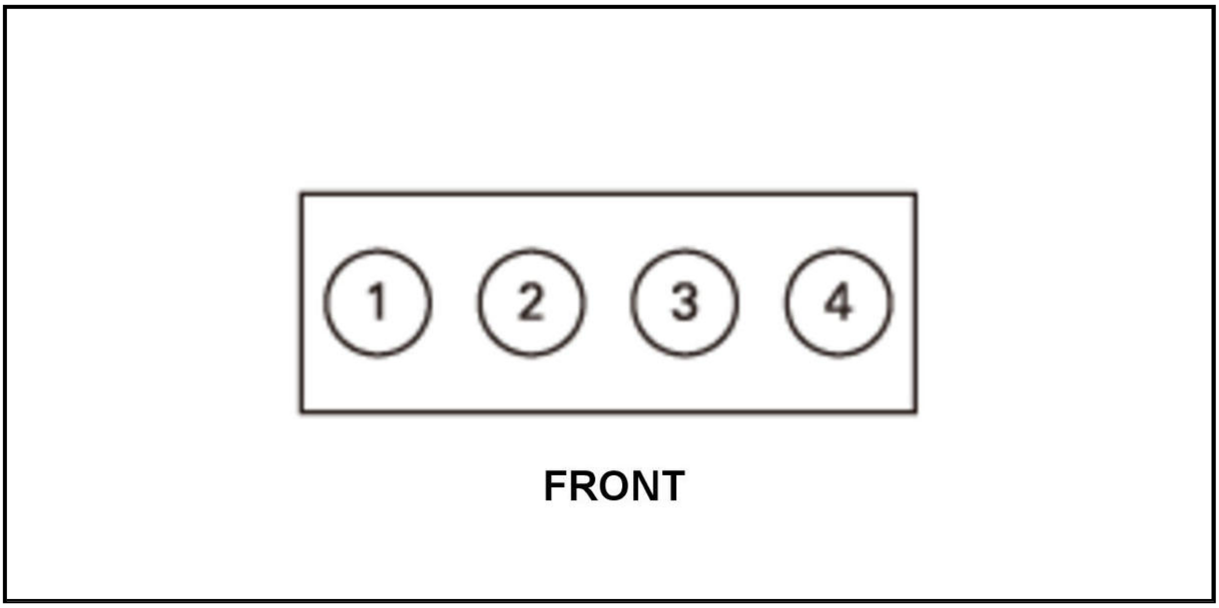
   NO

   The engine compression and the cylinder leakage are normal. Go to step 18.

18. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust valve clearance to specification (cold), then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 19.

19. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B

Signal	Current conditions	
	Values	Unit
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 20.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

20. CKP Pattern Clear/Pattern Learn

-1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

-2. **Select CRANK PATTERN CLEAR, and clear the CKP pattern** .

CRANK PATTERN CLEAR

Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

21. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 22.

22. Inspect Ignition Coil

-1. Inspect the ignition coil and the spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and the spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 23.

23. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 25.

NO

There is a failure in the ignition coil or the spark plug. Go to step 24.

24. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

25. Check MAP Sensor Fluctuation

-1. Start the engine, and let it idle until the cooling fans cycle twice.

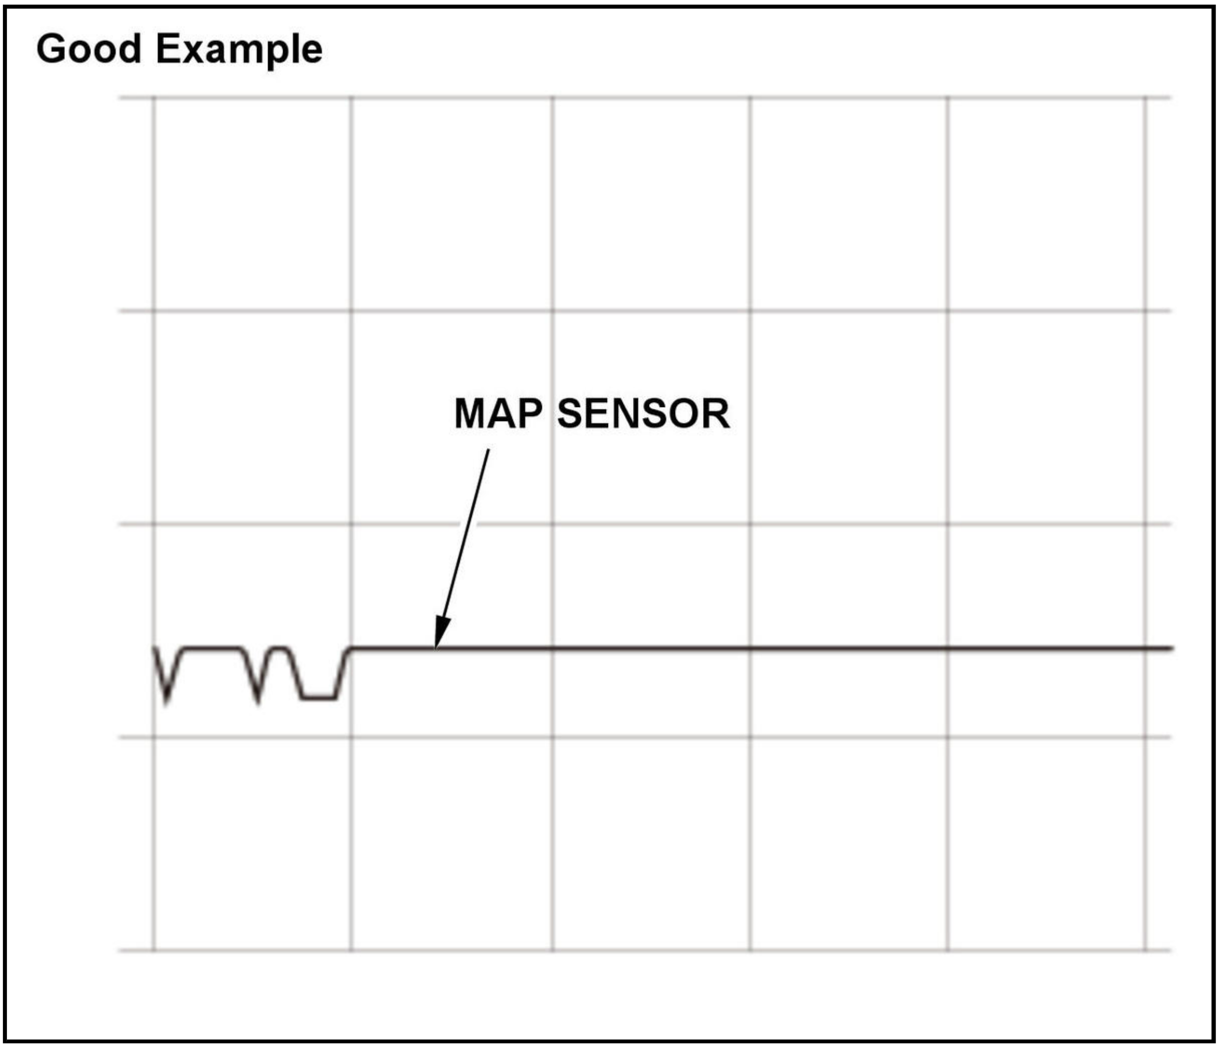
-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

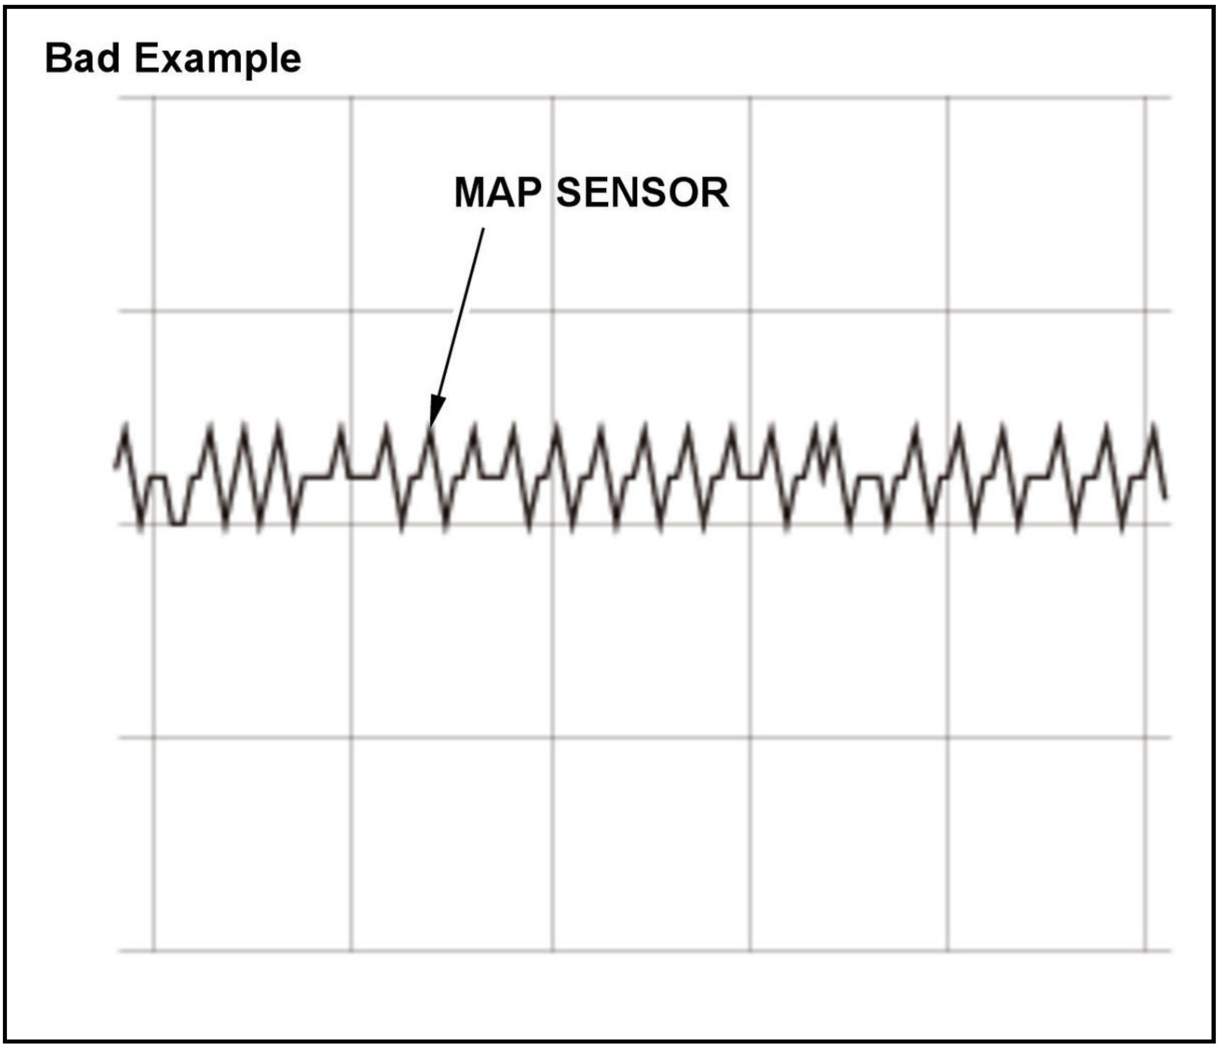
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 26.

NO

The intake manifold vacuum fluctuation is OK. Go to step 29.

26. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg. F (38 deg. C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 27.

NO

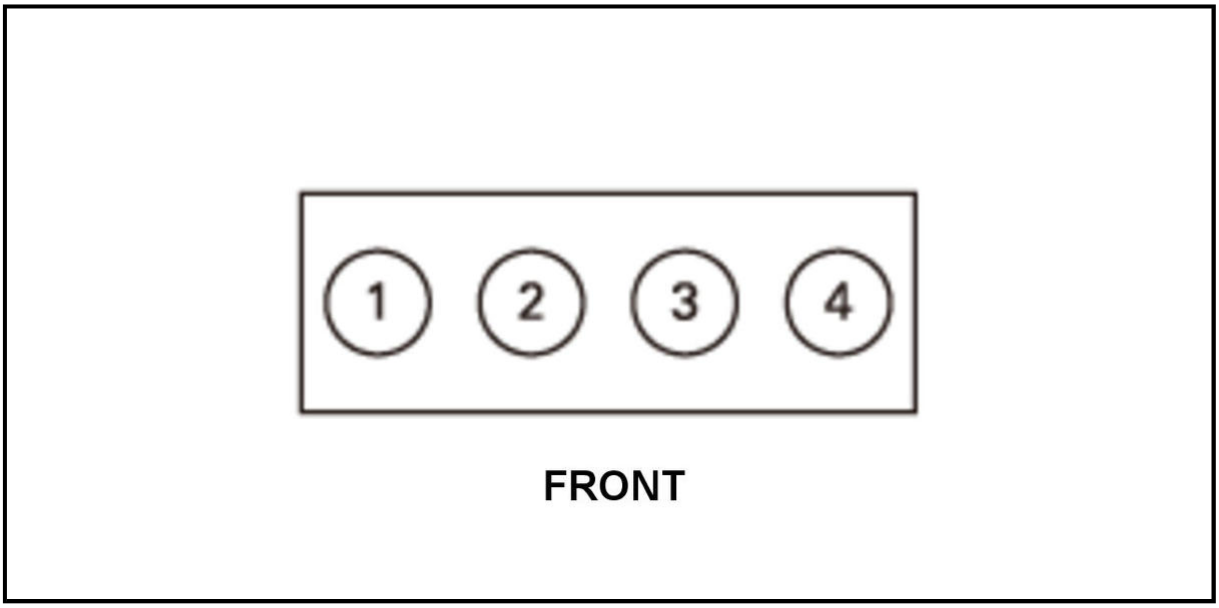
The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

27. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

   NO

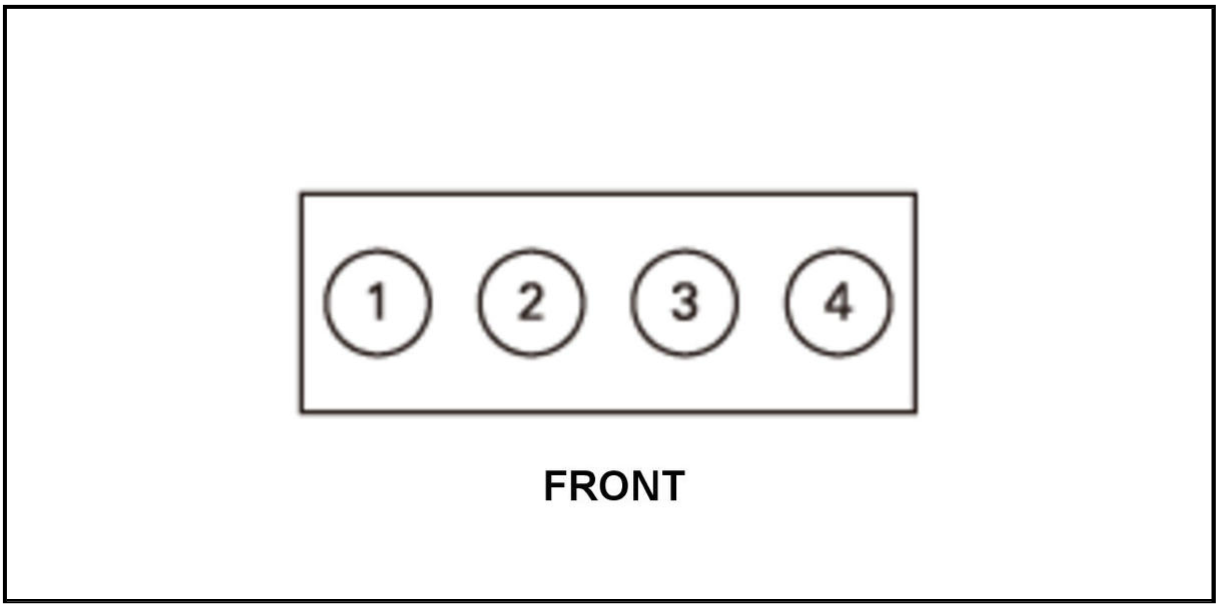
   The engine compression and the cylinder leakage are normal. Go to step 28.

28. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 29.

29. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. All of the failures have been checked for this type of misfire. Go to step 1 in the Problem verification procedure and ensure you selected the correct troubleshooting procedure.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

30. Inspect Spark Plug

    -1. **Remove the spark plug from the problem cylinder** .

    -2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

    Does the spark plug show any signs of failure or is it not the correct part number?

    YES

    Replace the spark plug .

    NO

    Go to step 31.

31. Check Ignition Coil Spark

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. **Remove the ignition coil from the problem cylinder** .

    -3. Connect a commercially available spark tester between the ignition coil and engine ground.

    -4. Start the engine with the ignition coil connected.

    Does the ignition coil produce a spark?

    YES

    The ignition coil wiring is OK. Go to step 39.

    NO

    There is a problem with the ignition coil, or the Ignition coil circuit. Go to step 32.

32. Exchange Ignition Coil

    -1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

    -2. Connect a commercially available spark tester between the ignition coil and engine ground.

    -3. Start the engine with the ignition coil connected.

    Does the ignition coil produce a spark?

    YES

    The ignition coil has a failure. **Replace the ignition coil** .

    NO

    There is a problem with the ignition coil circuit. Go to step 33.

33. Check Ignition Coil Power and Ground

    -1. Disconnect the ignition coil 3P connector from the problem cylinder.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between ignition coil 3P connector terminals No. 1 (power) and No. 2 (ground).

NOTE: After the vehicle is turned to the OFF (LOCK) mode, this circuit may still show battery voltage for a period of time. This is normal.

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the PCM connectors.

-4. Check for continuity between the ignition coil control terminal at the PCM connector and at the ignition coil 3P connector terminal No. 3.

Is there continuity?

YES

The ignition coil control circuit is not open. Go to step 37.

NO

Repair the open circuit between the ignition coil and the PCM.

37. Check Ignition Coil Control Short to Ground

-1. Check for continuity between ignition coil control terminal at the ignition coil 3P connector terminal No. 3 (Ignition Control) and body ground.

G101

Is there battery voltage between the ignition coil power terminal and engine ground?

YES

The power circuit is OK. Repair the open circuit between the ignition coil (3P connector terminal No. 2) and G101.

NO

Repair the open circuit between the ignition coil and the ignition coil relay.

39. Inspect Ignition Coil

-1. Inspect the ignition coil and spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 40.

40. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with one from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 42.

NO

There is a failure in the ignition coil or the spark plug. Go to step 41.

41. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

42. Check MAP Sensor Fluctuation

-1. Start the engine, and let it idle until the cooling fans cycle twice.

-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

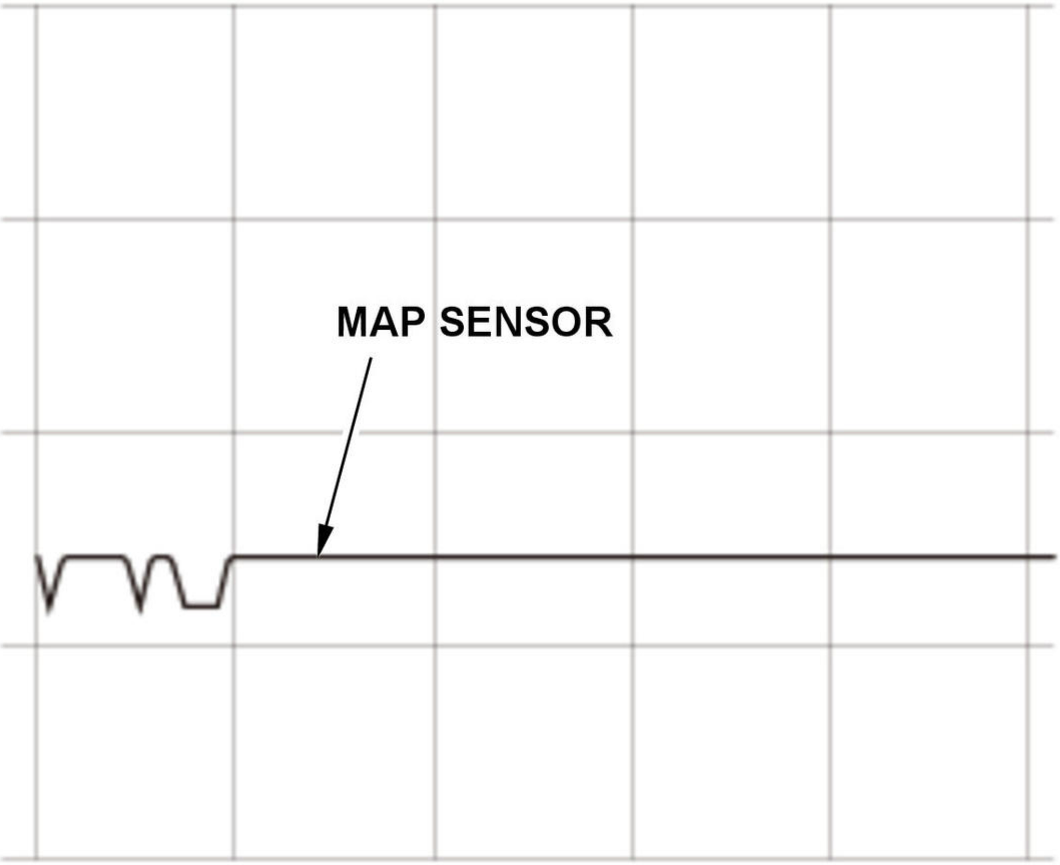
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

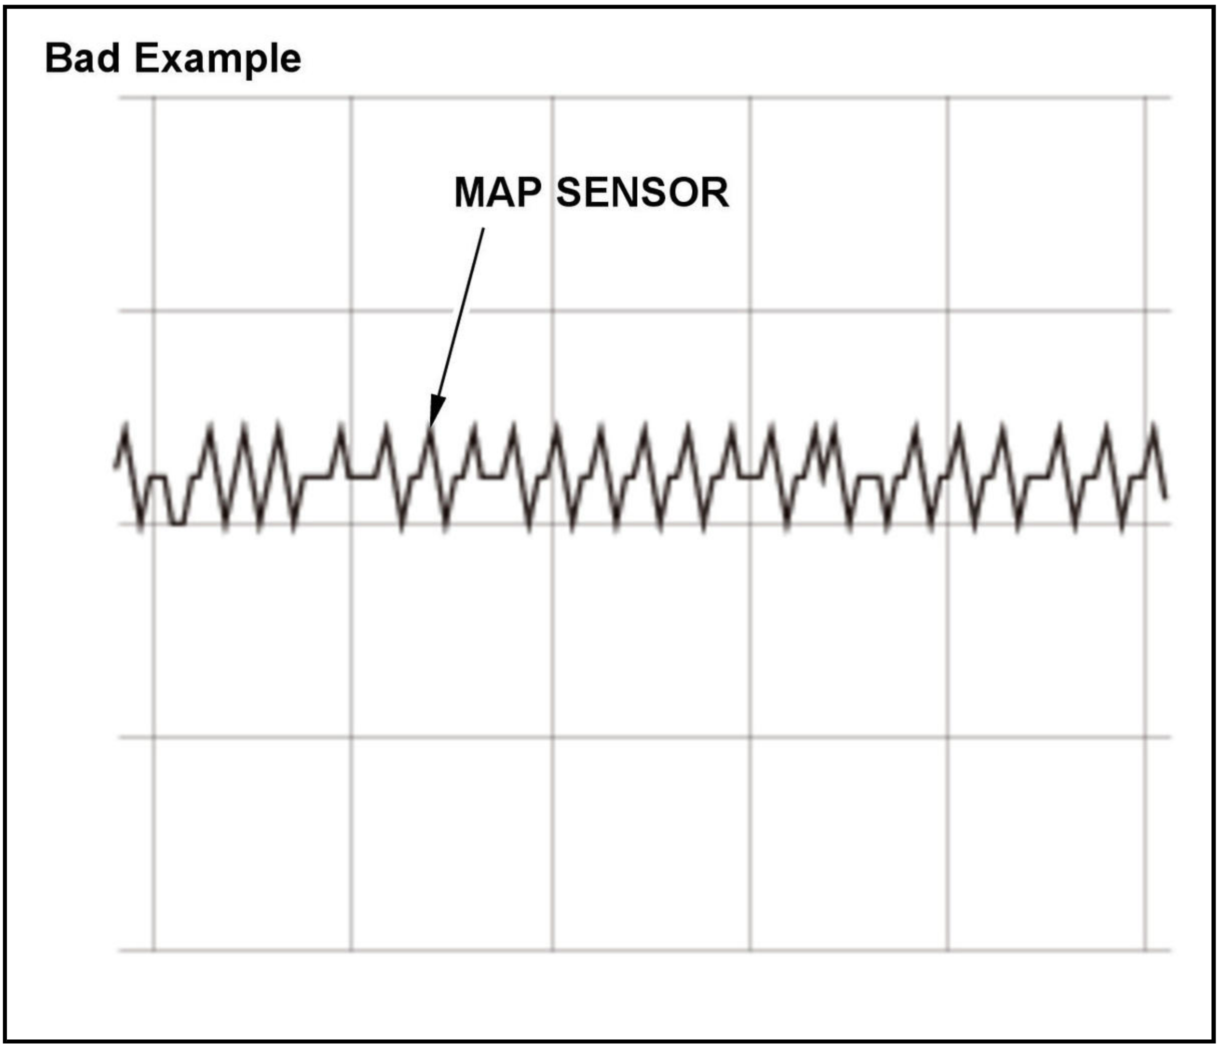
-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.

Good Example





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 43.

NO

The intake manifold vacuum fluctuation is OK. Go to step 46.

43. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg. F (38 deg. C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 44.

NO

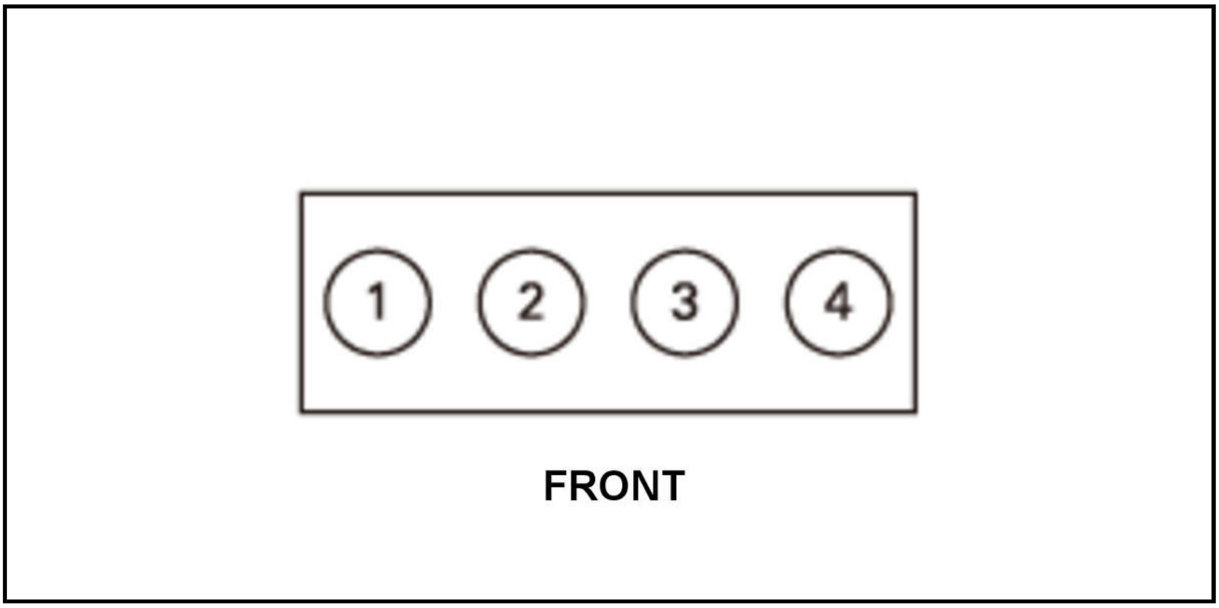
The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

44. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

   NO

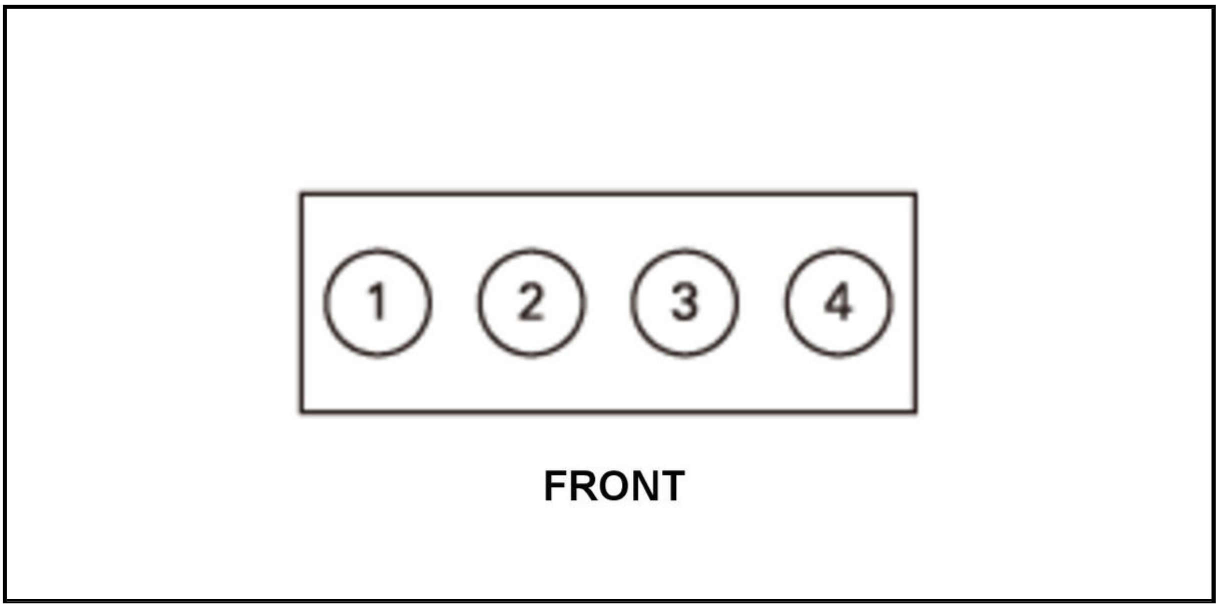
   The engine compression and the cylinder leakage are normal. Go to step 45.

45. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 46.

46. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 47.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

47. CKP Pattern Clear/Pattern Learn

-1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

-2. **Select CRANK PATTERN CLEAR, and clear the CKP pattern** .

CRANK PATTERN CLEAR

Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

48. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 49.

49. Check MAP Sensor Fluctuation

-1. Start the engine, and let it idle until the cooling fans cycle twice.

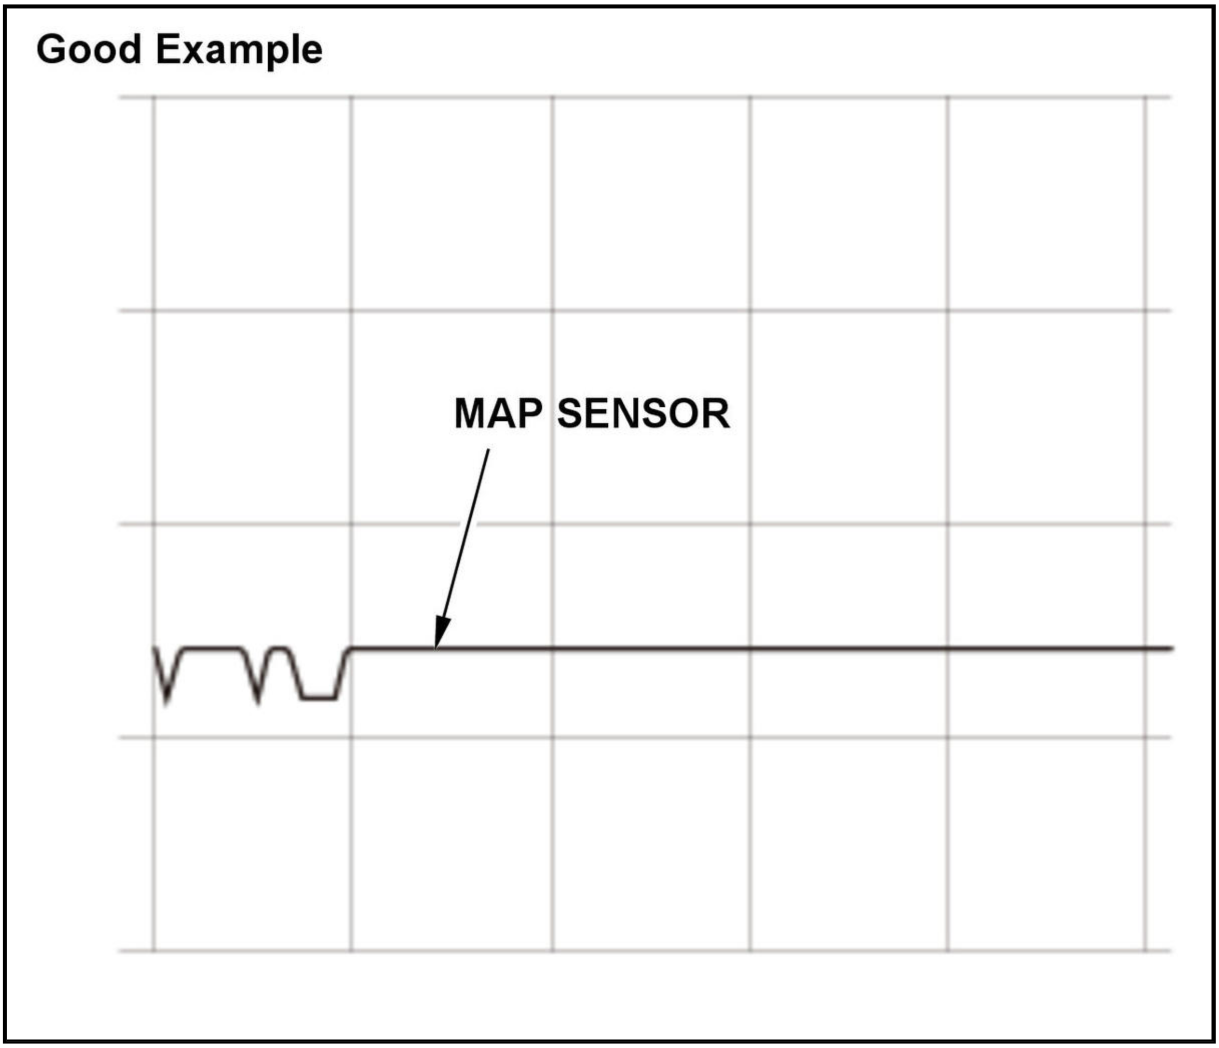
-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

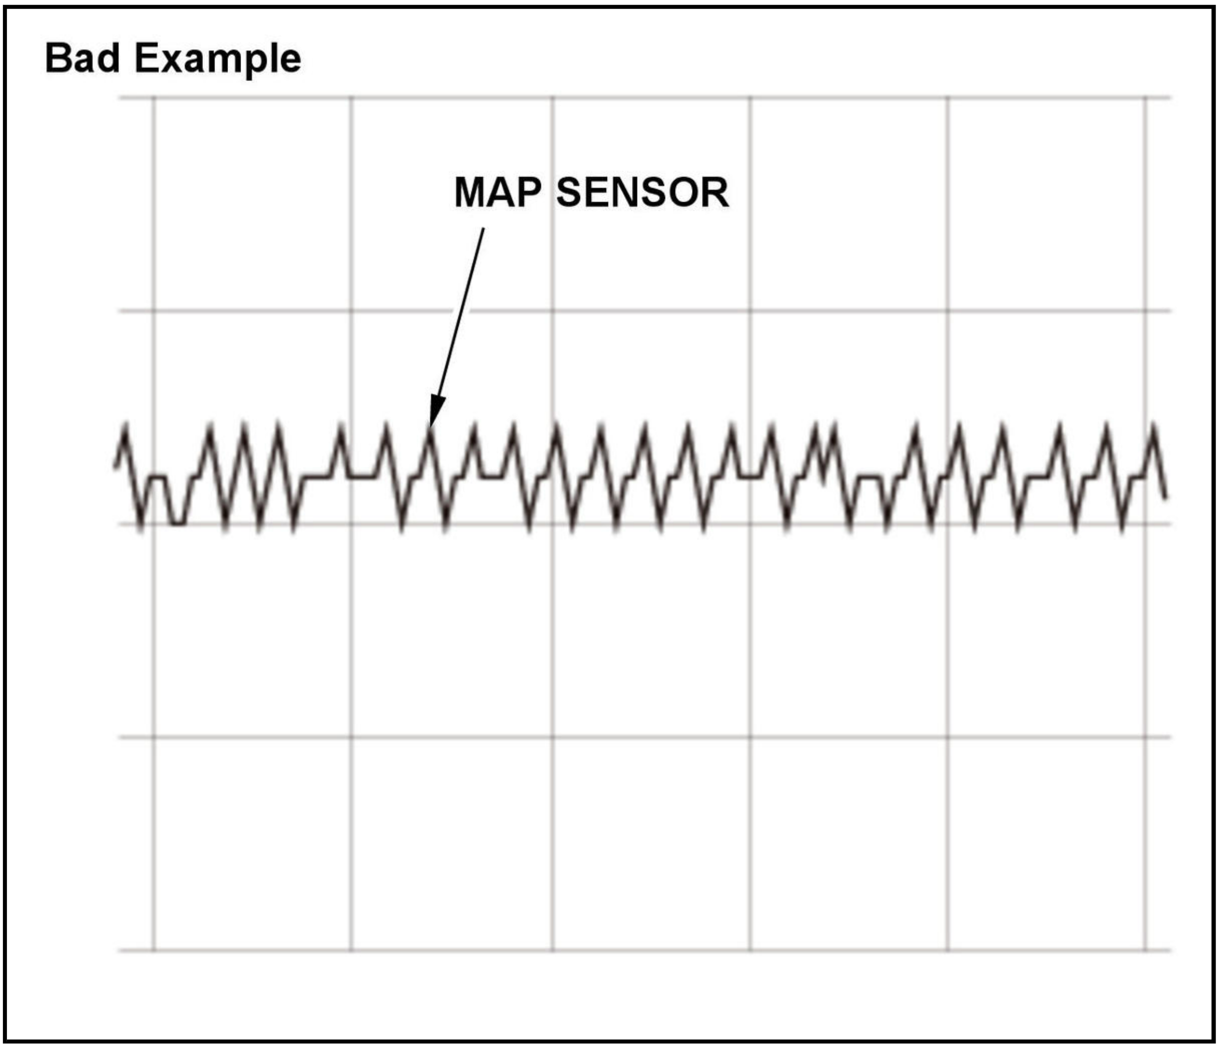
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 50.

NO

The intake manifold vacuum fluctuation is OK. Go to step 53.

50. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg. F (38 deg. C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 51.

NO

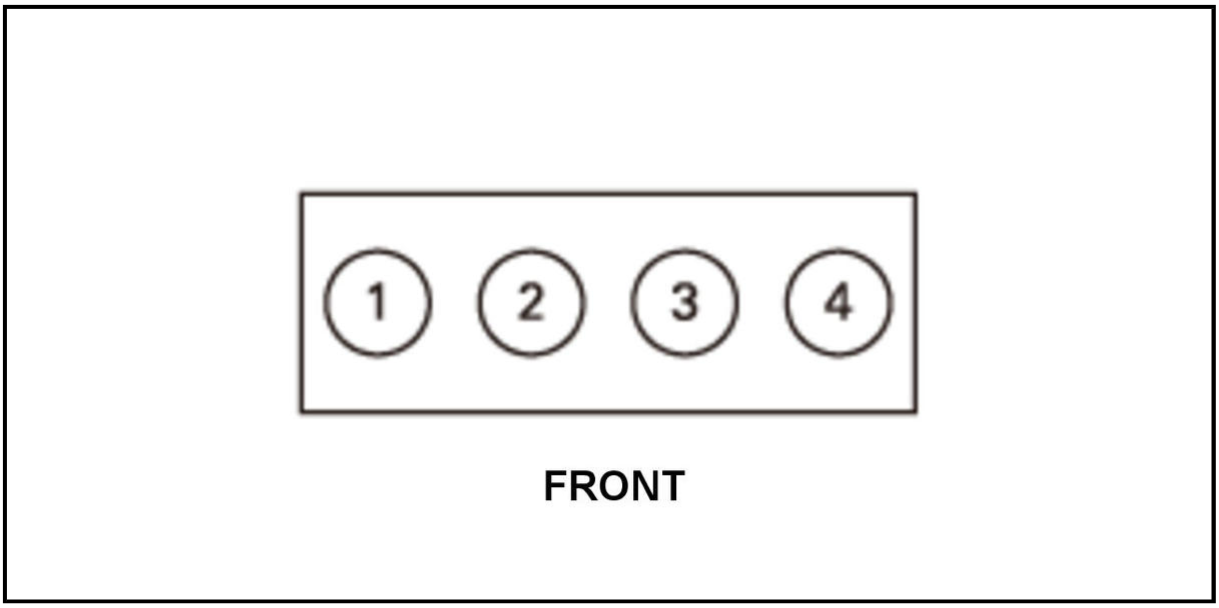
The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

51. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

   NO

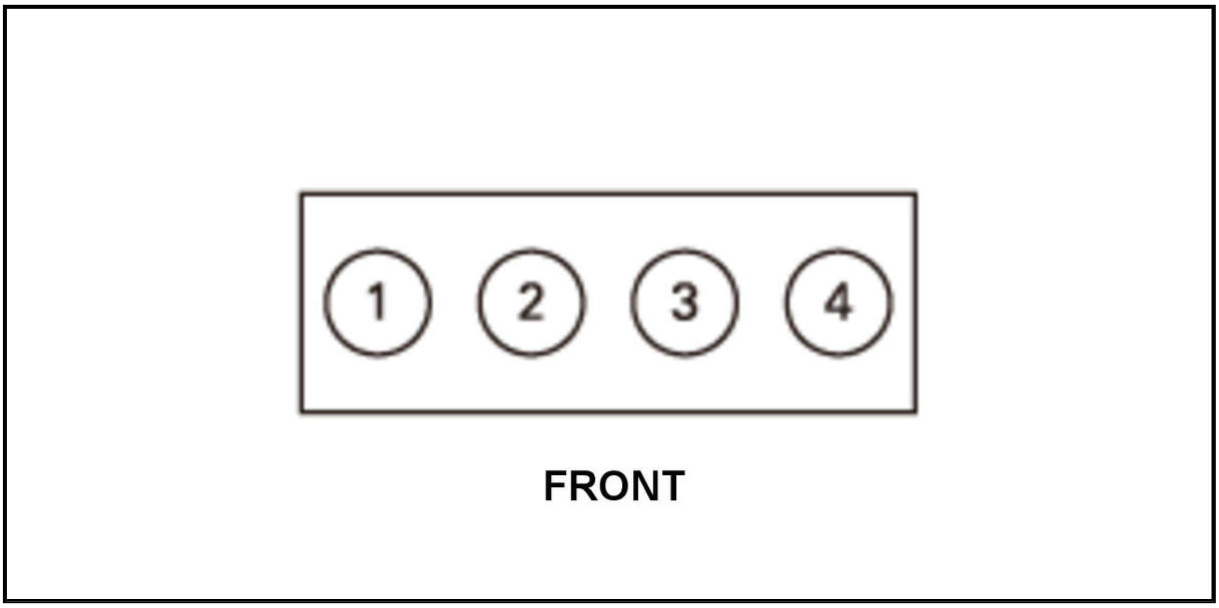
   The engine compression and the cylinder leakage are normal. Go to step 52.

52. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 53.

53. Check Fuel Pressure

-1. **Relieve the fuel pressure** .

-2. **Attach the fuel pressure gauge set and the fuel pressure gauge** .

-3. Locate and record the fuel pressure specification for your vehicle.

Minimum Pressure (kPa)	Maximum Pressure (kPa)
B	B

-4. Start the engine, and record the fuel pressure under the conditions the misfire was duplicated.

Fuel Pressure (kPa)
B

Is the fuel pressure within specifications?

YES

The fuel pressure is OK. Go to step 54.

NO

Check for pinched or damaged fuel lines. If OK, replace the fuel tank unit .

54. Check Fuel Contamination

-1. Remove the fuel tank unit .

-2. Inspect for evidence of fuel contamination such as diesel fuel, water, rust, or debris.

NOTE: If the misfire occurred shortly after refueling, the likely cause is poor fuel quality. The MIL DIST (MIL distance) value in the DATA LIST, along with the fuel level, can help you make this determination. Incorrect or contaminated fuel typically affects multiple cylinders. But a problem such as water in the fuel can cause a single cylinder misfire that occurs randomly.

Is there evidence of fuel contamination?

YES

Replace the fuel filter and then drain/refill the fuel tank with known-good fuel.

NO

The fuel system has no signs of fuel contamination. Go to step 55.

55. Check MAF Sensor g/s

-1. Locate and record the MAF SENSOR g/s specification for your vehicle. This can be found in troubleshooting procedure for DTC P0171.

Minimum g/s	Maximum g/s	Specified RPM
B	B	B

Ensure the vehicle meets these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 176 deg. F (80 deg. C)
- Transmission in P or N
- All electrical loads off

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B

-3. Monitor the ENGINE SPEED in the DATA LIST with the HDS. Raise and hold the engine speed steady at the specified rpm.

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B

-4. While holding the rpm steady, check the MAF SENSOR in the DATA LIST.

Signal	Current conditions	
	Values	Unit
MAF SENSOR	B	B

Is the MAF Sensor g/s value within specifications?

YES

The MAF sensor is reading correctly. **Replace all fuel injectors as a set** .

NO

The MAF sensor is not reading correctly. **Replace the MAF sensor/IAT sensor** .

56. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 57.

57. Inspect Ignition Coil

-1. Inspect the ignition coil and the spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and the spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 58.

58. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and the spark plug are OK. Go to step 60.

NO

There is a failure in the ignition coil or the spark plug. Go to step 59.

59. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

60. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B

Signal	**Current conditions**	
	Values	**Unit**
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 61.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

61. Inspect VTEC System

-1. **Perform the VTEC rocker arm test** .

Does the engine pass the VTEC rocker arm test?

YES

Go to step 62.

NO

Repair the VTEC system.

62. CKP Pattern Clear/Pattern Learn

-1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

-2. **Select CRANK PATTERN CLEAR, and clear the CKP pattern** .

CRANK PATTERN CLEAR

Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

63. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 64.

64. Check Fuel Pressure

-1. **Relieve the fuel pressure** .

-2. **Attach the fuel pressure gauge set and the fuel pressure gauge** .

-3. Locate and record the fuel pressure specification for your vehicle.

Minimum Pressure (kPa)	Maximum Pressure (kPa)
B	B

-4. Start the engine, and record the fuel pressure under the conditions the misfire was duplicated.

Fuel Pressure (kPa)
B

Is the fuel pressure within specifications?

YES

The fuel pressure is OK. Go to step 65.

NO

Check for pinched or damaged fuel lines. If OK, **replace the fuel tank unit** .

65. Check Fuel Contamination

-1. **Remove the fuel tank unit** .

-2. Inspect for evidence of fuel contamination such as diesel fuel, water, rust, or debris.

NOTE: If the misfire occurred shortly after refueling, the likely cause is poor fuel quality. The MIL DIST (MIL distance) value in the DATA LIST, along with the fuel level, can help you make this determination. Incorrect or contaminated fuel typically affects multiple cylinders. But a problem such as water in the fuel can cause a single cylinder misfire that occurs randomly.

Is there evidence of fuel contamination?

YES

Replace the fuel filter and then drain/refill the fuel tank with a known-good fuel.

NO

The fuel system has no signs of fuel contamination. Go to step 66.

66. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 67.

NO

The fuel injector is faulty. **Replace all fuel injectors as a set** .

67. Inspect VTEC System

-1. **Perform the VTEC rocker arm test** .

Does the engine pass the VTEC rocker arm test?

YES

Go to step 68.

NO

Repair the VTEC system.

68. Check for Exhaust Restrictions

-1. Reinstall all removed parts, and reconnect all connectors.

-2. Record the MAP SENSOR value while the engine is off.

Signal	Current conditions	
	Values	Unit
MAP SENSOR	B	B

-3. Start the engine, and monitor the ENGINE SPEED and MAP SENSOR in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP SENSOR	B	B
ENGINE SPEED	B	B

-4. Raise the engine speed to 3, 500 rpm and hold the throttle steady.

Does the MAP SENSOR read near atmospheric pressure (engine off value)?

YES

There is a restriction in the exhaust system. Check for catalyst damage and repair as necessary.

NO

Go to step 69.

69. CKP Pattern Clear/Pattern Learn

-1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

-2. **Select CRANK PATTERN CLEAR, and clear the CKP pattern** .

CRANK PATTERN CLEAR

Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	**Unit**
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B

Signal	Current conditions	
	Values	**Unit**
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

70. Check MAP Sensor Fluctuation

-1. Start the engine, and let it idle until the cooling fans cycle twice.

-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

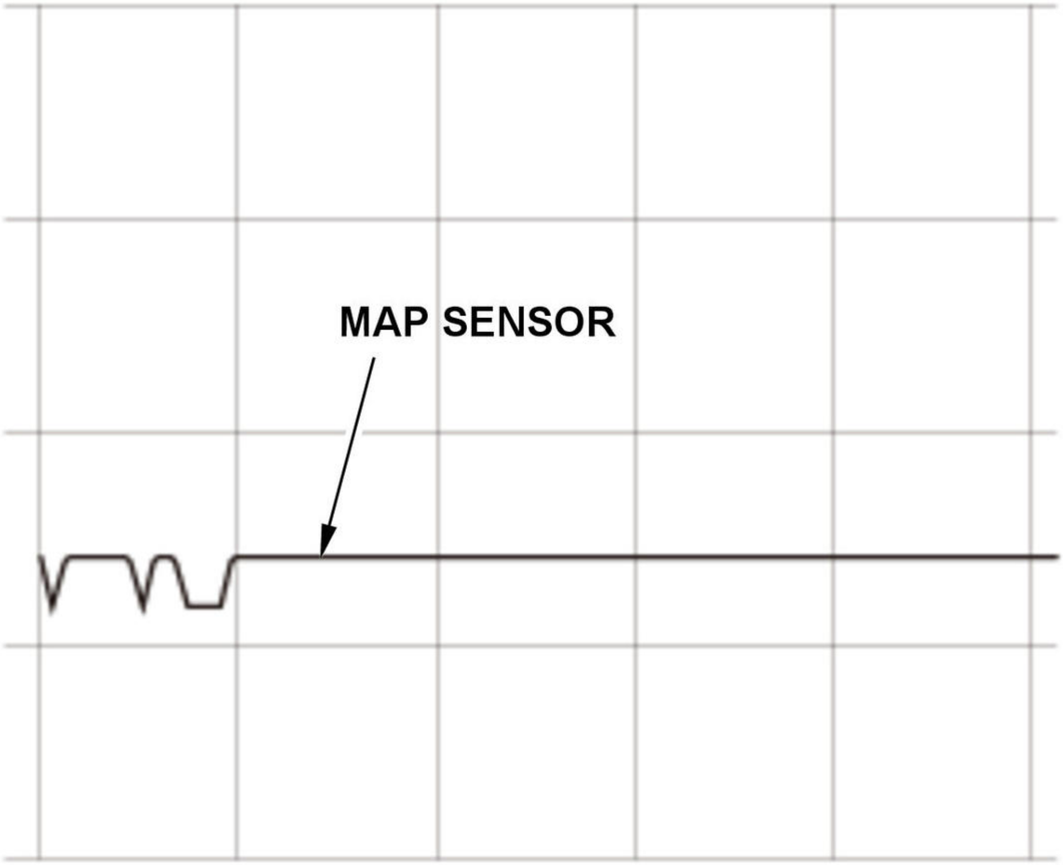
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

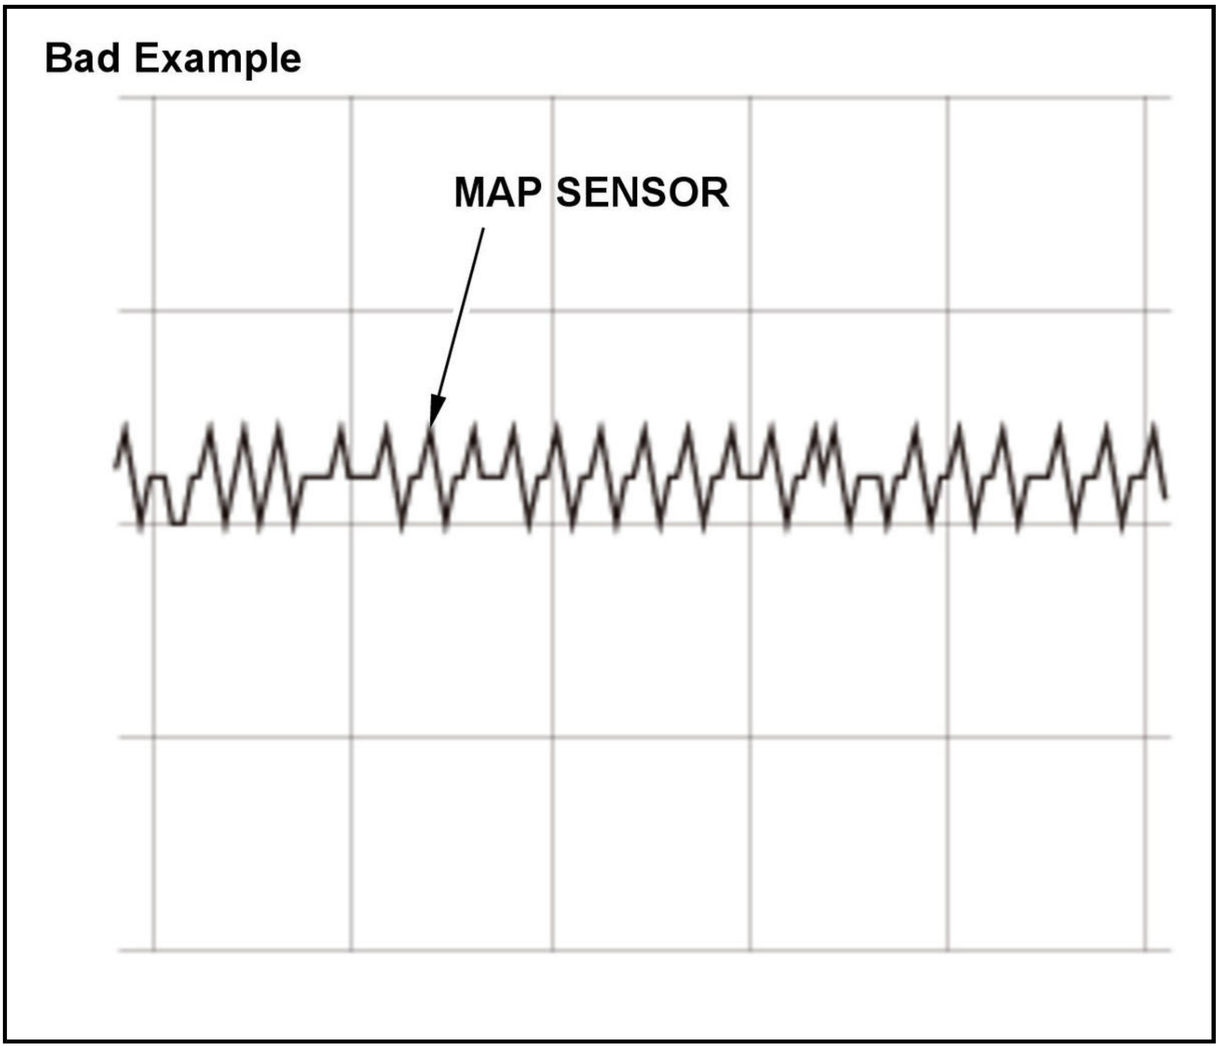
-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.

Good Example





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 71.

NO

The intake manifold vacuum fluctuation is OK. Go to step 74.

71. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg. F (38 deg. C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 72.

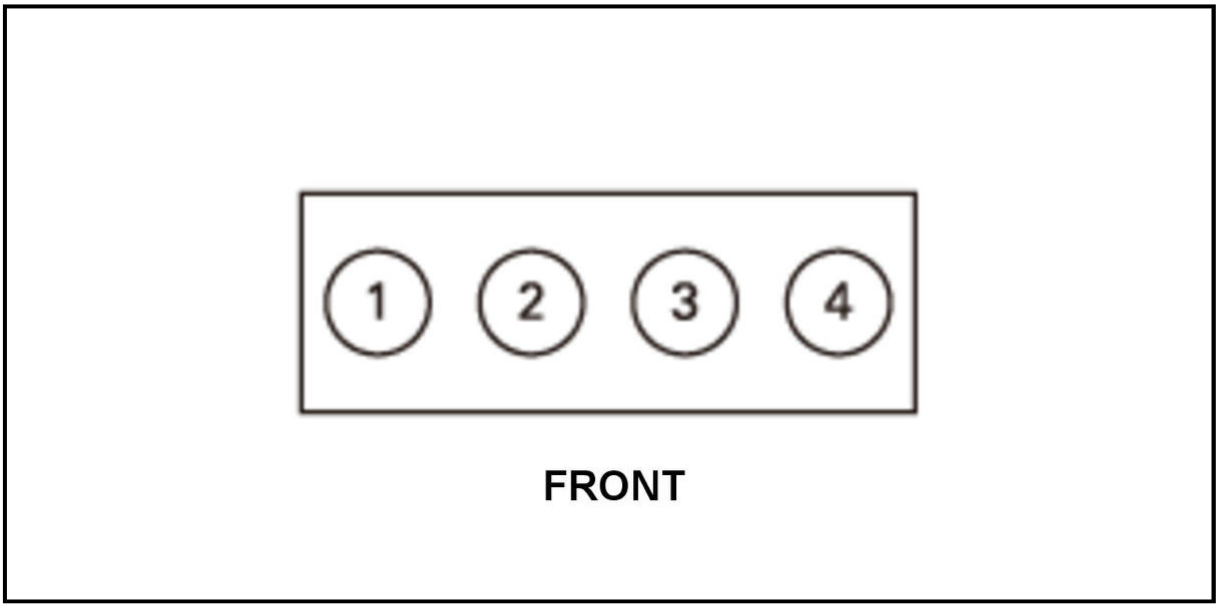
NO

The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

72. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

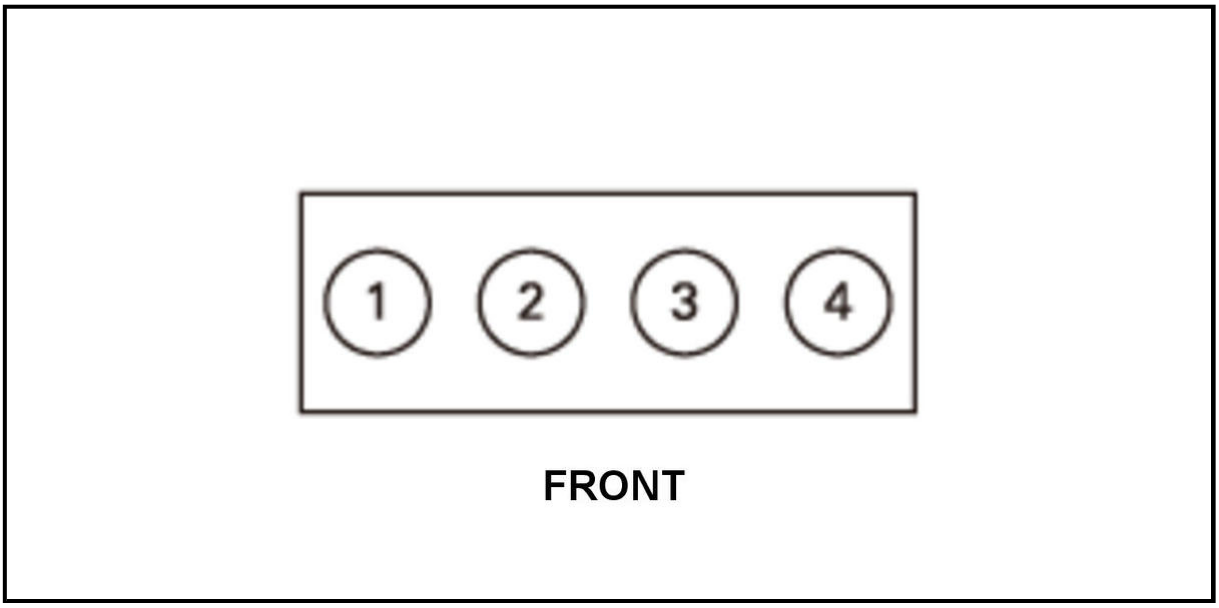
   NO

   The engine compression and the cylinder leakage are normal. Go to step 73.

73. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

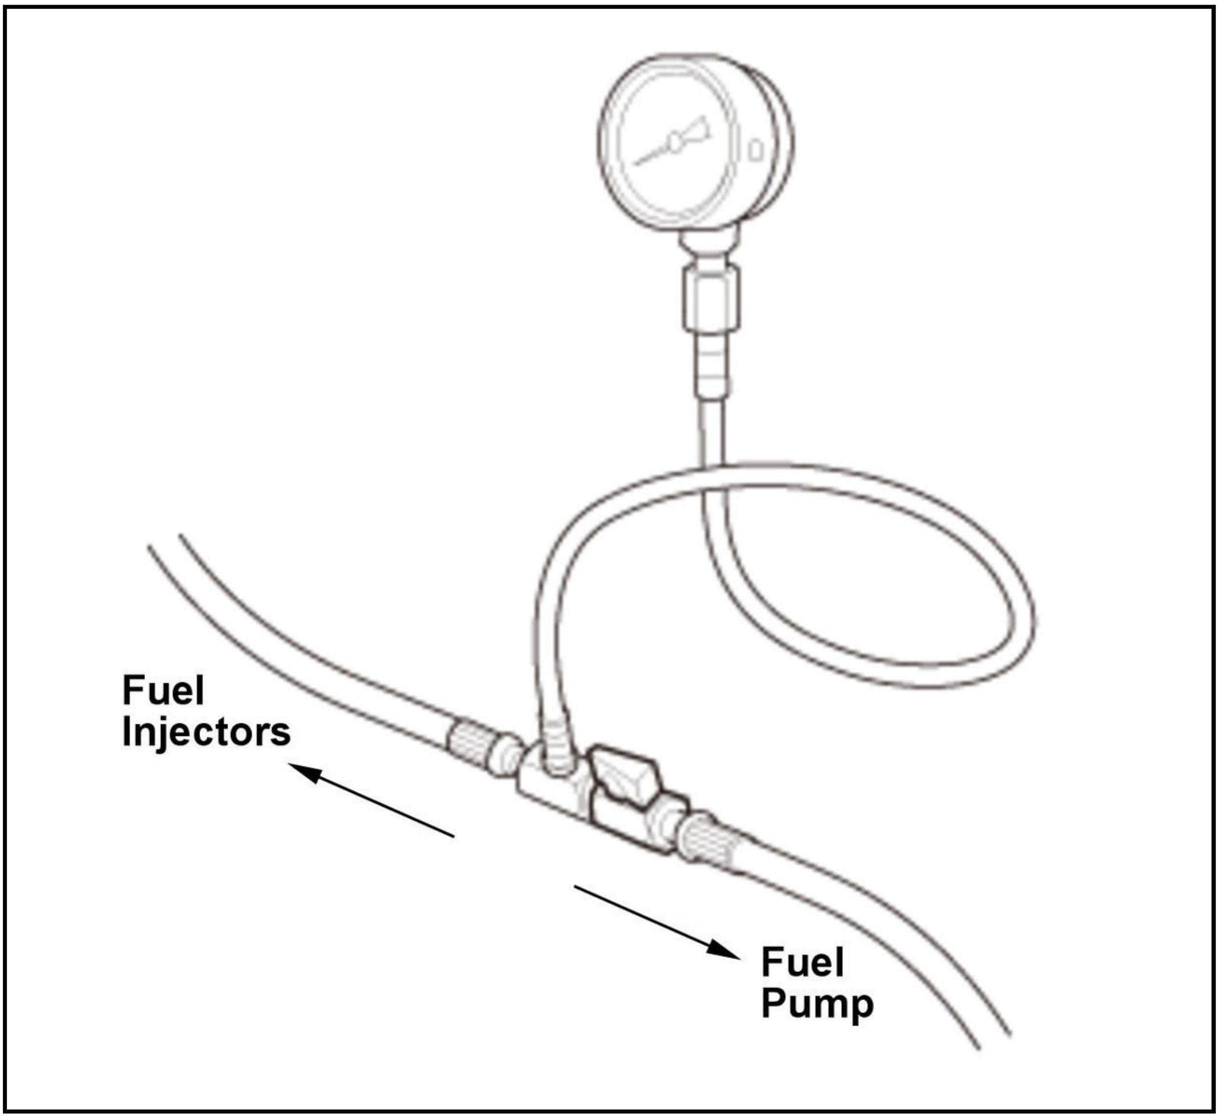
NO

The cylinders are sealing properly. Go to step 74.

74. Check Fuel Injector Leak Down

-1. **Connect the fuel pressure gauge set** .

-2. Ensure that the fuel shut off valve is on the fuel pump side of the pressure gauge.



-3. Start the engine, and then shut it off.

-4. Turn the shut off valve 90 deg. to isolate the pressure between the fuel injectors and the fuel pressure gauge.

-5. Record the initial fuel pressure reading.

-6. Let the vehicle sit for 10 minutes.

-7. Check the fuel pressure.

Does the pressure drop more than 10 PSI within 10 minutes?

YES

The fuel injectors are leaking. **Replace all fuel injectors as a set** .

NO

Go to step 75.

75. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 76.

76. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and the spark plug are OK. Go to step 78.

NO

There is a failure in the ignition coil or the spark plug. Go to step 77.

77. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

78. Engine Carbon Removal

-1. Perform a top engine cleaning following the product manufacturer's instructions.

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
CYL1 MISFIRE	B	B
CYL2 MISFIRE	B	B
CYL3 MISFIRE	B	B
CYL4 MISFIRE	B	B

Did the misfire counts stay?

YES

The carbon removal procedure did not correct the misfire. **Replace all fuel injectors as a set** .

NO

The carbon removal procedure corrected the misfire.

DTC P0326 (1.5 L ENGINE)

DTC P0326 : Knock Sensor Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0326 Knock Sensor Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Hold the engine speed at 2, 000 rpm or more without load (in P or N) for at least 5 seconds.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0326 Knock Sensor Malfunction	B	B

Is DTC P0326 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Knock sensor installation check

   -1. Check that the knock sensor is installed correctly.

   Is the knock sensor installed correctly?

   YES

   Installation is OK. **Replace the knock sensor** .

   NO

   Installation is not correct, reinstall the knock sensor.

DTC P0326 (2.4 L ENGINE) (2017 2018 2019)

DTC P0326 : Knock Sensor Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0326 Knock Sensor Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 1, 500 rpm or more without load (in P or N) for at least 5 seconds.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0326 Knock Sensor Malfunction	B	B

   Is DTC P0326 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the** failure under the same conditions with the on-board snapshot .

2. Knock sensor installation check

 -1. Check that the knock sensor is installed correctly.

 Is the knock sensor installed correctly?

 YES

 Installation is OK. Replace the knock sensor .

 NO

 Installation is not correct, reinstall the knock sensor.

DTC P0327 (1.5 L ENGINE)

DTC P0327 : Knock Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0327 Knock Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

 -1. Turn the vehicle to the ON mode.

 -2. Clear the DTC with the HDS.

 -3. Turn the vehicle to the OFF (LOCK) mode.

 -4. Turn the vehicle to the ON mode.

 -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0327 Knock Sensor Circuit Low Voltage	B	B

 Is DTC P0327 indicated?

 YES

 Go to step 2.

 NO

 Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Determine possible failure area (knock sensor, others)

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Disconnect the following connector.

Knock sensor 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

Is DTC P0328 indicated?

YES

Replace the knock sensor .

NO

Go to step 3.

3. Shorted wire check (KS line to KSGND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

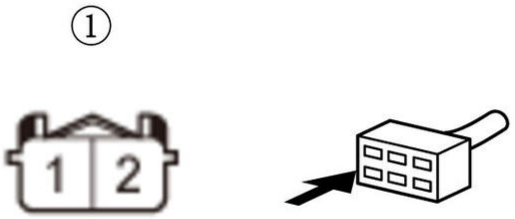
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P) disconnected
	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	Knock sensor 2P connector (female terminals) No. 2: ①



Is there continuity?

YES

Repair a short in the KS wire to the KSGND wire between the PCM (E34, E35) and the knock sensor.

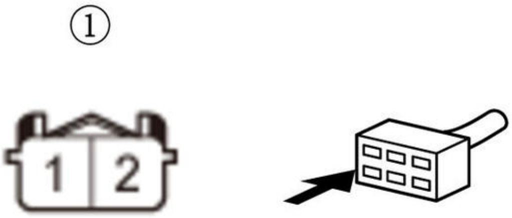
NO

Go to step 4.

4. Shorted wire check (KS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P) disconnected
	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the KS wire between the PCM (E35) and the knock sensor.

NO

The KS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0327 (2.4 L ENGINE) (2017 2018 2019)

DTC P0327 : Knock Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0327 Knock Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0327 Knock Sensor Circuit Low Voltage	B	B

   Is DTC P0327 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (knock sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Knock sensor 2P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

   Is DTC P0328 indicated?

   YES

   Replace the knock sensor .

   NO

   Go to step 3.

3. Shorted wire check (KS line to KSGND line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

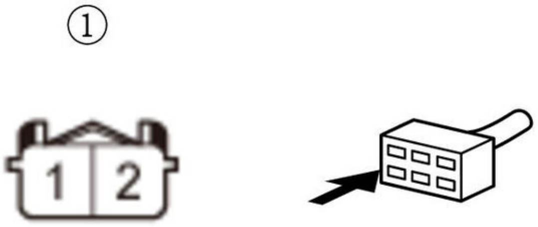
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector C (51P) disconnected
	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	Knock sensor 2P connector (female terminals) No. 2: ①



Is there continuity?

YES

Repair a short in the KS wire to the KSGND wire between the PCM and the knock sensor.

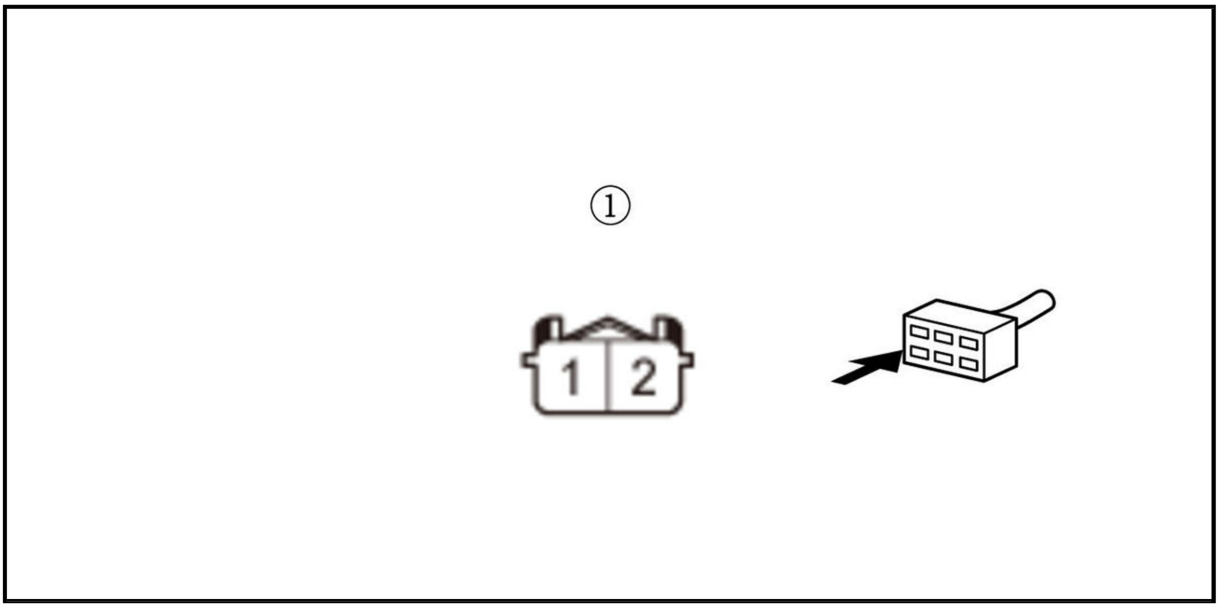
NO

Go to step 4.

4. Shorted wire check (KS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector C (51P) disconnected
	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the KS wire between the PCM (C29) and the knock sensor.

NO

The KS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P0328 (1.5 L ENGINE)

DTC P0328 : Knock Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

Is DTC P0328 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (knock sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

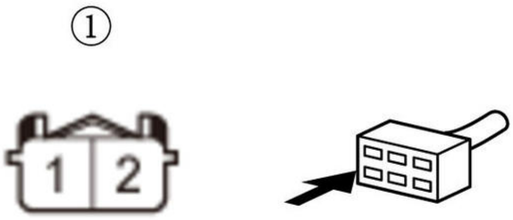
-2. Disconnect the following connector.

Knock sensor 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	Knock sensor 2P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Replace the knock sensor .

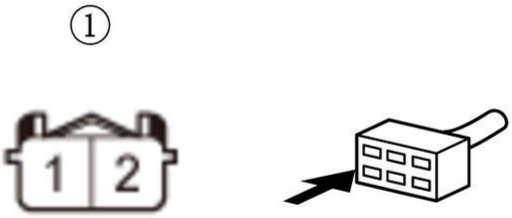
NO

Go to step 3.

3. Determine possible failure area (KS line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (KS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

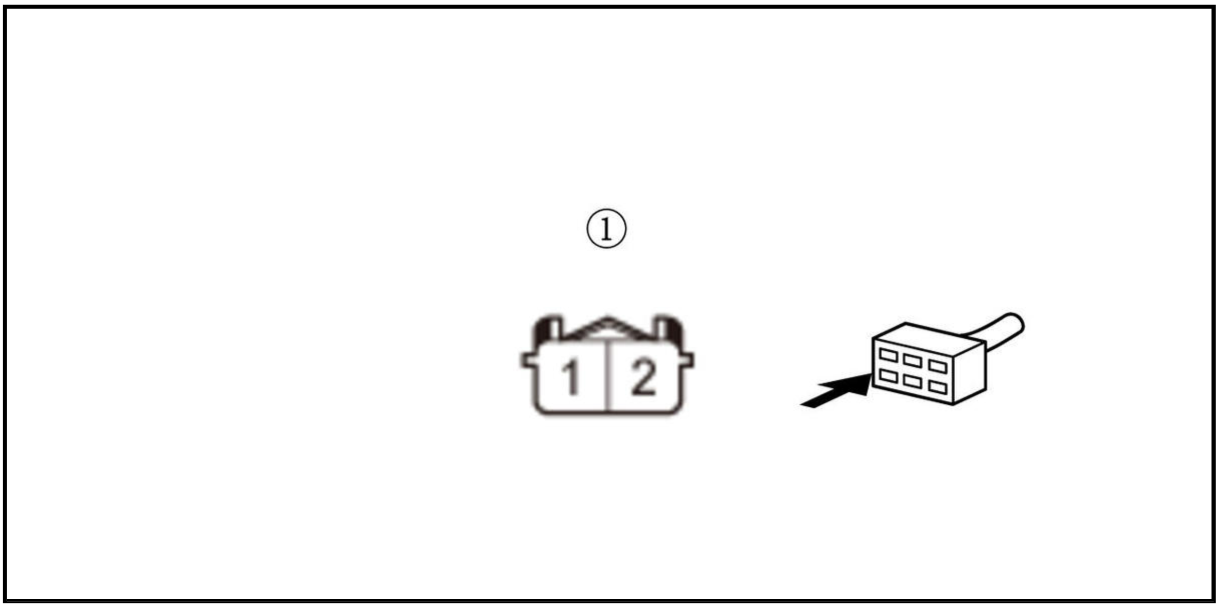
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Knock sensor 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 35**



Is there continuity?

YES

The KS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the KS wire between the PCM (E35) and the knock sensor.

5. Open wire check (KSGND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

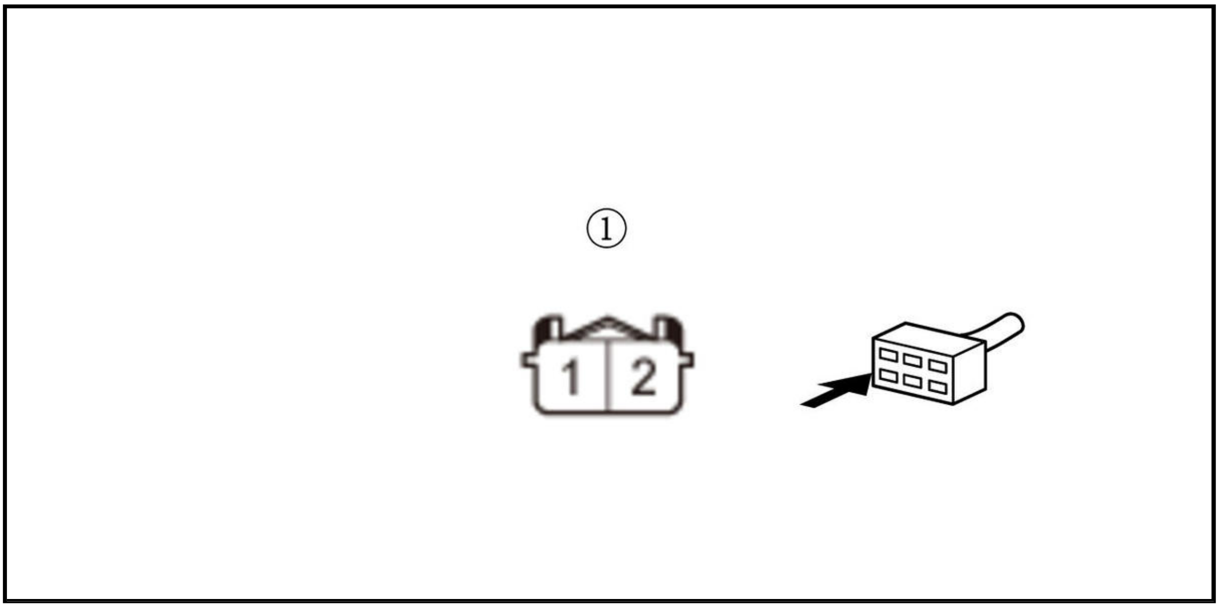
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Knock sensor 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 34**



Is there continuity?

YES

The KSGND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the KSGND wire between the PCM (E34) and the knock sensor.

DTC TROUBLESHOOTING

DTC P062B (1.5 L ENGINE)

DTC P062B : PCM Internal Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P062B PCM Internal Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P062B PCM Internal Circuit Malfunction	B	B

Is DTC P062B indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time.

DTC P062B (2.4 L ENGINE) (2017 2018 2019)

DTC P062B : PCM Internal Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P062B PCM Internal Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P062B PCM Internal Circuit Malfunction	B	B

Is DTC P062B indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P062F (PGM-FI SYSTEM (1.5 L ENGINE))

DTC P062F : PCM Internal Control Module Keep Alive Memory (KAM) Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P062F PCM Internal Control Module Keep Alive Memory (KAM) Error	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P062F PCM Internal Control Module Keep Alive Memory (KAM) Error	B	B

Is DTC P062F indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P062F (PGM-FI SYSTEM (2.4 L ENGINE)) (2017 2018 2019)

DTC P062F : PCM Internal Control Module Keep Alive Memory (KAM) Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P062F PCM Internal Control Module Keep Alive Memory (KAM) Error	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P062F PCM Internal Control Module Keep Alive Memory (KAM) Error	B	B

   Is DTC P062F indicated?

   YES

   The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

   NO

   Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0630 (1.5 L ENGINE)

DTC P0630 : VIN Not Programmed or Mismatch

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is stored only when the PCM does not have the VIN information of the vehicle. Use the HDS to input the missing VIN information.

DTC Description	Confirmed DTC	Pending DTC
P0630 VIN Not Programmed or Mismatch	B	B

DTC (PGM-FI)

1. VIN check

   -1. Turn the vehicle to the ON mode.

   -2. Check the VIN with the HDS.

Does the HDS show the vehicle's VIN?

YES

Go to step 4.

NO

Go to step 2.

2. VIN check (rewrite)

-1. Input the correct VIN to the PCM with the HDS.

Does the HDS show COMPLETE?

YES

Go to step 4.

NO

Go to step 3.

3. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P062F PCM Internal Control Module Keep Alive Memory (KAM) Error	B	B

Is DTC P062F indicated?

YES

Go to the troubleshooting for DTC P062F.

NO

Go to step 4.

4. PCM check

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode, and wait 5 seconds.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0630 VIN Not Programmed or Mismatch	B	B

Is DTC P0630 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0630 (2.4 L ENGINE) (2017 2018 2019)

DTC P0630 : VIN Not Programmed or Mismatch

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is stored only when the PCM does not have the VIN information of the vehicle. Use the HDS to input the missing VIN information.

DTC Description	Confirmed DTC	Pending DTC
P0630 VIN Not Programmed or Mismatch	B	B

DTC (PGM-FI)

1. VIN check

   -1. Turn the vehicle to the ON mode.

   -2. Check the VIN with the HDS.

   Does the HDS show the vehicle's VIN?

   YES

   Go to step 4.

   NO

   Go to step 2.

2. VIN check (rewrite)

   -1. Input the correct VIN to the PCM with the HDS.

   Does the HDS show COMPLETE?

   YES

   Go to step 4.

   NO

   Go to step 3.

3. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0630 VIN Not Programmed or Mismatch	B	B

Is DTC P062F indicated?

YES

Go to the troubleshooting for DTC P062F.

NO

Go to step 4.

4. PCM check

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode, and wait 5 seconds.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0630 VIN Not Programmed or Mismatch	B	B

Is DTC P0630 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0641 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC P0641 : Sensor Reference Voltage A Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM and these parts. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

- CKP sensor
- MAP sensor
- Fuel rail pressure sensor
- Throttle body
- APP sensor

2. Determine possible failure area (VCC lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

CKP sensor 3P connector
MAP sensor 3P connector
Fuel rail pressure sensor 3P connector
Throttle body 6P connector
APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted part check:

Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:

- CKP sensor

- MAP sensor
- Fuel rail pressure sensor
- Throttle body
- APP sensor

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

Replace the part that caused the DTC when it was reconnected.

NO

Check for poor connections or loose terminals at the PCM and the following parts, then go to step 1.

- CKP sensor
- MAP sensor
- Fuel rail pressure sensor
- Throttle body
- APP sensor

4. Shorted wire check (VCC lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
PCM connector E (80P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between these test points and body ground individually.

Test condition	Vehicle ON mode
	CKP sensor 3P connector: disconnected
	MAP sensor 3P connector: disconnected
	Fuel rail pressure sensor 3P connector: disconnected
	Throttle body 6P connector: disconnected
	APP sensor 6P connector: disconnected
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected

Connector	Terminal
PCM connector A (50P)	No. 45
PCM connector E (80P)	No. 70 and No. 75

Is there any voltage?

YES

Repair a short to power in the VCC wire between the PCM (A45, E70, E75) and each part that was disconnected in step 2.

NO

Go to step 5.

5. Shorted wire check (VCC lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
	CKP sensor 3P connector: disconnected
	MAP sensor 3P connector: disconnected
	Fuel rail pressure sensor 3P connector: disconnected
	Throttle body 6P connector: disconnected
	APP sensor 6P connector: disconnected
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected

Connector	Terminal
PCM connector A (50P)	No. 45
PCM connector E (80P)	No. 70 and No. 75

Is there continuity?

YES

Repair a short to ground in the VCC wire between the PCM (A45, E70, E75) and each part that was disconnected in step 2.

NO

The VCC wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0641 (PGM-FI SYSTEM (2.4 L ENGINE)) (2017 2018 2019)

DTC P0641 : Sensor Reference Voltage A Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM and these parts. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

- MAP sensor
- Fuel rail pressure sensor
- CVT drive pulley speed sensor
- APP sensor
- A/C pressure sensor
- FTP sensor (USA models)

2. Determine possible failure area (VCC lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

MAP sensor 3P connector
Fuel rail pressure sensor 3P connector
CVT drive pulley speed sensor 3P connector
APP sensor 6P connector
A/C pressure sensor 3P connector
FTP sensor 3P connector (USA models)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted part check:

Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:

- MAP sensor
- Fuel rail pressure sensor
- CVT drive pulley speed sensor
- APP sensor
- A/C pressure sensor
- FTP sensor (USA models)

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

Replace the part that caused the DTC when it was reconnected.

NO

Check for poor connections or loose terminals at the PCM and the following parts, then go to step 1.

- MAP sensor
- Fuel rail pressure sensor
- CVT drive pulley speed sensor
- APP sensor
- A/C pressure sensor
- FTP sensor (USA models)

4. Shorted wire check (VCC lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (51P)
PCM connector C (51P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between these test points and body ground individually.

Test condition	Vehicle ON mode
	MAP sensor 3P connector: disconnected
	Fuel rail pressure sensor 3P connector: disconnected
	CVT drive pulley speed sensor 3P connector: disconnected
	APP sensor 6P connector: disconnected
	A/C pressure sensor 3P connector: disconnected
	FTP sensor 3P connector: disconnected (USA models)
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected

Connector	Terminal
PCM connector A (51P)	No. 29 and No. 31

Connector	Terminal
PCM connector C (51P)	No. 41

Is there any voltage?

YES

Repair a short to power in the VCC wire between the PCM (A29, A31, or C41) and each part that was disconnected in step 2.

NO

Go to step 5.

5. Shorted wire check (VCC lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
	MAP sensor 3P connector: disconnected
	Fuel rail pressure sensor 3P connector: disconnected
	CVT drive pulley speed sensor 3P connector: disconnected
	APP sensor 6P connector: disconnected
	A/C pressure sensor 3P connector: disconnected
	FTP sensor 3P connector: disconnected (USA models)
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected

Connector	Terminal
PCM connector A (51P)	No. 29 and No. 31
PCM connector C (51P)	No. 41

Is there continuity?

YES

Repair a short in the VCC wire between the PCM (A29, A31, or C41) and each part that was disconnected in step 2.

NO

The VCC wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0651 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC P0651 : Sensor Reference Voltage B Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

   Is DTC P0651 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM and these parts. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   - CMP sensor A
   - CMP sensor B
   - Turbocharger boost sensor
   - Turbocharger
   - APP sensor
   - A/C pressure sensor
   - MAF sensor/IAT sensor 1
   - EVAP leak check module (USA and Canada models)

2. Determine possible failure area (VCC lines, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

CMP sensor A 3P connector
CMP sensor B 3P connector
Turbocharger boost sensor 3P connector
Turbocharger 5P connector
APP sensor 6P connector
A/C pressure sensor 3P connector
MAF sensor/IAT sensor 1 4P connector
EVAP leak check module 8P connector (USA and Canada models)

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

Is DTC P0651 indicated?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted part check:

Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:

- CMP sensor A
- CMP sensor B
- Turbocharger boost sensor
- Turbocharger
- APP sensor
- A/C pressure sensor
- MAF sensor/IAT sensor 1
- EVAP leak check module (USA and Canada models)

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

Is DTC P0651 indicated?

YES

Replace the part that caused the DTC when it was reconnected.

NO

Check for poor connections or loose terminals at the PCM and the following parts, then go to step 1.

- CMP sensor A
- CMP sensor B
- Turbocharger boost sensor
- Turbocharger
- APP sensor
- A/C pressure sensor
- MAF sensor/IAT sensor 1
- EVAP leak check module (USA and Canada models)

4. Shorted wire check (VCC lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
PCM connector E (80P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between these test points and body ground individually.

Test condition	Vehicle ON mode
	CMP sensor A 3P connector: disconnected
	CMP sensor B 3P connector: disconnected
	Turbocharger boost sensor 3P connector: disconnected
	Turbocharger 5P connector: disconnected
	APP sensor 6P connector: disconnected
	A/C pressure sensor 3P connector: disconnected
	MAF sensor/IAT sensor 1 4P connector
	EVAP leak check module 8P connector (USA and Canada models)
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected

Connector	Terminal
PCM connector A (50P)	No. 44
PCM connector E (80P)	No. 63 and No. 77

Is there any voltage?

YES

Repair a short to power in the VCC wire between the PCM (A44, E63, E77) and each part that was disconnected in step 2.

NO

Go to step 5.

5. Shorted wire check (VCC lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
	CMP sensor A 3P connector: disconnected
	CMP sensor B 3P connector: disconnected
	Turbocharger boost sensor 3P connector: disconnected
	Turbocharger 5P connector: disconnected
	APP sensor 6P connector: disconnected
	A/C pressure sensor 3P connector: disconnected
	MAF sensor/IAT sensor 1 4P connector
	EVAP leak check module 8P connector (USA and Canada models)
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected

Connector	Terminal
PCM connector A (50P)	No. 44
PCM connector E (80P)	No. 63 and No. 77

Is there continuity?

YES

Repair a short to ground in the VCC wire between the PCM (A44, E63, E77) and each part that was disconnected in step 2.

NO

The VCC wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

DTC P0651 (PGM-FI SYSTEM (2.4 L ENGINE)) (2017 2018 2019)

DTC P0651 : Sensor Reference Voltage B Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

   Is DTC P0651 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM and these parts. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   - APP sensor
   - Throttle body
   - CVT speed sensor
   - CVT driven pulley pressure sensor
   - Torque converter turbine speed sensor
2. Determine possible failure area (VCC lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

APP sensor 6P connector
Throttle body 6P connector
CVT speed sensor 3P connector
CVT driven pulley pressure sensor 3P connector
Torque converter turbine speed sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

Is DTC P0651 indicated?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted part check:

Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:

- APP sensor
- Throttle body
- CVT speed sensor
- CVT driven pulley pressure sensor
- Torque converter turbine speed sensor

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

Is DTC P0651 indicated?

YES

Replace the part that caused the DTC when it was reconnected.

NO

Check for poor connections or loose terminals at the PCM and the following parts, then go to step 1.

- APP sensor
- Throttle body
- CVT speed sensor
- CVT driven pulley pressure sensor

- Torque converter turbine speed sensor

4. Shorted wire check (VCC lines to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector A (51P)
PCM connector B (51P)
PCM connector C (51P)

   -4. Turn the vehicle to the ON mode.

   -5. Measure the voltage between these test points and body ground individually.

Test condition	Vehicle ON mode
	APP sensor 6P connector: disconnected
	Throttle body 6P connector: disconnected
	CVT speed sensor 3P connector: disconnected
	CVT driven pulley pressure sensor 3P connector: disconnected
	Torque converter turbine speed sensor 3P connector: disconnected
	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	PCM connector C (51P): disconnected

Connector	Terminal
PCM connector A (51P)	No. 40
PCM connector B (51P)	No. 48
PCM connector C (51P)	No. 30

Is there any voltage?

YES

Repair a short to power in the VCC wire between the PCM (A40, B48, or C30) and each part that was disconnected in step 2.

NO

Go to step 5

5. Shorted wire check (VCC lines to ground)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
	APP sensor 6P connector: disconnected
	Throttle body 6P connector: disconnected
	CVT speed sensor 3P connector: disconnected
	CVT driven pulley pressure sensor 3P connector: disconnected
	Torque converter turbine speed sensor 3P connector: disconnected

	PCM connector A (51P): disconnected
	PCM connector B (51P): disconnected
	PCM connector C (51P): disconnected

Connector	Terminal
PCM connector A (51P)	No. 40
PCM connector B (51P)	No. 48
PCM connector C (51P)	No. 30

Is there continuity?

YES

Repair a short in the VCC wire between the PCM (A40, B48, or C30) and each part that was disconnected in step 2.

NO

The VCC wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0657 (1.5 L ENGINE)

DTC P0657 : PCM Power Supply Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0657 PCM Power Supply Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0657 PCM Power Supply Circuit Malfunction	B	B

Is DTC P0657 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 3.

NO

Replace the relay circuit board .

3. Fuse check

-1. Check the following fuse.

Fuse	No. A7 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 7.

NO

Go to step 4.

4. Determine possible failure area (+B IGP line, others)

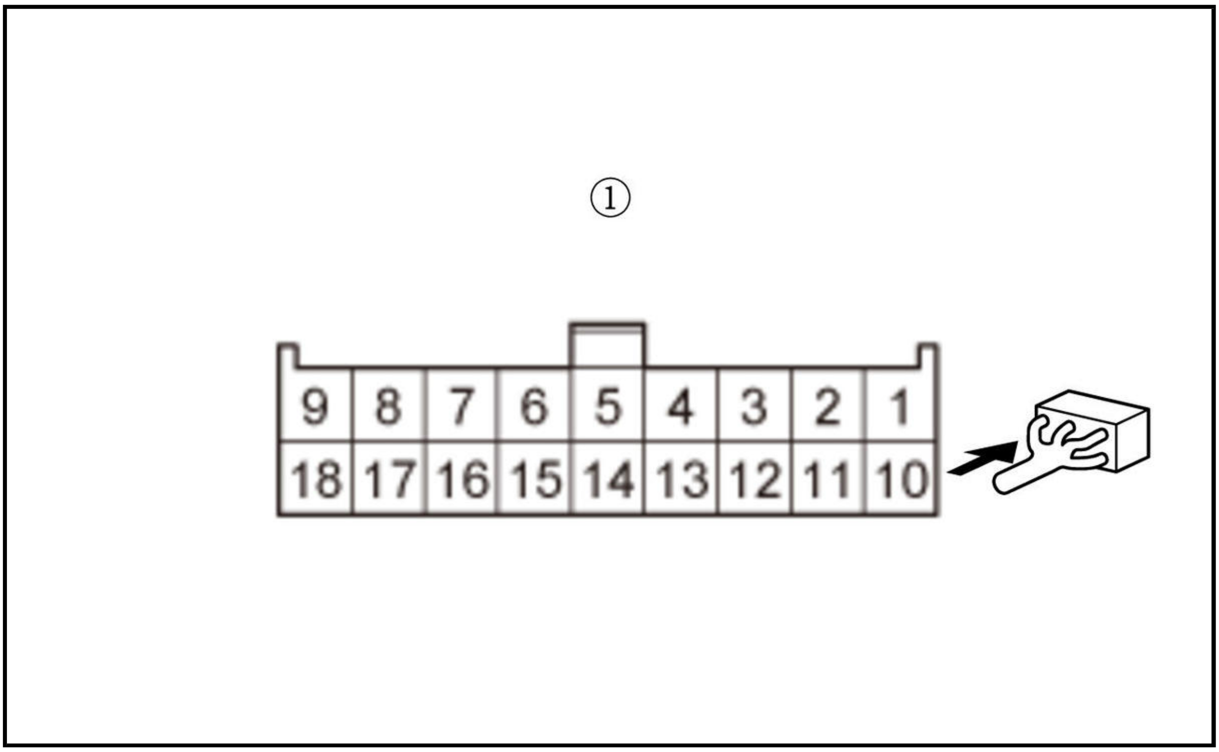
-1. Remove the blown No. A7 (15 A) fuse from the under-hood fuse/relay box.

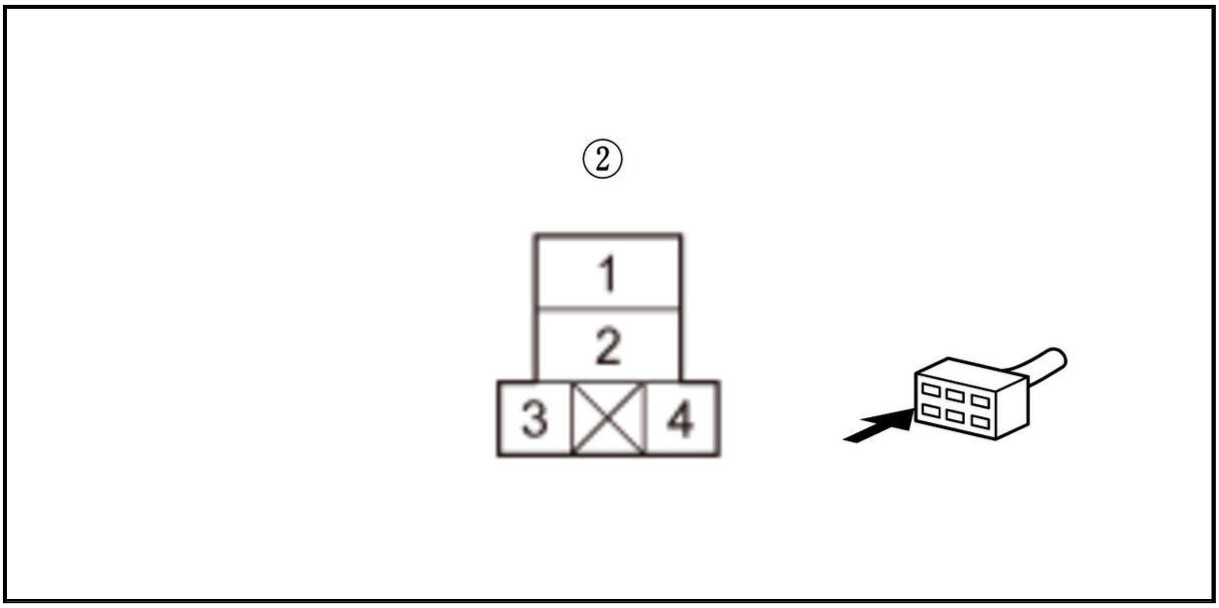
-2. **Remove the injector relay** .

-3. Check for continuity the between following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	Injector relay: disconnected

Connector	Terminal
Relay circuit board connector C (18P) (female terminals): ①	No. 18
Injector relay 4P socket (female terminals): ②	No. 3





Is there continuity?

YES

Repair a short in the +B IGP wire between the No. A7 (15 A) fuse in the under-hood fuse/relay box and the relay circuit board and the injector relay. Also replace the No. A7 (15 A) fuse.

NO

Go to step 5.

5. Parts internal circuit check

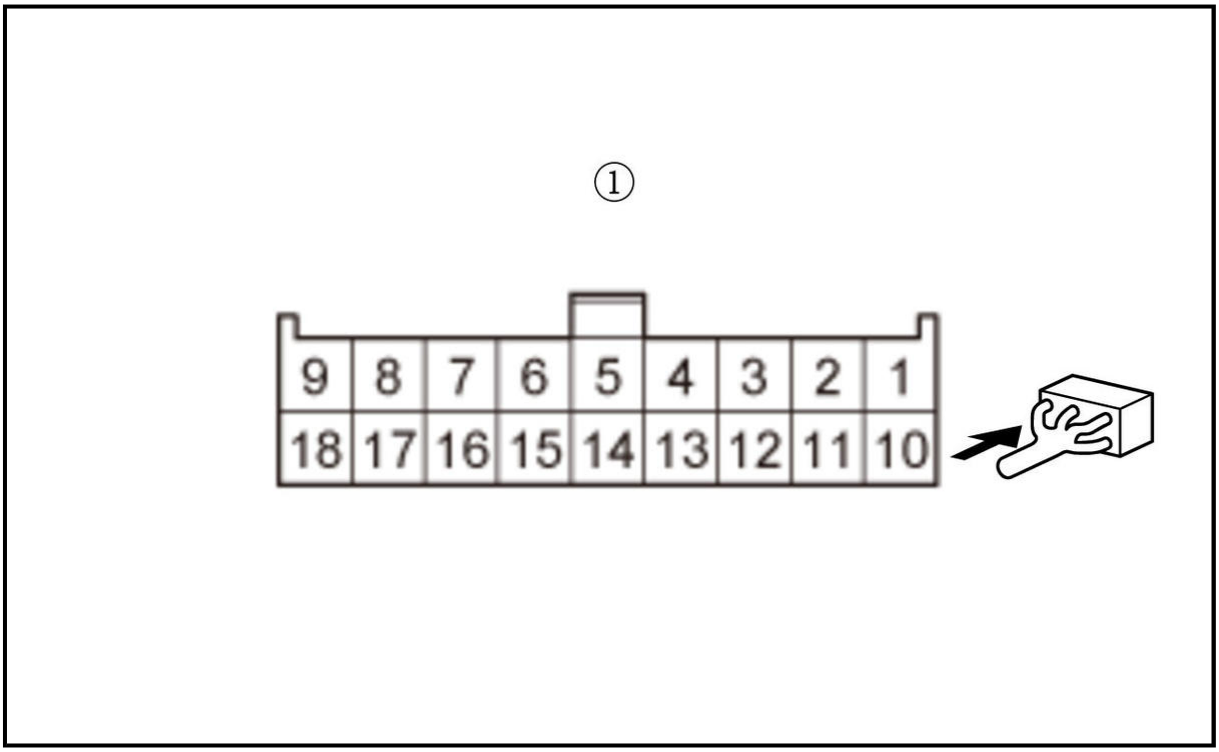
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Check for continuity between test points 1 and 2 while disconnecting these parts, one at a time:

- PGM-FI main relay 2
- PCM connector A (50P)

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①

Test point 2	Body ground



Does continuity go away with the part (s) removed?

YES

Replace the part that continuity goes away when it was disconnected. If the part is PCM, Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** . Also replace the No. A7 (15 A) fuse.

NO

Go to step 6.

6. Shorted wire check (FI MAIN RLY OUT line)

-1. Disconnect the following connectors.

PGM-FI main relay 2
PCM connector A (50P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PGM-FI main relay 2: disconnected
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 8**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the FI MAIN RLY OUT line between the relay circuit board, PGM-FI main relay 2, and the PCM (A8). Also replace the No. A7 (15 A) fuse.

NO

Replace the relay circuit board. Also replace the No. A7 (15 A) fuse in the under-hood fuse/relay box.

7. Determine possible failure area (PGM-FI main relay 1 control circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Install the relay circuit board** .

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (50P)

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 5**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 10.

NO

Go to step 8.

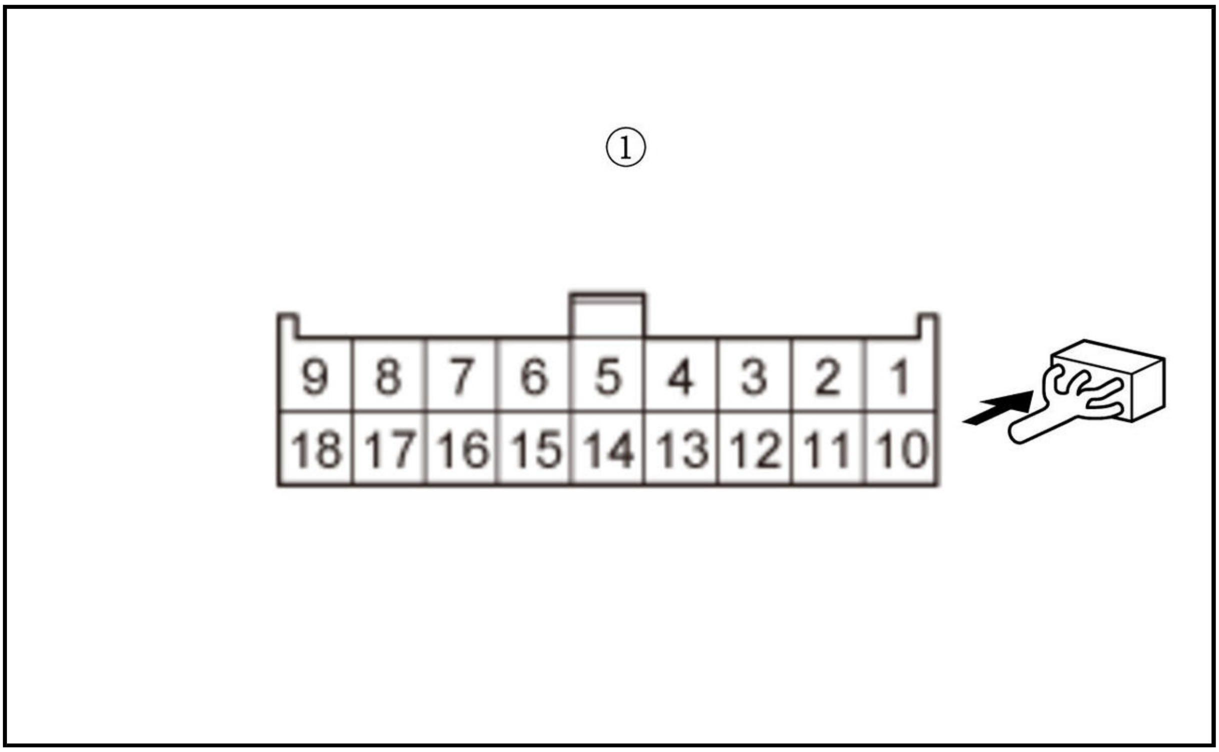
8. Determine possible failure area (+B IGP line, others)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 9.

NO

Repair an open in the +B IGP wire between the No. A7 (15 A) fuse in the under-hood fuse/relay box and the relay circuit board.

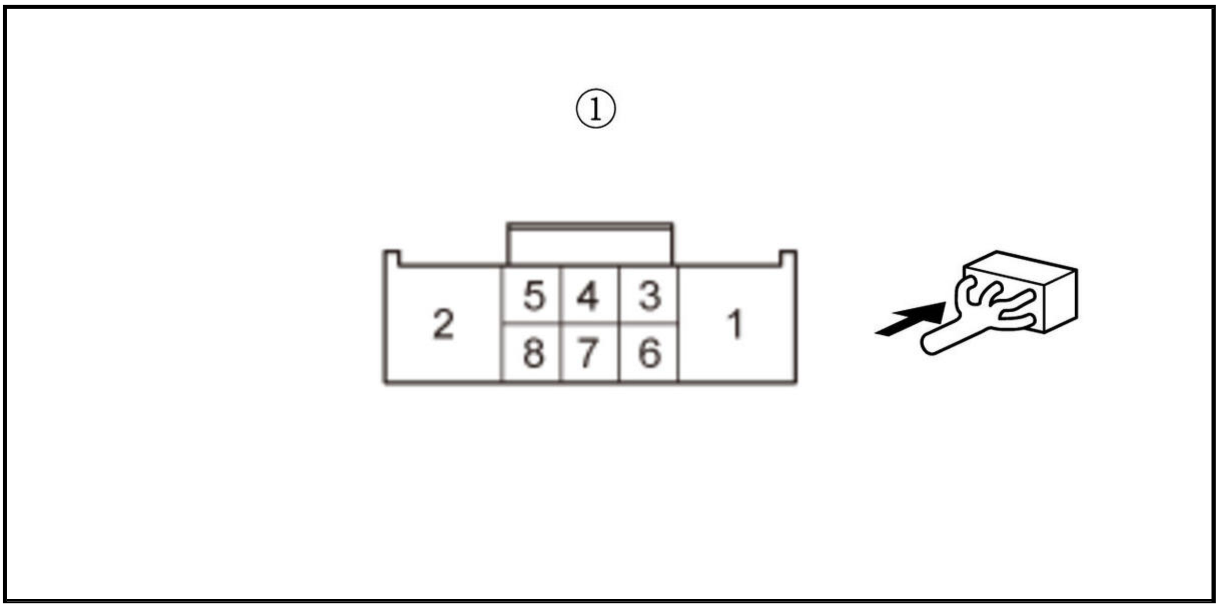
9. Open wire check (FI MAIN RLY CL- line)

-1. Disconnect the following connector.

Relay circuit board connector A (8P)

-2. Connect terminals A and B with a jumper wire.

Terminal A	Relay circuit board connector A (8P) (female terminals) No. 7: ①
Terminal B	Body ground



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Relay circuit board connector A (8P): disconnected
B	Relay circuit board connector C (18P): disconnected
B	Relay circuit board connector A (8P) No. 7: jumped to body ground
Test point 1	**PCM connector A (50P) No. 5**
Test point 2	Body ground

Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the FI MAIN RLY CL- wire between the PCM (A5) and the relay circuit board.

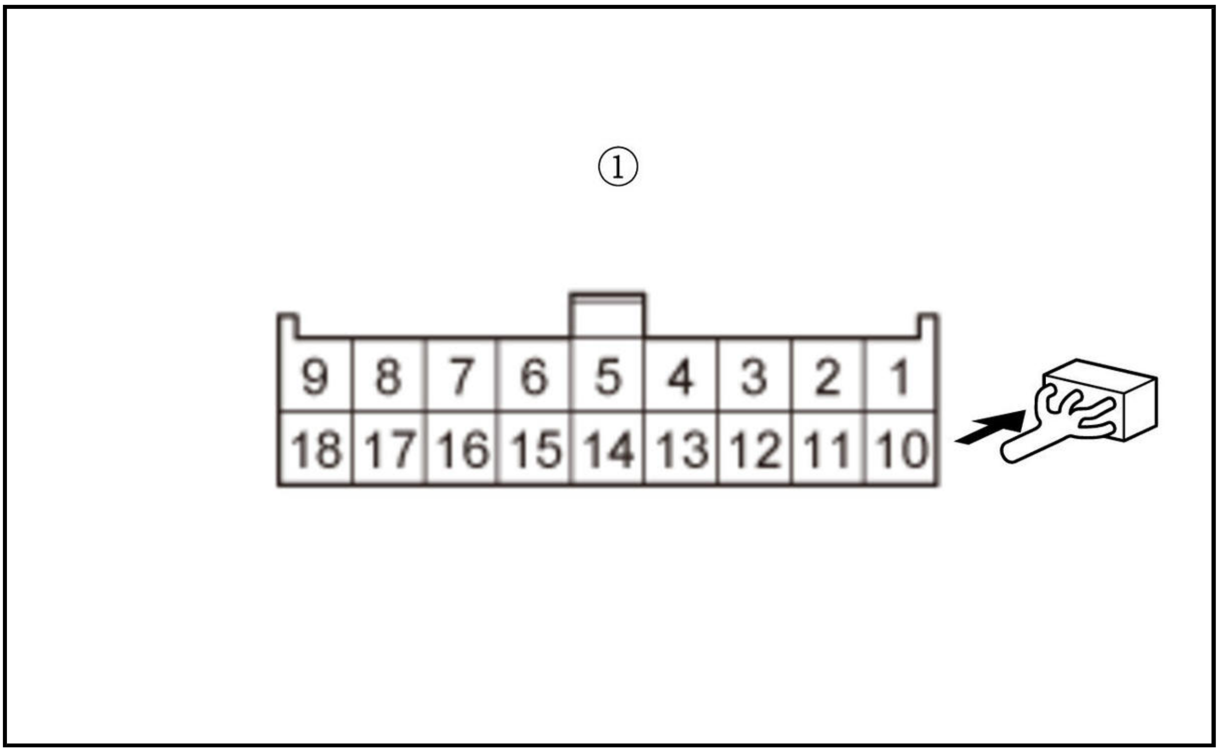
10. Open wire check (FI MAIN RLY OUT line)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Connect terminals A and B with a jumper wire.

Terminal A	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Terminal B	Body ground



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Relay circuit board connector C (18P): disconnected
B	Relay circuit board connector C (18P) No. 17: jumped to body ground
Test point 1	**PCM connector A (50P) No. 8**
Test point 2	Body ground

Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the FI MAIN RLY OUT wire between the PCM (A8) and relay circuit board.

DTC P065A (1.5 L ENGINE)

DTC P065A : ACG No Charging Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P065A ACG No Charging Malfunction	B	B

DTC (PGM-FI)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle for 1 minute.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0562 Charging System Low Voltage	B	B

Is DTC P0562 indicated?

YES

Go to the troubleshooting for **DTC P0562** .

NO

Go to step 2.

2. Problem verification

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P065A ACG No Charging Malfunction	B	B

Is DTC P065A indicated?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check the alternator and the drive belt. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Drive belt check

-1. **Inspect the drive belt** .

Is the drive belt OK?

YES

Repair or **replace the alternator** .

NO

Replace the drive belt .

DTC P065A (2.4 L ENGINE) (2017 2018 2019)

DTC P065A : ACG No Charging Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P065A ACG No Charging Malfunction	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine, and let it idle for 1 minute.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0562 Charging System Low Voltage	B	B

   Is DTC P0562 indicated?

   YES

   Go to the troubleshooting for **DTC P0562** .

   NO

   Go to step 2.

2. Problem verification

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P065A ACG No Charging Malfunction	B	B

   Is DTC P065A indicated?

   YES

   Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check the alternator and the drive belt. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Drive belt check

   -1. **Inspect the drive belt** .

   Is the drive belt OK?

   YES

   Repair or **replace the alternator** .

   NO

   Replace the drive belt .

DTC P0685 (2.4 L ENGINE) (2017 2018 2019)

DTC P0685 : PCM Power Control Circuit/Internal Circuit Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the problem does not return after you clear the DTC, or if this DTC is stored intermittently, check for loose terminals at the IGP (ECU)/FI MAIIN RLY OUT line connectors before replacing the PCM.

DTC Description	Confirmed DTC	Pending DTC
P0685 PCM Power Control Circuit/Internal Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle for 30 seconds.

   -4. Turn the vehicle to the OFF (LOCK) mode.

   -5. Turn the vehicle to the ON mode.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0685 PCM Power Control Circuit/Internal Circuit Malfunction	B	B

   Is DTC P0685 indicated?

   YES

   The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

   NO

   Intermittent failure. Check the following items. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   - PGM-FI main relay 1
   - PGM-FI main fuse
   - Poor connections or loose terminals between the PCM and the under-hood fuse/relay box
   - Poor or loose PCM ground terminals and connections
   - Poor or loose 12 volt battery cables and connections
   - Check the 12 volt battery

DTC P06A8 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC P06A8 : Internal VCC Power Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P06A8 Internal VCC Power Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Reset the PCM with the HDS .

   Reset PCM

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P06A8 Internal VCC Power Malfunction	B	B

   Is DTC P06A8 indicated?

   YES

   The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

   NO

   Intermittent failure, the system is OK at this time.

DTC P06A8 (PGM-FI SYSTEM (2.4 L ENGINE)) (2017 2018 2019)

DTC P06A8 : Internal VCC Power Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P06A8 Internal VCC Power Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Reset the PCM with the HDS .

   Reset PCM

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P06A8 Internal VCC Power Malfunction	B	B

Is DTC P06A8 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**

DTC P0703 (1.5 L ENGINE)

DTC P0703 : Brake Pedal Position Switch (NC) Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the accelerator pedal is pressed with pressing the brake pedal lightly and continuously for 5 minutes or more, this DTC will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0703 Brake Pedal Position Switch (NC) Malfunction	B	B

DTC (PGM-FI)

1. Brake pedal position switch signal (BKSWNC) check 1

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS without pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CRUISE BRAKE SW/IDLE STOP SW	CLOSE	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 7.

   NO

   Go to step 2.

2. Brake pedal position switch installation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Adjust the brake pedal and the brake pedal position switch** .

   -3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS without pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
CRUISE BRAKE SW/IDLE STOP SW	CLOSE	B	B	B

Do the current condition (s) match the threshold?

YES

The failure is not duplicated.

NO

Go to step 3.

3. Determine possible failure area (brake pedal position switch, others)

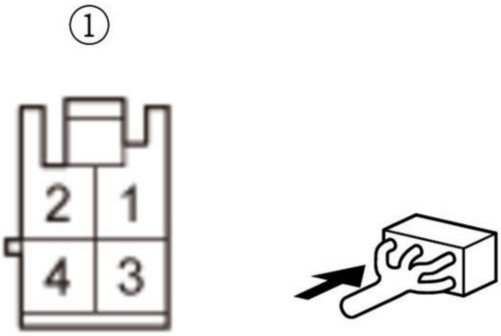
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Brake pedal position switch 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Brake pedal position switch 4P connector (female terminals) No. 3: ①
Terminal B	Brake pedal position switch 4P connector (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CRUISE BRAKE SW/IDLE STOP SW	CLOSE	B	B	B

Do the current condition (s) match the threshold?

YES

Replace the brake pedal position switch .

NO

Go to step 4.

4. Determine possible failure area (IG1 ACG line, others)

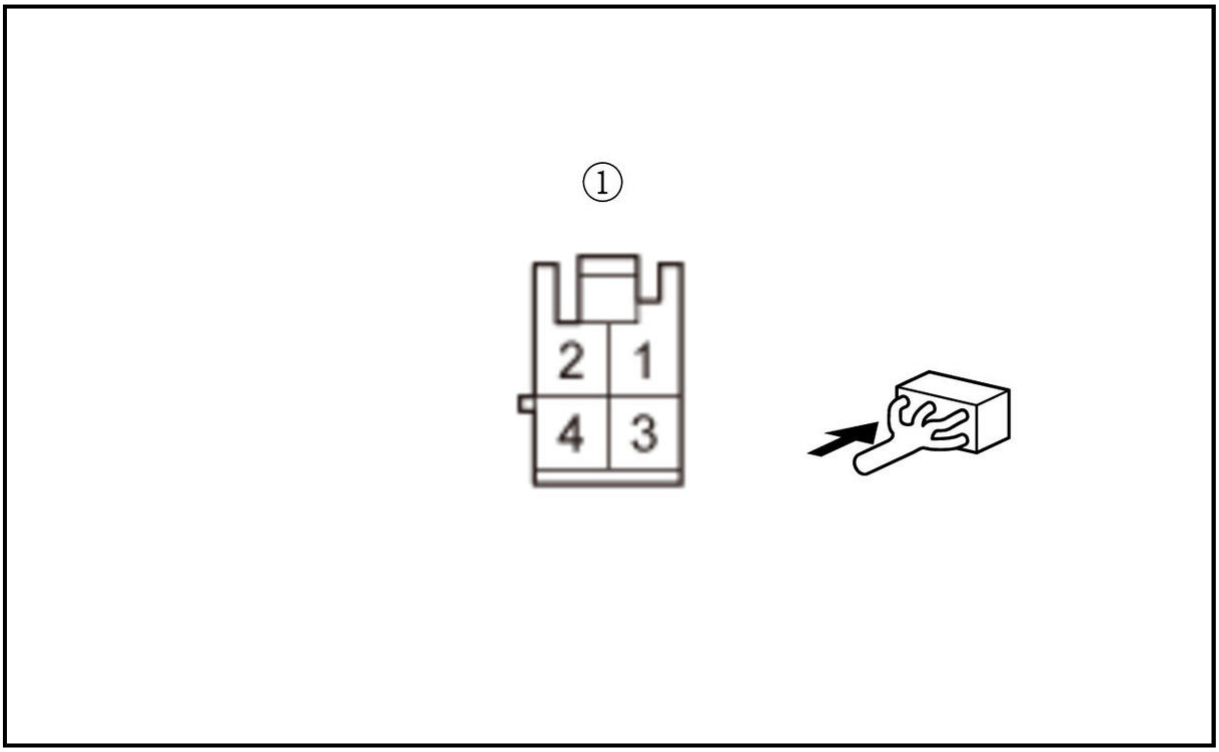
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the brake pedal position switch 4P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Brake pedal position switch 4P connector: disconnected
Test point 1	Brake pedal position switch 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

NO

Go to step 6.

5. Open wire check (BKSWNC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

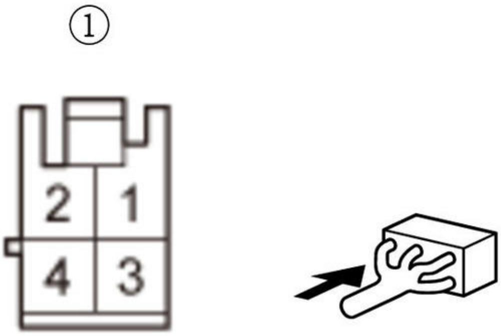
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	Brake pedal position switch 4P connector (female terminals) No. 3: ①
Terminal B	Brake pedal position switch 4P connector (female terminals) No. 4: ①



-5. Exit the SCS mode with the HDS.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Brake pedal position switch 4P connector: disconnected
	Brake pedal position switch 4P connector No. 3 and No. 4: jumped
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 49**
Test point 2	Body ground

Is there battery voltage?

YES

The BKSWNC wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the BKSWNC wire between the PCM (A49) and the brake pedal position switch.

6. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. D21 (10 A)
Location	Under-dash fuse/relay box

   Is the fuse OK?

   YES

   Repair an open in the IG1 ACG wire between the No. D21 (10 A) fuse and the brake pedal position switch.

   NO

   Replace the No. D21 (10 A) fuse. Also check for a short to ground on the No. D21 (10 A) fuse circuit if needed.

7. Brake pedal position switch signal (BKSWNC) check 2

   -1. Turn the vehicle to the ON mode.

   -2. Press the brake pedal.

   -3. Check the parameter (s) below with the HDS while pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CRUISE BRAKE SW/IDLE STOP SW	OPEN	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the brake pedal position switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   Go to step 8.

8. Brake pedal position switch check

   -1. **Test the brake pedal position switch** .

   Is the brake pedal position switch OK?

YES

The brake pedal position switch is OK. Repair a short to power in the BKSWNC wire between the PCM (A49) and the brake pedal position switch.

NO

Replace the brake pedal position switch .

DTC P0703 (2.4 L ENGINE) (2017 2018 2019)

DTC P0703 : Brake Pedal Position Switch (NC) Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the accelerator pedal is pressed with pressing the brake pedal lightly and continuously for 5 minutes or more, this DTC will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0703 Brake Pedal Position Switch (NC) Malfunction	B	B

DTC (PGM-FI)

1. Brake pedal position switch signal (BKSWNC) check 1

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS without pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CRUISE BRAKE SW/IDLE STOP SW	CLOSE	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 7.

   NO

   Go to step 2.

2. Brake pedal position switch installation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Adjust the brake pedal and the brake pedal position switch** .

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS without pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CRUISE BRAKE SW/IDLE STOP SW	CLOSE	B	B	B

Do the current condition (s) match the threshold?

YES

The failure is not duplicated.

NO

Go to step 3.

3. Determine possible failure area (brake pedal position switch, others)

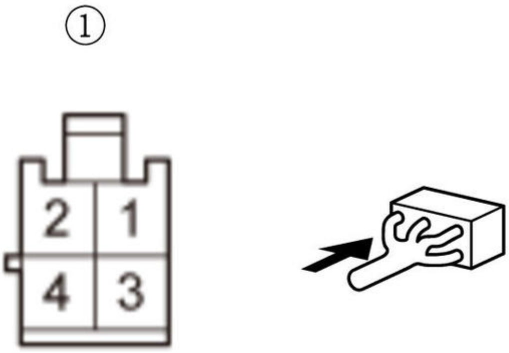
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Brake pedal position switch 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Brake pedal position switch 4P connector (female terminals) No. 3: ①
Terminal B	Brake pedal position switch 4P connector (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CRUISE BRAKE SW/IDLE STOP SW	CLOSE	B	B	B

Do the current condition (s) match the threshold?

YES

Replace the brake pedal position switch .

NO

Go to step 4.

4. Determine possible failure area (IG1 ACG line, others)

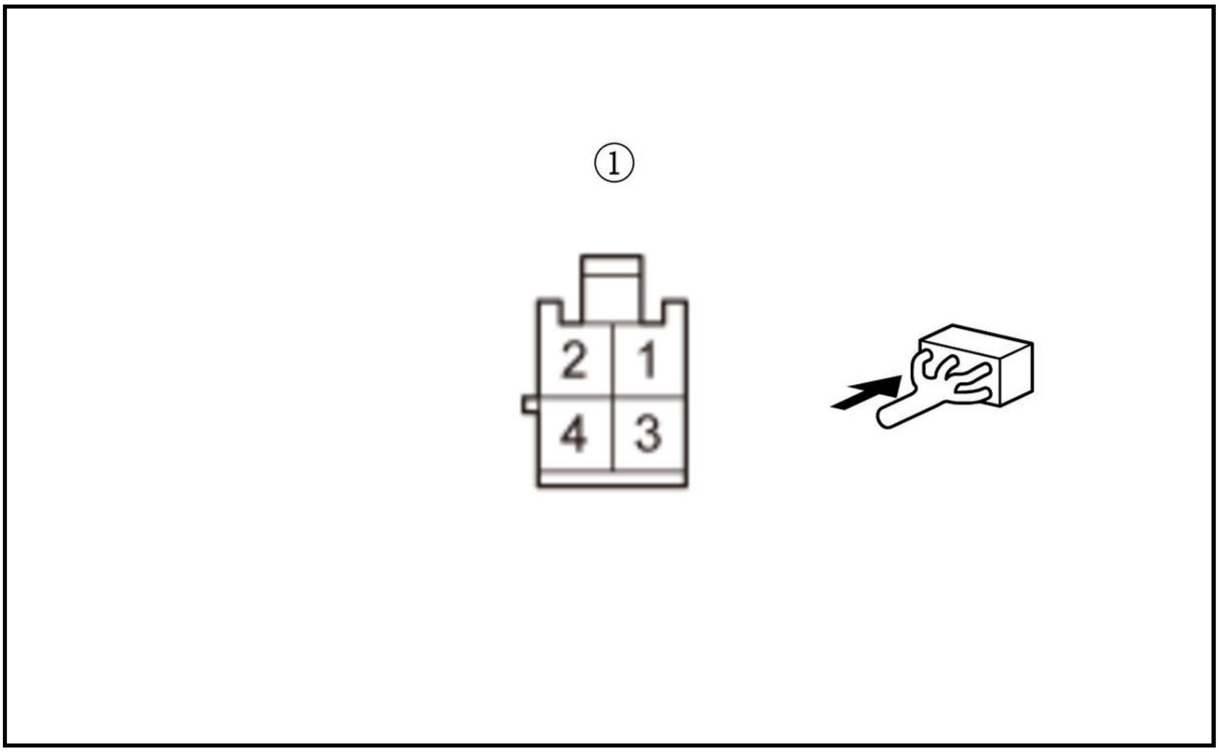
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the brake pedal position switch 4P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Brake pedal position switch 4P connector: disconnected
Test point 1	Brake pedal position switch 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 ACG wire is OK. Go to step 5.

NO

Go to step 6.

5. Open wire check (BKSWNC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

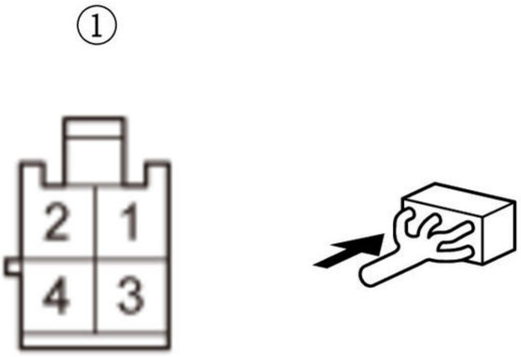
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	Brake pedal position switch 4P connector (female terminals) No. 3: ①
Terminal B	Brake pedal position switch 4P connector (female terminals) No. 4: ①



-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Brake pedal position switch 4P connector: disconnected Brake pedal position switch 4P connector No. 3 and No. 4: jumped PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 24**
Test point 2	Body ground

Is there battery voltage?

YES

The BKSWNC wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the BKSWNC wire between the PCM (A24) and the brake pedal position switch.

6. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D21 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Repair an open in the IG1 ACG wire between the No. D21 (10 A) fuse and the brake pedal position switch.

NO

Replace the No. D21 (10 A) fuse. Also check for a short to ground on the No. D21 (10 A) fuse circuit if needed.

7. Brake pedal position switch signal (BKSWNC) check 2

-1. Turn the vehicle to the ON mode.

-2. Press the brake pedal.

-3. Check the parameter (s) below with the HDS while pressing the brake pedal.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
CRUISE BRAKE SW/IDLE STOP SW	OPEN	B	B	B

Do the current condition (s) match the threshold?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the brake pedal position switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Go to step 8.

8. Brake pedal position switch check

-1. **Test the brake pedal position switch** .

Is the brake pedal position switch OK?

YES

The brake pedal position switch is OK. Repair a short to power in the BKSWNC wire between the PCM (A24) and the brake pedal position switch.

NO

Replace the brake pedal position switch .

DTC P0705 (CVT (ECM/PCM))

DTC P0705 : Transmission Range Switch Multiple Shift Position Input

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0705 Transmission Range Switch Multiple Shift Position Input	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Compare the transmission range switch signal inputs with the HDS to the following table, in each shift lever position.

Signal	Threshold						Current conditions	
	P	R	N	D	S	L	Values	Unit
A/T P Switch	ON	OFF	OFF	OFF	OFF	OFF	B	B
A/T R Switch	OFF	ON	OFF	OFF	OFF	OFF	B	B
A/T N Switch	OFF	OFF	ON	OFF	OFF	OFF	B	B
A/T D Switch	OFF	OFF	OFF	ON	OFF	OFF	B	B

Signal	Threshold						Current conditions	
	P	R	N	D	S	L	Values	Unit
A/T S Switch	OFF	OFF	OFF	OFF	ON	OFF	B	B
A/T L Switch	OFF	OFF	OFF	OFF	OFF	ON	B	B
ATP-FWD	OFF	OFF	OFF	ON	ON	ON	B	B
ATP-RVS	OFF	ON	OFF	OFF	OFF	OFF	B	B

   Do the transmission range switch signals match?

   YES

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   NO

   The failure is duplicated. Go to step 2.

2. Transmission range switch signal check

-1. Compare the transmission range switch signal inputs with the HDS to the following table, in each shift lever position.

Signal	Threshold						Current conditions	
	P	**R**	**N**	**D**	**S**	**L**	**Values**	**Unit**
A/T P Switch	ON	OFF	OFF	OFF	OFF	OFF	B	B
A/T R Switch	OFF	ON	OFF	OFF	OFF	OFF	B	B
A/T N Switch	OFF	OFF	ON	OFF	OFF	OFF	B	B
A/T D Switch	OFF	OFF	OFF	ON	OFF	OFF	B	B
A/T S Switch	OFF	OFF	OFF	OFF	ON	OFF	B	B
A/T L Switch	OFF	OFF	OFF	OFF	OFF	ON	B	B
ATP-FWD	OFF	OFF	OFF	ON	ON	ON	B	B
ATP-RVS	OFF	ON	OFF	OFF	OFF	OFF	B	B

Is any transmission ranges switch signals ON in all shift lever positions?

YES

Go to step 4.

NO

Records the abnormal circuit, then go to step 3.

3. Transmission range switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

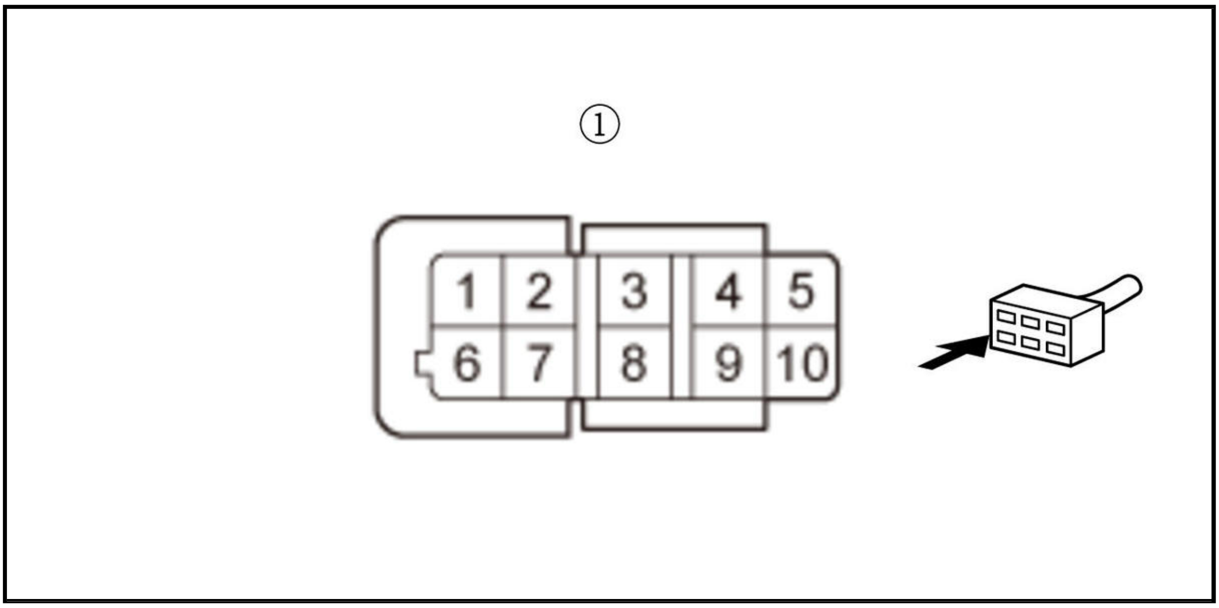
-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Connect the transmission range switch connector terminal that incorrectly indicates ON in step 2 to body ground with a jumper wire.

Signal	Transmission range switch 10P connector (female terminals) : ①
	Terminal number
A/T P Switch	5
A/T R Switch	4
A/T N Switch	9
A/T D Switch	3
A/T S Switch	8
A/T L Switch	2
Forward Switch	6

Signal	Transmission range switch 10P connector (female terminals) : ①
	Terminal number
Reverse Switch	10



-4. Turn the vehicle to the ON mode.

-5. Compare the transmission range switch signal inputs with the HDS.

Signal	Current conditions	
	Values	Unit
A/T P Switch	B	B
A/T R Switch	B	B
A/T N Switch	B	B
A/T D Switch	B	B
A/T S Switch	B	B
A/T L Switch	B	B
Forward Switch	B	B
Reverse Switch (ATPRVS)	B	B

Do multiple transmission range switch signals indicate ON?

YES

The transmission range switch is OK. Repair a short in the wires between the corresponding transmission range switch connector terminal and the PCM. Refer to the following table.

B	ATP P	ATP R	ATP N	ATP D	ATP S	ATP L	ATP FWD	ATP RVS
PCM	C34	C27	C24	C25	C43	C44	C26	C23
Transmission range switch	5	4	9	3	8	2	6	10

NO

Replace the transmission range switch .

4. Transmission range switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Turn the vehicle to the ON mode.

-4. Check the transmission range switch signal input that remained ON with the HDS.

Signal	Current conditions	
	Values	**Unit**
A/T P Switch	B	B
A/T R Switch	B	B

Signal	Current conditions	
	Values	**Unit**
A/T N Switch	B	B
A/T D Switch	B	B
A/T S Switch	B	B
A/T L Switch	B	B
Forward Switch	B	B
Reverse Switch (ATPRVS)	B	B

Do any transmission range switch signals remain ON?

YES

The transmission range switch is OK. Go to step 5.

NO

Replace the transmission range switch .

5. Shorted wire check (corresponding line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

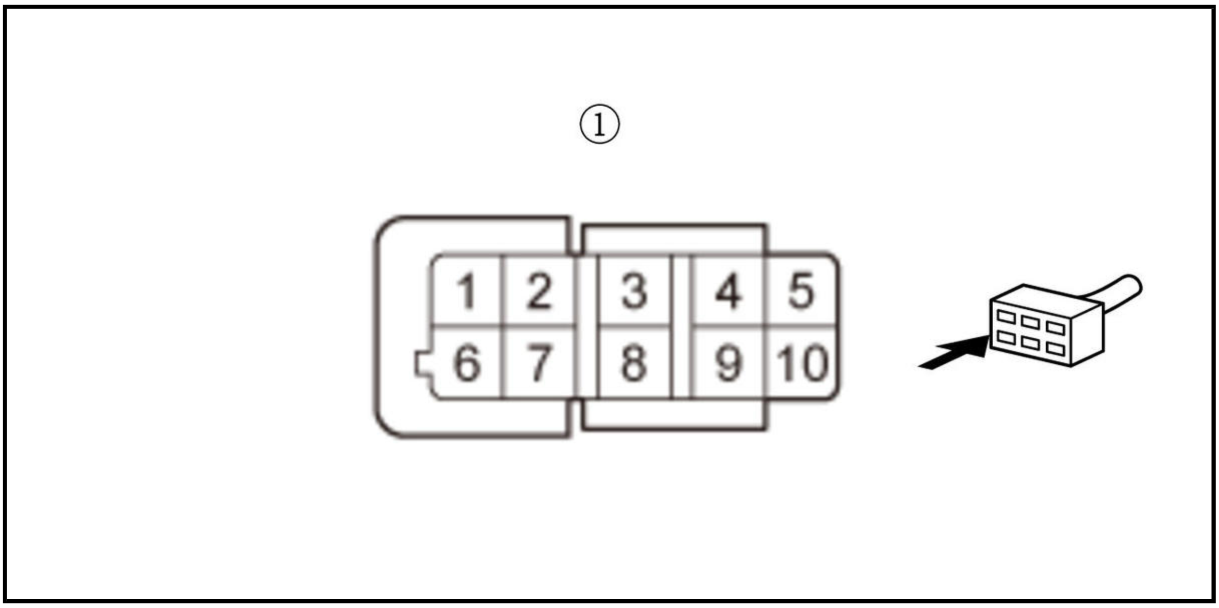
NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between the connector terminal on the circuit that remained ON in step 4 and body ground; refer to the following table.

Signal	Transmission range switch 10P connector (female terminals) : ①
	Terminal number
A/T P Switch	5
A/T R Switch	4
A/T N Switch	9
A/T D Switch	3
A/T S Switch	8
A/T L Switch	2
Forward Switch	6
Reverse Switch	10



Does the circuit that indicated ON have continuity to body ground?

YES

Repair a short to body ground in the wire between the corresponding transmission range switch connector terminal and the PCM.

NO

The wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

DTC P0706 (CVT (ECM/PCM))

DTC P0706 : Transmission Range Switch Open

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0706 Transmission Range Switch Open	B	B	B

DTC (CVT)

1. Problem verification

-1. **Make sure the shift cable is properly adjusted** .

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h), then slow down to 6 mph (10 km/h).

-5. Turn the engine off. Repeat the test-drive in step 1-4 again.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0706 Transmission Range Switch Open	B	B	B

Is DTC P0706 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission range switch check

-1. **Do the transmission range switch test** .

Is the transmission range switch OK?

YES

The transmission range switch is OK. Go to step 3.

NO

Check for proper transmission range switch installation, then recheck. If the transmission range switch installation is OK, **replace the transmission range switch** .

3. Open wire check (FWD line)

-1. Turn the vehicle to the OFF (LOCK) mode.

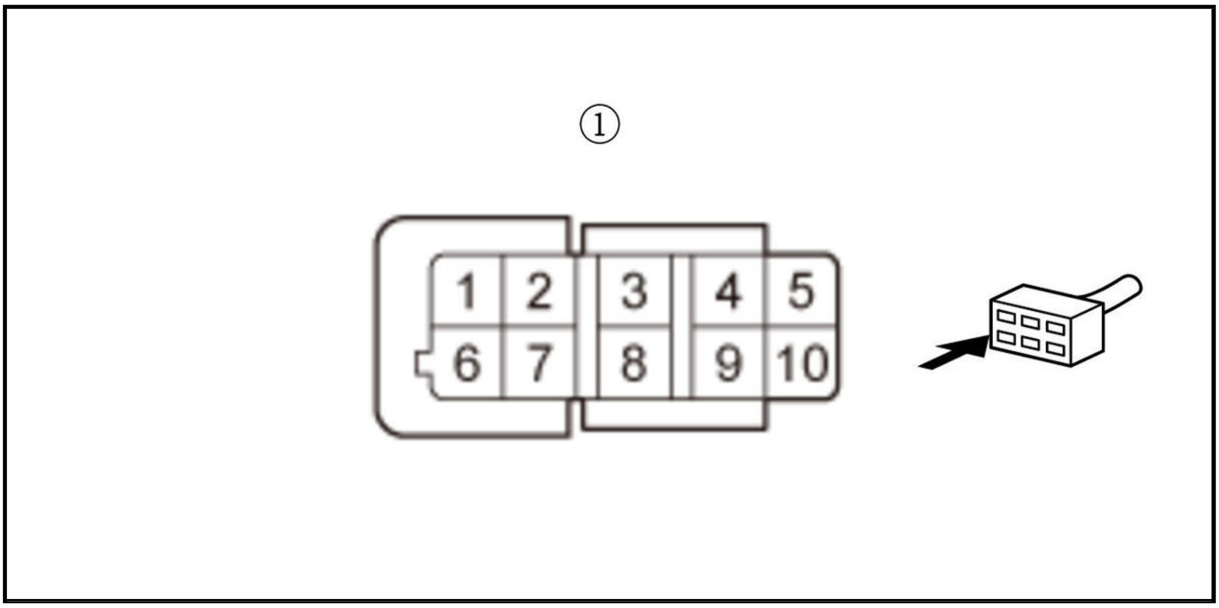
-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Transmission range switch 10P connector: disconnected
Test point 1	Transmission range switch 10P connector (female terminals) No. 6 : ①
Test point 2	Body ground



Is there voltage?

YES

The FWD wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the FWD wire between the transmission range switch and the PCM.

DTC P0710 (CVT (ECM/PCM)) (2018 2019 2020 2021)

DTC P0712 : CVT Fluid Temperature Sensor (Short)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0710 CVT Fluid Temperature Sensor (Out of Range)	B	B	B

DTC (CVT)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for other Pending or Confirmed DTCs indicated along with DTC P0710 with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0712 CVT Fluid Temperature Sensor (Short)	B	B	B
P0713 CVT Fluid Temperature Sensor (Open)	B	B	B

Are there other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 2.

2. Problem verification

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
CVTF Temp Sensor (V)	0.05-0.09	V	B	B
	4.83-4.92	V	B	B

Do the current condition (s) match the threshold?

YES (0.05-0.09 V)

Go to step 3.

YES (4.83-4.92 V)

Go to step 5.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid temperature sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

3. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Solenoid wire harness A 8P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
CVTF Temp Sensor (V)	Less than 0.09	V	B	B

Do the current condition (s) match the threshold?

YES

The transmission fluid temperature sensor is OK. Go to step 4.

NO

Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

4. Shorted wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 37**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the TATF wire between solenoid wire harness A and the PCM.

NO

The TATF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If this DTC goes away and the PCM was substituted, **replace the original PCM** .

5. Determine possible failure area (TATF line, others)

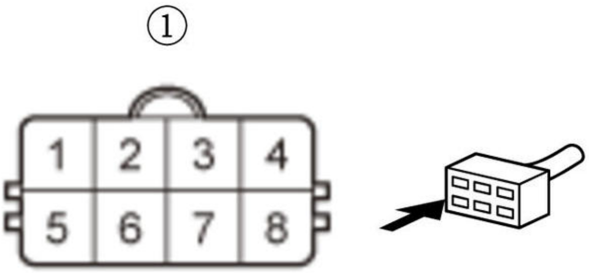
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Solenoid wire harness A 8P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Solenoid wire harness A 8P connector (female terminals) No. 7: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 6.

NO

Go to step 7.

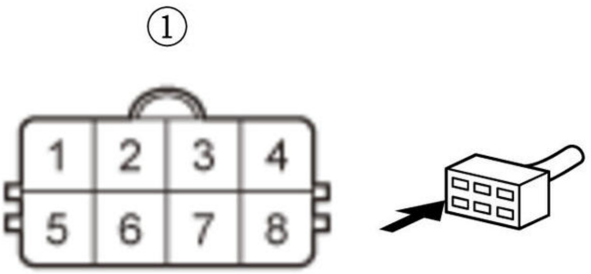
6. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Solenoid wire harness A 8P connector (female terminals) No. 6: ①
Terminal B	Solenoid wire harness A 8P connector (female terminals) No. 7: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

Do the current condition (s) match the threshold?

YES

Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

NO

The transmission fluid temperature sensor is OK. Repair an open in the SG2 wire between solenoid wire harness A and the PCM.

7. Open wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

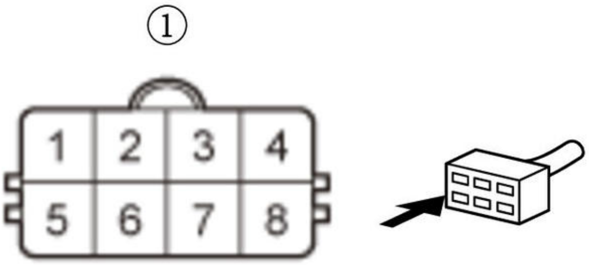
NOTE: This step must be done to protect the PCM from damage.

-4. Disconnect the following connector.

PCM connector C (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 7: ①
Test point 2	**PCM connector C (51P) No. 37**



Is there continuity?

YES

The TATF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If this DTC goes away and the PCM was substituted, **replace the original PCM** .

NO

Repair an open in the TATF wire between solenoid wire harness A and the PCM.

DTC P0712 (CVT (ECM/PCM))

DTC P0712 : CVT Fluid Temperature Sensor (Short)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .

- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0712 CVT Fluid Temperature Sensor (Short)	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for an intermittent short to ground in the TATF wire between the transmission fluid temperature sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission fluid temperature sensor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Solenoid wire harness A 8P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The transmission fluid temperature sensor is OK. Go to step 3.

   NO

   Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

3. Shorted wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 37**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the TATF wire between the solenoid wire harness A and the PCM.

NO

The TATF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

DTC P0713 (CVT (ECM/PCM))

DTC P0713 : CVT Fluid Temperature Sensor (Open)

NOTE:

- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.
- Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0713 CVT Fluid Temperature Sensor (Open)	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	More than 4.93	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for an intermittent short to ground in the TATF wire between the transmission fluid temperature sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TATF line, others)

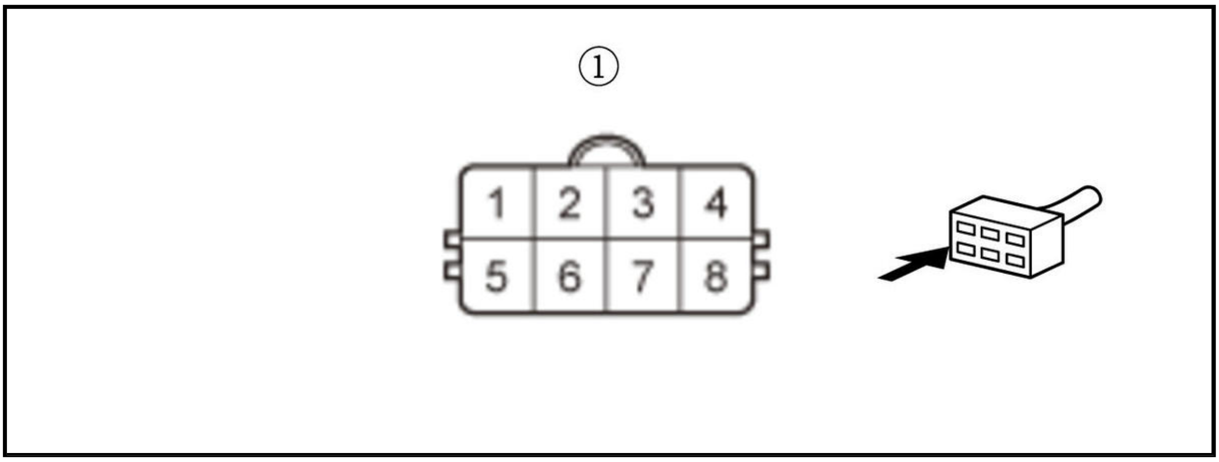
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Solenoid wire harness A 8P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Solenoid wire harness A 8P connector (female terminals) No. 7 : ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

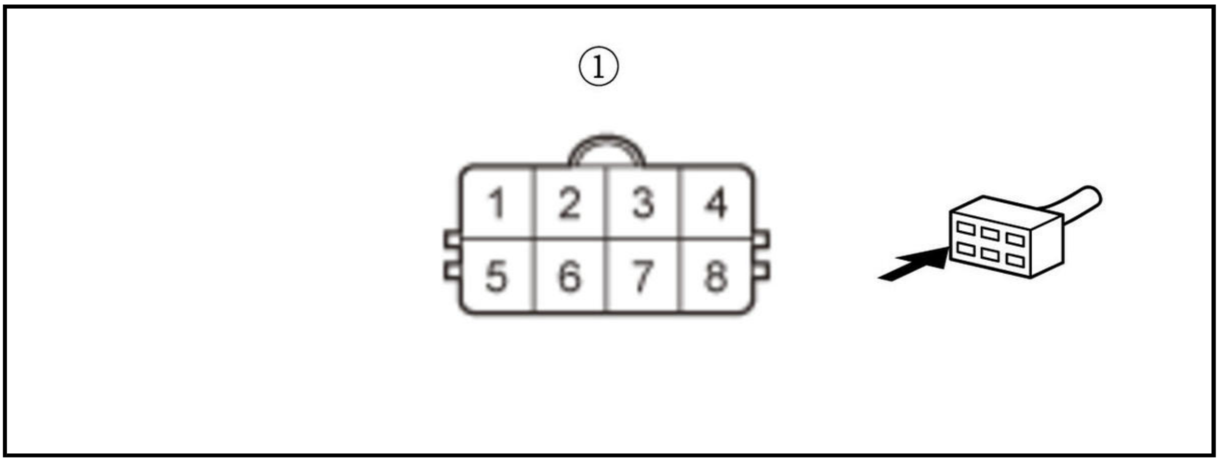
3. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Solenoid wire harness A 8P connector (female terminals) No. 6 : ①
Terminal B	Solenoid wire harness A 8P connector (female terminals) No. 7 : ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

Do the current condition (s) match the threshold?

YES

Faulty transmission fluid temperature sensor. Replace solenoid wire harness A .

NO

The transmission fluid temperature sensor is OK. Repair an open in the SG2 wire between the solenoid wire harness A and the PCM.

4. Open wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

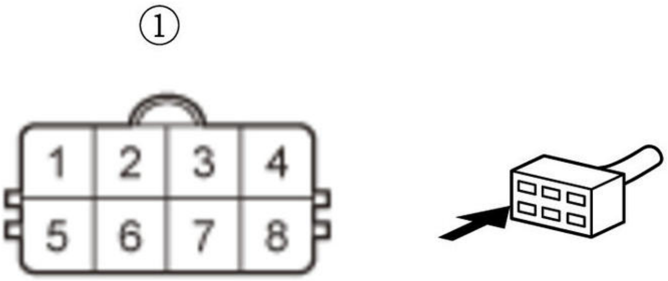
-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected

Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 7 : ①
Test point 2	PCM connector C (51P) No. 37



Is there continuity?

YES

The TATF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or replace the original PCM .

NO

Repair an open in the TATF wire between the solenoid wire harness A and the PCM.

DTC P0716 (CVT (ECM/PCM))

DTC P0716 : CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit Range/Performance / Input/Turbine Speed Sensor A Circuit Range/Performance

NOTE:

- Before you troubleshoot, review the General Troubleshooting Information .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0716 CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit Range/Performance / Input/Turbine Speed Sensor A Circuit Range/Performance	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

-4. Start the engine.

-5. **Enter the VSA maintenance mode** .

-6. Test-drive the vehicle at speeds over 19 mph (30 km/h) for at least 30 seconds. Slow down, and stop the wheels.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0716 CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit Range/Performance / Input/Turbine Speed Sensor A Circuit Range/Performance	B	B	B

Is DTC P0716 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the torque converter turbine speed sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque converter turbine speed sensor check

-1. Rotate the front wheels with the shift lever in D, while monitoring the Torque Converter Turbine Speed rpm and the Input Shaft (Drive Pulley) Speed rpm in the Data List with the HDS.

-2. Compare the parameters below with the HDS.

Signal	Current conditions	
	Values	Unit
Torque Converter Turbine Speed	B	B
Input Shaft (Drive Pulley) Speed rpm	B	B

Are the speeds about the same?

YES

The torque converter turbine speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Replace the torque converter turbine speed sensor .

DTC P0717 (CVT (ECM/PCM))

DTC P0717 : CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit No Signal / Input/Turbine Speed Sensor A Circuit No Signal

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0717 CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit No Signal / Input/Turbine Speed Sensor A Circuit No Signal	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

   -4. Start the engine.

   -5. Enter the VSA maintenance mode .

   -6. Test-drive the vehicle at speeds over 19 mph (30 km/h) for at least 30 seconds. Slow down, and stop the wheels.

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0717 CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit No Signal / Input/Turbine Speed Sensor A Circuit No Signal	B	B	B

   Is DTC P0717 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the torque converter turbine speed sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (NT line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

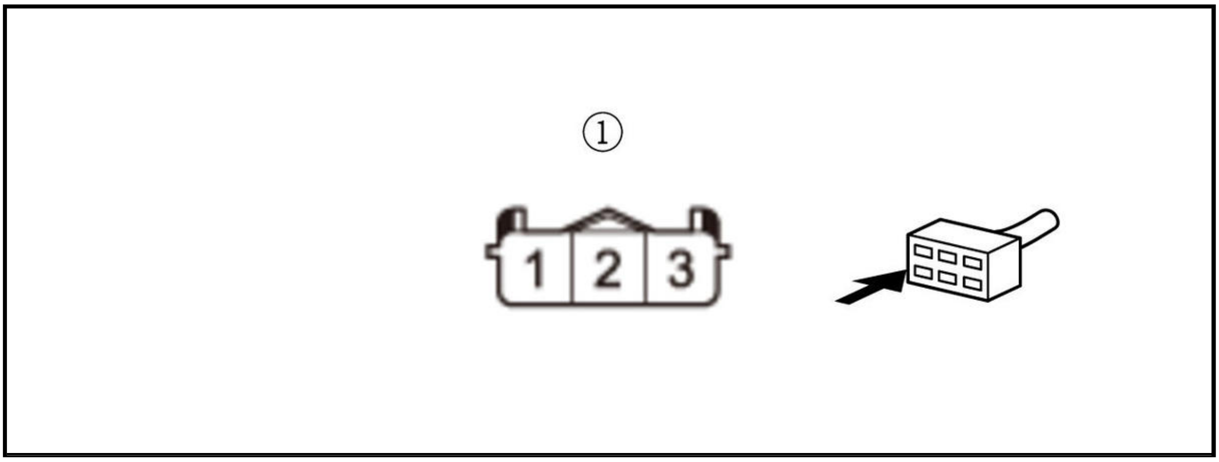
Torque converter turbine speed sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Torque converter turbine speed sensor 3P connector: disconnected

Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 3.

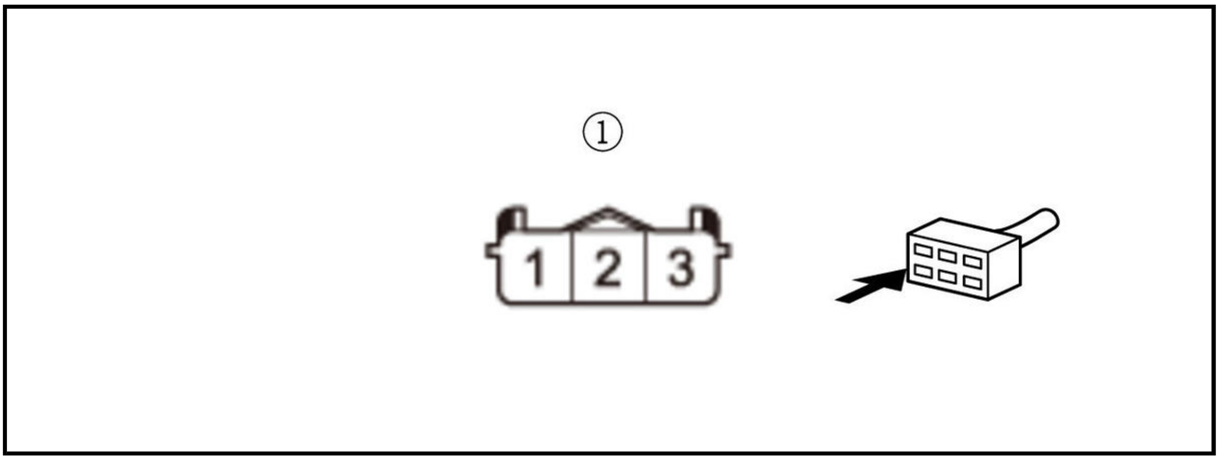
NO

Go to step 5.

3. Open wire check (VCC2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Torque converter turbine speed sensor 3P connector: disconnected
Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 4.

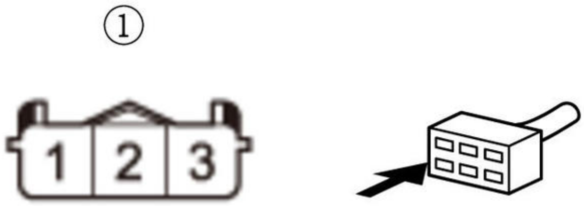
NO

Repair an open in the VCC2 wire between the torque converter turbine speed sensor and the PCM.

4. Torque converter turbine speed sensor check

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Torque converter turbine speed sensor 3P connector: disconnected
Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	Torque converter turbine speed sensor 3P connector (female terminals) No. 3 : ①



Is there about 5 V?

YES

Replace the torque converter turbine speed sensor .

NO

Repair an open in the SG2 wire between the torque converter turbine speed sensor and the PCM.

5. Shorted wire check (NT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

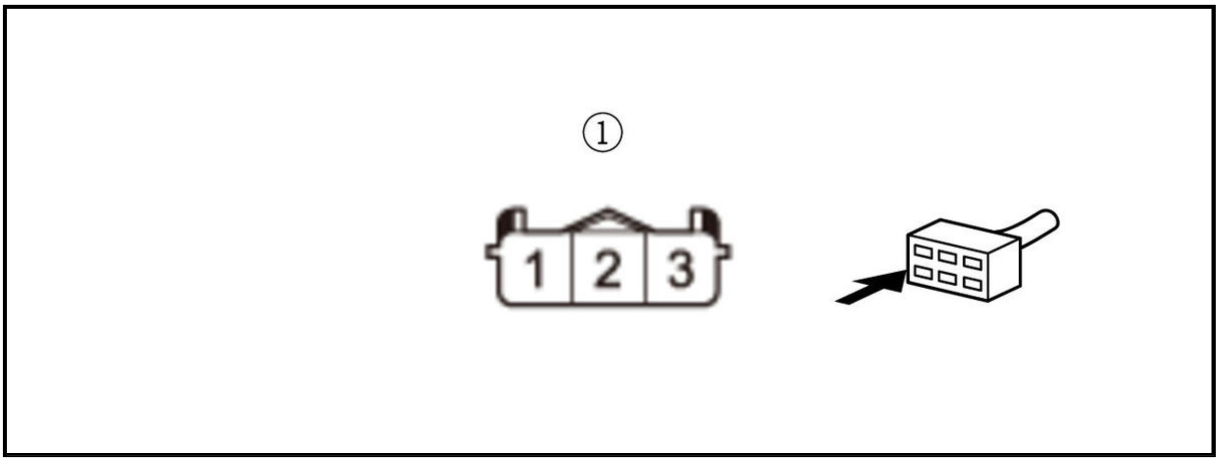
-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Torque converter turbine speed sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the NT wire between the torque converter turbine speed sensor and the PCM.

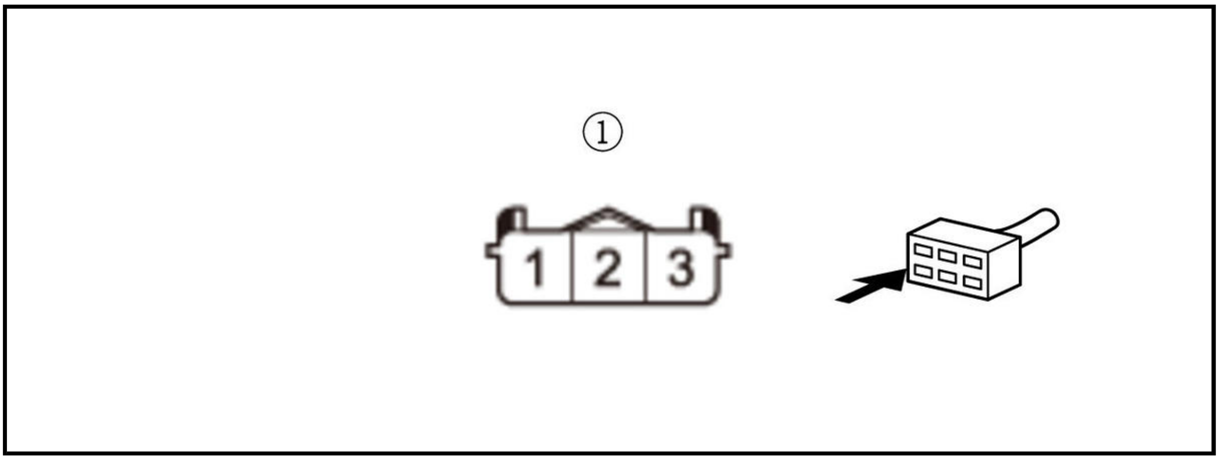
NO

The NT wire is not shorted. Go to step 6.

6. Open wire check (NT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque converter turbine speed sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	**PCM connector C (51P) No. 21**



Is there continuity?

YES

The NT wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the NT wire between the torque converter turbine speed sensor and the PCM.

DTC P0741 (CVT (ECM/PCM))

DTC P0741 : Torque Converter Clutch Circuit Performance or Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0741 Torque Converter Clutch Circuit Performance or Stuck OFF	B	B	B

DTC (CVT)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine in P position/mode, shift the transmission to N position/mode, then to D position/mode while pressing the brake pedal. Release the brake pedal, start off in D position/mode, and test-drive the vehicle at speeds about 37 mph (60 km/h) on a flat road for at least 1 minute. Slow down and stop the vehicle, and turn the engine off.

-4. Repeat the test-drive in step 1-3 again.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0741 Torque Converter Clutch Circuit Performance or Stuck OFF	B	B	B

Is DTC P0741 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shift solenoid valve B check

-1. **Do the shift solenoid valve B test** .

Does the shift solenoid valve B work properly?

YES

Shift solenoid valve B is OK. Go to step 3.

NO

Faulty shift solenoid valve B. **Replace the valve body assembly** .

3. CVT lock-up clutch control solenoid valve check

-1. **Do the CVT lock-up clutch control solenoid valve test** .

Does the CVT lock-up clutch control solenoid valve work properly?

YES

The CVT lock-up clutch control solenoid valve is OK. **Replace the transmission** , or the torque converter.

NO

Faulty CVT lock-up clutch control solenoid valve. **Replace the valve body assembly** .

DTC P0746 (CVT (ECM/PCM))

DTC P0746 : CVT Drive Pulley Pressure Control Solenoid Valve Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0746 CVT Drive Pulley Pressure Control Solenoid Valve Stuck OFF	B	B	B

DTC (CVT)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle. Then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

-4. Turn the engine off. Repeat the test-drive in step 1-3 again.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0746 CVT Drive Pulley Pressure Control Solenoid Valve Stuck OFF	B	B	B

Is DTC P0746 indicated?

YES

The failure is duplicated. Faulty CVT drive pulley pressure control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0777 (CVT (ECM/PCM))

DTC P0777 : CVT Driven Pulley Pressure Control Solenoid Valve Stuck ON

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0777 CVT Driven Pulley Pressure Control Solenoid Valve Stuck ON	B	B	B

DTC (CVT)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle. Then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

   -4. Turn the engine off. Repeat the test-drive in step 1-3 again.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0777 CVT Driven Pulley Pressure Control Solenoid Valve Stuck ON	B	B	B

   Is DTC P0777 indicated?

   YES

   The failure is duplicated. Faulty CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0780 (CVT (ECM/PCM))

DTC P0780 : Shift Error

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is stored whenever DTCs P1898 and P1899 are detected.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B

DTC (CVT)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle. Then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

-4. Turn the engine off. Repeat the test-drive in step 1-3 again.

-5. Check for other Pending or Confirmed DTCs indicated along with DTC P0780 with the HDS.

NOTE: P0780 means there is one or more CVT DTCs regarding the shift control system.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B
P1898 CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF	B	B	B
P1899 CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON	B	B	B

Are there other DTCs?

1. **YES**

   Go to the indicated DTC's troubleshooting.

   - **P1898**
   - **P1899**

   NO

   There are no DTCs along with DTC P0780. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

DTC P0792 (CVT (ECM/PCM))

DTC P0792 : Intermediate Shaft Speed Sensor A Circuit Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0792 Intermediate Shaft Speed Sensor A Circuit Range/Performance	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

-4. Start the engine.

-5. **Enter the VSA maintenance mode** .

-6. Test-drive the vehicle with the shift lever in D position/mode, and keep the vehicle at speeds over 19 mph (30 km/h) for at least 30 seconds. Slow down and stop the wheels.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0792 Intermediate Shaft Speed Sensor A Circuit Range/Performance	B	B	B

Is DTC P0792 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the PCM and the CVT drive pulley speed sensor. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT drive pulley speed sensor check

-1. Rotate the front wheels with the shift lever in D, while monitoring the Input Shaft (Drive Pulley) Speed rpm and the Torque Converter Turbine Speed rpm in the Data List with the HDS.

-2. Compare the parameters below with the HDS.

Signal	Current conditions	
	Values	Unit
Input Shaft (Drive Pulley) Speed rpm	B	B
Torque Converter Turbine Speed	B	B

Are the speeds about the same?

YES

The CVT drive pulley speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Replace the CVT drive pulley speed sensor .

DTC P0793 (CVT (ECM/PCM))

DTC P0793 : Intermediate Shaft Speed Sensor A Circuit No Signal

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0793 Intermediate Shaft Speed Sensor A Circuit No Signal	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

   -4. Start the engine.

   -5. **Enter the VSA maintenance mode** .

   -6. Test-drive the vehicle with the shift lever in D position/mode, and keep the vehicle at speeds over 19 mph (30 km/h) for at least 30 seconds. Slow down and stop the wheels.

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0793 Intermediate Shaft Speed Sensor A Circuit No Signal	B	B	B

   Is DTC P0793 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the PCM and the CVT drive pulley speed sensor. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (NDR DD line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

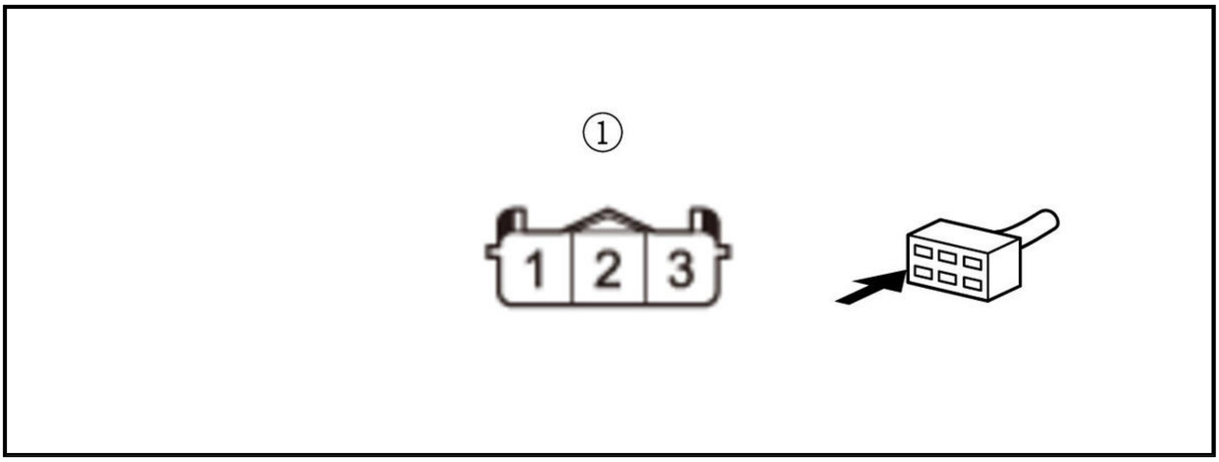
   -2. Disconnect the following connector.

CVT drive pulley speed sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT drive pulley speed sensor 3P connector: disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 3.

NO

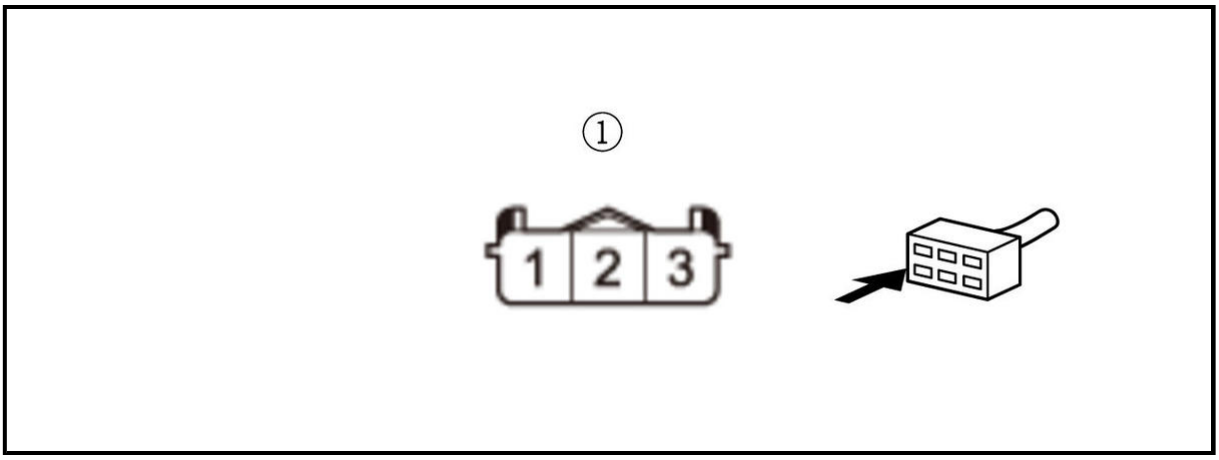
Go to step 5.

3. Open wire check (VCC1 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT drive pulley speed sensor 3P connector: disconnected

Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 4.

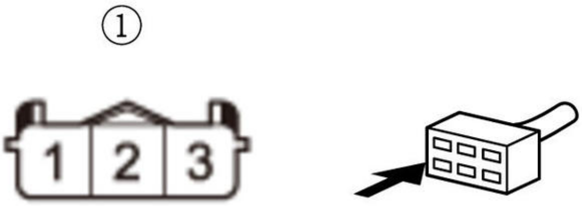
NO

Repair an open in the VCC1 wire between the CVT drive pulley speed sensor and the PCM.

4. CVT drive pulley speed sensor check

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT drive pulley speed sensor 3P connector: disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	CVT drive pulley speed sensor 3P connector (female terminals) No. 3 : ①



Is there about 5 V?

YES

Replace the CVT drive pulley speed sensor .

NO

Repair an open in the SG1 wire between the CVT drive pulley speed sensor and the PCM.

5. Shorted wire check (NDR DD line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

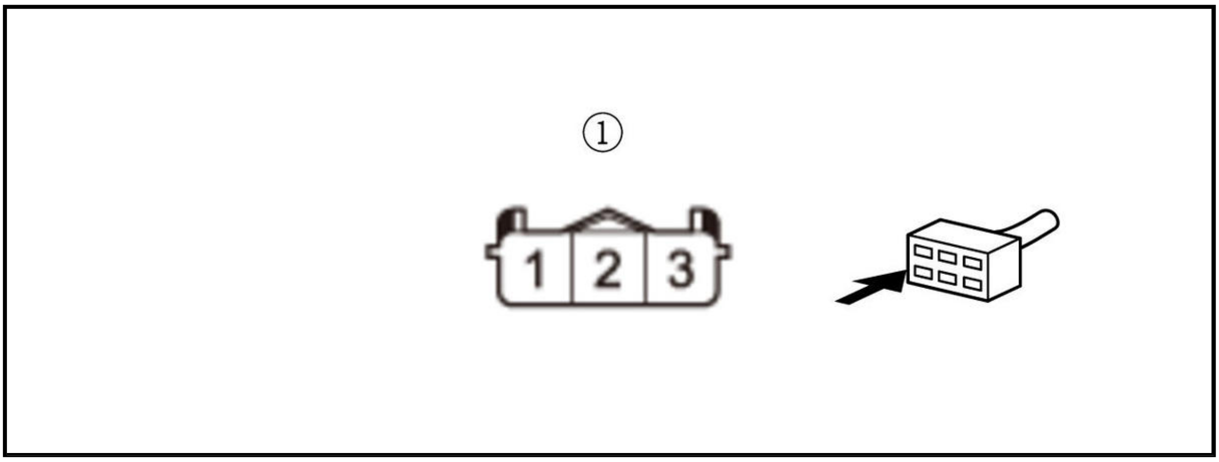
NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley speed sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the NDR DD wire between the CVT drive pulley speed sensor and the PCM.

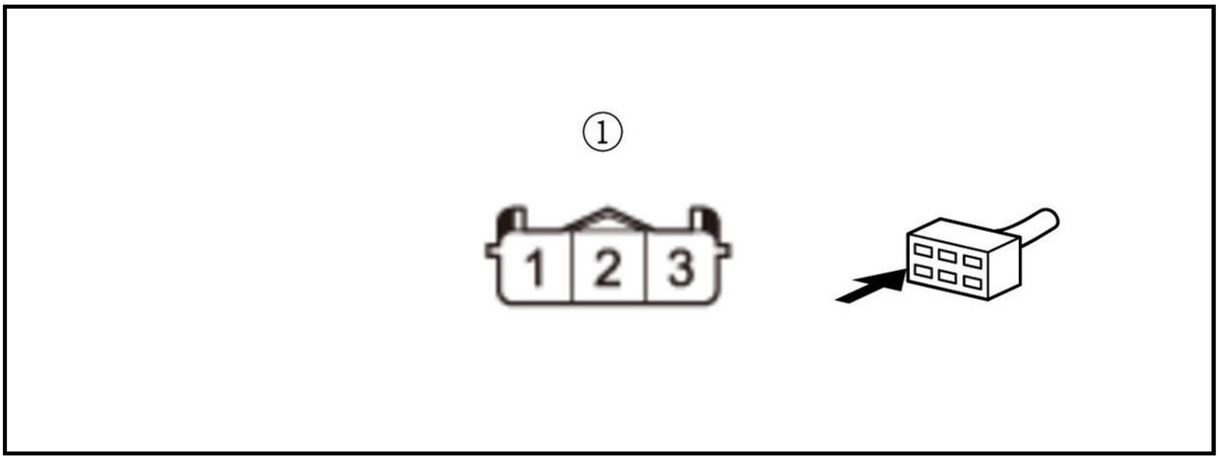
NO

The NDR DD wire is not shorted. Go to step 6.

6. Open wire check (NDR DD line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley speed sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	PCM connector C (51P) No. 33



Is there continuity?

YES

The NDR DD wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or replace the original PCM .

NO

Repair an open in the NDR DD wire between the CVT drive pulley speed sensor and the PCM.

DTC P0796 (CVT (ECM/PCM))

DTC P0796 : Pressure Control Solenoid Valve C Performance or Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0796 Pressure Control Solenoid Valve C Performance or Stuck OFF	B	B	B

DTC (CVT)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Start the engine in P position/mode. Shift the transmission to N position/mode, then to D position/mode while pressing the brake pedal, and wait for at least 30 seconds.

    -4. Turn the engine off. Repeat the shift lever operational mode in step 1-3 again.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0796 Pressure Control Solenoid Valve C Performance or Stuck OFF	B	B	B

    Is DTC P0796 indicated?

    YES

    The failure is duplicated. Faulty CVT clutch pressure control solenoid valve. **Replace the valve body assembly** .

    NO

    Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0797 (CVT (ECM/PCM))

DTC P0797 : Pressure Control Solenoid Valve C Stuck ON

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0797 Pressure Control Solenoid Valve C Stuck ON	B	B	B

DTC (CVT)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

-3. With the brake pedal pressed, do the following operational mode of the shift lever five times:

- Start the engine in P position/mode.
- Shift the transmission to N position/mode, then to D position/mode.
- Shift the transmission to N position/mode, and wait for at least 2 seconds.
- Shift the transmission to D position/mode.

-4. Turn the engine off. Repeat the shift lever operational mode in step 1-3 five times.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0797 Pressure Control Solenoid Valve C Stuck ON	B	B	B

Is DTC P0797 indicated?

YES

The failure is duplicated. Faulty CVT clutch pressure control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0842 (CVT (ECM/PCM))

DTC P0842 : Transmission Fluid Pressure Sensor/Switch A Circuit Low

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0842 Transmission Fluid Pressure Sensor/Switch A Circuit Low	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Driven Pulley Pressure Sensor (V)	Less than 0.21	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for an intermittent short to ground in the PDN wire between the CVT driven pulley pressure sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (PDN line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

CVT driven pulley pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
Driven Pulley Pressure Sensor (V)	Less than 0.21	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (PDN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

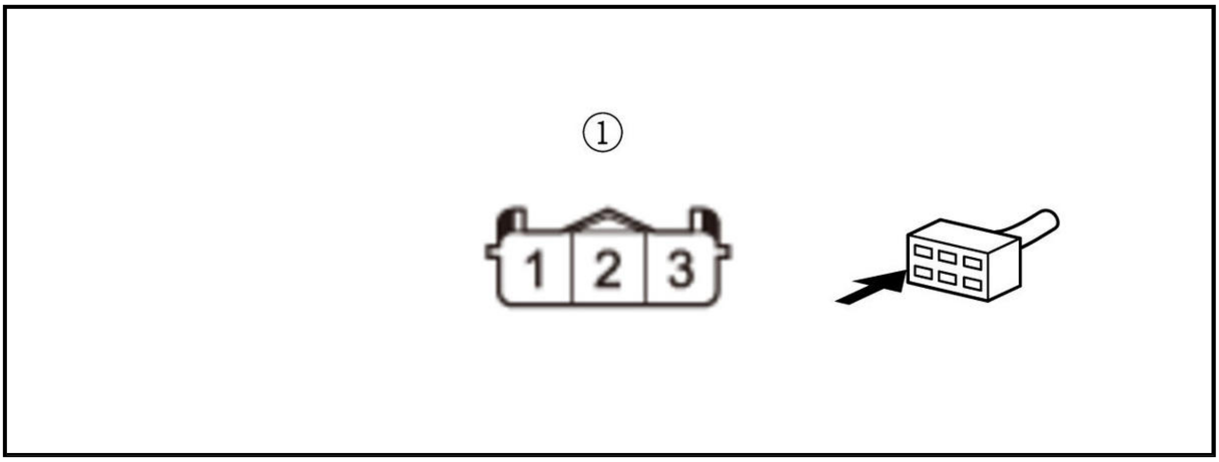
NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 2 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the PDN wire between the CVT driven pulley pressure sensor and the PCM.

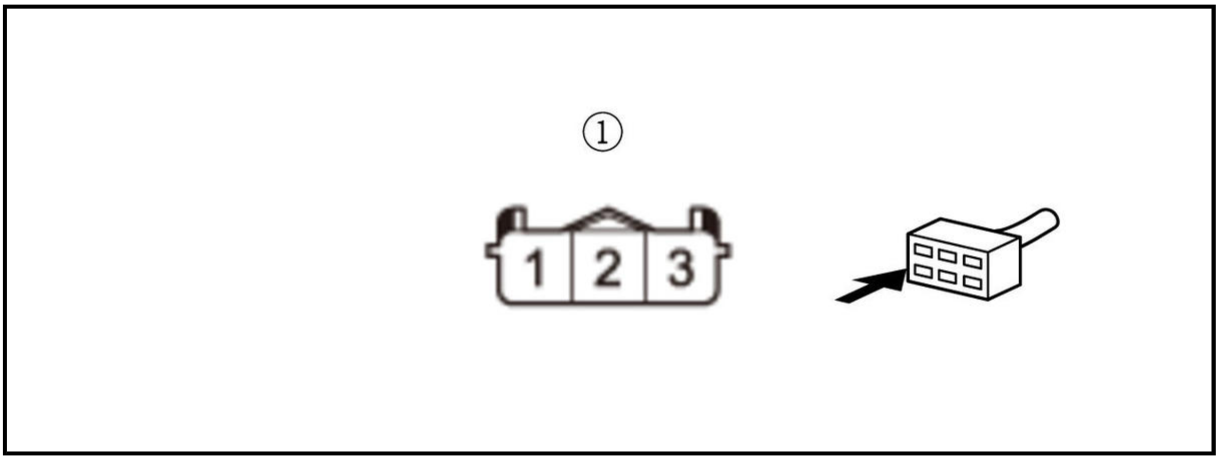
NO

The PDN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

4. Open wire check (VCC2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT driven pulley pressure sensor 3P connector: disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

The VCC2 wire is OK. **Replace the CVT driven pulley pressure sensor** .

NO

Repair an open in the VCC2 wire between the CVT driven pulley pressure sensor and the PCM.

DTC P0843 (CVT (ECM/PCM))

DTC P0843 : Transmission Fluid Pressure Sensor/Switch A Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0843 Transmission Fluid Pressure Sensor/Switch A Circuit High	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Driven Pulley Pressure Sensor (V)	More than 4.84	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT driven pulley pressure sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (PDN line, others)

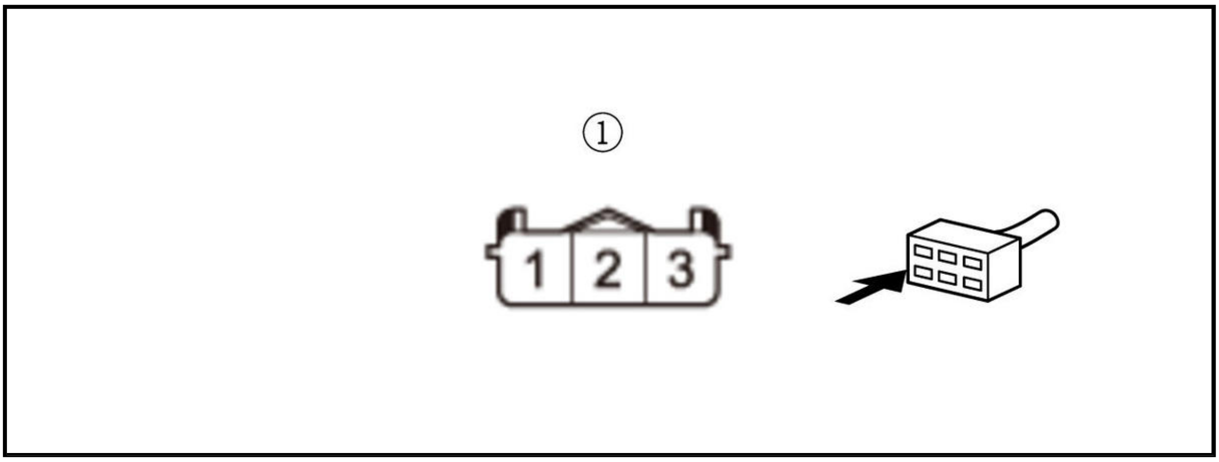
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

CVT driven pulley pressure sensor 3P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	CVT driven pulley pressure sensor 3P connector (female terminals) No. 1 : ①
Terminal B	CVT driven pulley pressure sensor 3P connector (female terminals) No. 2 : ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Driven Pulley Pressure Sensor (V)	More than 4.84	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

3. Open wire check (PDN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

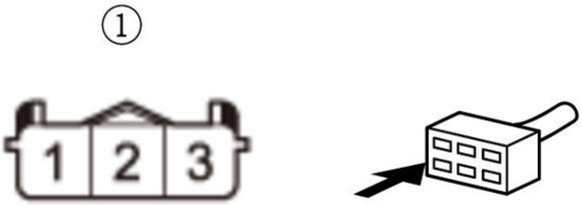
NOTE: This step must be done to protect the PCM from damage.

-4. Disconnect the following connector.

PCM connector C (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure sensor 3P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 2 : ①
Test point 2	**PCM connector C (51P) No. 49**



Is there continuity?

YES

The PDN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the PDN wire between the CVT driven pulley pressure sensor and the PCM.

4. CVT driven pulley pressure sensor check

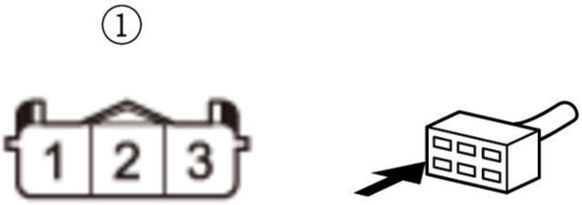
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT driven pulley pressure sensor 3P connector: disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 1 : ①
Test point 2	CVT driven pulley pressure sensor 3P connector (female terminals) No. 3 : ①



Is there about 5 V?

YES

Replace the CVT driven pulley pressure sensor .

NO

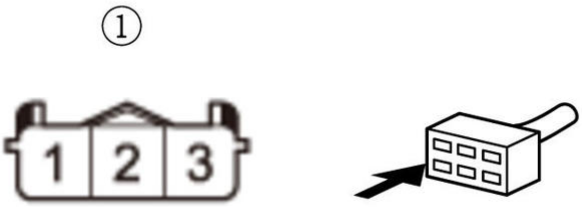
Go to step 5.

5. Power supply circuit check

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

B	CVT driven pulley pressure sensor 3P connector: disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Repair an open in the SG2 wire between the CVT driven pulley pressure sensor and the PCM.

NO

Repair an open in the VCC2 wire between the CVT driven pulley pressure sensor and the PCM.

DTC P0864 (1.5 L ENGINE)

DTC P0864 : PT-CAN Malfunction (PCM-Transmission Control Module (TCM))

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- According to the detected DTC (s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the PCM.

DTC Description	Confirmed DTC	Pending DTC
P0864 PT-CAN Malfunction (PCM-Transmission Control Module (TCM))	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0864 PT-CAN Malfunction (PCM-Transmission Control Module (TCM))	B	B

Is DTC P0864 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the TCM and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. CVT system check

-1. Check for communication to the CVT system with the HDS.

Does the HDS communicate with the CVT system?

YES

Go to step 3.

NO

Go to the symptom troubleshooting for CVT system .

3. Open wire check (TM-CAN H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 4**
Test point 2	**PCM connector A (50P) No. 21**

Is there continuity?

YES

Go to step 4.

NO

Repair an open in the TM-CAN H wire between the PCM (A21) and the TCM.

4. Open wire check (TM-CAN L line)

   -1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 12**
Test point 2	**PCM connector A (50P) No. 20**

Is there continuity?

YES

The TM-CAN L wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TM-CAN L wire between the PCM (A20) and the TCM.

DTC P0962 (CVT (ECM/PCM))

DTC P0962 : CVT Drive Pulley Pressure Control Valve Circuit Low

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0962 CVT Drive Pulley Pressure Control Valve Circuit Low	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0962 CVT Drive Pulley Pressure Control Valve Circuit Low	B	B	B

Is DTC P0962 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT drive pulley pressure control solenoid valve and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT drive pulley pressure control solenoid valve check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 4**
Test point 2	Body ground

Is there 5.0-6.3 Ω?

YES

The CVT drive pulley pressure control solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 3.

3. Shorted wire check (DR LS line)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected

Test point 1	**PCM connector C (51P) No. 4**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the DR LS wire between the solenoid wire harness A 8P connector and the PCM.

NO

Go to step 4.

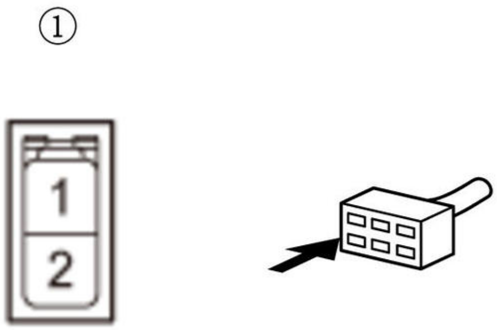
4. CVT drive pulley pressure control solenoid valve internal resistance check

-1. Disconnect the following connector.

CVT drive pulley pressure control solenoid valve 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	CVT drive pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT drive pulley pressure control solenoid valve 2P connector (male terminals) No. 1 : ①
Test point 2	CVT drive pulley pressure control solenoid valve 2P connector (male terminals) No. 2 : ①



Is there 5.0-6.3 Ω?

YES

Go to step 5.

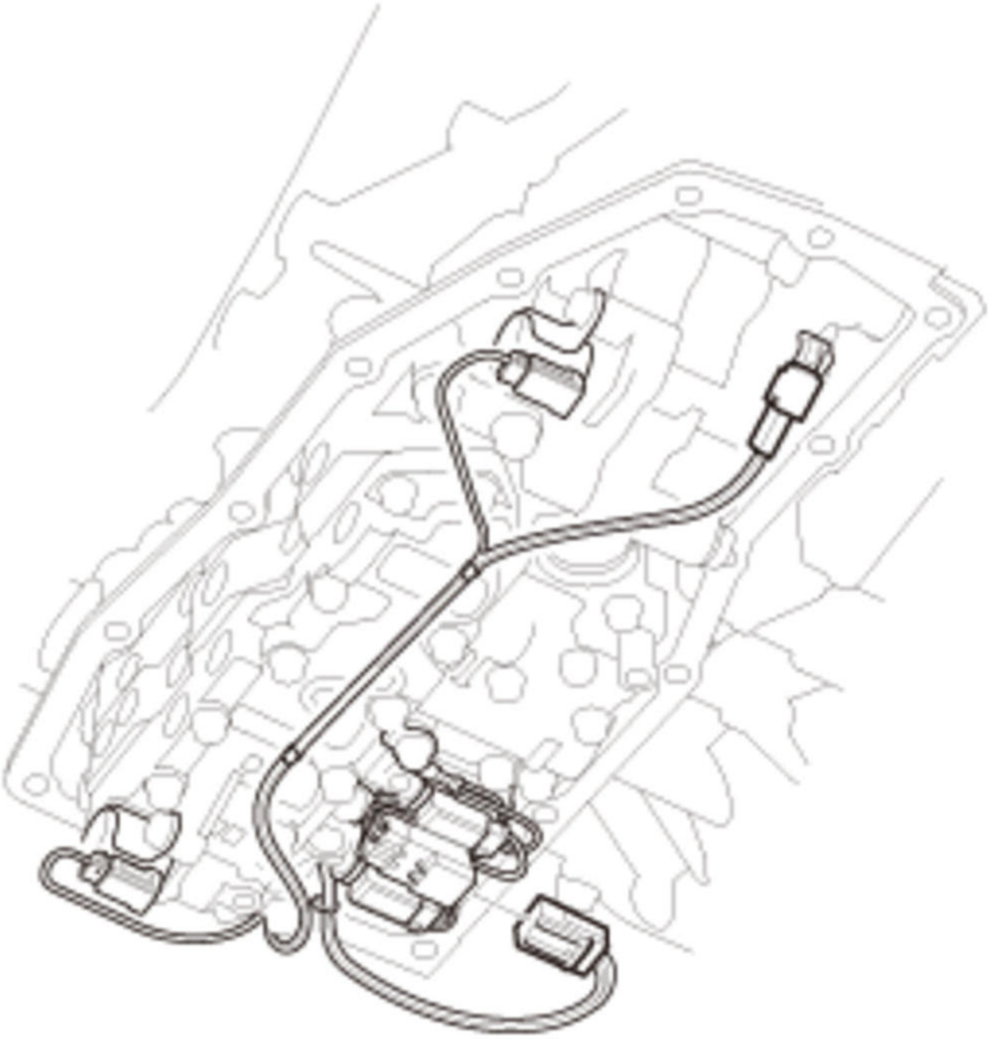
NO

Faulty CVT drive pulley pressure control solenoid valve. **Replace the valve body assembly** .

5. Determine shorted wire in either solenoid wire harness A or B (DRC+ line)

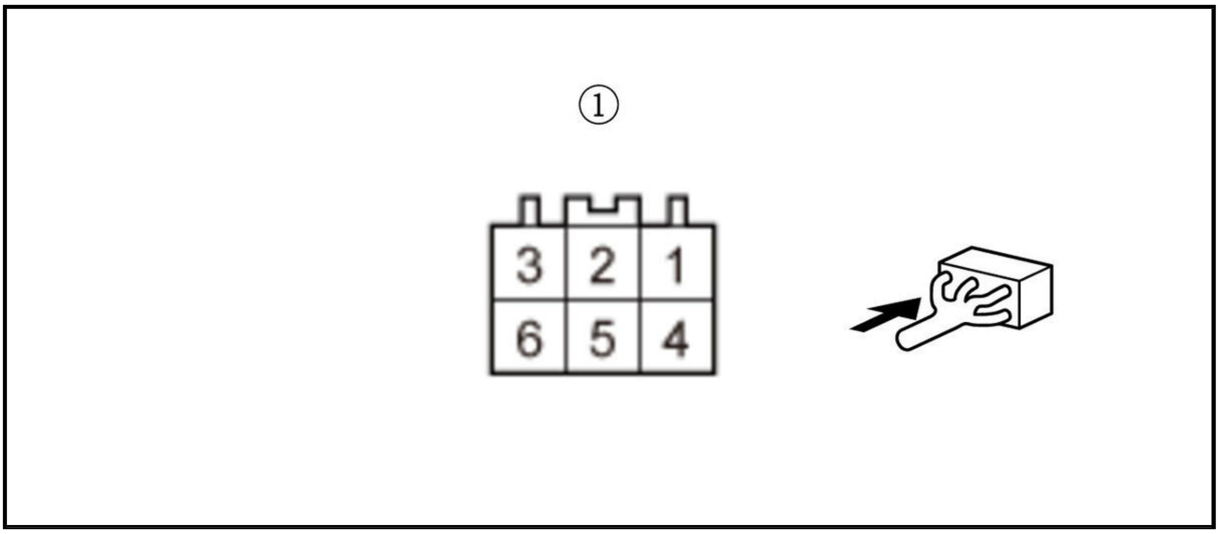
-1. Disconnect the following connector.

Solenoid wire harness A 6P connector



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	Solenoid wire harness A 6P connector: disconnected
B	CVT drive pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	Solenoid wire harness A 6P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the DRC+ wire between the solenoid wire harness A 6P connector and the solenoid wire harness A 8P connector.

NO

Repair a short to body ground in the DRC+ wire between the CVT drive pulley pressure control solenoid valve and the solenoid wire harness B 6P connector.

DTC P0963 (CVT (ECM/PCM))

DTC P0963 : CVT Drive Pulley Pressure Control Valve Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0963 CVT Drive Pulley Pressure Control Valve Circuit High	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine, and wait for at least 1 second.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0963 CVT Drive Pulley Pressure Control Valve Circuit High	B	B	B

Is DTC P0963 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT drive pulley pressure control solenoid valve and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT drive pulley pressure control solenoid valve check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 4**
Test point 2	Body ground

Is there 5.0-6.3 Ω?

YES

The CVT drive pulley pressure control solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 3.

3. Shorted wire check (DR LS line to power)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Solenoid wire harness A 8P connector : disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 4**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the DR LS wire between the solenoid wire harness A 8P connector and the PCM.

NO

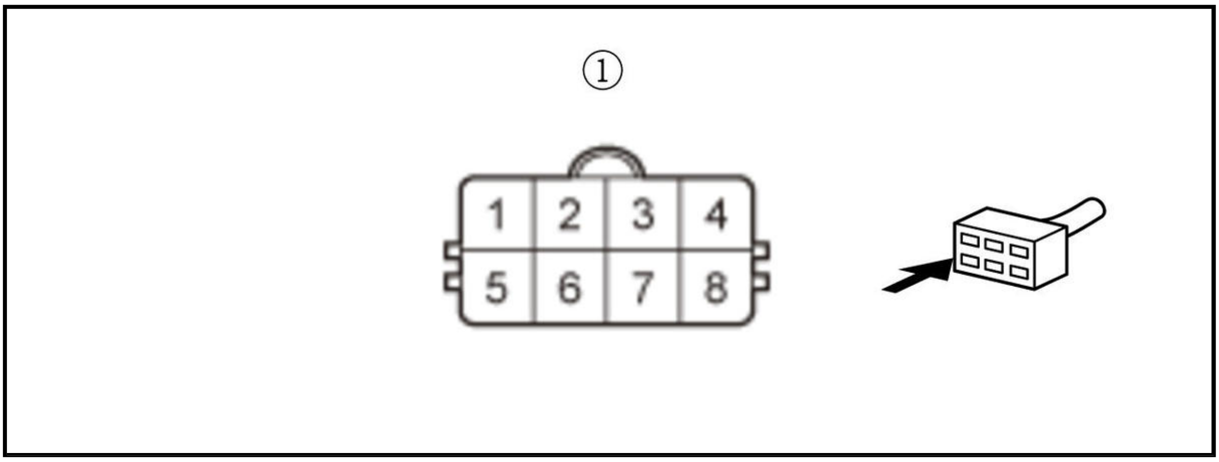
The DR LS wire is not shorted to power. Go to step 4.

4. Open wire check (DR LS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 8 : ①
Test point 2	**PCM connector C (51P) No. 4**



Is there continuity?

YES

Go to step 5.

NO

Repair an open in the DR LS wire between the solenoid wire harness A 8P connector and the PCM.

5. Open wire check (GND line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-2. Disconnect the following connectors.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	PCM connector B (51P): disconnected
Test Circuit 1	B
Test point 1	**PCM connector B (51P) No. 11**
Test point 2	Body ground
Test Circuit 2	B

Test point 1	**PCM connector B (51P) No. 12**
Test point 2	Body ground

Are there continuity?

YES

Go to step 6.

NO

Repair an open in GND wire between the PCM and body ground (G101), or repair poor body ground (G101).

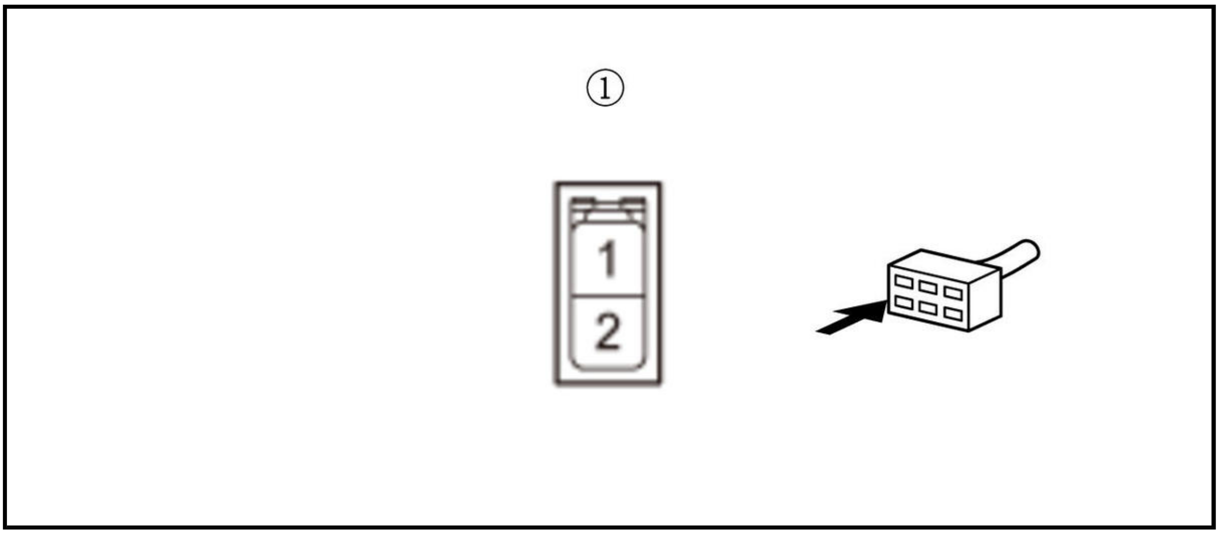
6. CVT drive pulley pressure control solenoid valve internal resistance check

-1. Disconnect the following connector.

CVT drive pulley pressure control solenoid valve 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT drive pulley pressure control solenoid valve 2P connector (male terminals) No. 1 : ①
Test point 2	CVT drive pulley pressure control solenoid valve 2P connector (male terminals) No. 2 : ①



Is there 5.0-6.3 Ω?

YES

Go to step 7.

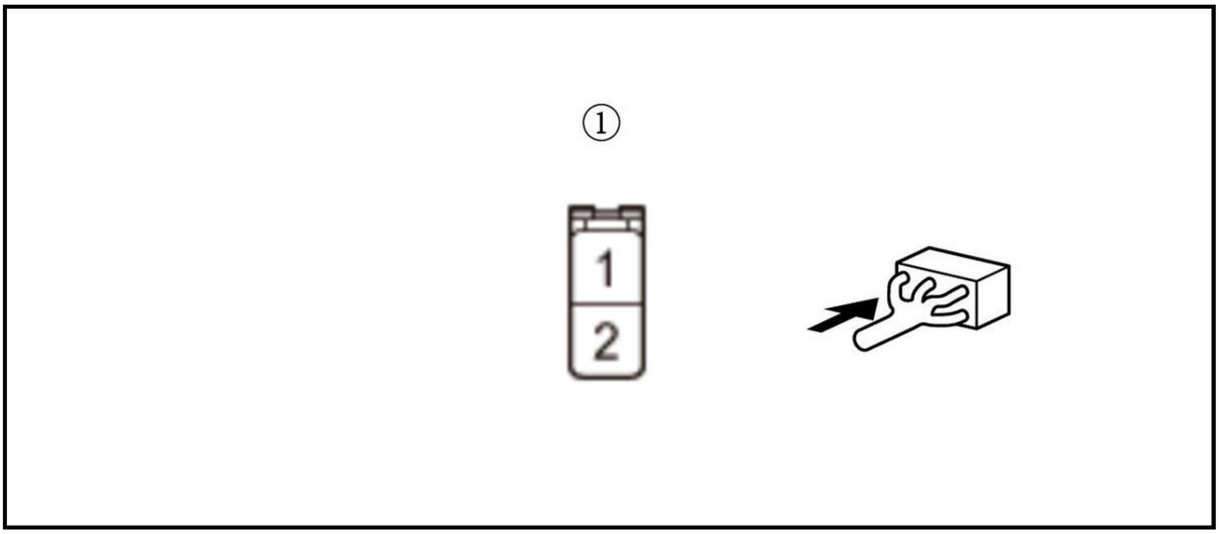
NO

Faulty CVT drive pulley pressure control solenoid valve. **Replace the valve body assembly** .

7. Open wire check (DRC- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT drive pulley pressure control solenoid valve 2P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 8.

NO

Repair an open in the DRC- wire between the CVT drive pulley pressure control solenoid valve and body ground (G161), or repair poor body ground (G161).

8. Determine opened wire in either solenoid wire harness A or B (DRC+ line)

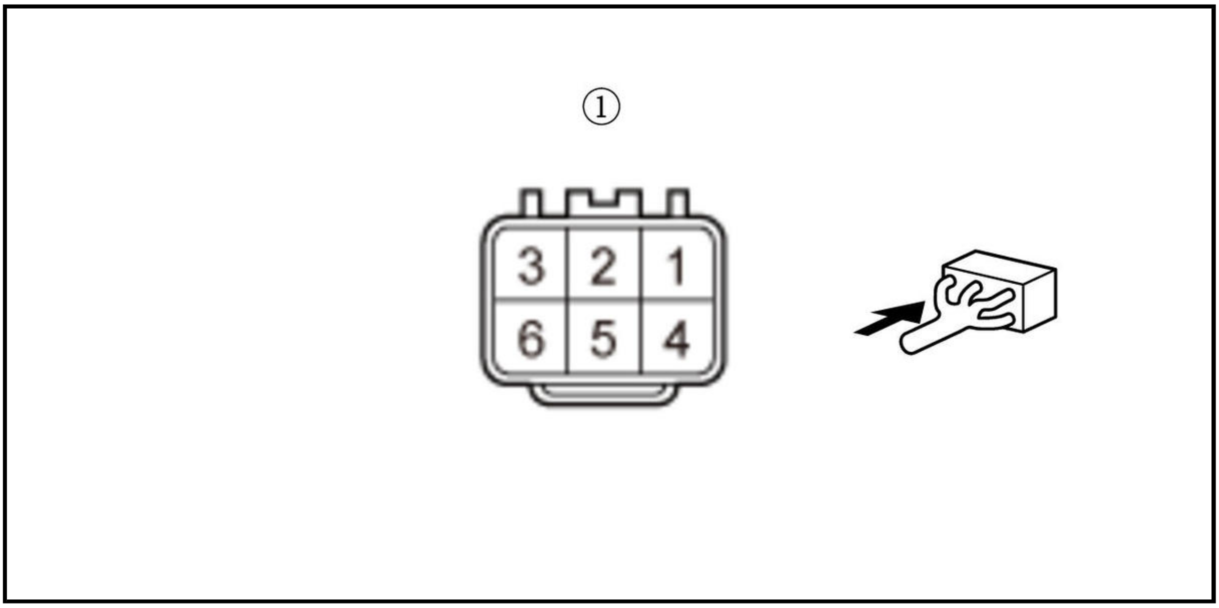
-1. Disconnect the following connector.

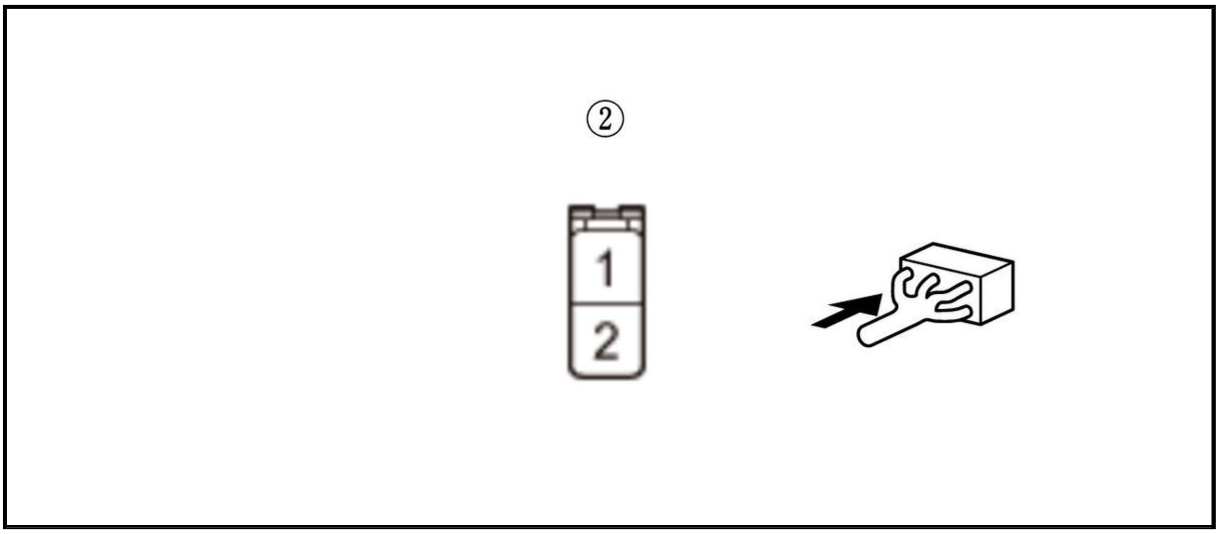
Solenoid wire harness B 6P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	Solenoid wire harness B 6P connector: disconnected
B	CVT drive pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	Solenoid wire harness B 6P connector (male terminals) No. 1 : ①

Test point 2	CVT drive pulley pressure control solenoid valve 2P connector (female terminals) No. 2 : ②





Is there continuity?

YES

Repair an open in the DRC+ wire between the solenoid wire harness A 6P connector and the solenoid wire harness A 8P connector.

NO

Repair an open in the DRC+ wire between the CVT drive pulley pressure control solenoid valve and the solenoid wire harness B 6P connector.

DTC P0966 (CVT (ECM/PCM))

DTC P0966 : CVT Driven Pulley Pressure Control Valve Circuit Low

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0966 CVT Driven Pulley Pressure Control Valve Circuit Low	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0966 CVT Driven Pulley Pressure Control Valve Circuit Low	B	B	B

   Is DTC P0966 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT driven pulley pressure control solenoid valve and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT driven pulley pressure control solenoid valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the PCM from damage.

   -3. Disconnect the following connector.

PCM connector C (51P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 10**
Test point 2	Body ground

   Is there 5.0-6.3 Ω?

   YES

   The CVT driven pulley pressure control solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 3.

3. Shorted wire check (DN LS line)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 10**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the DN LS wire between the solenoid wire harness A 8P connector and the PCM.

NO

Go to step 4.

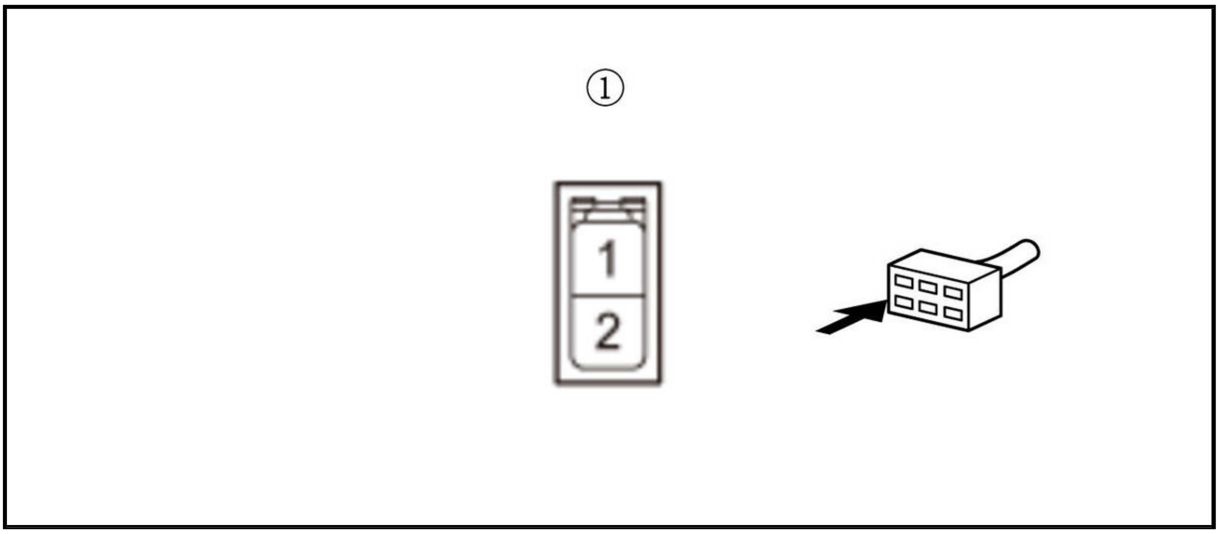
4. CVT driven pulley pressure control solenoid valve internal resistance check

-1. Disconnect the following connector.

CVT driven pulley pressure control solenoid valve 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	CVT driven pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT driven pulley pressure control solenoid valve 2P connector (male terminals) No. 1 : ①
Test point 2	CVT driven pulley pressure control solenoid valve 2P connector (male terminals) No. 2 : ①



Is there 5.0-6.3 Ω?

YES

Go to step 5.

NO

Faulty CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

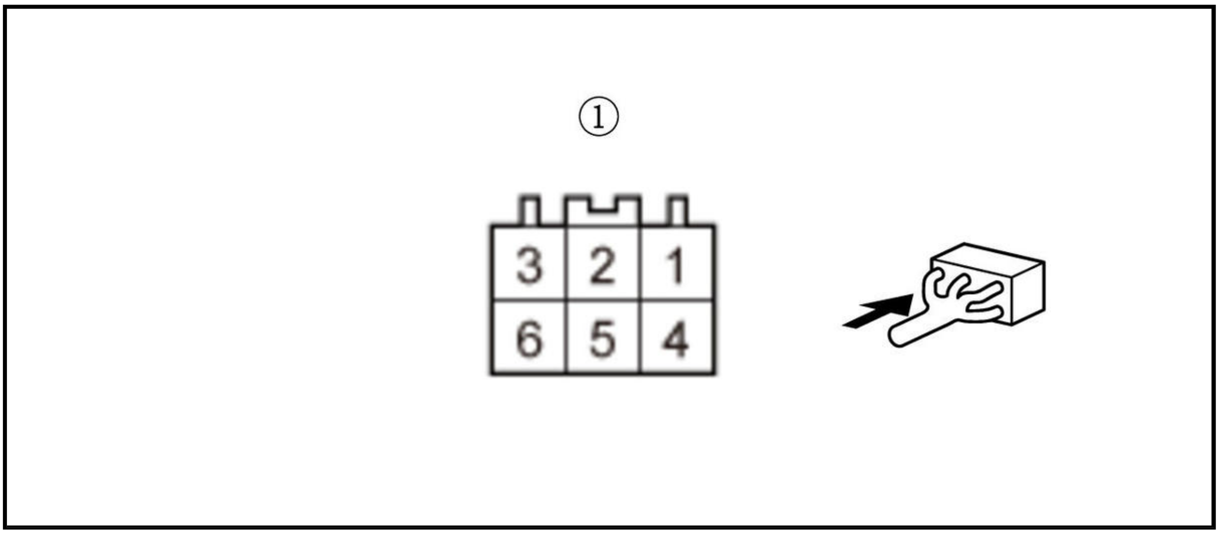
5. Determine shorted wire in either solenoid wire harness A or B (DNC+ line)

-1. Disconnect the following connector.

Solenoid wire harness B 6P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	Solenoid wire harness B 6P connector: disconnected
Test point 1	Solenoid wire harness A 6P connector (female terminals) No. 2 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the DNC+ wire between the solenoid wire harness A 6P connector and the solenoid wire harness A 8P connector.

NO

Repair a short to body ground in the DNC+ wire between the CVT driven pulley pressure control solenoid valve and the solenoid wire harness B 6P connector.

DTC P0967 (CVT (ECM/PCM))

DTC P0967 : CVT Driven Pulley Pressure Control Valve Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0967 CVT Driven Pulley Pressure Control Valve Circuit High	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0967 CVT Driven Pulley Pressure Control Valve Circuit High	B	B	B

   Is DTC P0967 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT driven pulley pressure control solenoid valve and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT driven pulley pressure control solenoid valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 10**
Test point 2	Body ground

Is there 5.0-6.3 Ω?

YES

The CVT driven pulley pressure control solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 3.

3. Shorted wire check (DN LS line to power)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Solenoid wire harness A 8P connector : disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 10**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the DN LS wire between the solenoid wire harness A 8P connector and the PCM.

NO

The DN LS wire is not shorted to power. Go to step 4.

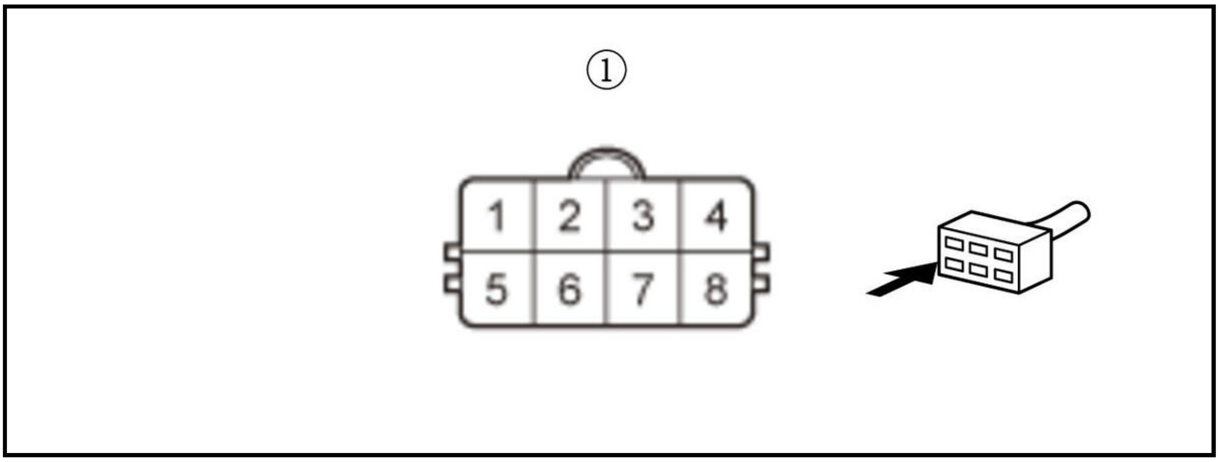
4. Open wire check (DN LS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 3 : ①
Test point 2	**PCM connector C (51P) No. 10**



Is there continuity?

YES

Go to step 5.

NO

Repair an open in the DN LS wire between the solenoid wire harness A 8P connector and the PCM.

5. Open wire check (GND1 line, GND2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	PCM connector C (51P): disconnected
Test Circuit 1	B
Test point 1	**PCM connector B (51P) No. 11**
Test point 2	Body ground
Test Circuit 2	B
Test point 1	**PCM connector B (51P) No. 12**
Test point 2	Body ground

Are there continuity?

YES

Go to step 6.

NO

Repair an open in GND1 wire and/or GND2 wire between the PCM and body ground (G101), or repair poor body ground (G101).

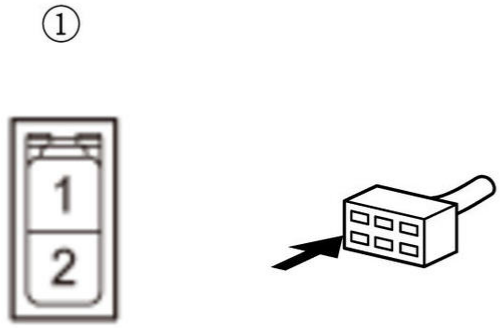
6. CVT driven pulley pressure control solenoid valve internal resistance check

-1. Disconnect the following connector.

CVT driven pulley pressure control solenoid valve 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT driven pulley pressure control solenoid valve 2P connector (male terminals) No. 1 : ①
Test point 2	CVT driven pulley pressure control solenoid valve 2P connector (male terminals) No. 2 : ①



Is there 5.0-6.3 Ω?

YES

Go to step 7.

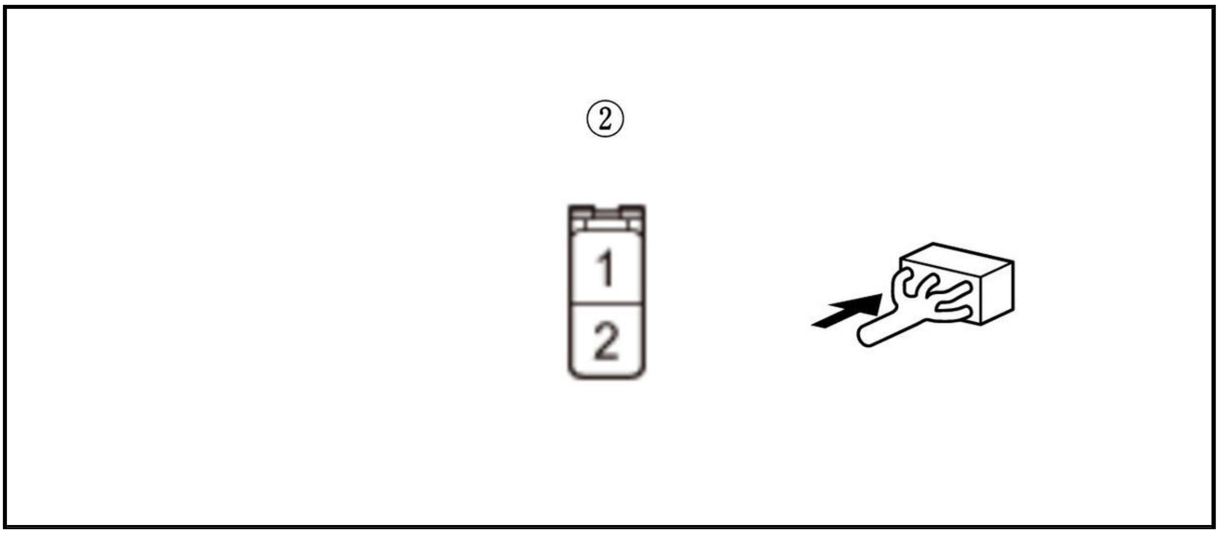
NO

Faulty CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

7. Open wire check (DNC- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT driven pulley pressure control solenoid valve 2P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 8.

NO

Repair an open in the DNC- wire between the CVT driven pulley pressure control solenoid valve and body ground (G161), or repair poor body ground (G161).

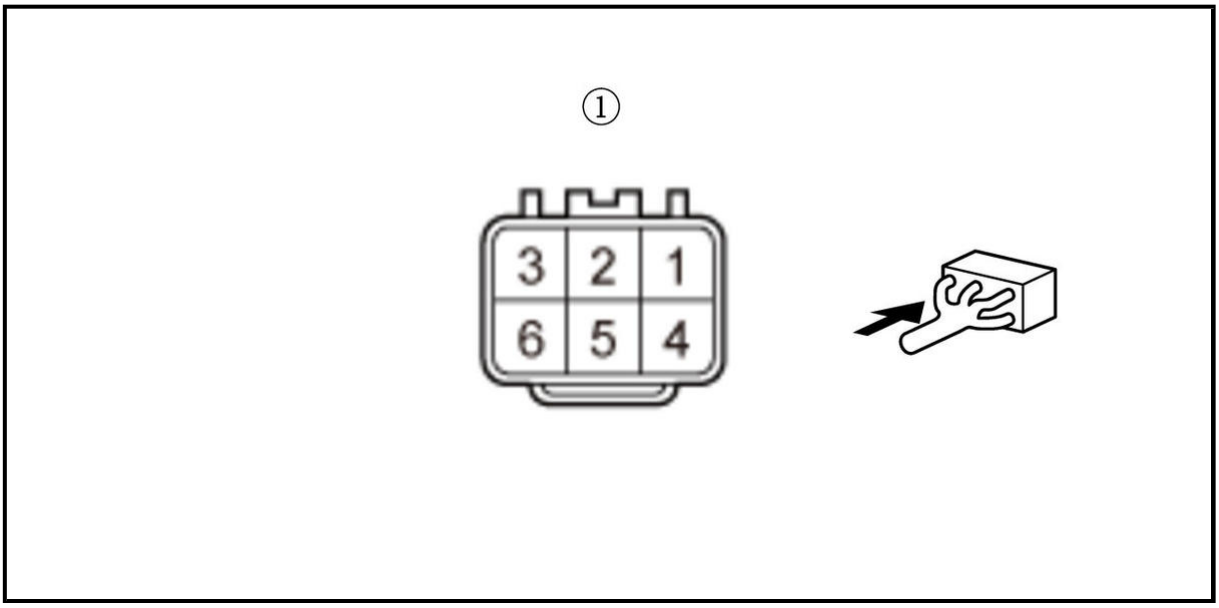
8. Determine opened wire in either solenoid wire harness A or B (DNC+ line)

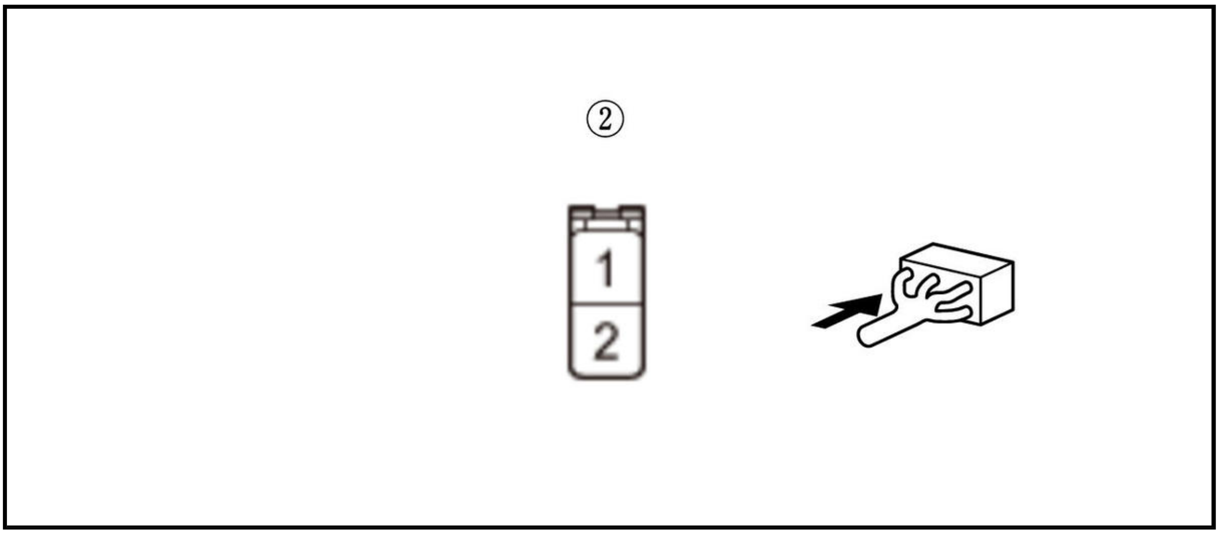
-1. Disconnect the following connector.

Solenoid wire harness B 6P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	Solenoid wire harness B 6P connector: disconnected
B	CVT driven pulley pressure control solenoid valve 2P connector: disconnected
Test point 1	Solenoid wire harness B 6P connector (male terminals) No. 2 : ①
Test point 2	CVT driven pulley pressure control solenoid valve 2P connector (female terminals) No. 2 : ②





Is there continuity?

YES

Repair an open in the DNC+ wire between the solenoid wire harness A 6P connector and the solenoid wire harness A 8P connector.

NO

Repair an open in the DNC+ wire between the CVT driven pulley pressure control solenoid valve and the solenoid wire harness B 6P connector.

DTC P0970 (CVT (ECM/PCM))

DTC P0970 : Pressure Control Solenoid C Control Circuit Low

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0970 Pressure Control Solenoid C Control Circuit Low	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0970 Pressure Control Solenoid C Control Circuit Low	B	B	B

   Is DTC P0970 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT clutch pressure control solenoid valve and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT clutch pressure control solenoid valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the PCM from damage.

   -3. Disconnect the following connector.

PCM connector C (51P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 5**
Test point 2	Body ground

   Is there 4.7-5.9 Ω?

   YES

   The CVT clutch pressure control solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

   NO

   Go to step 3.

3. Shorted wire check (CPC LS line)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 5**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the CPC LS wire between the solenoid wire harness A 8P connector and the PCM.

NO

Go to step 4.

4. CVT clutch pressure control solenoid valve internal resistance check

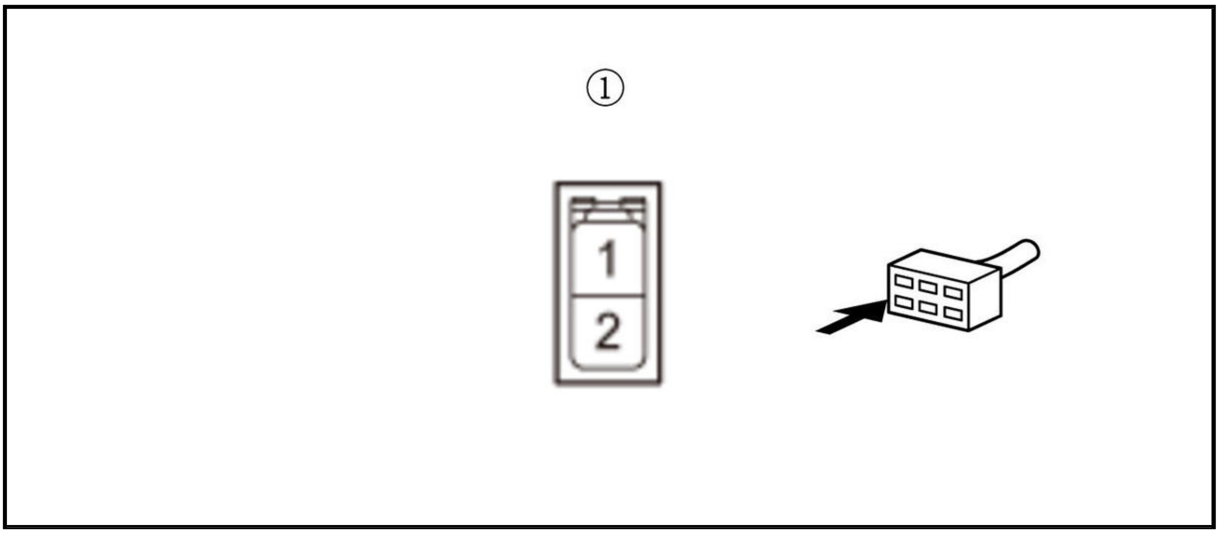
-1. **Remove the valve body assembly** .

-2. Disconnect the following connector.

CVT clutch pressure control solenoid valve 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Lower valve body: removed
B	CVT clutch pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT clutch pressure control solenoid valve 2P connector (male terminals) No. 1 : ①
Test point 2	CVT clutch pressure control solenoid valve 2P connector (male terminals) No. 2 : ①



Is there 4.7-5.9 Ω?

YES

Go to step 5.

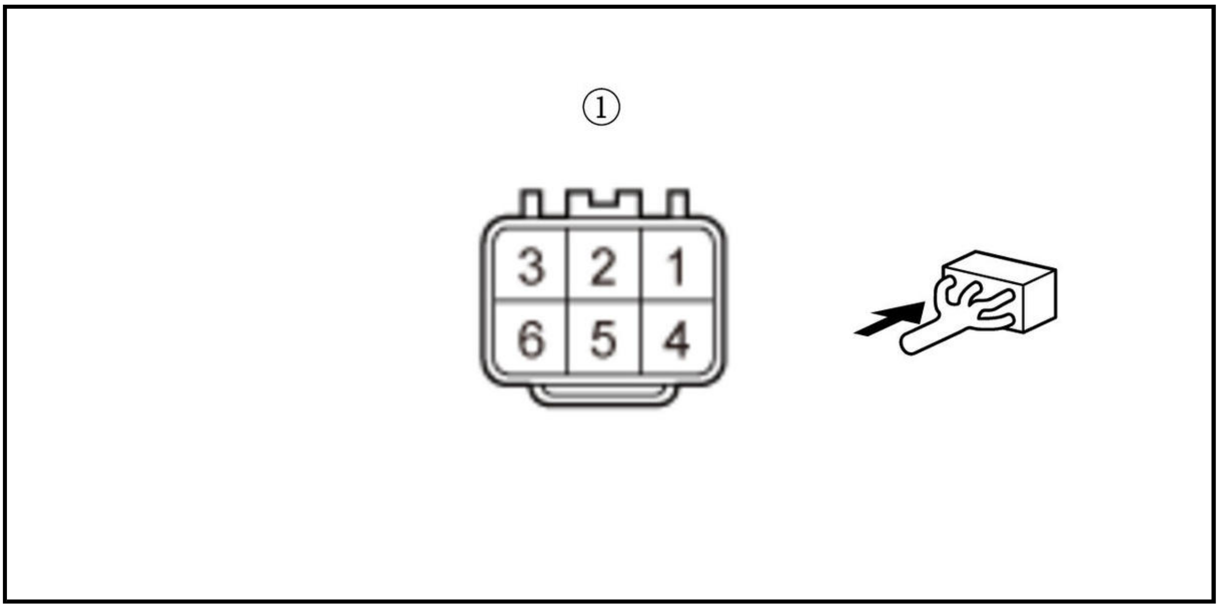
NO

Faulty CVT clutch pressure control solenoid valve. **Replace the valve body assembly** .

5. Determine shorted wire in either solenoid wire harness A or B (CPC+ line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Valve body assembly: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT clutch pressure control solenoid valve 2P connector: disconnected
Test point 1	Solenoid wire harness B 6P connector (male terminals) No. 5 : ①
Test point 2	Body ground (valve body assembly)



Is there continuity?

YES

Repair a short to body ground in the CPC+ wire between the CVT clutch pressure control solenoid valve and the solenoid wire harness B 6P connector.

NO

Repair a short to body ground in the CPC+ wire between the solenoid wire harness A 6P connector and the solenoid wire harness A 8P connector.

DTC P0971 (CVT (ECM/PCM))

DTC P0971 : Pressure Control Solenoid C Control Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0971 Pressure Control Solenoid C Control Circuit High	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0971 Pressure Control Solenoid C Control Circuit High	B	B	B

   Is DTC P0971 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT clutch pressure control solenoid valve and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT clutch pressure control solenoid valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 5**
Test point 2	Body ground

Is there 4.7-5.9 Ω?

YES

The CVT clutch pressure control solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 3.

3. Shorted wire check (CPC LS line to power)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Solenoid wire harness A 8P connector : disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 5**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the CPC LS wire between the solenoid wire harness A 8P connector and the PCM.

NO

The CPC LS wire is not shorted to power. Go to step 4.

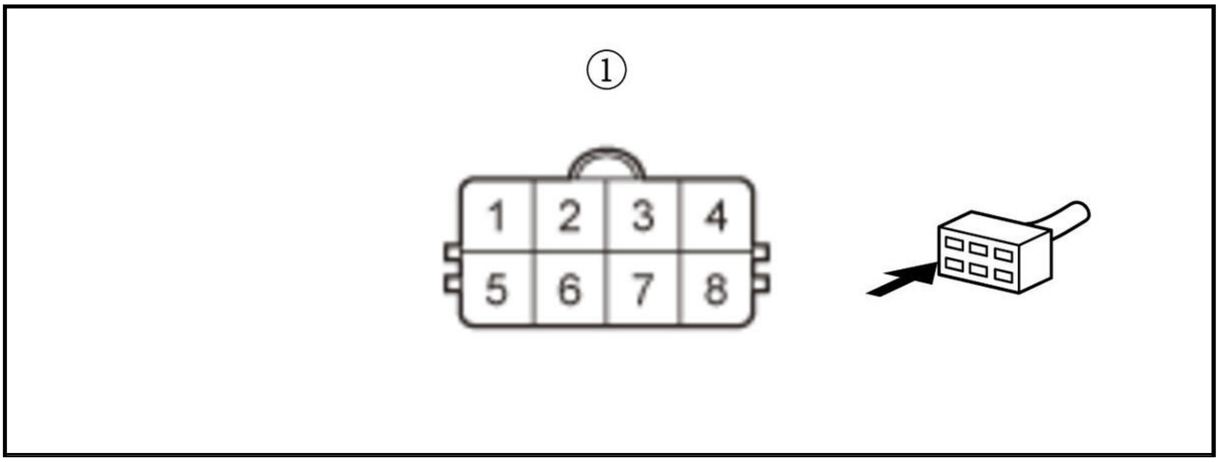
4. Open wire check (CPC LS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected

Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 1 : ①
Test point 2	**PCM connector C (51P) No. 5**



Is there continuity?

YES

Go to step 5.

NO

Repair an open in the CPC LS wire between the solenoid wire harness A 8P connector and the PCM.

5. Open wire check (GND1 line, GND2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
Test Circuit 1	B
Test point 1	**PCM connector B (51P) No. 11**
Test point 2	Body ground
Test Circuit 2	B
Test point 1	**PCM connector B (51P) No. 12**
Test point 2	Body ground

Are there continuity?

YES

Go to step 6.

NO

Repair an open in GND1 wire and/or GND2 wire between the PCM and body ground (G101), or repair poor body ground (G101).

6. CVT clutch pressure control solenoid valve internal resistance check

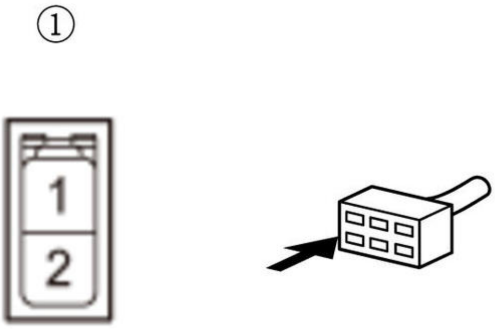
-1. **Remove the valve body assembly** .

-2. Disconnect the following connector.

CVT clutch pressure control solenoid valve 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Lower valve body: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT clutch pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT clutch pressure control solenoid valve 2P connector (female terminals) No. 1 : ①
Test point 2	CVT clutch pressure control solenoid valve 2P connector (female terminals) No. 2 : ①



Is there 4.7-5.9 Ω?

YES

Go to step 7.

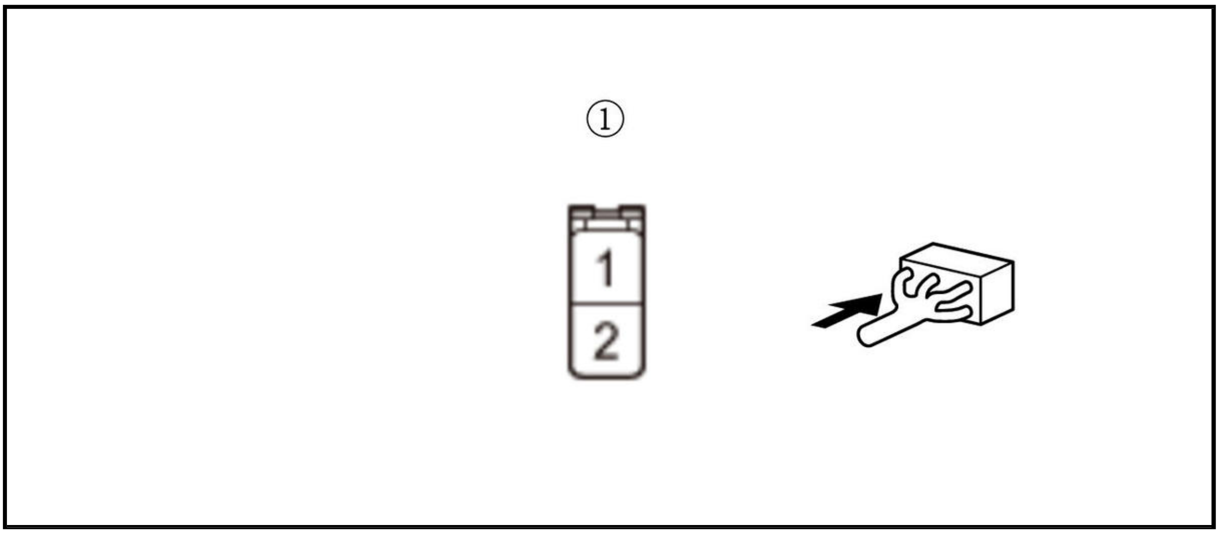
NO

Faulty CVT clutch pressure control solenoid valve. Replace the valve body assembly .

7. Open wire check (CPC- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Lower valve body: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT clutch pressure control solenoid valve 2P connector: disconnected
Test point 1	CVT clutch pressure control solenoid valve 2P connector (female terminals) No. 1 : ①
Test point 2	Body ground (valve body assembly)



Is there continuity?

YES

Go to step 8.

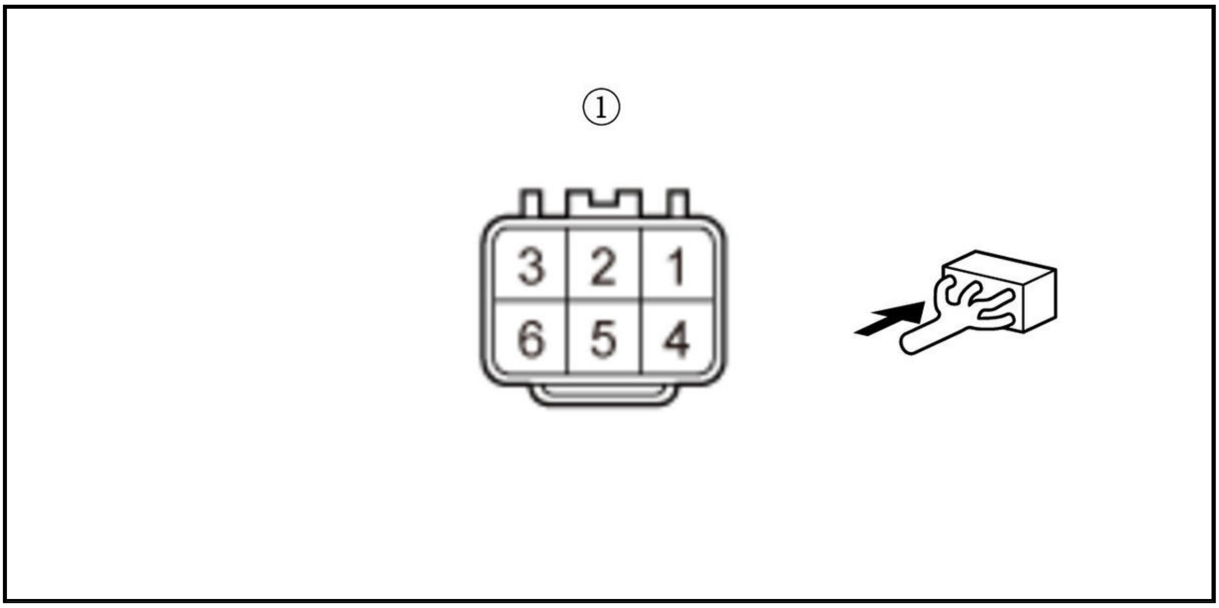
NO

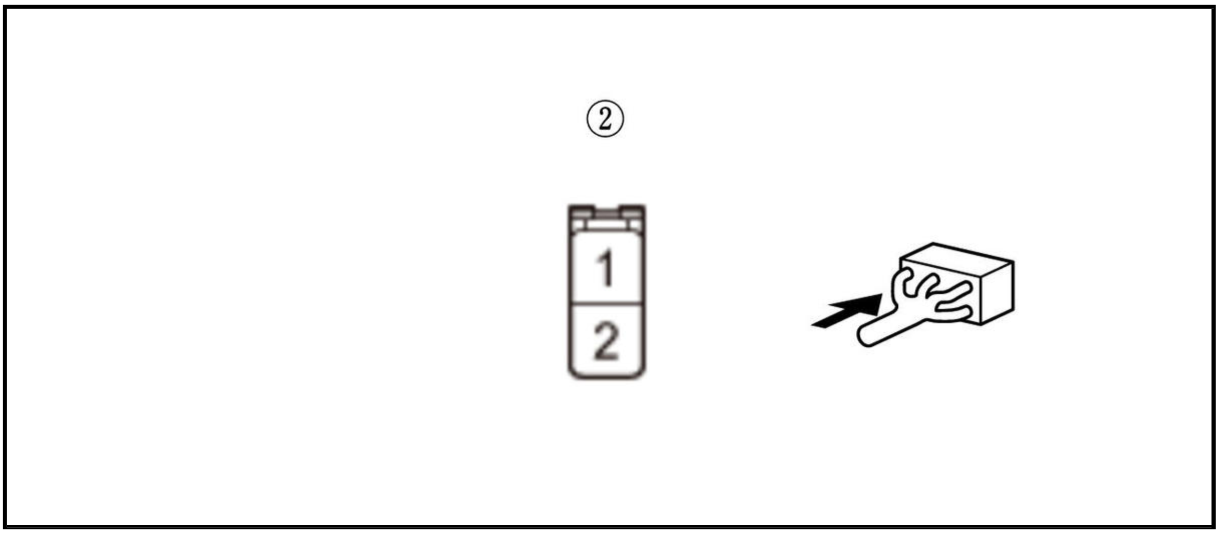
Repair an open in the CPC- wire between the CVT clutch pressure control solenoid valve and body ground (G162), or repair poor body ground (G162).

8. Determine opened wire in either solenoid wire harness A or B (CPC+ line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Lower valve body: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT clutch pressure control solenoid valve 2P connector: disconnected
Test point 1	Solenoid wire harness B 6P connector (male terminals) No. 5 : ①
Test point 2	CVT clutch pressure control solenoid valve 2P connector (female terminals) No. 2 : ②





Is there continuity?

YES

Repair an open in the CPC+ wire between the solenoid wire harness A 6P connector and the solenoid wire harness A 8P connector.

NO

Repair an open in the CPC+ wire between the CVT clutch pressure control solenoid valve and the solenoid wire harness B 6P connector.

DTC P0976 (CVT (ECM/PCM))

DTC P0976 : Shift Solenoid Valve B Circuit Low

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0976 Shift Solenoid Valve B Circuit Low	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

   -4. Test-drive the vehicle in D on a flat road at speeds about 37 mph (60 km/h) for at least 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0976 Shift Solenoid Valve B Circuit Low	B	B	B

Is DTC P0976 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the shift solenoid valve B and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. IG1 MISS SOL line check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 11**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 MISS SOL wire is OK. Go to step 3.

NO

Check for a blown No. D4 (10 A) fuse in the under-dash fuse/relay box. If the fuse is blown, replace it. If the fuse blows again, repair a short in the No. D4 (10 A) fuse circuit. If the fuse is OK, repair an open in the IG1 MISS SOL wire between the PCM and the under-dash fuse/relay box.

3. Shift solenoid valve B check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected

Test point 1	**PCM connector C (51P) No. 19**

Test point 2	Body ground

Is there 10.6-13.5 Ω?

YES

The shift solenoid valve B is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 4.

4. Shorted wire check (SOL B line)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 19**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the SOL B wire between the solenoid wire harness A 8P connector and the PCM.

NO

Go to step 5.

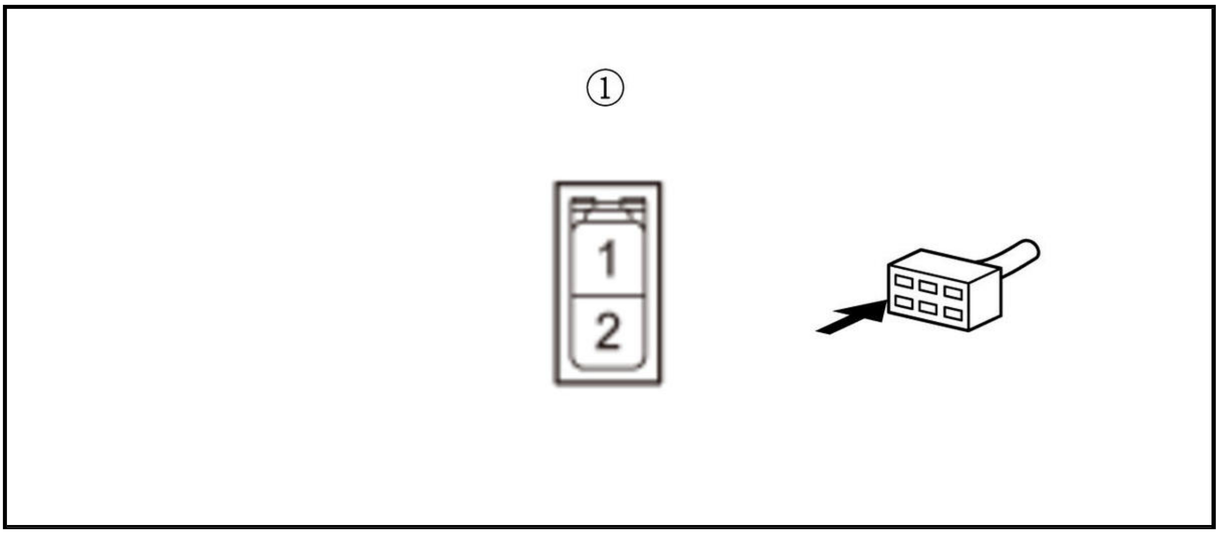
5. Shift solenoid valve B internal resistance check

-1. Disconnect the following connector.

Shift solenoid valve B 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	Shift solenoid valve B 2P connector: disconnected
Test point 1	Shift solenoid valve B 2P connector (male terminals) No. 1 : ①
Test point 2	Body ground



Is there 10.6-13.5 Ω?

YES

Shift solenoid valve B is OK. Repair a short to body ground in the SHB+ wire between the solenoid wire harness A 8P connector and shift solenoid valve B.

NO

Faulty shift solenoid valve B. **Replace the valve body assembly** .

DTC P0977 (CVT (ECM/PCM))

DTC P0977 : Shift Solenoid Valve B Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0977 Shift Solenoid Valve B Circuit High	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine in P, and wait for at least 10 seconds.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0977 Shift Solenoid Valve B Circuit High	B	B	B

Is DTC P0977 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the shift solenoid valve B and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shift solenoid valve B check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 19**
Test point 2	Body ground

Is there 10.6-13.5 Ω?

YES

The shift solenoid valve B is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 3.

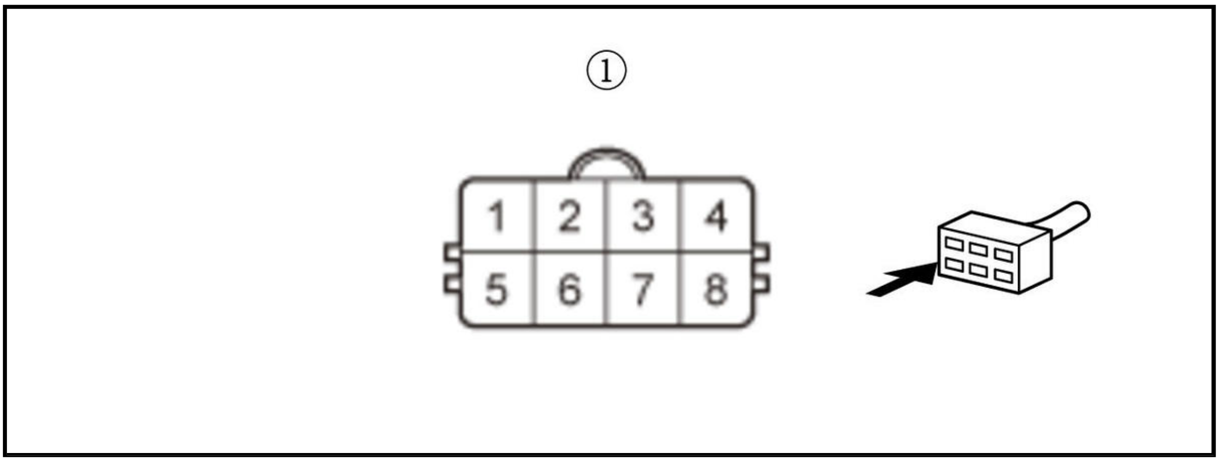
3. Open wire check (SOL B line)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 5 : ①
Test point 2	**PCM connector C (51P) No. 19**



Is there continuity?

YES

Go to step 4.

NO

Repair an open in the SOL B wire between the solenoid wire harness A 8P connector and the PCM.

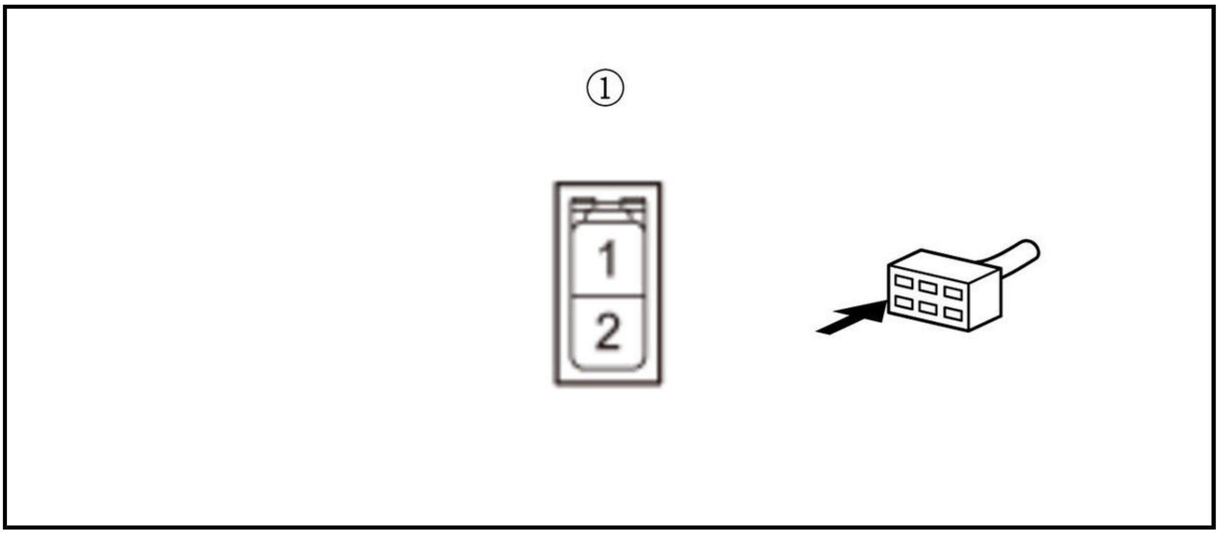
4. Shift solenoid valve B internal resistance check

-1. Disconnect the following connector.

Shift solenoid valve B 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	Shift solenoid valve B 2P connector: disconnected
Test point 1	Shift solenoid valve B 2P connector (male terminals) No. 1 : ①
Test point 2	Body ground



Is there 10.6-13.5 Ω?

YES

Shift solenoid valve B is OK. Repair an open in the SHB+ wire between the solenoid wire harness A 8P connector and shift solenoid valve B.

NO

Faulty shift solenoid valve B. **Replace the valve body assembly** .

DTC P0A11 (1.5 L ENGINE) (2020 2021)

DTC P0A11 : DC-DC Converter Activation Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0A11 DC-DC Converter Activation Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Test-drive the vehicle under the auto idle stop system operating condition, and stop the engine using auto idle stop** .

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0A11 DC-DC Converter Activation Circuit Malfunction	B	B

   Is DTC P0A11 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the DC-DC converter and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (Open in DCDC STS line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (50P)

   -4. Exit the SCS mode with the HDS.

   -5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 14**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (DCDC STS line)

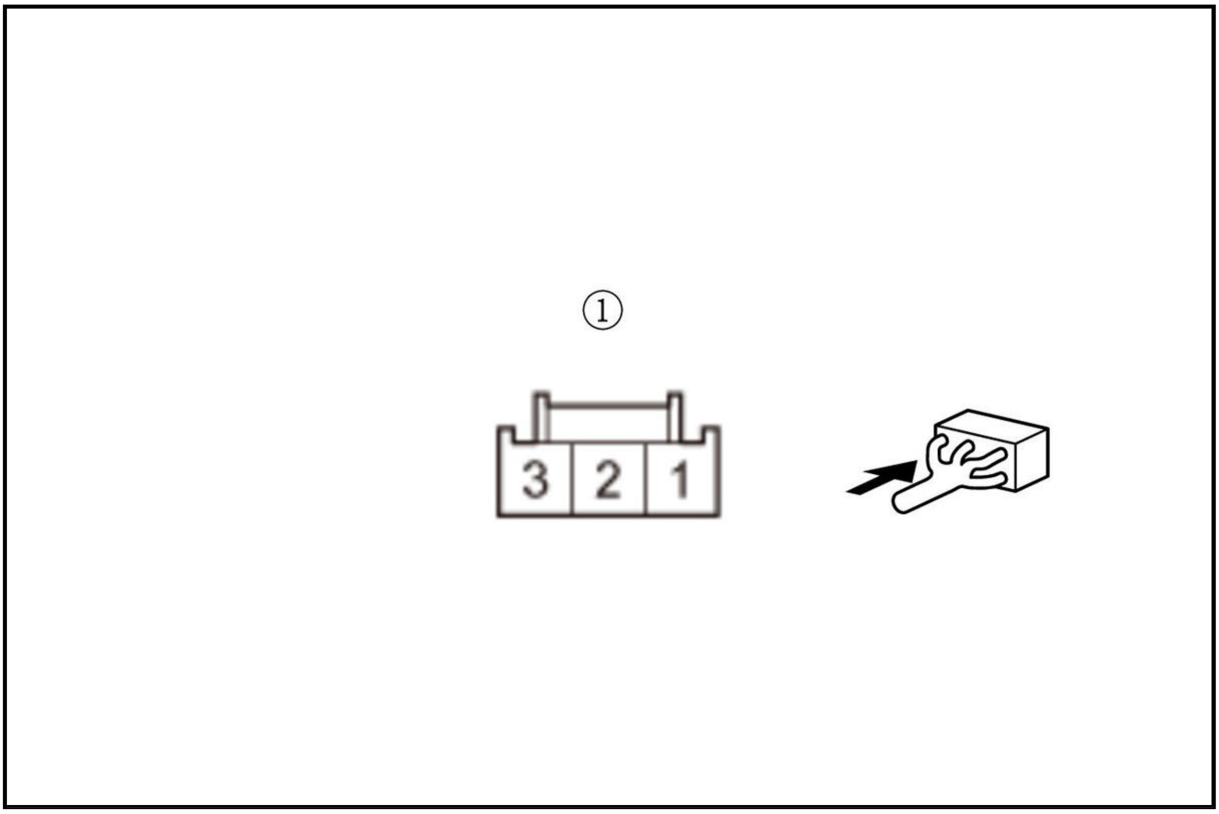
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 14**



Is there 1.0 Ω or less?

YES

Replace the DC-DC converter .

NO

Repair an open in the DCDC STS wire between the PCM (A14) and the DC-DC converter.

4. Shorted wire check (DCDC STS line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

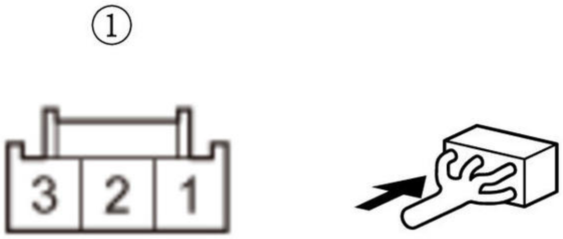
-2. Disconnect the following connector.

DC-DC converter connector A (3P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V or more?

YES

Repair a short to power in the DCDC STS wire between the PCM (A14) and the DC-DC converter.

NO

The DCDC STS wire is OK. **Replace the DC-DC converter** . If DTC P0A11 was indicated after the DC-DC converter was replaced, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0A94 (1.5 L ENGINE) (2020 2021)

DTC P0A94 : DC-DC Converter Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0A94 DC-DC Converter Performance Problem	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Test-drive the vehicle under the auto idle stop system operating condition, and stop the engine using auto idle stop** .

   NOTE: If the auto idle stop system indicator (amber) blinks and the engine keeps running, go to step 1

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E5 LIN Communication Error (PCM-DC-DC Converter)	B	B

   Is DTC P16E5 indicated?

   YES

   Go to the troubleshooting for **DTC P16E5**.

   NO

   Go to step 2.

2. Problem verification

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0A94 DC-DC Converter Performance Problem	B	B

   Is DTC P0A94 indicated?

   YES

   Go to step 3.

NO

Check the fuses in the auxiliary under-dash fuse/relay box. If the fuse (s) is blown, repair a short in the fuse circuit. If it is OK, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the DC-DC converter and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (DCDC STS line, others)

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
DC-DC CONVERTER CST ERROR	Normal	B	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (DCDC STS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

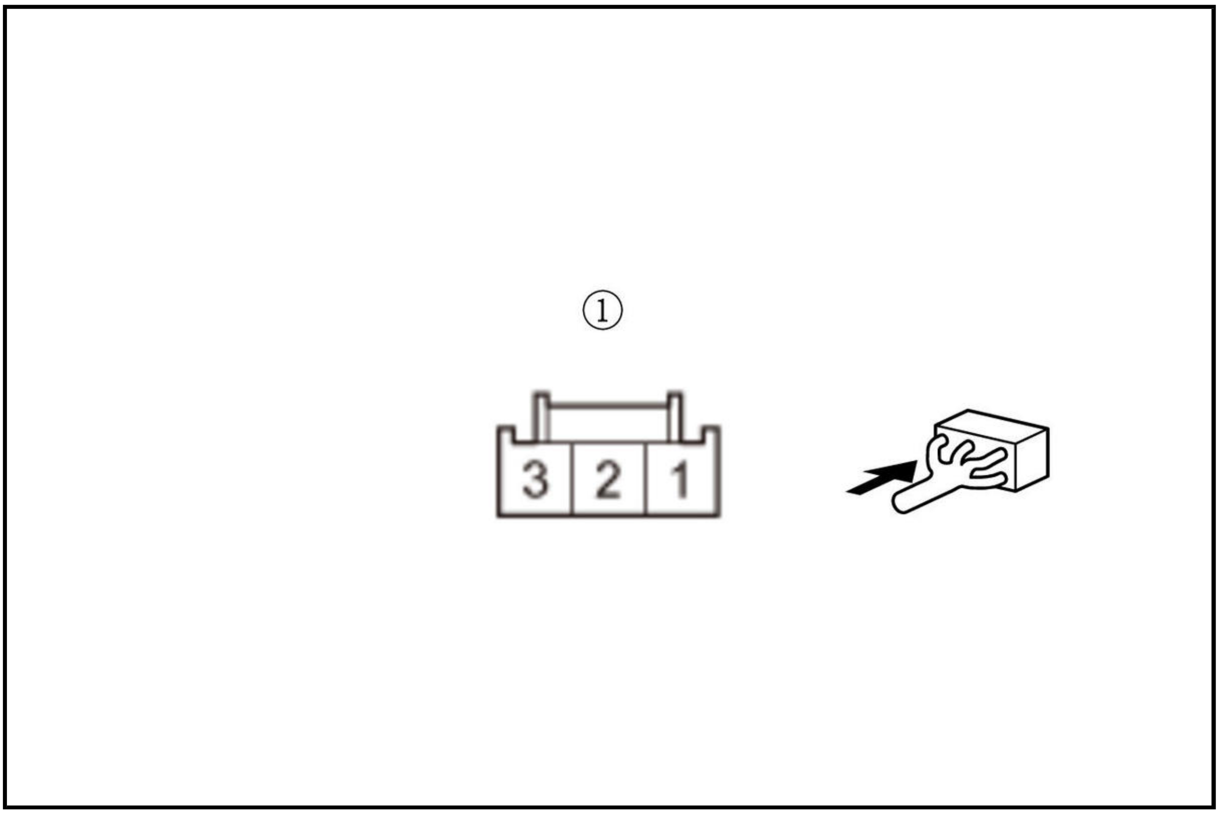
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

DC-DC converter connector A (3P)
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector A (3P): disconnected
B	PCM connector A (50P): disconnected
Test point 1	DC-DC converter connector A (female terminals) (3P) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The DCDC STS wire is OK. **Replace the DC-DC converter** . If DTC P0A94 was indicated after the DC-DC converter was replaced, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the DCDC STS wire between the PCM (A14) and the DC-DC converter.

5. Open wire check (GND line)

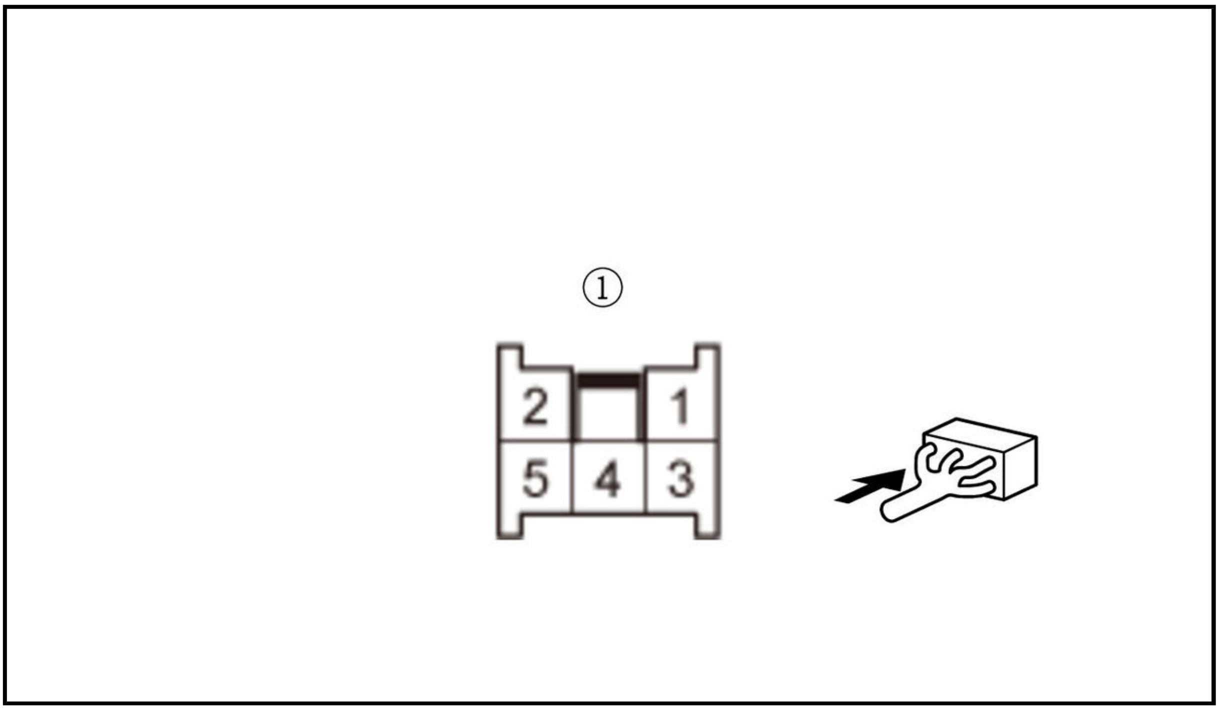
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

DC-DC converter connector B (5P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter connector B (5P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 6.

NO

Repair an open in the GND wire between the DC-DC converter and G352.

6. Determine possible failure area (DC-DC converter input/output lines)

-1. Reconnect the following connector.

DC-DC converter connector B (5P)

-2. Turn the vehicle to the ON mode.

-3. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
DC-DC CONVERTER INPUT ERROR 1	B	B
DC-DC CONVERTER INPUT ERROR 2	B	B
DC-DC CONVERTER OUTPUT ERROR 1	B	B
DC-DC CONVERTER OUTPUT ERROR 2	B	B

Do these parameters indicate Malfunction?

DC-DC converter input error 1 indicates Malfunction

Go to step 7.

DC-DC converter input error 2 indicates Malfunction

Go to step 9.

DC-DC converter output error 1 indicates Malfunction

Check for DCDC OUT1 circuit shorted, or aftermarket parts connected to DCDCT OUT1 wire. Repair a short in DCDC OUT1 circuit or remove the aftermarket parts if needed. If DCDC OUT1 wire is OK, **replace the DC-DC converter** .

DC-DC converter output error 2 indicates Malfunction

Check for DCDC OUT2 circuit shorted, or aftermarket parts connected to DCDC OUT2 wire. Repair a short in DCDC OUT2 circuit or remove the aftermarket parts if needed. If DCDC OUT2 wire is OK, **replace the DC-DC converter** .

All parameters indicates Normal

DC-DC converter input and output lines are OK. **Replace the DC-DC converter** .

7. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A1-1**

Is the fuse OK?

YES

Go to step 8.

NO

Check for a short in the +B DC/DC1 wire between the DC-DC converter and the No. A1-1 fuse, the DCDC OUT1 wire between the DC-DC converter and the under-hood fuse/relay box, and repair it if needed. Also replace the No. A1-1 fuse.

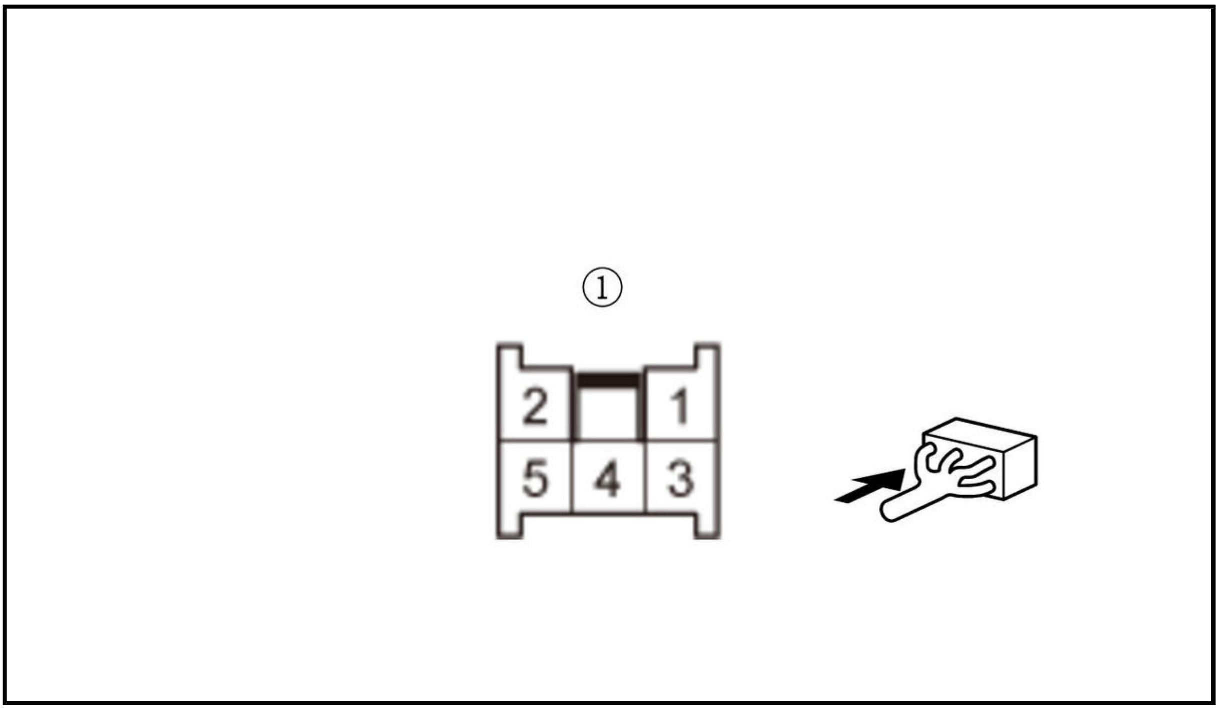
8. Open wire check (+B DC/DC1 line)

-1. Disconnect the following connector.

DC-DC converter connector B (5P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter connector B (5P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B DC/DC1 wire is OK. **Replace the DC-DC converter** . If DTC P0A94 was indicated after the DC-DC converter was replaced, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the +B DC/DC1 wire between the DC-DC converter and the **No. A1-1 fuse** .

9. Fuse check

-1. Check the following fuse.

Fuse	**No. A4-3**

Is the fuse OK?

YES

Go to step 10.

NO

Check for a short in the +B DC/DC2 wire between the DC-DC converter and the No. A4-3 fuse, the DCDC OUT2 wire between the DC-DC converter and the under-hood fuse/relay box, and repair it if needed. If the wires are OK, **replace the DC-DC converter** . Also replace the No. A4-3 fuse.

10. Open wire check (+B DC/DC2 line)

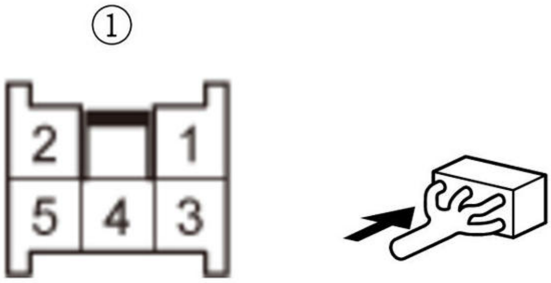
-1. Disconnect the following connector.

DC-DC converter connector B (5P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter connector B (5P) (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B DC/DC2 wire is OK. **Replace the DC-DC converter** . If DTC P0A94 was indicated after the DC-DC converter was replaced, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the +B DC/DC2 wire between the DC-DC converter and the **No. A4-3 fuse** .

DTC P1009 (1.5 L ENGINE)

DTC P1009 : VTC A Advance Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0341 is stored at the same time as DTC P1009, troubleshoot DTC P1009 first, then recheck for DTC P0341.
- If DTC P1009 set after replacing the VTC actuator, verify that the correct timing marks on the crank pulley were used.

DTC Description	Confirmed DTC	Pending DTC
P1009 VTC A Advance Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1009 VTC A Advance Malfunction	B	B

Is DTC P1009 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. VTC oil control solenoid valve A operation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Test VTC oil control solenoid valve A** .

   Is the solenoid valve OK?

   YES

   Go to step 3.

   NO

   Replace VTC oil control solenoid valve A .

3. VTC actuator A check

   -1. **Inspect VTC actuator A** .

   Is the actuator OK?

   YES

   Check the VTC system oil passages and clean them if needed.

   NO

   Replace VTC actuator A .

DTC P1009 (2.4 L ENGINE) (2017 2018 2019)

DTC P1009 : VTC Advance Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0341 is stored at the same time as DTC P1009, troubleshoot DTC P1009 first, then recheck for DTC P0341.

- If DTC P1009 set after replacing the VTC actuator, verify that the correct timing marks on the crank pulley were used.

DTC Description	Confirmed DTC	Pending DTC
P1009 VTC Advance Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1009 VTC Advance Malfunction	B	B

   Is DTC P1009 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. VTC oil control solenoid valve operation check

   -1. **Test the VTC oil control solenoid valve** .

   Is the VTC oil control solenoid valve OK?

   YES

   Go to step 3.

   NO

   Replace the VTC oil control solenoid valve .

3. VTC actuator check

   -1. **Inspect the VTC actuator** .

   Is the actuator OK?

   YES

   Check the VTC system oil passages and clean them if needed.

   NO

   Replace the VTC actuator .

DTC P101A (1.5 L ENGINE)

DTC P101A : VTC B Advance Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0366 is stored at the same time as DTC P101A, troubleshoot DTC P101A first, then recheck for DTC P0366.
- If DTC P101A set after replacing the VTC actuator, verify that the correct timing marks on the crank pulley were used.

DTC Description	Confirmed DTC	Pending DTC
P101A VTC B Advance Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P101A VTC B Advance Malfunction	B	B

   Is DTC P101A indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. VTC oil control solenoid valve B operation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Test VTC oil control solenoid valve B** .

   Is the solenoid valve OK?

   YES

   Go to step 3.

   NO

   Replace VTC oil control solenoid valve B .

3. VTC actuator B check

-1. **Inspect VTC actuator B** .

Is the actuator OK?

YES

Check the VTC system oil passages and clean them if needed.

NO

Replace VTC actuator B .

DTC P1172 (1.5 L ENGINE)

DTC P1172 : A/F Sensor (Sensor 1) Circuit Out of Range High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1172 A/F Sensor (Sensor 1) Circuit Out of Range High	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Monitor the OBD STATUS for P1172 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1172 A/F Sensor (Sensor 1) Circuit Out of Range High	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the A/F sensor (Sensor 1)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F Sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

DTC P1172 (2.4 L ENGINE) (2017 2018 2019)

DTC P1172 : A/F Sensor (Sensor 1) Circuit Out of Range High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1172 A/F Sensor (Sensor 1) Circuit Out of Range High	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Monitor the OBD STATUS for P1172 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1172 A/F Sensor (Sensor 1) Circuit Out of Range High	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the A/F sensor (Sensor 1)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F Sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

DTC P1320 (1.5 L ENGINE)

DTC P1320 : Super Knock

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Make sure the spark plugs are genuine parts and have the correct part number for the vehicle. If the plugs are aftermarket's products or they do not have the correct part number, they may cause this DTC.

DTC Description	Confirmed DTC	Pending DTC
P1320 Super Knock	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Record all the on-board snapshots with the HDS.

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

-4. Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- Engine Speed
- Vehicle Speed
- ECT Sensor 1
- MAP Sensor (Hi Res)
- REL TP Sensor
- IAT Sensor (1)

On-board Snapshot

Signal	Current conditions	
	Values	Unit
Engine Speed	B	B
Vehicle Speed	B	B
ECT Sensor 1 Voltage	B	B
MAP Sensor (Hi Res)	B	B
REL TP Sensor	B	B
IAT Sensor (1)	B	B

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1320 Super Knock	B	B

Is DTC P1320 indicated?

YES

The failure is duplicated. **Check for damage of the spark plug (s) and replace them if needed** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P1454, P2422 (2.4 L ENGINE) (2017 2018 2019)

DTC P1454 : FTP Sensor Circuit Range/Performance Problem **DTC P2422** : EVAP Canister Vent Shut Valve Stuck Closed Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1454 FTP Sensor Circuit Range/Performance Problem	B	B
P2422 EVAP Canister Vent Shut Valve Stuck Closed Malfunction	B	B

DTC (PGM-FI)

1. EVAP system check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Insert the emergency fuel funnel into the fuel filler neck .

NOTE: The emergency fuel funnel is stored under the cargo lining.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
FTP SENSOR	-0.67-0.67	kPa	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Go to step 5.

2. Problem verification

-1. Remove the emergency fuel funnel from the fuel filler neck.

-2. Clear the DTC with the HDS.

-3. Start the engine, and let it idle without load (in P or N) until the radiator fan comes on.

-4. Monitor the EVAP PC DUTY (purge control duty) in the DATA LIST with the HDS, while holding the engine speed at 3, 000 rpm with the EVAP PC DUTY at 20 % or more for at least 4 minutes, then let the engine idle.

Signal	**Current conditions**	
	Values	**Unit**
EVAP PC DUTY	B	B

-5. Monitor the OBD STATUS for DTC P1454 and/or P2422 in the DTCs MENU with the HDS.

DTC Description	**OBD STATUS**
P1454 FTP Sensor Circuit Range/Performance Problem	B
P2422 EVAP Canister Vent Shut Valve Stuck Closed Malfunction	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

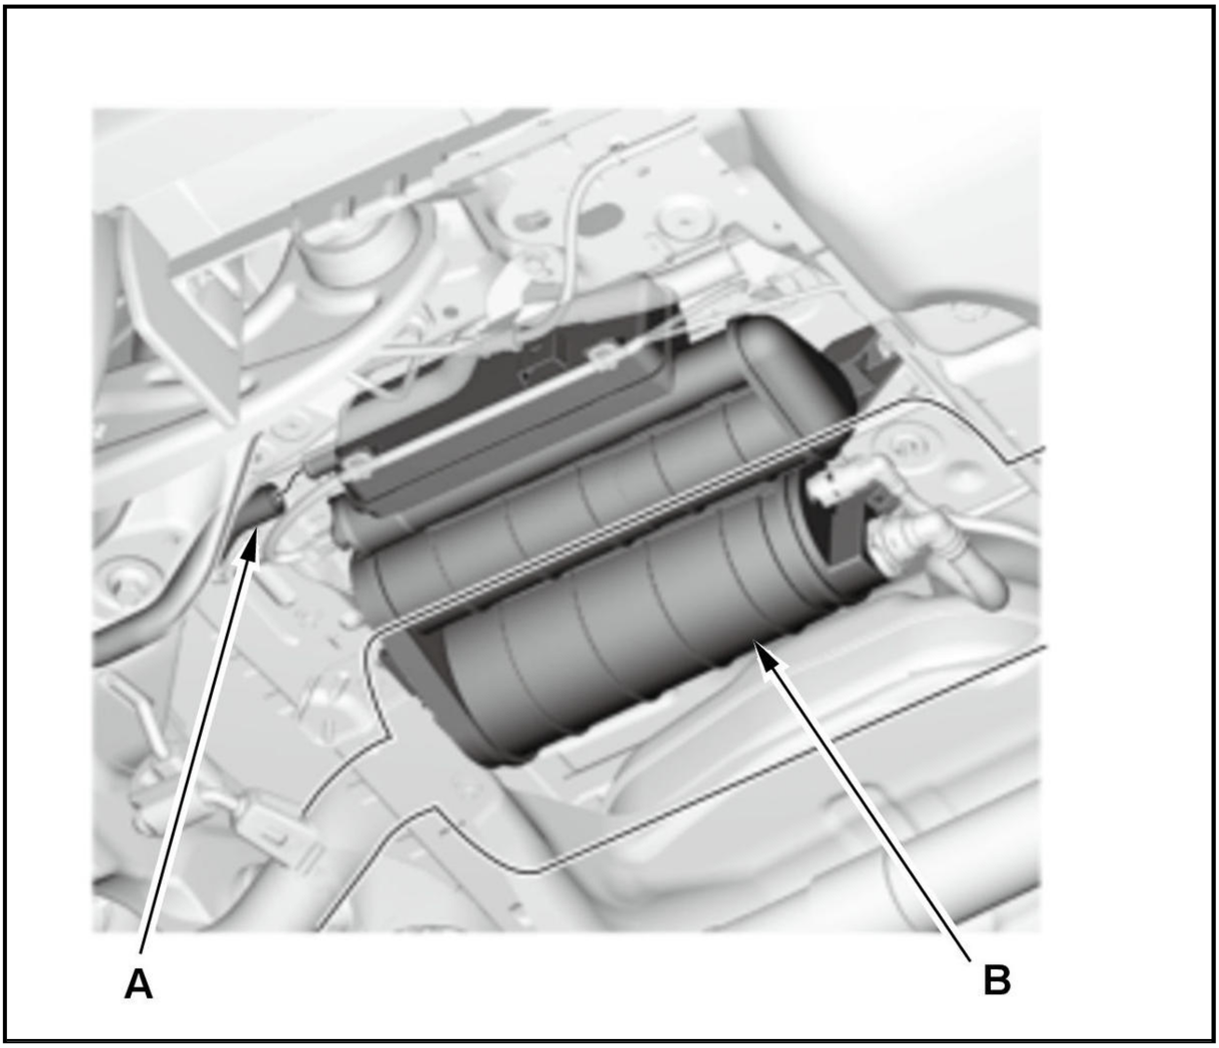
If the HDS indicates PASSED, there might be an intermittent failure, and the system is OK at this time. **Check the on-board snapshot, and repeat the driving conditions when the DTC set (fuel level, engine speed, vehicle speed, and outside air temperature)** . If no problem is found, check for poor connections or loose terminals between the FTP sensor and the PCM. Also check for a blockage in the FTP sensor vent port and vent hose, and the EVAP canister vent hose and drain joint. If the HDS indicates NOT COMPLETED, let the engine idle until a result comes on.

3. EVAP canister vent line check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Clear the DTC with the HDS.

-3. Disconnect the EVAP canister vent hose (A) from the EVAP canister (B).



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FTP SENSOR	-0.67-0.67	kPa	B	B

Do the current condition (s) match the threshold?

YES

Check for a blockage in the EVAP canister vent hose or drain tube joint.

NO

Go to step 4.

4. EVAP canister vent shut valve operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the EVAP canister vent shut valve** .

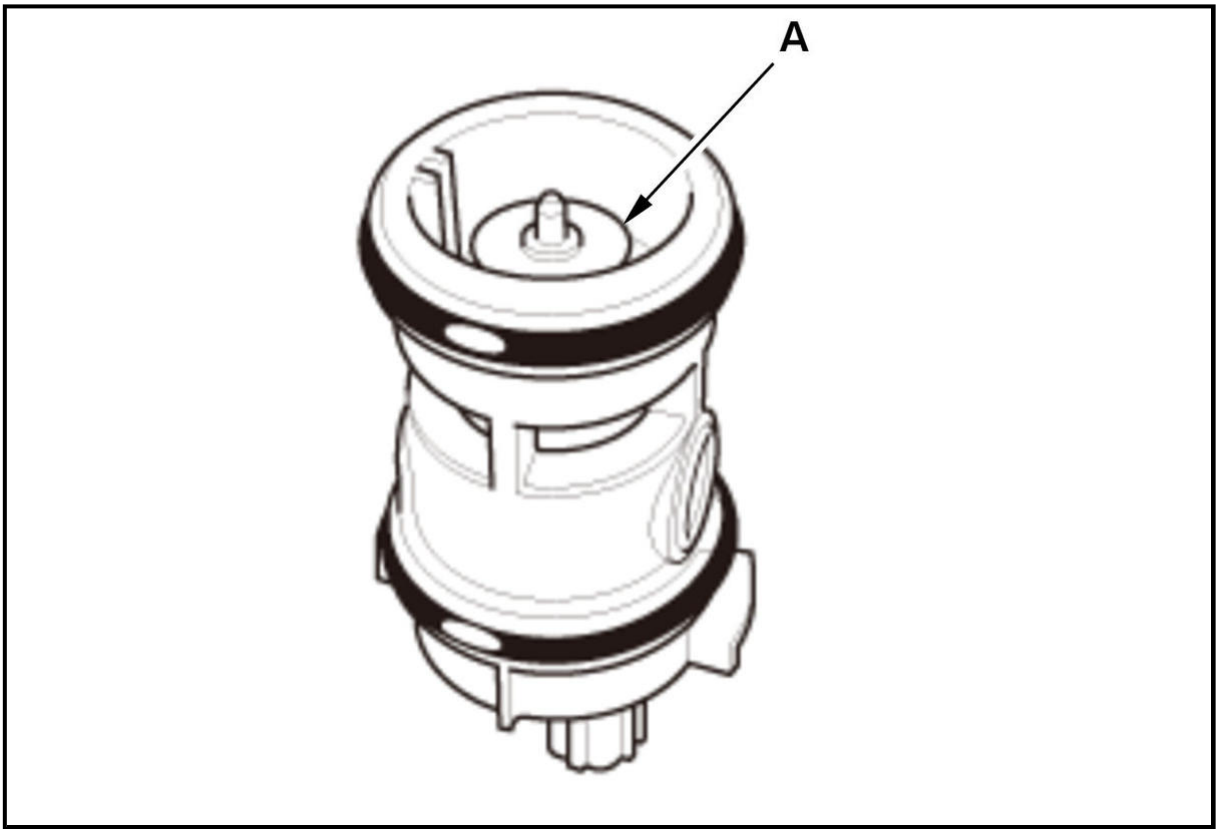
-3. Connect the 2P connector to the EVAP canister vent shut valve.

-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST in the INSPECTION MENU, and do the EVAP CVS ON in the SINGLE SOLENOID with the HDS.

SINGLE SOLENOID

Check the EVAP canister vent shut valve (A) operation.



Is the valve free of corrosion, and does it operate properly?

YES

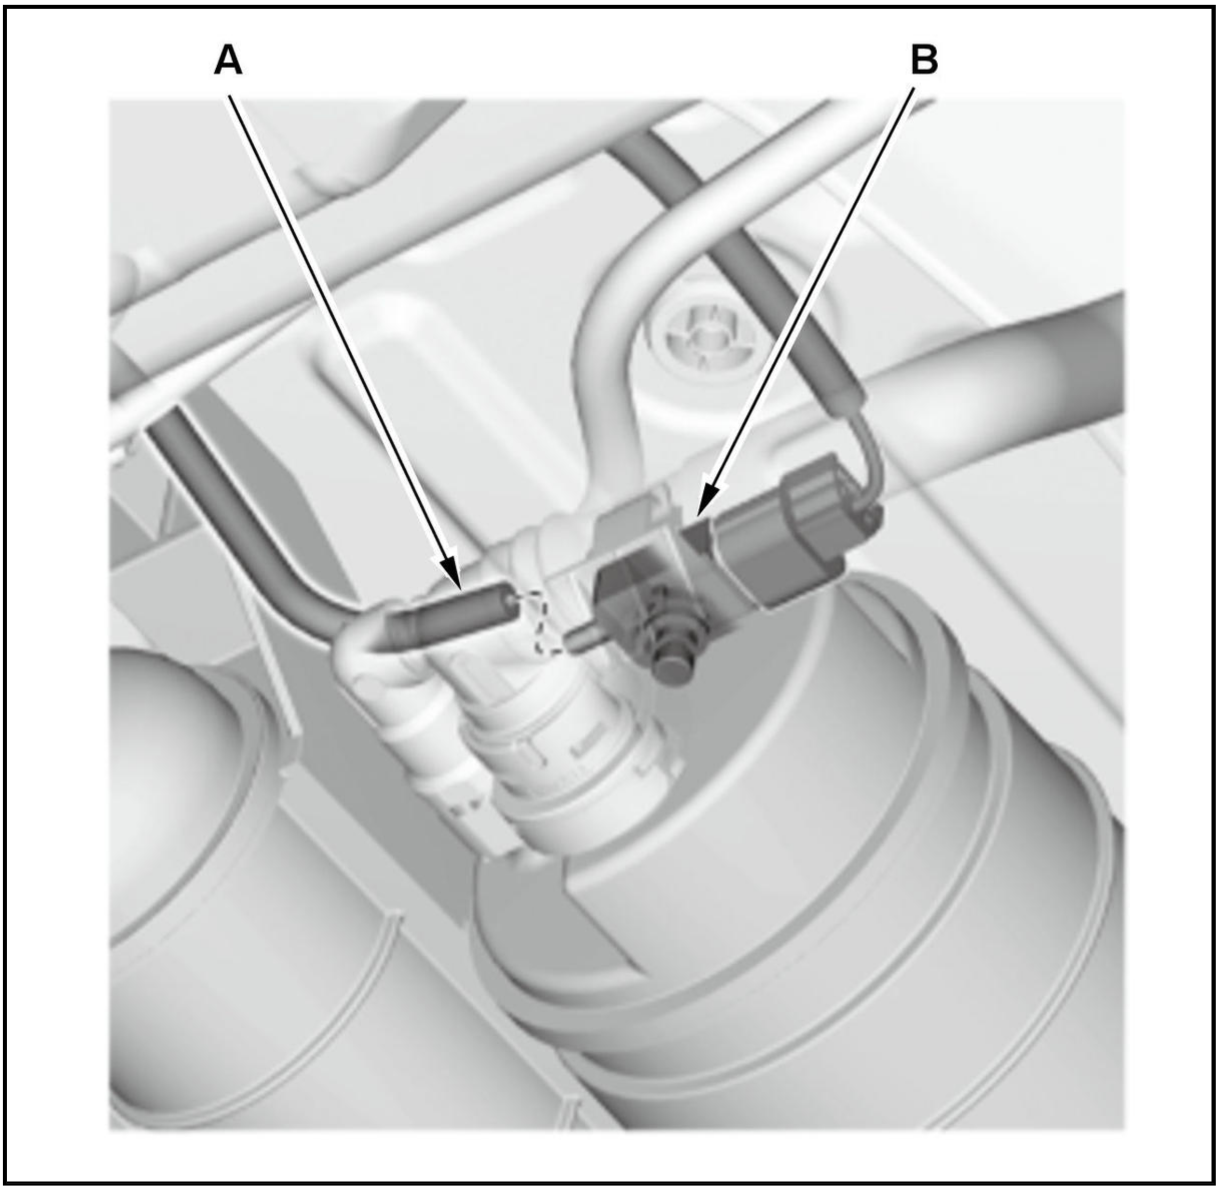
The EVAP canister vent shut valve is OK. Go to step 5.

NO

Replace the EVAP canister vent shut valve .

5. FTP sensor vent hose restriction check

-1. Disconnect the hose (A) from the FTP sensor (B).



-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FTP SENSOR	-0.67-0.67	kPa	B	B

Do the current condition (s) match the threshold?

YES

Check for a blockage in the FTP sensor vent hose.

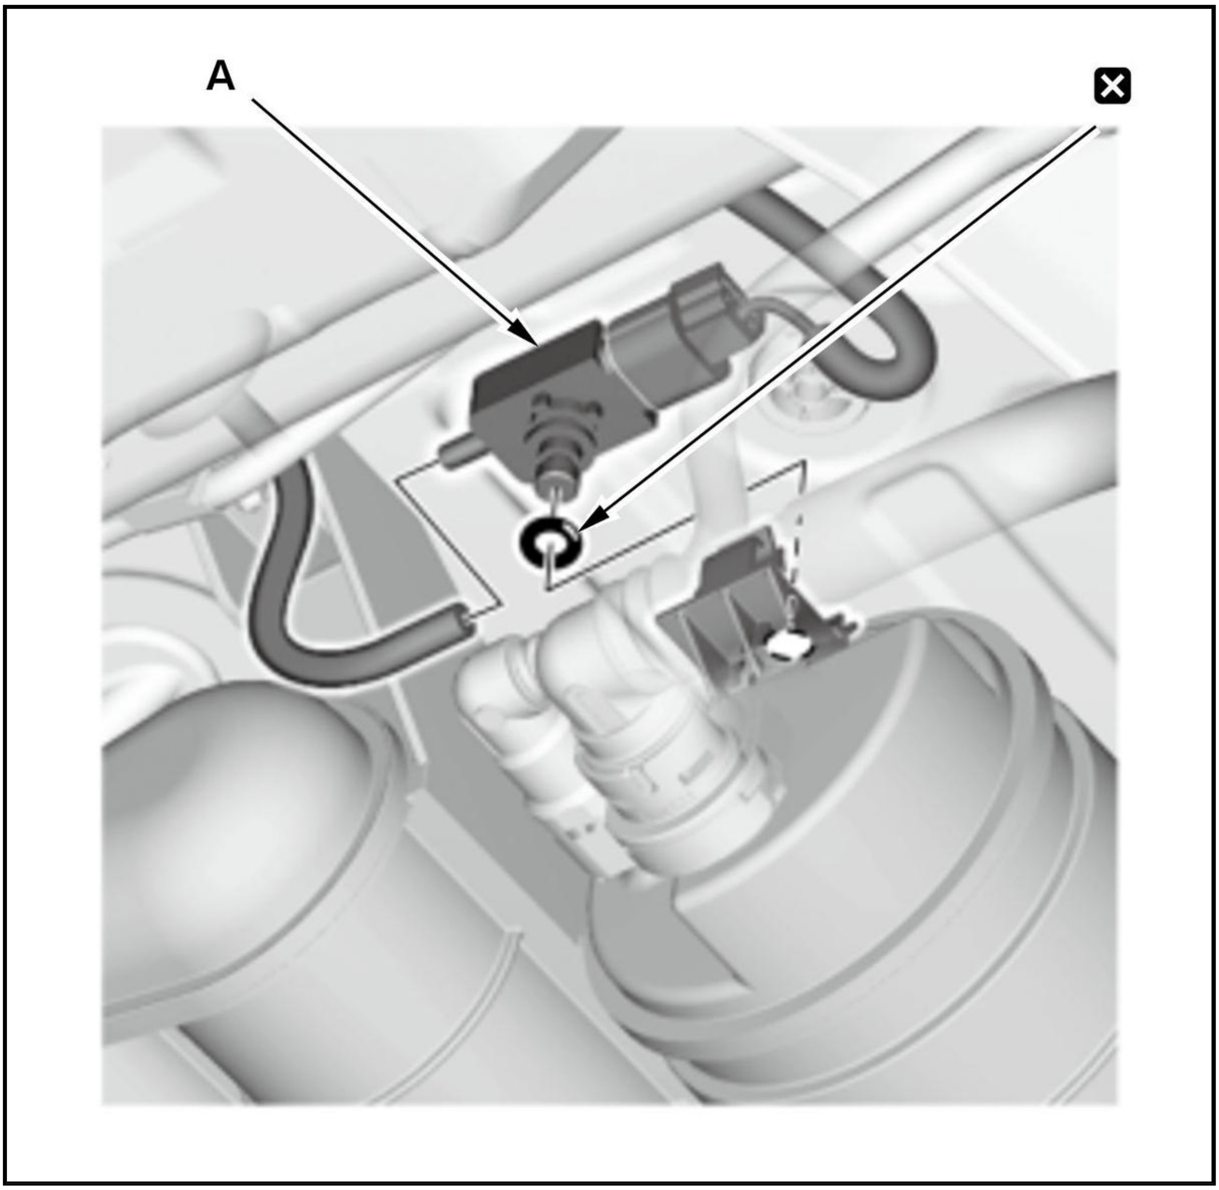
NO

Go to step 6.

6. FTP sensor port restriction check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the FTP sensor (A) from the EVAP canister with its connector connected.



-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FTP SENSOR	-0.67-0.67	kPa	B	B

Do the current condition (s) match the threshold?

YES

The FTP sensor port is OK. The EVAP canister has an internal blockage; **replace the EVAP canister** .

NO

Replace the FTP sensor .

DTC P1458 (2.4 L ENGINE) (2017 2018 2019)

DTC P1458 : FTP Sensor Circuit Range/Performance Problem

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of DTCs listed below are indicated at the same time as DTC P1458, troubleshoot those DTCs first, then recheck for P1458.

  P0451, P0452, P0453, P1454: FTP sensor

  P2422: EVAP canister vent shut valve

- Do not start the engine during this troubleshooting.

DTC Description	Confirmed DTC	Pending DTC
P1458 FTP Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Fuel level check

   -1. Turn the vehicle to the ON mode.

   -2. Note these recorded on-board snapshot parameters with the HDS:

   - MAX Value of FTP SENSOR
   - MIN Value of FTP SENSOR
   - FUEL LEVEL

   On-board Snapshot

   -3. Check the FUEL LEVEL in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
FUEL LEVEL	B	B

Is the current FUEL LEVEL less than it is on the on-board snapshot?

YES

Go to step 2.

NO

Drain the fuel until the FUEL LEVEL is less than it is on the on-board snapshot, then go to step 2.

2. Determine possible failure area (FTP sensor, others)

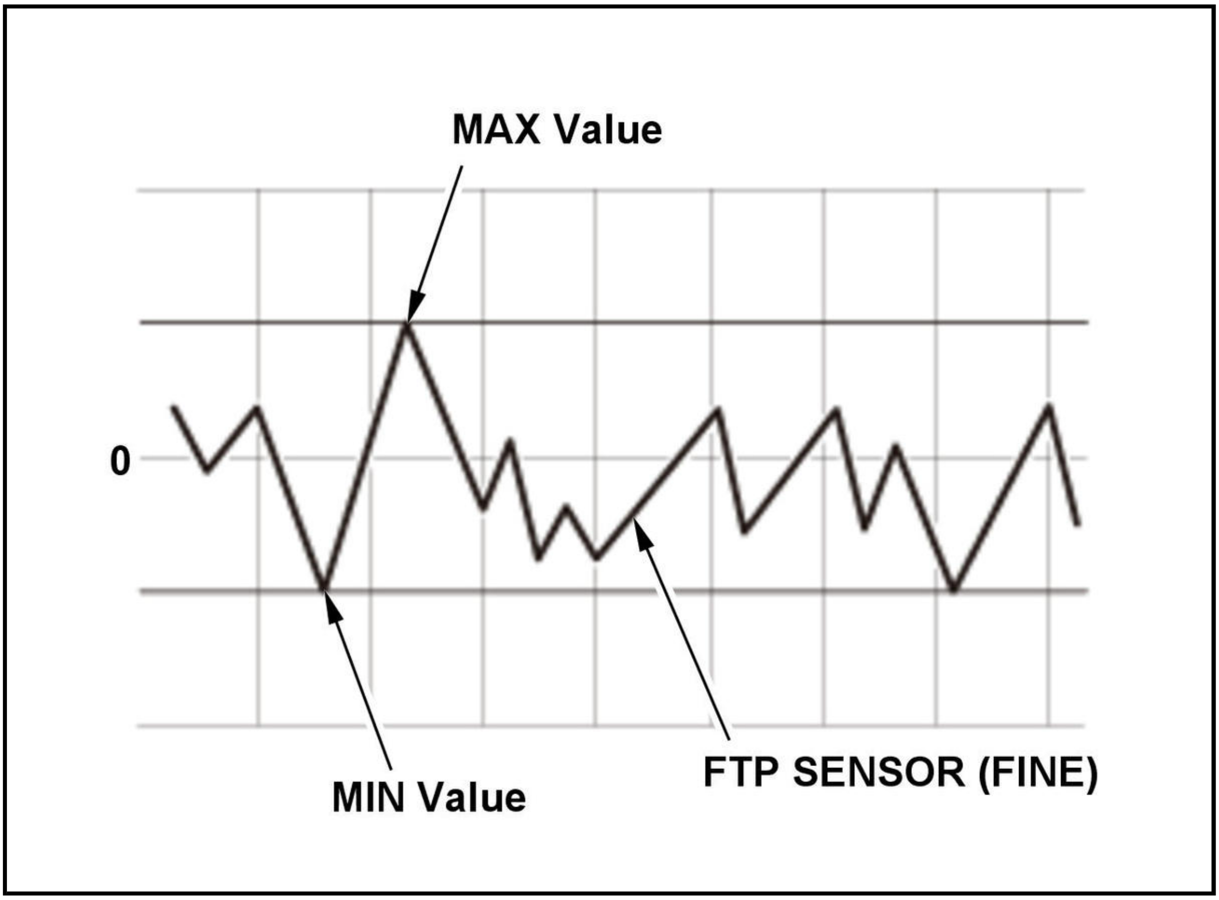
   -1. Select the EVAP TEST in the INSPECTION MENU, then select the EVAP CVS OFF in the SINGLE SOLENOID with the HDS.

   SINGLE SOLENOID

   Take a snapshot with the HDS for 3 minutes without starting the engine.

   Check the recorded snapshot parameter with the HDS:

   - MAX Value of FTP SENSOR (FINE)
   - MIN Value of FTP SENSOR (FINE)



Are the MAX and MIN values of the FTP SENSOR (FINE) within the range of +/-0.67 kPa (0.2 inHg, 5 mmHg)?

YES

Go to step 3.

NO

Go to step 5.

3. FTP sensor performance check 1

-1. Check the FTP SENSOR (FINE) in the recorded snapshot with the HDS.

Does it vary 0.067 kPa (0.02 inHg, 0.5 mmHg) or more within 3 seconds?

YES

Go to step 4.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the PCM. Also check for a blockage in the EVAP vent hose. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

4. FTP sensor performance check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the FTP sensor** .

-3. Reconnect the following connector.

FTP sensor 3P connector

-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
FTP SENSOR (FINE)	B	B

Does it vary 0.067 kPa (0.02 inHg, 0.5 mmHg) or more within 3 seconds?

YES

Replace the FTP sensor .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the PCM. Also check for a blockage in the EVAP vent hose. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

5. Determine possible failure area (EVAP canister vent line, others)

-1. **Insert the emergency fuel funnel into the fuel filler neck** , and wait 1 minute.

NOTE: The emergency fuel funnel is stored under the cargo lining.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FTP SENSOR (FINE)	More than 0.67	kPa	B	B
	Less than -0.67	kPa		

Do the current condition (s) match the threshold?

YES

Go to step 6.

NO

Remove the emergency fuel funnel from the fuel filler neck, then go to step 8.

6. FTP sensor vent hose check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the FTP sensor** .

-3. Reconnect the following connector.

FTP sensor 3P connector

-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
FTP SENSOR (FINE)	More than 0.67	kPa	B	B
	Less than -0.67	kPa		

Do the current condition (s) match the threshold?

YES

Go to step 7.

NO

Remove the blockage in the FTP sensor vent hose. Replace the hose if needed.

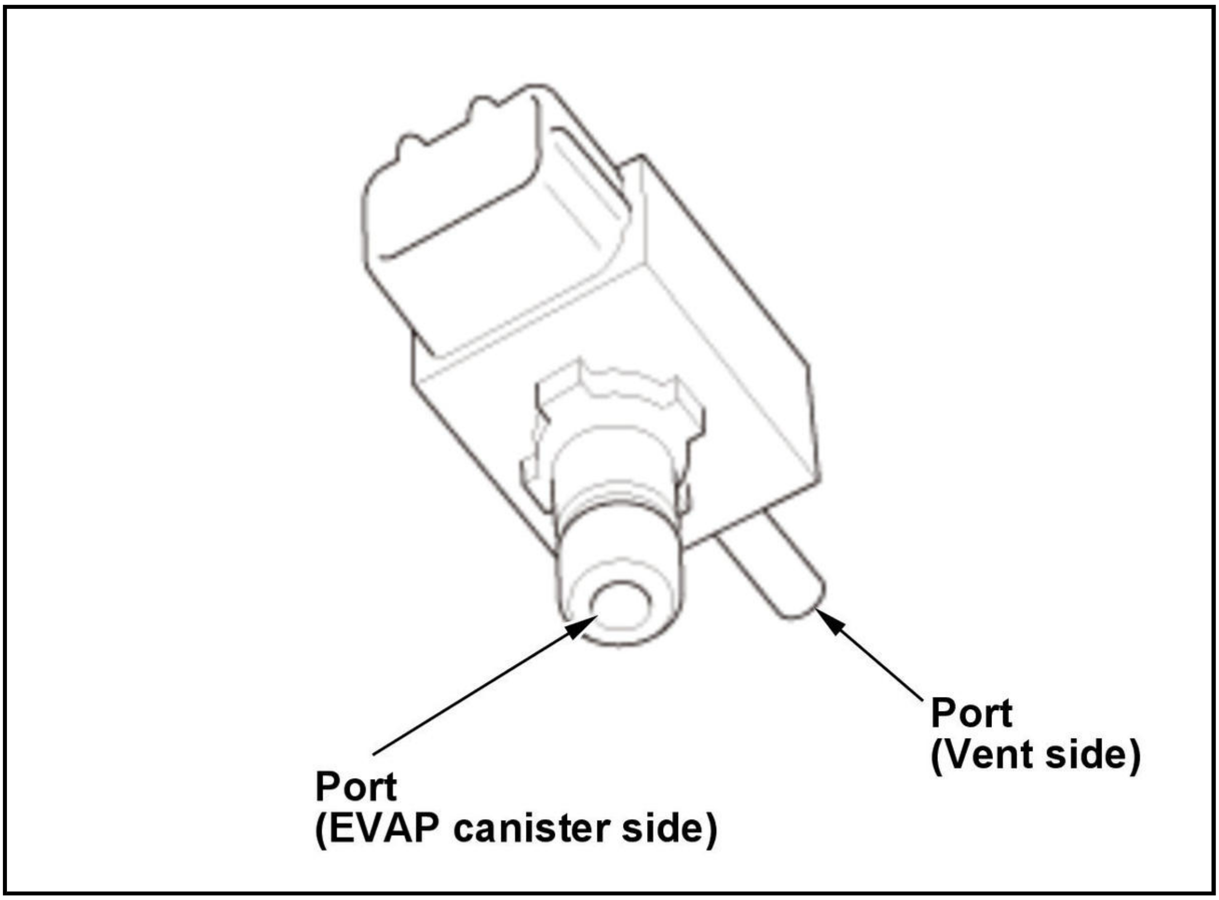
7. FTP sensor port visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

FTP sensor 3P connector

-3. Check for a blockage or damage at the FTP sensor ports (EVAP canister side and vent side).



Port
(Vent side)
Port
(EVAP canister side)

Is there any blockage or damage?

YES

Remove the blockage, and **replace the FTP sensor** if needed.

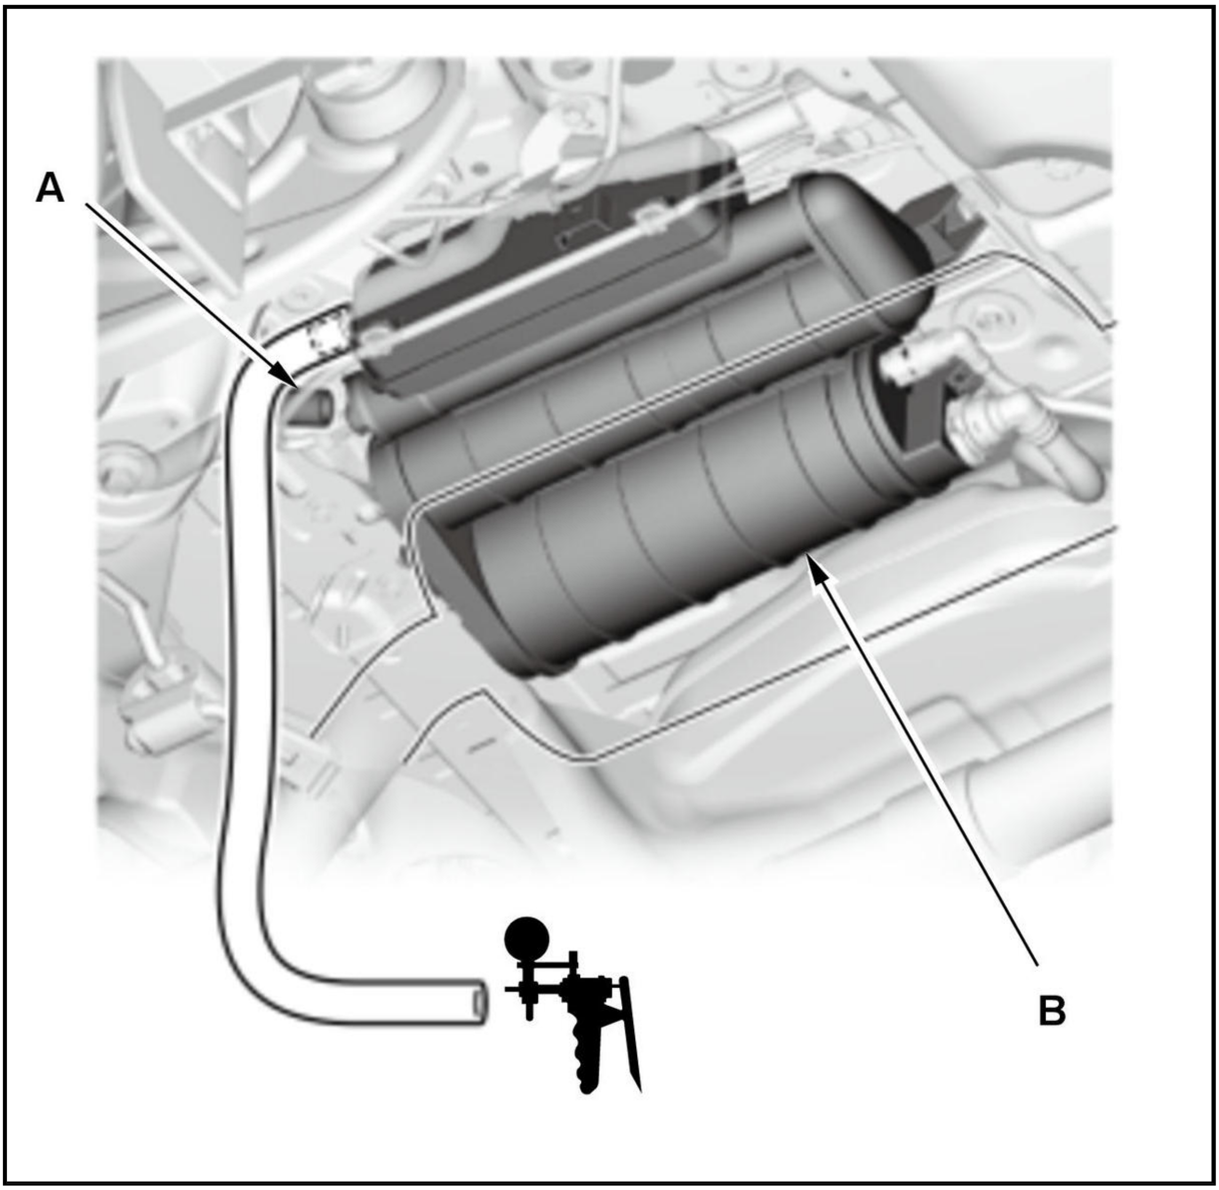
NO

Replace the FTP sensor .

8. EVAP canister vent shut valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the EVAP canister vent hose (A) from the EVAP canister (B), then connect a vacuum pump/gauge, 0-30 inHg, to the EVAP canister as shown.



-3. Turn the vehicle to the ON mode.

-4. Select the EVAP TEST in the INSPECTION MENU, then select the EVAP CVS OFF in the SINGLE SOLENOID with the HDS.

SINGLE SOLENOID

-5. Try to apply vacuum to the valve (not more than 5.3 kPa (1.6 inHg, 40 mmHg)) while checking the FTP SENSOR (FINE) in the DATA LIST with the HDS.

NOTE: To avoid damaging the FTP sensor, do not apply more than 5.3 kPa (1.6 inHg, 40 mmHg) of vacuum.

Signal	Current conditions	
	Values	**Unit**
FTP SENSOR (FINE)	B	B

Does the valve hold more than 1.3 kPa (0.4 inHg, 10 mmHg) of vacuum?

YES

Replace the EVAP canister vent shut valve .

NO

The EVAP canister vent shut valve is OK. Remove the blockage in the EVAP canister vent hose. Replace the hose if needed.

DTC P145D (1.5 L ENGINE)

DTC P145D : EVAP System Purge Flow Malfunction at turbocharging

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If DTC P145D is indicated alone, do the troubleshooting for DTC P04DF and P04F0 using the on-board snapshot for P145D.
- If DTC P0441, P04F0, P04F1, and P145D are stored at the same time, check for a poor connection, a blockage, or damage at the EVAP canister purge line between the EVAP canister purge valve and the EVAP canister. Also check for a stuck closed EVAP canister purge valve.
- If any of the DTCs listed below are indicated at the same time as DTC P145D, troubleshoot those DTCs first, then recheck for P145D.

  P04DF, P04F0, P04F1: EVAP system purge flow

DTC Description	Confirmed DTC	Pending DTC
P145D EVAP System Purge Flow Malfunction at turbocharging	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Purge Flow Check Test with the HDS.

   EVAP TEST (ELCM)

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P04DF EVAP System High Purge Flow Detected	B	B
P04F0 EVAP System Incorrect Purge Flow Detected	B	B
P04F1 EVAP System Low Purge Flow Detected	B	B
P145D EVAP System Purge Flow Malfunction at turbocharging	B	B

   Are DTC P04DF, P04F0, or P04F1 and P145D indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for DTC P04DF , DTC P04F0 , and DTC P04F1 .

DTC P145F, P1461, P1462, P24C1 (1.5 L ENGINE)

DTC P145F : EVAP Leak Check Module Pressure Sensor Range/Performance Problem **DTC P1461** : EVAP Leak Check Module Pressure Sensor Shifts **DTC P1462** : EVAP Leak Check Module Pressure Decompression

Defect **DTC P24C1** : Canister Change Over Valve Stuck Close

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P145F EVAP Leak Check Module Pressure Sensor Range/Performance Problem	B	B
P1461 EVAP Leak Check Module Pressure Sensor Shifts	B	B
P1462 EVAP Leak Check Module Pressure Decompression Defect	B	B
P24C1 Canister Change Over Valve Stuck Close	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST (ELCM)

   Is the result OK?

   YES

   If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   The failure is duplicated. Go to step 2.

2. EVAP leak check module drain hose check

   -1. **Remove the EVAP leak check module** and the **EVAP canister filter** , then check the blockage in the drain hoses and the EVAP canister filter.

   Are the parts OK?

   YES

   Replace the EVAP leak check module .

   NO

   Remove the blockage from them, or replace the part (s) if needed.

DTC P1549 (1.5 L ENGINE)

DTC P1549 : Charging System High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If a high voltage battery (24 V, etc.) is connected to the vehicle, this DTC can be stored.

DTC Description	Confirmed DTC	Pending DTC
P1549 Charging System High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check under these conditions:

   - A/C off
   - Headlights off
   - Rear window defogger off

   -6. Hold the engine speed at 3, 000 (rpm without load (in P or N) for 1 minute.

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1549 Charging System High Voltage	B	B

Is DTC P1549 indicated?

YES

The failure is duplicated. **Replace the alternator** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P1549 (2.4 L ENGINE) (2017 2018 2019)

DTC P1549 : Charging System High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If a high voltage battery (24 V, etc.) is connected to the vehicle, this DTC can be stored.

DTC Description	Confirmed DTC	Pending DTC
P1549 Charging System High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Check under these conditions:

   - A/C off
   - Headlights off
   - Rear window defogger off

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) for 1 minute.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1549 Charging System High Voltage	B	B

Is DTC P1549 indicated?

YES

The failure is duplicated. **Replace the alternator** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P154A (1.5 L ENGINE)

DTC P154A : Battery Sensor Internal Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P154A Battery Sensor Internal Failure	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P154A Battery Sensor Internal Failure	B	B

Is DTC P154A indicated?

YES

The failure is duplicated. **Replace the 12 volt battery sensor** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 12 volt battery sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P154A (2.4 L ENGINE) (2017 2018 2019)

DTC P154A : Battery Sensor Internal Failure

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the vehicle has an AGM type 12 volt battery, **do the 12 volt battery test** after this troubleshooting procedure to check the 12 volt battery performance.

DTC Description	Confirmed DTC	Pending DTC
P154A Battery Sensor Internal Failure	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS, and wait 10 seconds.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P154A Battery Sensor Internal Failure	B	B

Is DTC P154A indicated?

YES

The failure is duplicated. **Replace the 12 volt battery sensor** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 12 volt battery sensor and the gauge control module. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P154B (1.5 L ENGINE) (2020 2021)

DTC P154B : Battery Sensor Characteristic Abnormal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P154B Battery Sensor Characteristic Abnormal	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check the Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0112 IAT Sensor 1 Circuit Low Voltage	B	B
P0113 IAT Sensor Circuit High Voltage	B	B

   Is DTC P0112 and/or P0113 indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. 12 volt battery temperature check

   -1. Open the hood, and measure the temperature around the 12 volt battery sensor with a thermometer.

   -2. Start the engine, and let it idle for 10 seconds, then check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
ESTIMATED BATTERY TEMPERATURE	B	B

   Does the value of ESTIMATED BATTERY TEMPERATURE differ 41 deg. F (23 deg. C) or more from the value of the thermometer?

   YES

   Replace the 12 volt battery sensor .

   NO

   Go to step 3.

3. 12 volt battery sensor signal check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY CURRENT (BATTERY SENSOR)	More than 0	A	B	B

Do the current condition (s) match the threshold?

YES

Replace the 12 volt battery sensor .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 12 volt battery sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P1658 (1.5 L ENGINE)

DTC P1658 : ETCS Control Relay ON Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Select the ETCS TEST in the INSPECTION MENU with the HDS.

   ETCS TEST

   Is the RELAY circuit OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (PGM-FI subrelay circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   Go to step 2.

2. Relay circuit board check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Shorted wire check (FI SUB RLY CL- line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 25**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the FI SUB RLY CL- wire between the PCM (A25) and the relay circuit board (PGM-FI subrelay circuit).

NO

Go to step 4.

4. Shorted wire check (FI SUB RLY OUT line to power)

-1. Exit the SCS mode with the HDS.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 16**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the FI SUB RLY OUT wire between the PCM (A16) and the relay circuit board (PGM-FI subrelay circuit).

NO

The FI SUB RLY OUT wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P1658 (2.4 L ENGINE) (2017 2018 2019)

DTC P1658 : ETCS Control Relay ON Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Select the ETCS TEST in the INSPECTION MENU with the HDS.

   ETCS TEST

   Is the RELAY circuit OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (PGM-FI subrelay circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   The failure is duplicated. Go to step 2.

2. Relay circuit board check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Shorted wire check (DBW RLY- line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   -2. Disconnect the following connector.

PCM connector A (51P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
B	Relay circuit board: removed
Test point 1	**PCM connector A (51P) No. 19**
Test point 2	Body ground

   Is there continuity?

YES

Repair a short in the DBW RLY- wire between the PCM (A19) and the relay circuit board (PGM-FI subrelay circuit).

NO

The DBW RLY- wire is OK. Go to step 4.

4. Shorted wire check (VBDBW/DBW RLY OUT line to power)

   -1. Disconnect the following connector.

PCM connector C (51P)

   -2. Turn the vehicle to the ON mode.

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (51P): disconnected
B	Relay circuit board: removed
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the VBDBW/DBW RLY OUT wire between the PCM (C2) and the relay circuit board (PGM-FI subrelay circuit).

NO

The VBDBW/DBW RLY OUT wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P1659 (1.5 L ENGINE)

DTC P1659 : ETCS Control Relay OFF Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1659 ECTS Control Relay OFF Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1659 ECTS Control Relay OFF Malfunction	B	B

Is DTC P1659 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (PGM-FI subrelay circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 3.

NO

Replace the relay circuit board .

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A8 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

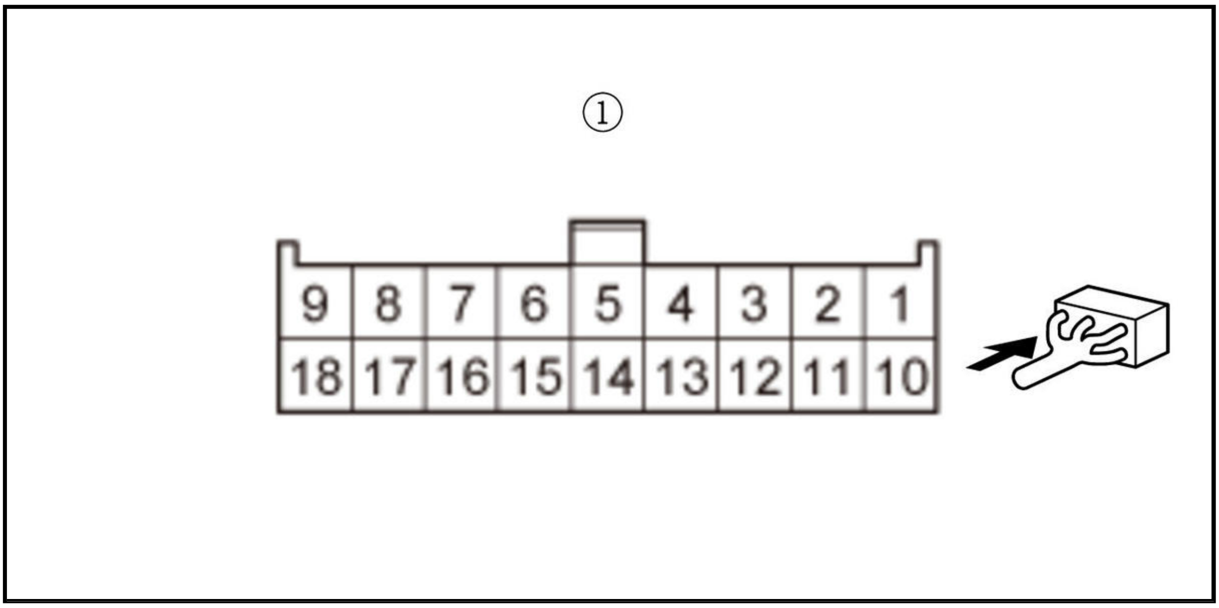
NO

Go to step 7.

4. Open wire check (+B FI SUB line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 14: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B FI SUB wire is OK. Go to step 5.

NO

Repair an open in the +B FI SUB wire between the No. A8 (15 A) fuse in the under-hood fuse/relay box and the relay circuit board. If needed, **replace the under-hood fuse/relay box** .

5. Open wire check (FI SUB RLY OUT line)

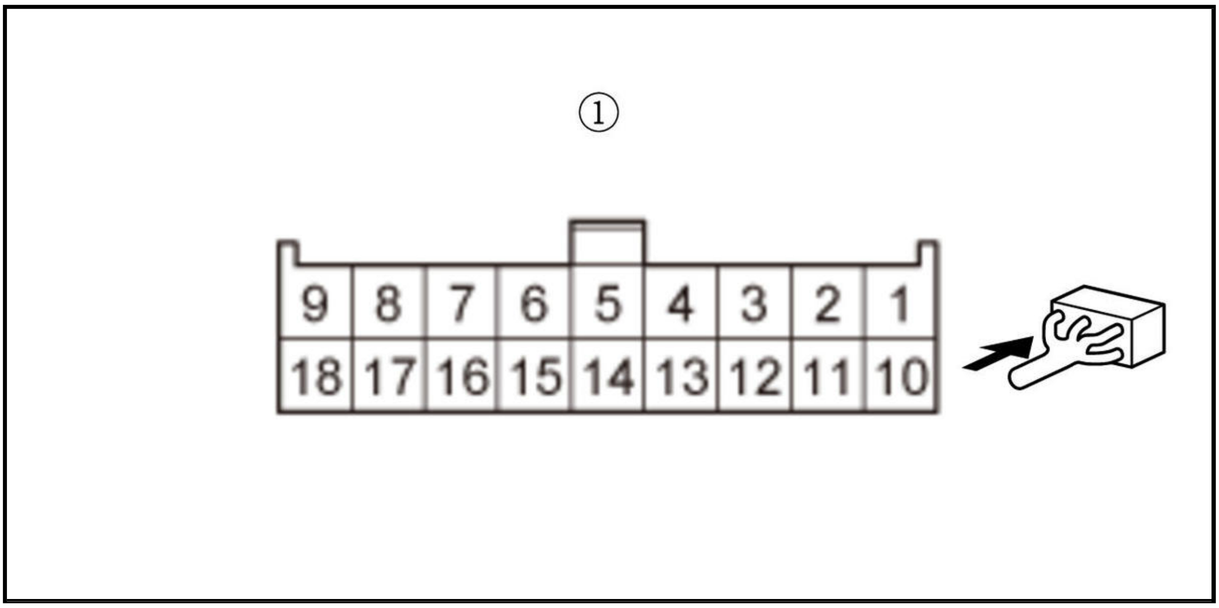
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 1: ①
Test point 2	**PCM connector A (50P) No. 16**



Is there continuity?

YES

The FI SUB RLY OUT wire is OK. Go to step 6.

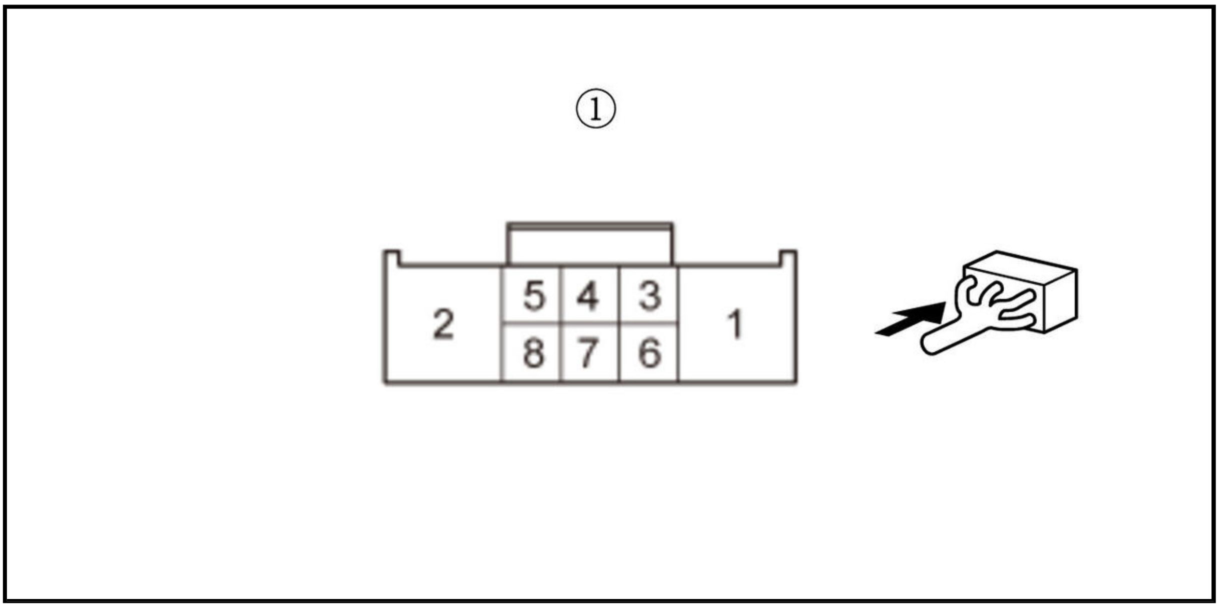
NO

Repair an open in the FI SUB RLY OUT wire between the PCM (A16) and the relay circuit board (PGM-FI subrelay circuit).

6. Open wire check (FI SUB RLY CL- line)

   -1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 3: ①
Test point 2	**PCM connector A (50P) No. 25**



Is there continuity?

YES

The FI SUB RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the FI SUB RLY CL- wire between the PCM (A25) and the relay circuit board (PGM-FI subrelay circuit).

7. Shorted wire check (FI SUB RLY OUT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 16**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the FI SUB RLY OUT wire between the PCM (A16) and the relay circuit board (PGM-FI subrelay circuit). Also replace the No. A8 (15 A) in the under-hood fuse/relay box.

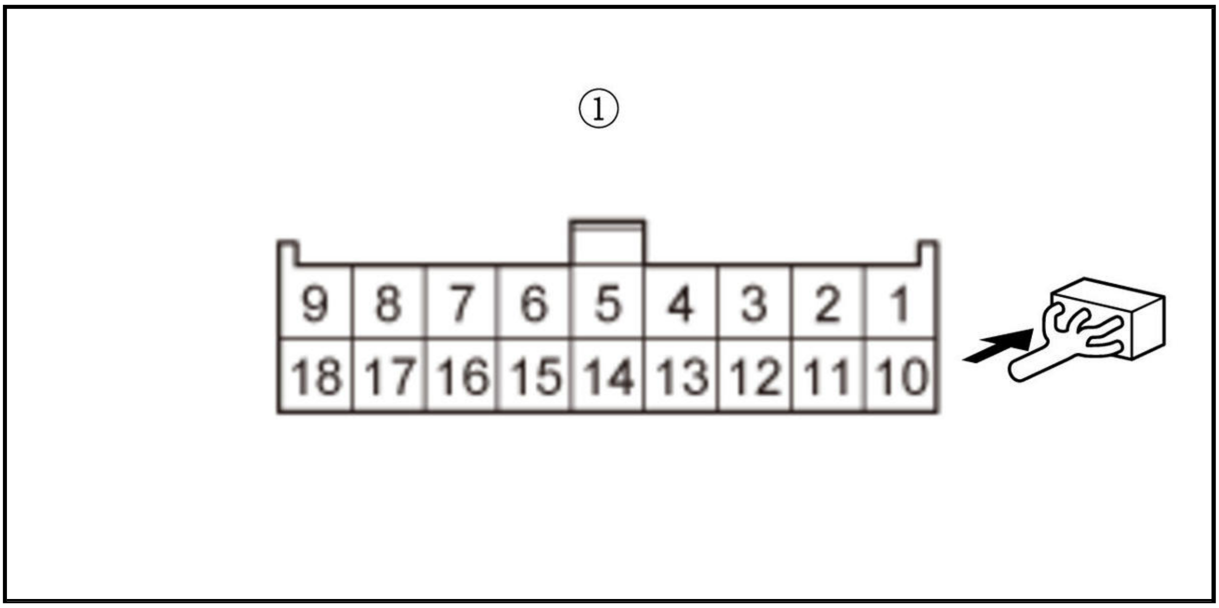
NO

The FI SUB RLY OUT wire is OK. Go to step 8.

8. Shorted wire check (+B FI SUB line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 14: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the +B FI SUB wire between the No. A8 (15 A) fuse in the under-hood fuse/relay box and the relay circuit board. If needed, **replace the under-hood fuse/relay box** . Also replace the No. A8 (15 A) fuse under-hood fuse/relay box.

NO

The +B FI SUB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** . Also replace the No. A8 (15 A) fuse in the under-hood fuse/relay box.

DTC P1659 (2.4 L ENGINE) (2017 2018 2019)

DTC P1659 : ETCS Control Relay OFF Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1659 ECTS Control Relay OFF Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1659 ECTS Control Relay OFF Malfunction	B	B

Is DTC P1659 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (PGM-FI subrelay circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 3.

NO

Replace the relay circuit board .

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A8 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

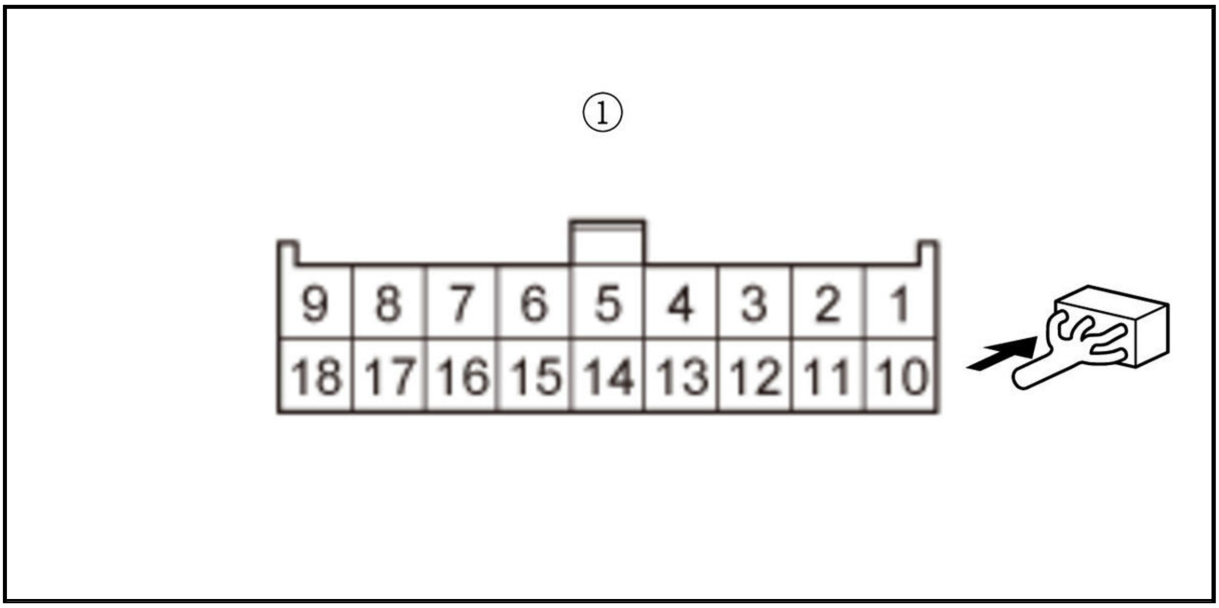
NO

Go to step 7.

4. Open wire check (+B DBW line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 14: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B DBW wire is OK. Go to step 5.

NO

Repair an open in the +B DBW wire between the No. A8 (15 A) fuse in the under-hood fuse/relay box and the relay circuit board. If needed, **replace the under-hood fuse/relay box** .

5. Open wire check (VBDBW/DBW RLY OUT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector C (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector C (51P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 2**

NO

Repair an open in the DBW RLY- wire between the PCM (A19) and the relay circuit board (PGM-FI subrelay circuit).

7. Shorted wire check (VBDBW/DBW RLY OUT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

PCM connector C (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the VBDBW/DBW RLY OUT wire between the PCM (C2) and the relay circuit board (PGM-FI subrelay circuit). Also replace the No. A8 (15 A) in the under-hood fuse/relay box.

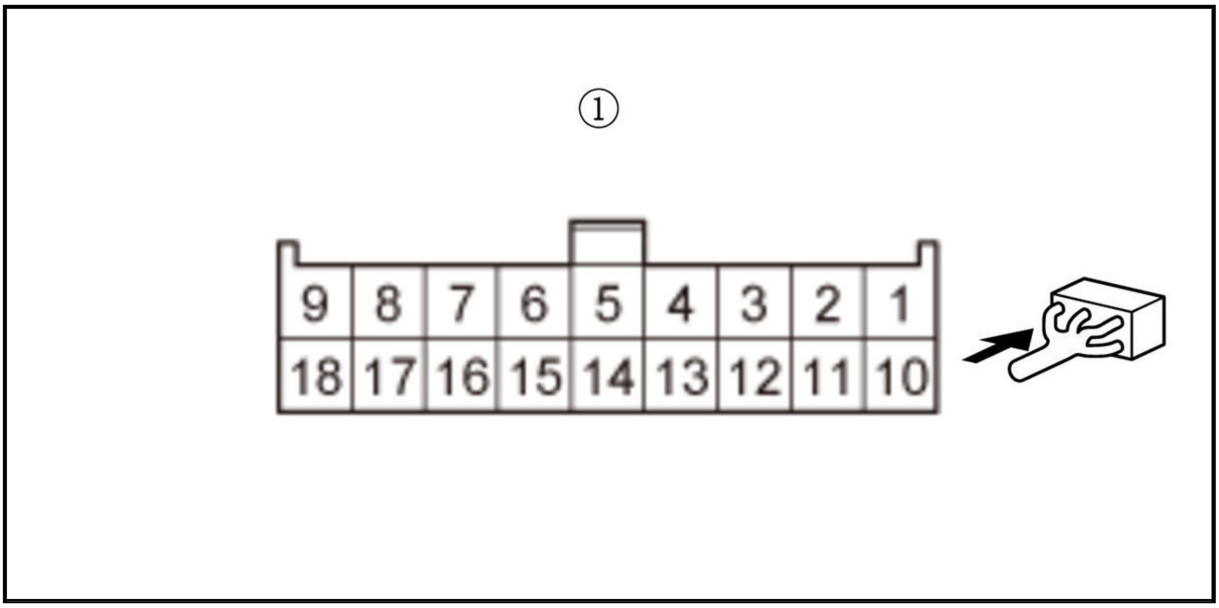
NO

The VBDBW/DBW RLY OUT wire is OK. Go to step 8.

8. Shorted wire check (+B DBW line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector C (51P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 14: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the +B DBW wire between the No. A8 (15 A) fuse in the under-hood fuse/relay box and the relay circuit board. If needed, **replace the under-hood fuse/relay box** . Also replace the No. A8 (15 A) fuse under-hood fuse/relay box.

NO

The +B DBW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** . Also replace the No. A8 (15 A) fuse in the under-hood fuse/relay box.

DTC P1683 (1.5 L ENGINE)

DTC P1683 : Throttle Valve Default Position Spring Performance Problem

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

-7. Turn the vehicle to the ON mode.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B

Is DTC P1683 indicated?

YES

Go to step 2.

NO

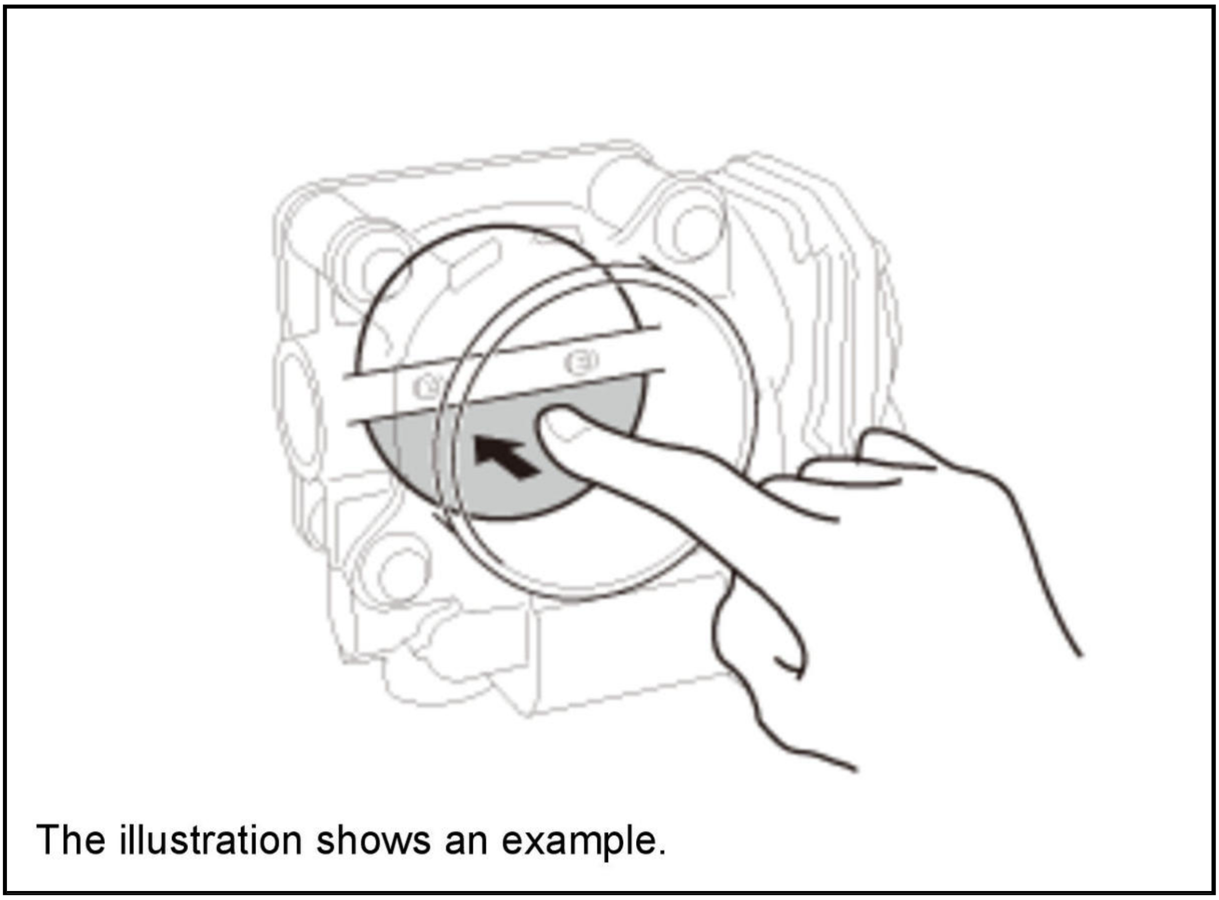
Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body default position spring check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Disconnect the throttle body duct from the throttle body** .

-3. Push the throttle valve closed as shown.



-4. Release the throttle valve.

Does the throttle valve return?

YES

Clean the throttle body . If DTC P1683 is indicated, **replace the throttle body** .

NO

Replace the throttle body .

DTC P1683 (2.4 L ENGINE) (2017 2018 2019)

DTC P1683 : Throttle Valve Default Position Spring Performance Problem

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

-6. Turn the vehicle to the ON mode.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B

Is DTC P1683 indicated?

YES

The failure is duplicated. Go to step 2.

NO

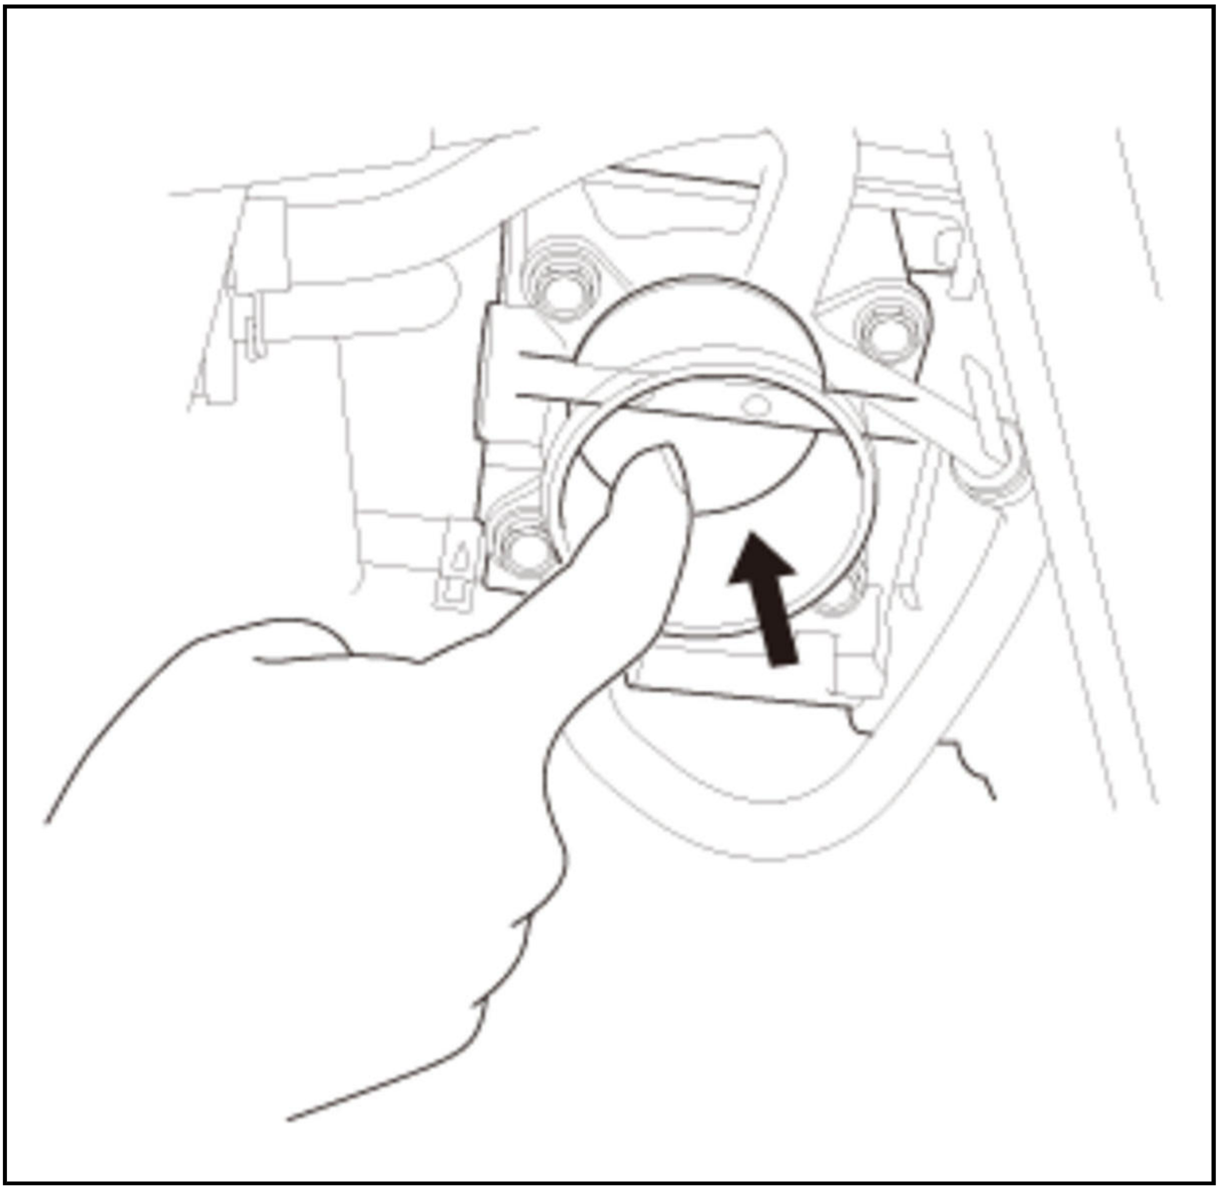
Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body default position spring check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the intake air duct from the throttle body .

-3. Push the throttle valve closed as shown.



-4. Release the throttle valve.

Does the throttle valve return?

YES

Clean the throttle body . If DTC P1683 is indicated, replace the throttle body .

NO

Replace the throttle body .

DTC P1684 (1.5 L ENGINE)

DTC P1684 : Throttle Valve Return Spring Performance Problem

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1684 Throttle Valve Return Spring Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -6. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

   -7. Turn the vehicle to the ON mode.

   -8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1684 Throttle Valve Return Spring Performance Problem	B	B

   Is DTC P1684 indicated?

   YES

   Go to step 2.

   NO

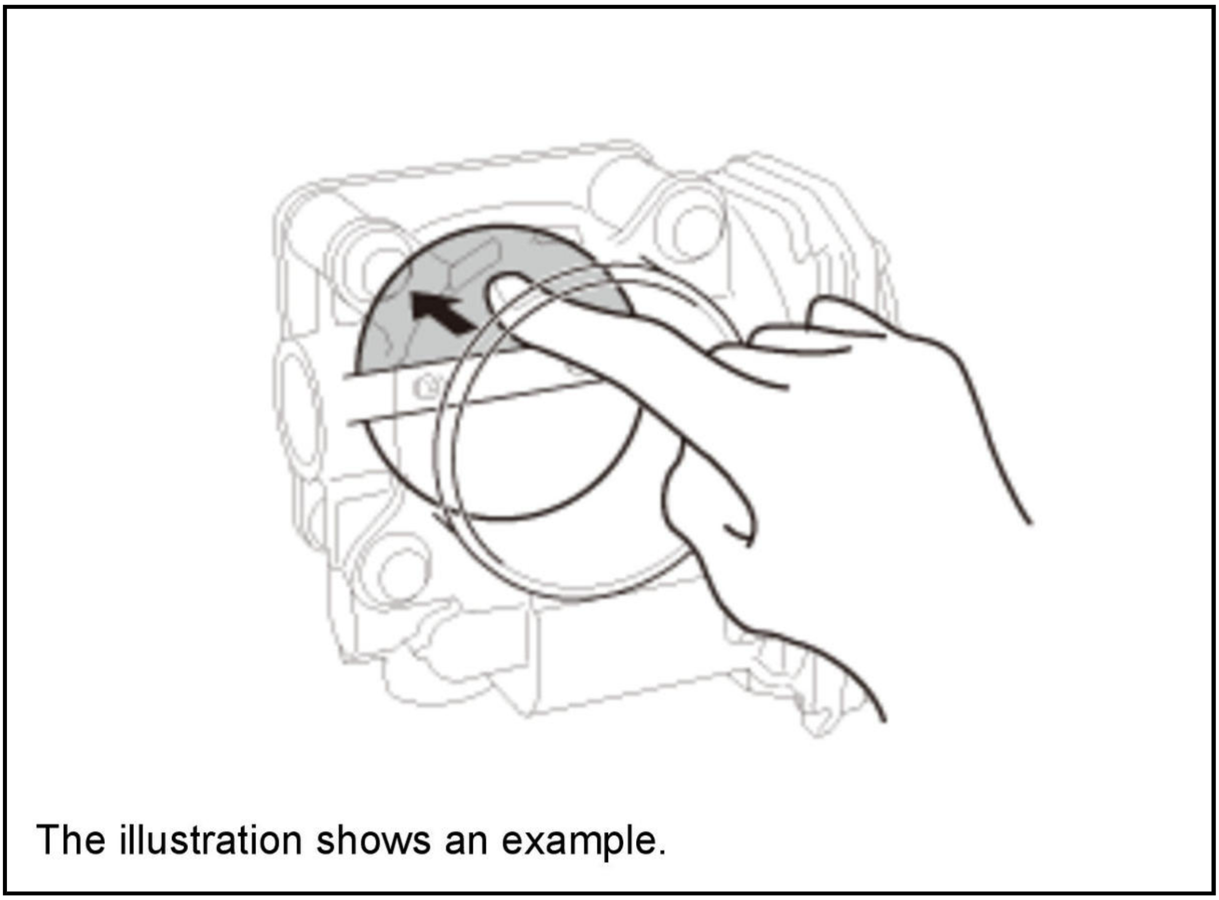
   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body condition check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Disconnect the throttle body duct from the throttle body** .

   -3. Push the throttle valve open as shown.



The illustration shows an example.

-4. Release the throttle valve.

Does the throttle valve return?

YES

Clean the throttle body . If DTC P1684 is indicated again, replace the throttle body .

NO

Replace the throttle body .

DTC P1684 (2.4 L ENGINE) (2017 2018 2019)

DTC P1684 : Throttle Valve Return Spring Performance Problem

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P1684 Throttle Valve Return Spring Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

-6. Turn the vehicle to the ON mode.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1684 Throttle Valve Return Spring Performance Problem	B	B

Is DTC P1684 indicated?

YES

The failure is duplicated. Go to step 2.

NO

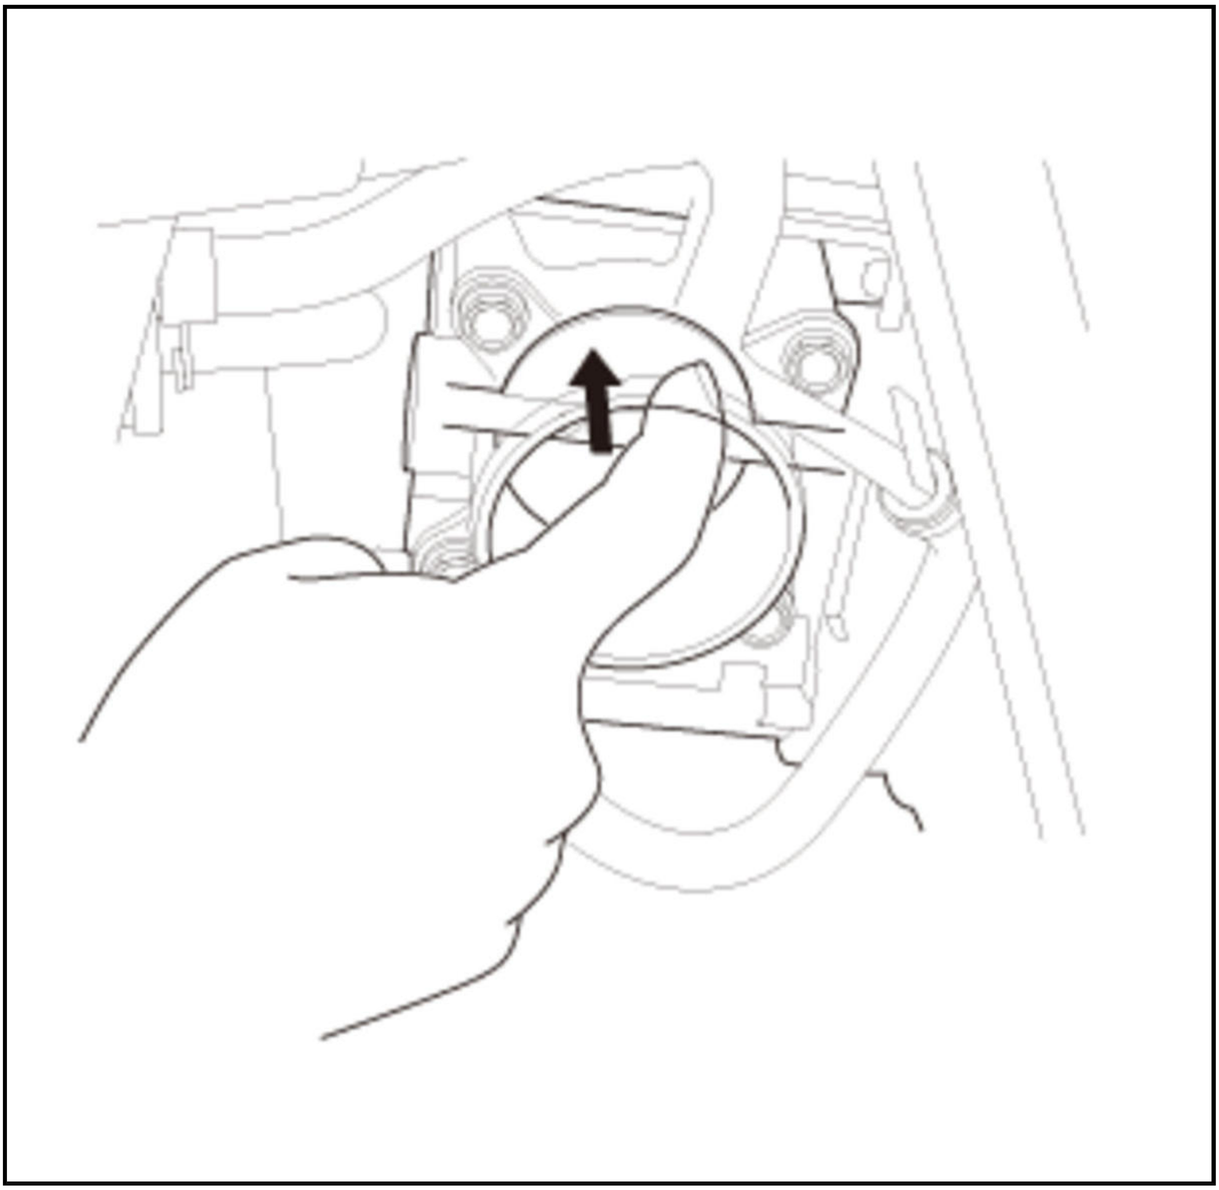
Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Disconnect the intake air duct from the throttle body** .

-3. Push the throttle valve open as shown.



-4. Release the throttle valve.

Does the throttle valve return?

YES

Clean the throttle body . If DTC P1684 is indicated again, **replace the throttle body** .

NO

Replace the throttle body .

DTC P16BB (1.5 L ENGINE)

DTC P16BB : Alternator B Terminal Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16BB Alternator B Terminal Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check under these conditions:

- A/C on
- Temperature control at maximum cool
- Blower fan at maximum speed
- Headlights on high beam
- Rear window defogger on

-6. Hold the engine speed at 2, 000 rpm without load (in P or N) for 1 minute.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16BB Alternator B Terminal Circuit Low Voltage	B	B

Is DTC P16BB indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and 12 volt battery. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . Also **check the 12 volt battery performance** .

2. ACG +B terminal check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for poor connections or loose terminals at the alternator and the 12 volt battery (ACG +B line).

Are the connections and terminals OK?

YES

Go to step 3.

NO

Repair the connections or the terminals.

3. Open wire check (ACG +B line)

-1. Check for an open in the wire between the alternator and the 12 volt battery at the engine harness (ACG +B line).

Is the harness OK?

YES

Replace the alternator .

NO

Repair an open in the ACG +B wire between the alternator and the 12 volt battery.

DTC P16BB (2.4 L ENGINE) (2017 2018 2019)

DTC P16BB : Alternator B Terminal Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P16BB Alternator B Terminal Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Check under these conditions:

- A/C on
- Temperature control at maximum cool
- Blower fan at maximum speed
- Headlights on high beam
- Rear window defogger on

-5. Hold the engine speed at 2, 000 rpm without load (in P or N) for 1 minute.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16BB Alternator B Terminal Circuit Low Voltage	B	B

Is DTC P16BB indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the 12 volt battery. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot . Also check the 12 volt battery performance .

2. ACG +B terminal check

-1. Check for poor connections or loose terminals at the alternator and the 12 volt battery (ACG +B line).

Are the connections and terminals OK?

YES

Go to step 3.

NO

Repair the connections or the terminals.

3. Open wire check (ACG +B line)

   -1. Check for an open in the wire between the alternator and the 12 volt battery.

   Is the harness OK?

   YES

   Replace the alternator .

   NO

   Repair an open in the +B wire between the alternator and the 12 volt battery.

DTC P16E2 (1.5 L ENGINE)

DTC P16E2 : PGM-FI-ACG LIN Communication Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Check for a loose terminal on the alternator (ACG +B terminal). If the alternator +B terminal was loose, DTC P16E2 will be stored.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI - ACG LIN Communication Error	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI - ACG LIN Communication Error	B	B

   Is DTC P16E2 indicated?

   YES

   Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check 1

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

Is DTC P16E3 indicated?

YES

Go to step 5.

NO

Go to step 3.

3. DTC check 2

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

Is DTC P16E8 indicated?

YES

Go to step 9.

NO

Go to step 4.

4. DTC check 3

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E5 LIN Communication Error (PCM-DC-DC Converter)	B	B

Is DTC P16E5 indicated?

YES

Go to step 13.

NO

Go to step 17.

5. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

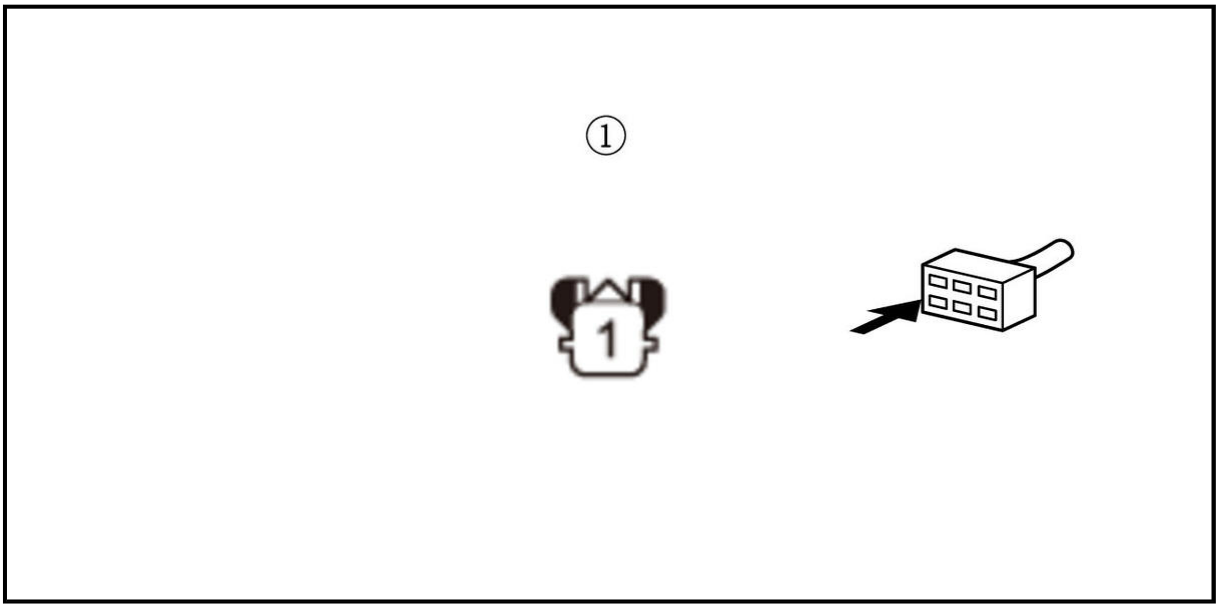
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Alternator 1P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

6. Shorted wire check (LIN (BATT SENSOR)/LIN line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Continue to check for continuity between the alternator 1P connector terminal and body ground, while disconnecting these connectors, one at a time:

- PCM connector A (50P)
- 12 volt battery sensor 2P connector
- Shutter grille (upper) 4P connector
- Shutter grille (lower) 4P connector
- DC-DC converter connector A (3P) (with auto idle stop system)

Does continuity go away when one of the above connectors is disconnected?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

NO

Repair a short in the LIN (BATT SENSOR)/LIN wire between the PCM (A10), the alternator, the 12 volt battery sensor, the shutter grille, and the DC-DC converter (with auto idle stop system).

7. Determine possible failure area (alternator, others)

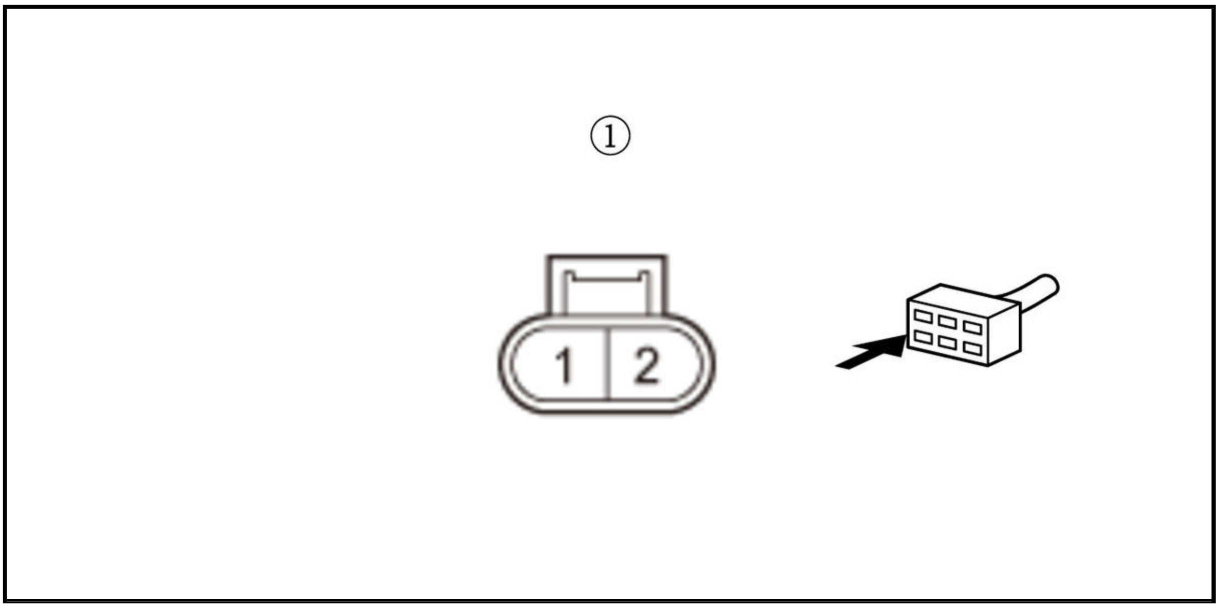
-1. Reconnect the alternator 1P connector.

-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 8.

NO

Replace the alternator .

8. Open wire check (LIN (BATT SENSOR)/LIN line) 1

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

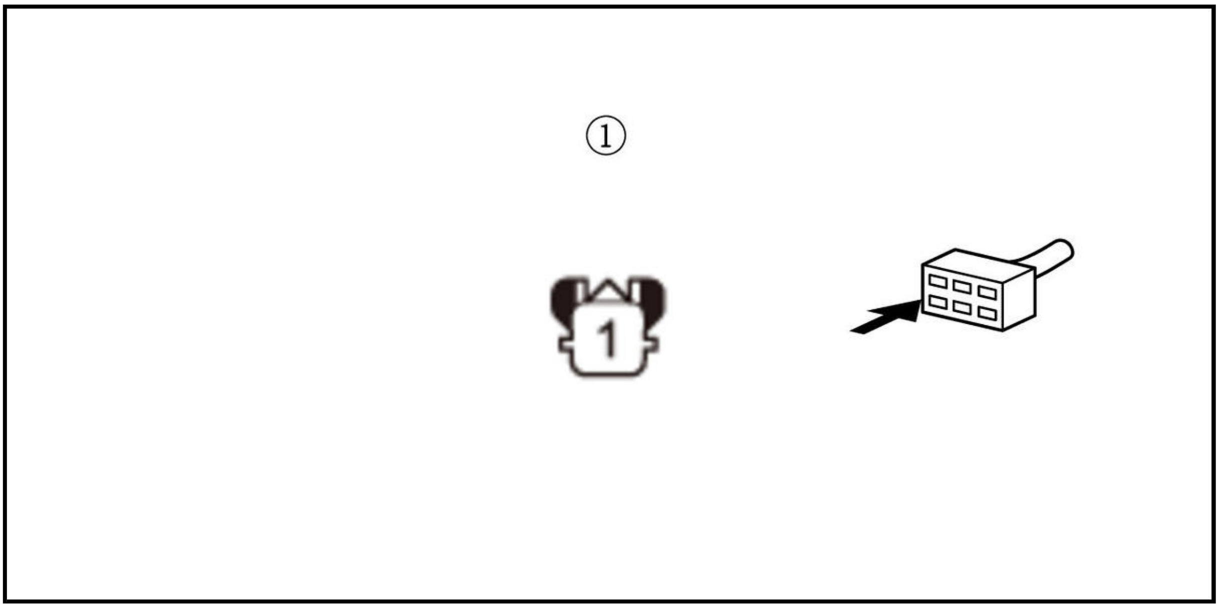
-2. Disconnect the following connectors.

Alternator 1P connector

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	Alternator 1P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the alternator.

9. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

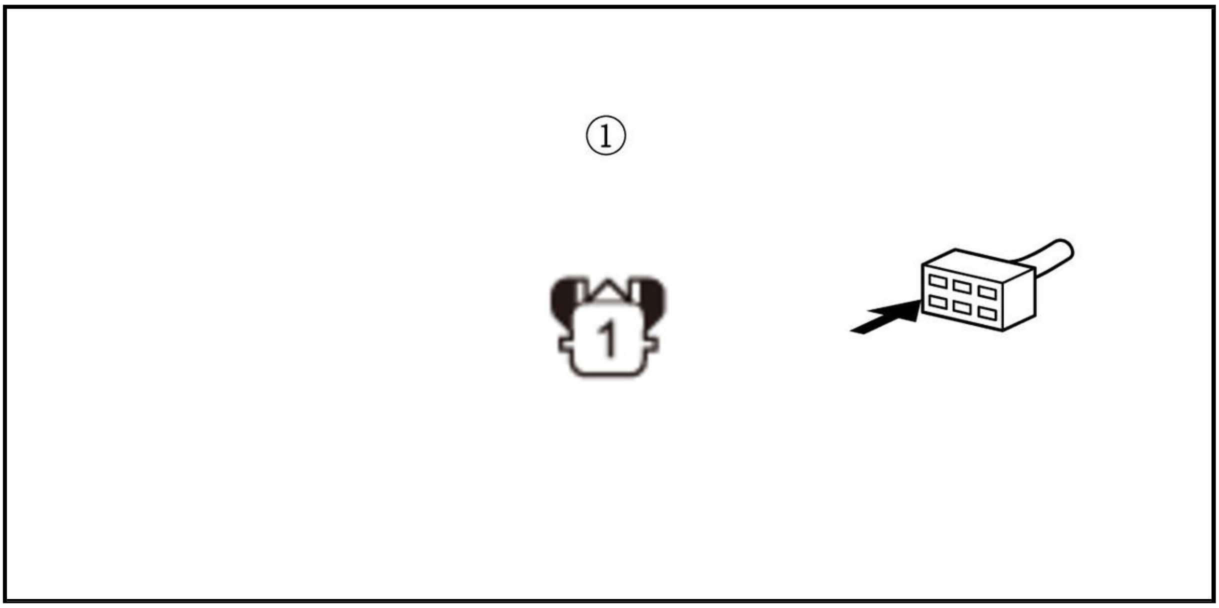
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Alternator 1P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 11.

NO

Go to step 10.

10. Shorted wire check (LIN (BATT SENSOR)/LIN line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Continue to check for continuity between the alternator 1P connector terminal and body ground, while disconnecting these connectors, one at a time:

- PCM connector A (50P)
- 12 volt battery sensor 2P connector
- Shutter grille (upper) 4P connector
- Shutter grille (lower) 4P connector
- DC-DC converter connector A (3P) (with auto idle stop system)

Does continuity go away when one of the above connectors is disconnected?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

NO

Repair a short in the LIN (BATT SENSOR)/LIN wire between the PCM (A10), the alternator, the 12 volt battery sensor, the shutter grille, and the DC-DC converter (with auto idle stop system).

11. Determine possible failure area (alternator, others)

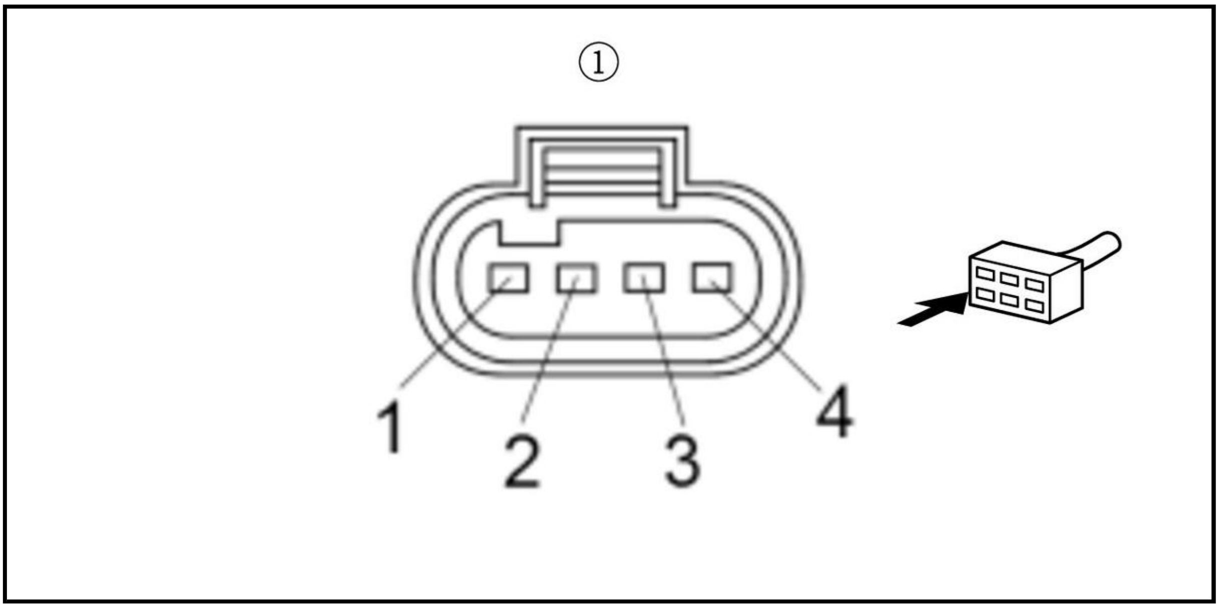
-1. Reconnect the alternator 1P connector.

-2. Disconnect the following connector.

Shutter grille (upper/lower) 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 12.

NO

Replace the alternator .

12. Open wire check (LIN (BATT SENSOR)/LIN line) 1

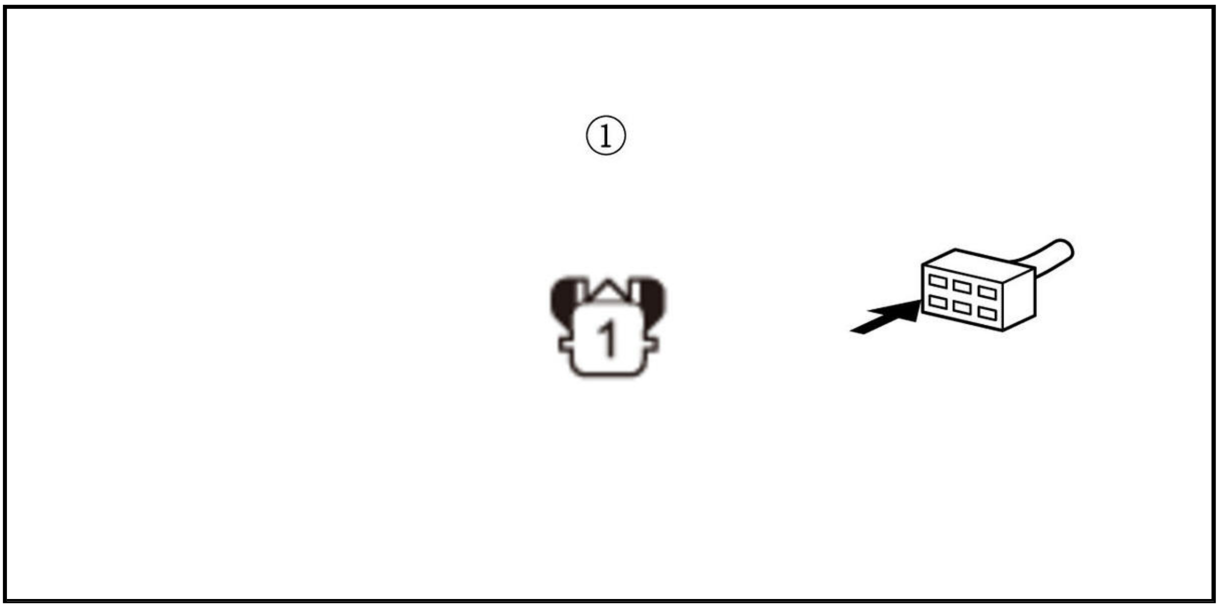
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

Alternator 1P connector
PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
B	Shutter grille (upper/lower) 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the alternator.

13. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

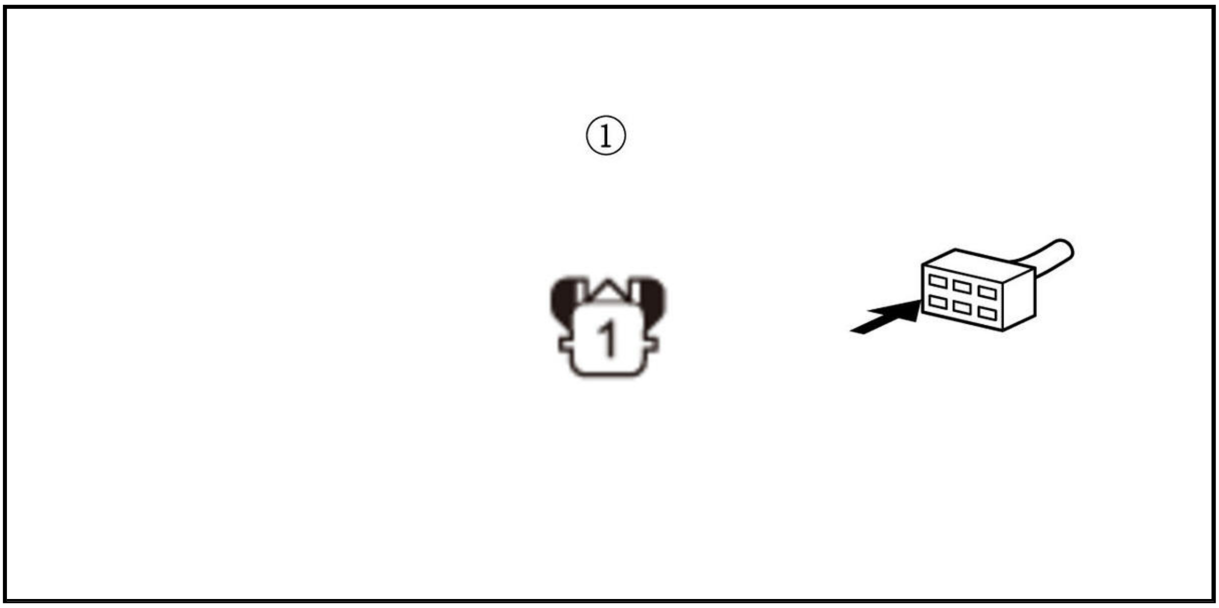
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Alternator 1P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 15.

NO

Go to step 14.

14. Shorted wire check (LIN (BATT SENSOR)/LIN line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Continue to check for continuity between the alternator 1P connector terminal and body ground, while disconnecting these connectors, one at a time:

- PCM connector A (50P)
- 12 volt battery sensor 2P connector
- Shutter grille (upper) 4P connector
- Shutter grille (lower) 4P connector
- DC-DC converter connector A (3P) (with auto idle stop system)

Does continuity go away when one of the above connectors is disconnected?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

NO

Repair a short in the LIN (BATT SENSOR)/LIN wire between the PCM (A10), the alternator, the 12 volt battery sensor, the shutter grille, and the DC-DC converter (with auto idle stop system).

15. Determine possible failure area (alternator, others)

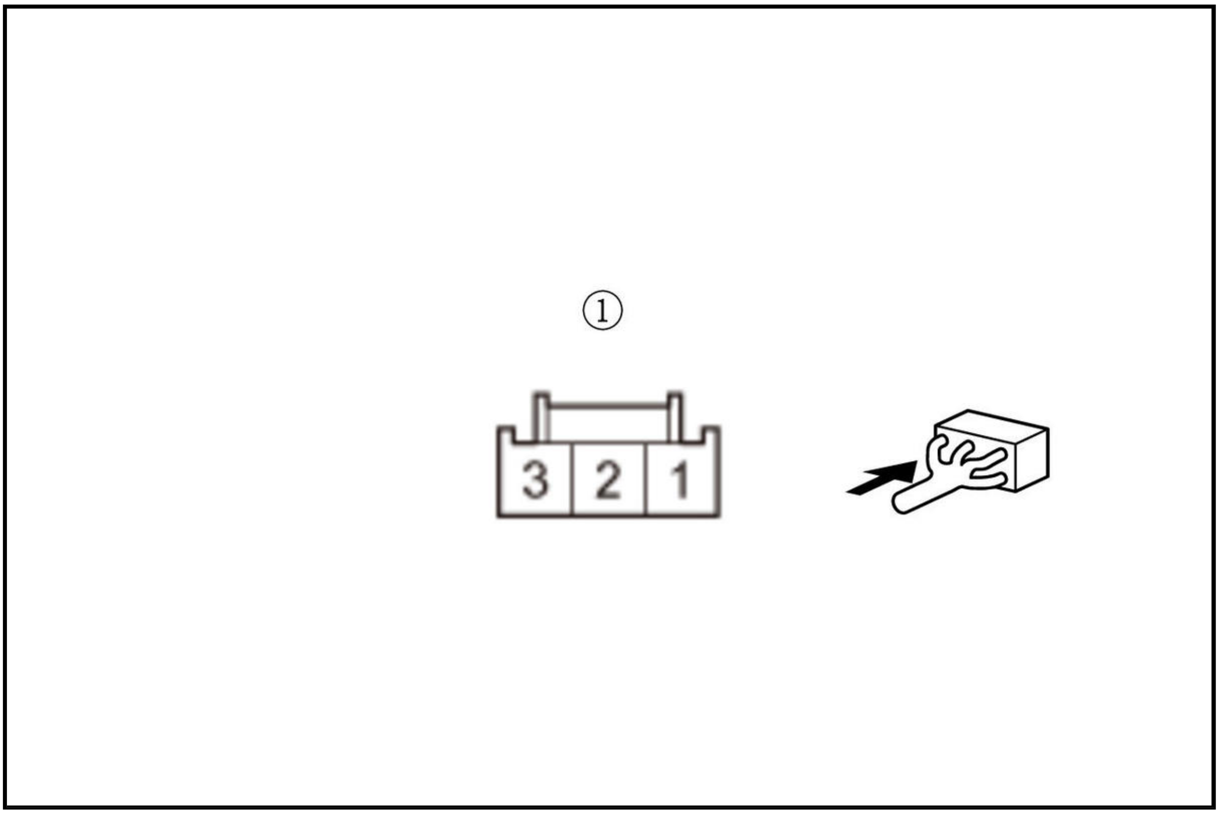
-1. Reconnect the alternator 1P connector.

-2. Disconnect the following connector.

DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 16.

NO

Replace the alternator .

16. Open wire check (LIN (BATT SENSOR)/LIN line) 1

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

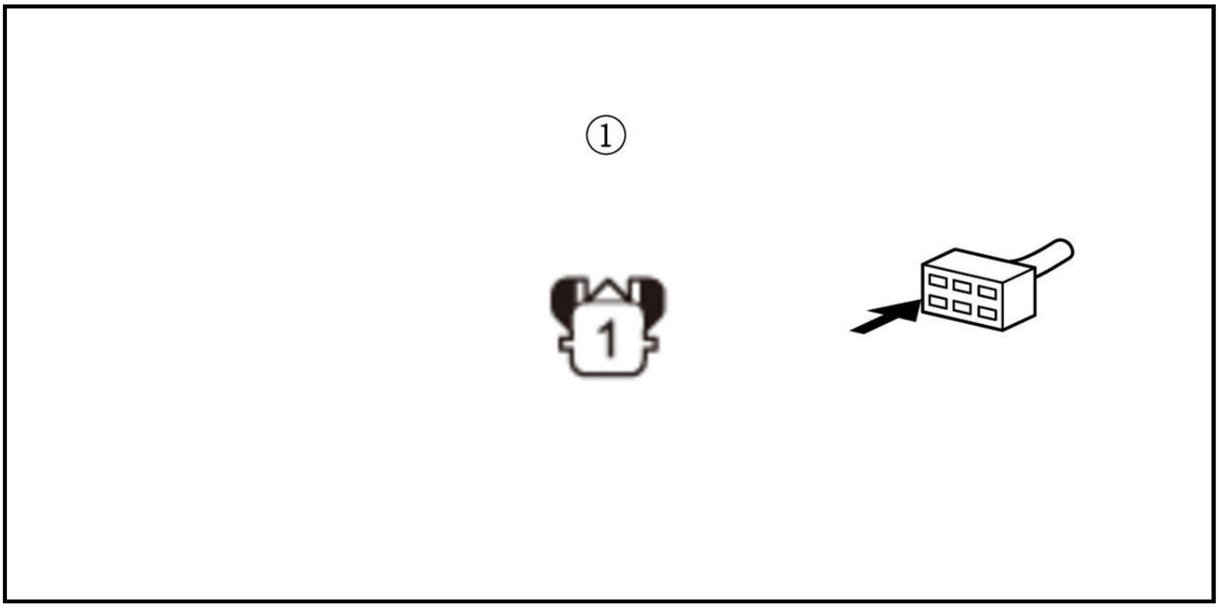
-2. Disconnect the following connectors.

Alternator 1P connector
PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
B	DC-DC converter connector A (3P): disconnected

B	PCM connector A (50P): disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the alternator.

17. Open wire check (LIN (BATT SENSOR)/LIN line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

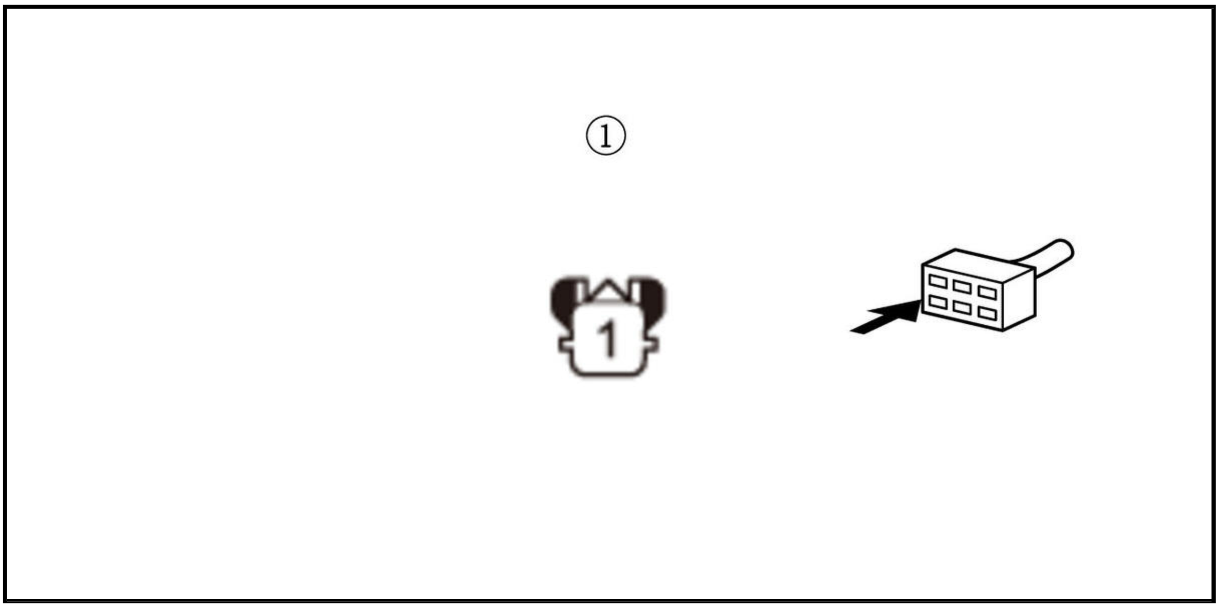
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

Alternator 1P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. **Replace the alternator** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the alternator.

DTC P16E2 (2.4 L ENGINE) (2017 2018 2019)

DTC P16E2 : PGM-FI-ACG LIN Communication Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Check for a loose terminal on the alternator (+B terminal). If the alternator +B terminal was loose, DTC P16E2 will be stored.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI - ACG LIN Communication Error	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI - ACG LIN Communication Error	B	B

   Is DTC P16E2 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check 1

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

Is DTC P16E3 indicated?

YES

Go to step 4.

NO

Go to step 3.

3. DTC check 2 (with shutter grille)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

Is DTC P16E8 indicated?

YES

Go to step 8.

NO

Go to step 12.

4. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

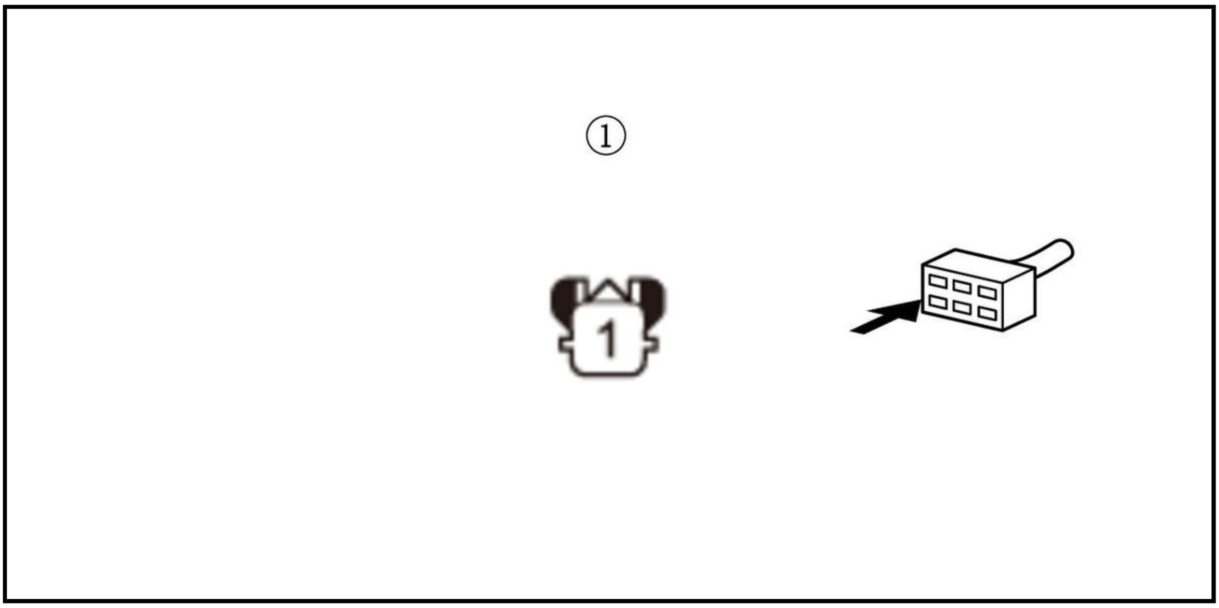
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Alternator 1P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 5.

NO

Go to step 6.

5. Shorted wire check (LIN (BATT SENSOR)/LIN line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between the alternator 1P connector terminal and body ground, while disconnecting these connectors, one at a time:

   - PCM connector B (51P)
   - 12 volt battery sensor 2P connector
   - Shutter grille (upper) 4P connector (with shutter grille)
   - Shutter grille (lower) 4P connector (with shutter grille)

   Does continuity go away when one of the above connectors is disconnected?

   YES

   The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

   NO

   Repair a short in the LIN (BATT SENSOR)/LIN wire between the PCM (B40), the alternator, the 12 volt battery sensor, and the shutter grille (with shutter grille).

6. Determine possible failure area (alternator, others)

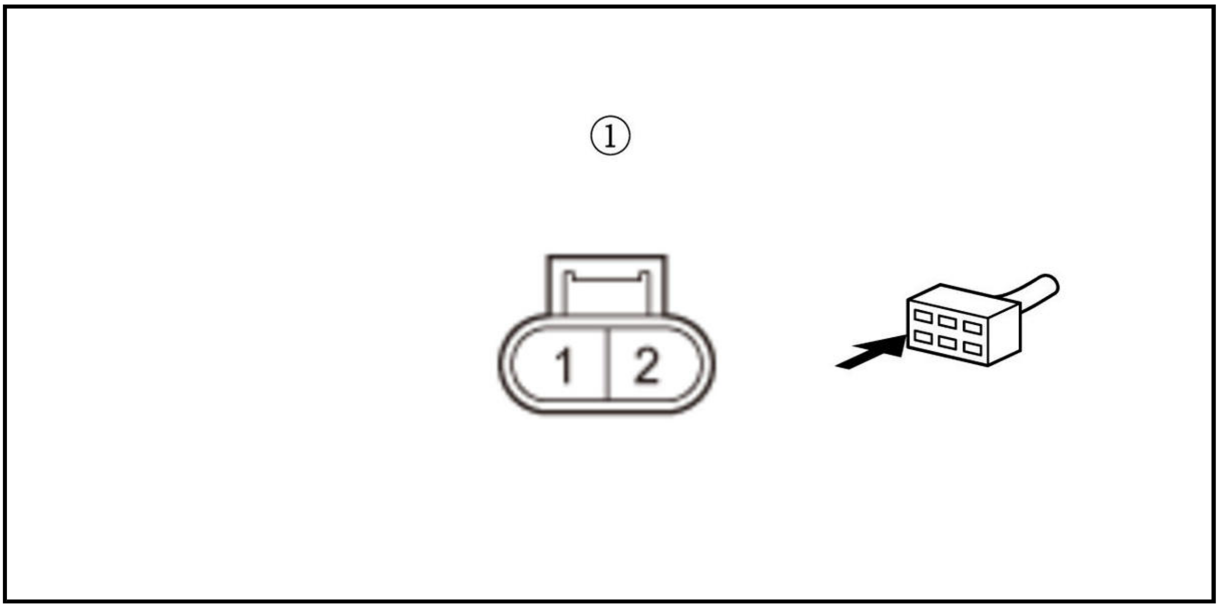
   -1. Reconnect the alternator 1P connector.

   -2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the alternator .

NO

Go to step 7.

7. Open wire check (LIN (BATT SENSOR)/LIN line) 1

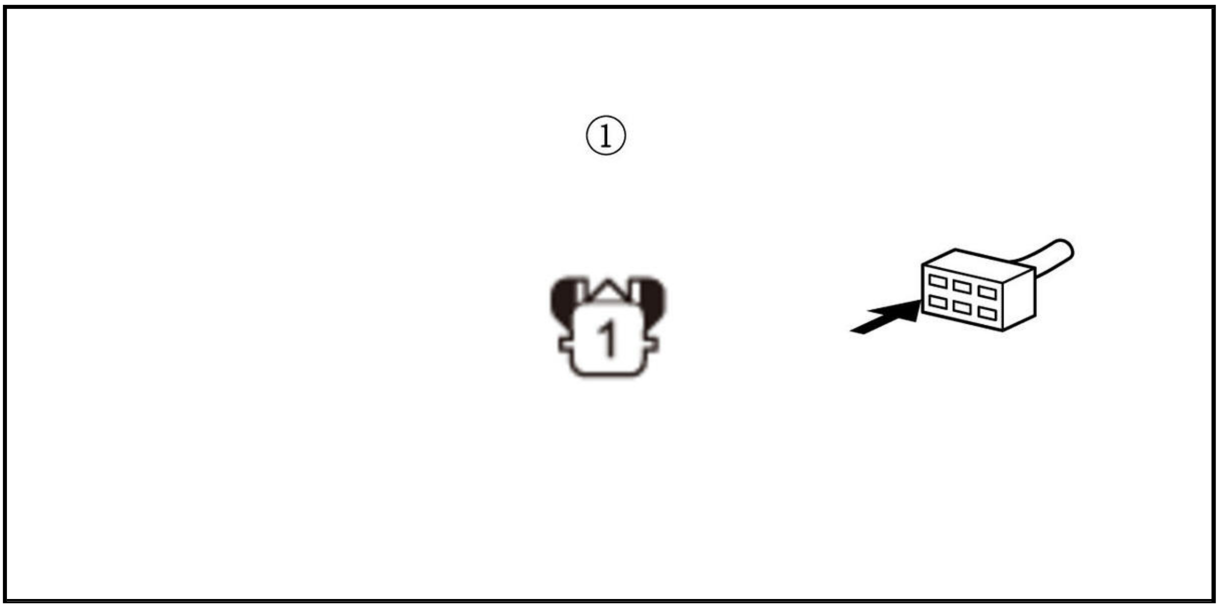
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

Alternator 1P connector
PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	Alternator 1P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (B40) and the alternator.

8. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

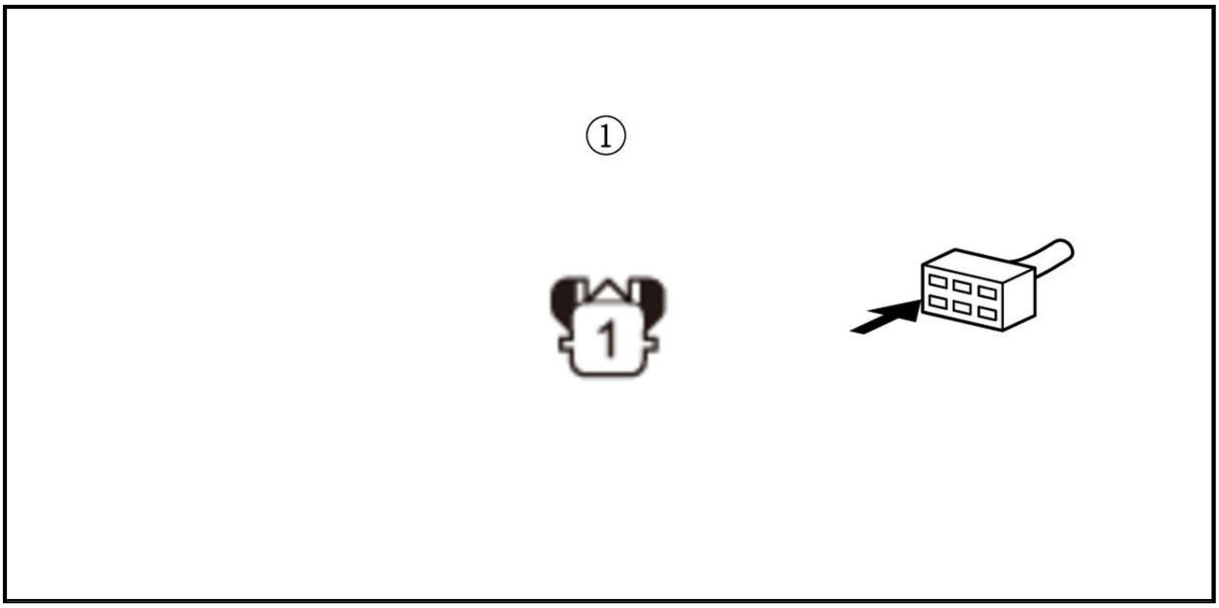
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Alternator 1P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 9.

NO

Go to step 10.

9. Shorted wire check (LIN (BATT SENSOR)/LIN line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between the alternator 1P connector terminal and body ground, while disconnecting these connectors, one at a time:

   - PCM connector B (51P)
   - 12 volt battery sensor 2P connector
   - Shutter grille (upper) 4P connector (with shutter grille)
   - Shutter grille (lower) 4P connector (with shutter grille)

   Does continuity go away when one of the above connectors is disconnected?

   YES

   The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

   NO

   Repair a short in the LIN (BATT SENSOR)/LIN wire between the PCM (B40), the alternator, the 12 volt battery sensor and the shutter grille (with shutter grille).

10. Determine possible failure area (alternator, others)

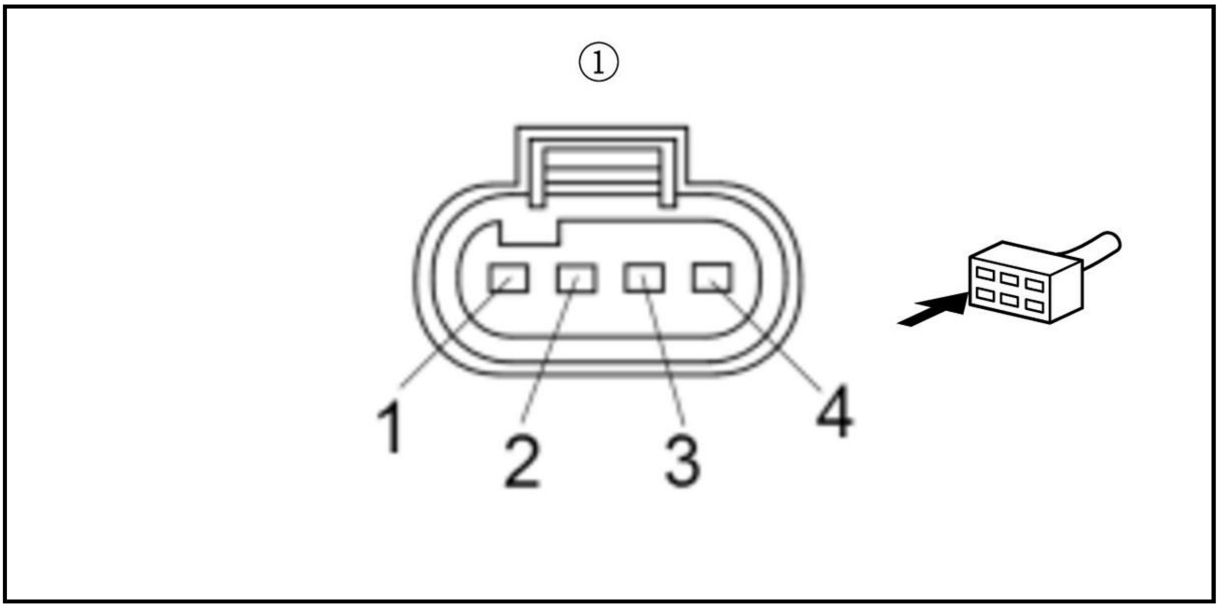
   -1. Reconnect the alternator 1P connector.

   -2. Disconnect the following connector.

Shutter grille (upper/lower) 4P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the alternator .

NO

Go to step 11.

11. Open wire check (LIN (BATT SENSOR)/LIN line) 1

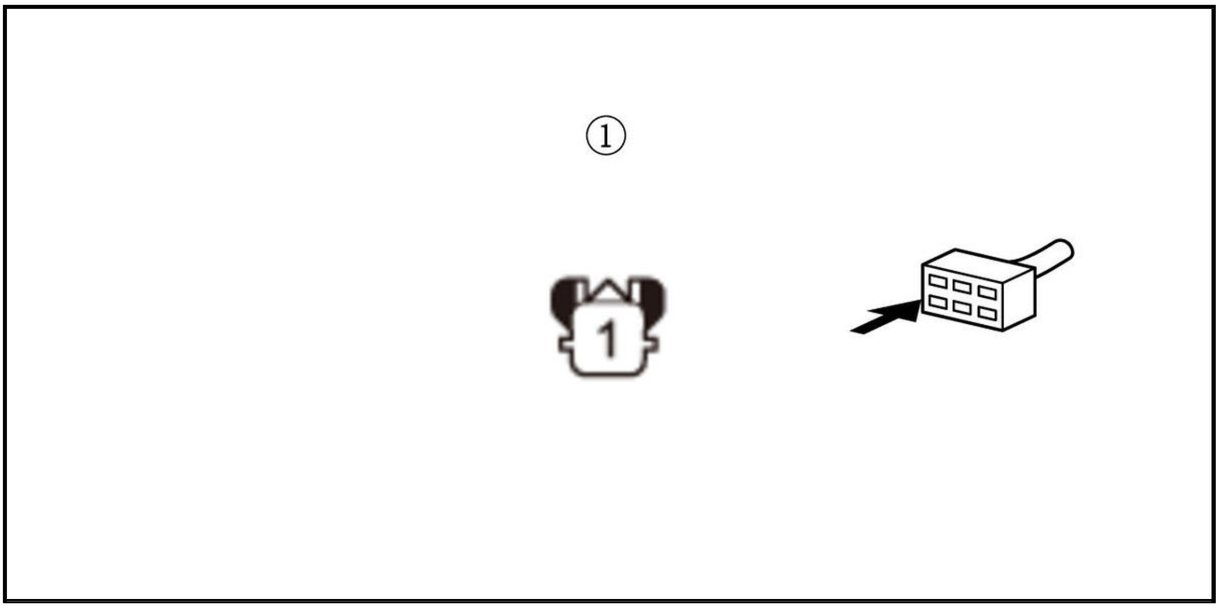
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

Alternator 1P connector
PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
B	Shutter grille (upper/lower) 4P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (B40) and the alternator.

12. Open wire check (LIN (BATT SENSOR)/LIN line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

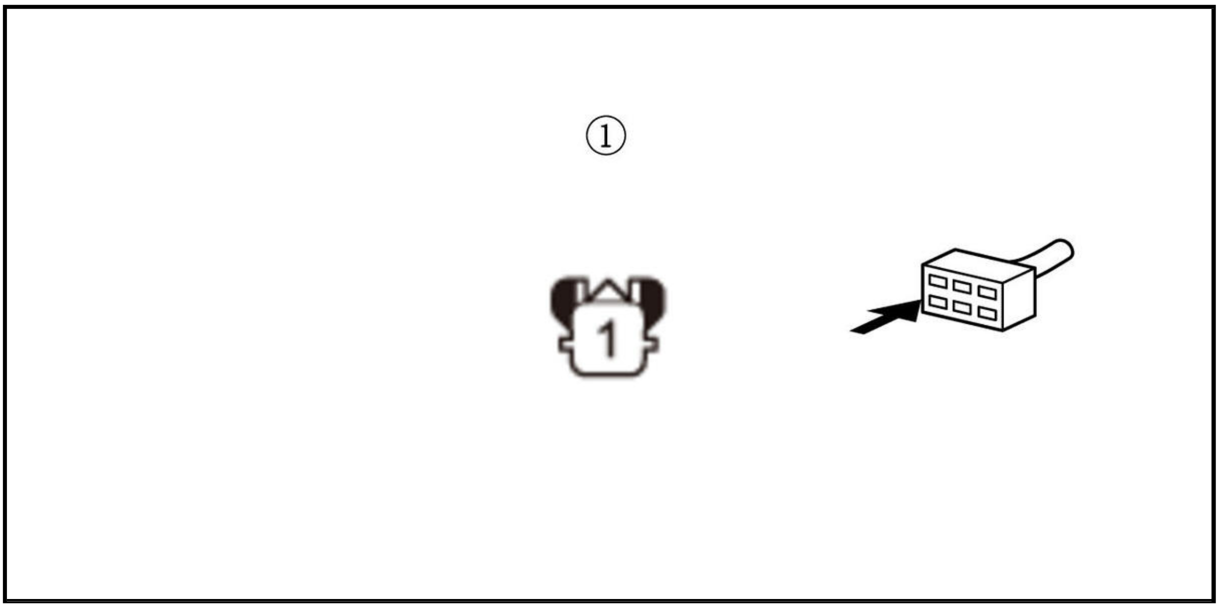
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

Alternator 1P connector
PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR)/LIN wire is OK. **Replace the alternator** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (B40) and the alternator.

DTC P16E3 (1.5 L ENGINE)

DTC P16E3 : PGM-FI-Battery Sensor LIN Communication Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Check for loose terminals on the 12 volt battery sensor (12 volt battery negative (-) terminal).

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 60 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

Is DTC P16E3 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 12 volt battery sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check 1

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI-ACG LIN Communication Error	B	B

   Is DTC P16E2 indicated?

   YES

   Go to step 5

   NO

   Go to step 3.

3. DTC check 2

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

   Is DTC P16E8 indicated?

   YES

   Go to step 9.

   NO

   Go to step 17.

4. DTC check 3

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E5 LIN Communication Error (PCM-DC-DC Converter)	B	B

   Is DTC P16E5 indicated?

   YES

   Go to step 13.

   NO

Go to step 17.

5. Determine possible failure area (LIN (BATT SENSOR)/LIN line shorted, others)

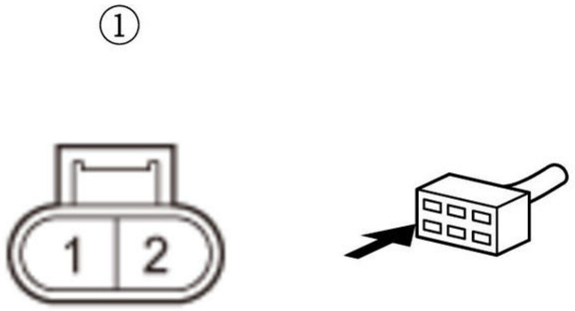
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

6. Shorted wire check (LIN (BATT SENSOR)/LIN line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Continue to check for continuity between 12 volt battery sensor 2P connector terminal No. 2 and body ground, while disconnecting these connectors, one at a time:

- Alternator 1P connector
- PCM connector A (50P)
- Shutter grille (upper) 4P connector
- Shutter grille (lower) 4P connector
- DC-DC converter connector A (3P) (with auto idle stop system)

Does continuity go away when one of the above connectors is disconnected?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

NO

Repair a short in the LIN (BATT SENSOR)/LIN wire between the 12 volt battery sensor, the alternator, the shutter grille, the DC-DC converter (with auto idle stop system), and the PCM (A10).

7. Determine possible failure area (12 volt battery sensor, others)

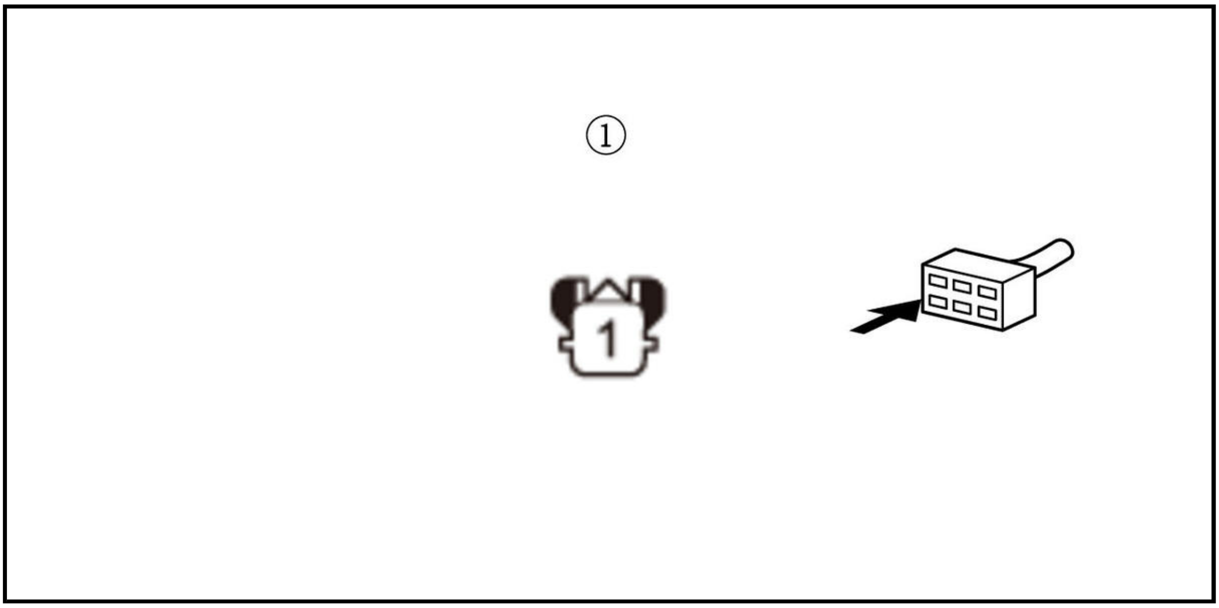
-1. Reconnect the 12 volt battery sensor 2P connector.

-2. Disconnect the following connector.

Alternator 1P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 8.

NO

Replace the 12 volt battery sensor .

8. Open wire check (LIN (BATT SENSOR)/LIN line) 1

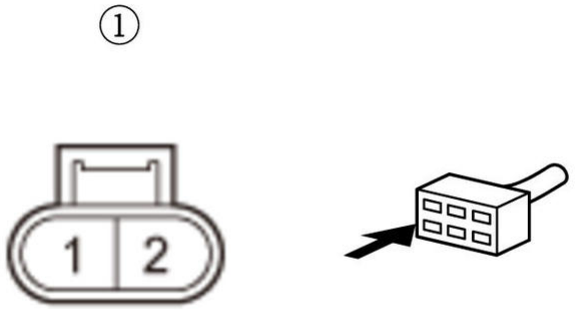
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

12 volt battery sensor 2P connector
PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Alternator 1P connector: disconnected
	12 volt battery sensor 2P connector: disconnected
	PCM connector A (50P): disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the 12 volt battery sensor.

9. Determine possible failure area (LIN (BATT SENSOR)/LIN line shorted, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

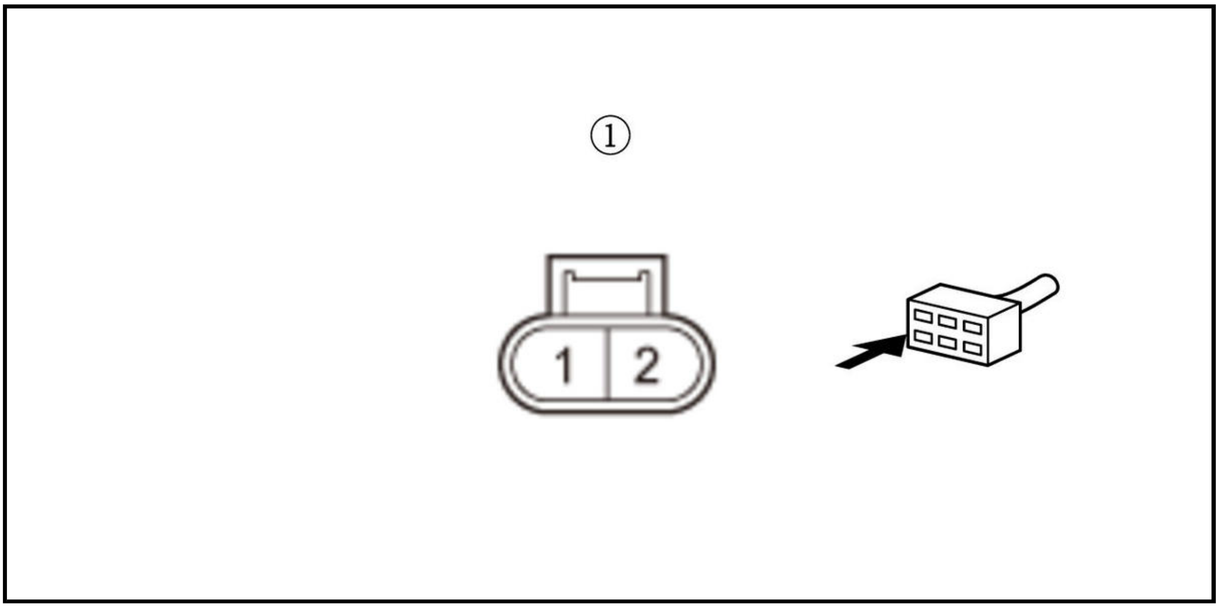
-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected

Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 11.

NO

Go to step 10.

10. Shorted wire check (LIN (BATT SENSOR)/LIN line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Continue to check for continuity between 12 volt battery sensor 2P connector terminal No. 2 and body ground, while disconnecting these connectors, one at a time:

- PCM connector A (50P)
- Alternator 1P connector
- Shutter grille (upper) 4P connector
- Shutter grille (lower) 4P connector
- DC-DC converter connector A (3P) (with auto idle stop system)

Does continuity go away when one of the above connectors is disconnected?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

NO

Repair a short in the LIN (BATT SENSOR)/LIN wire between the 12 volt battery sensor, the alternator, the shutter grille, the DC-DC converter (with auto idle stop system), and the PCM (A10).

11. Determine possible failure area (12 volt battery sensor, others)

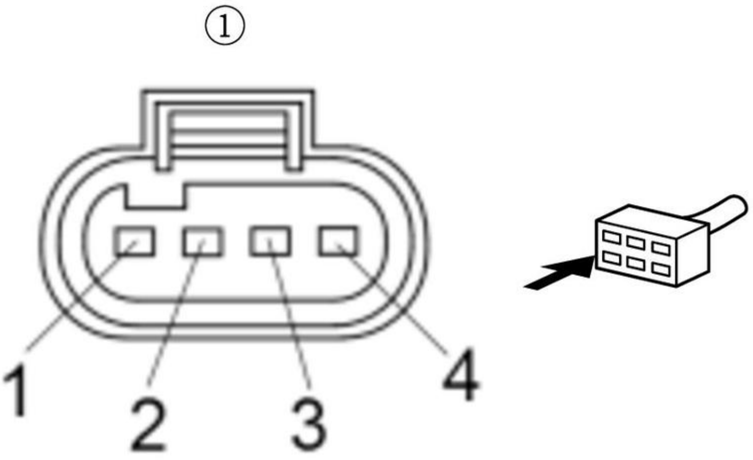
-1. Reconnect the 12 volt battery sensor 2P connector.

-2. Disconnect the following connector.

Shutter grille (upper/lower) 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 12.

NO

Replace the 12 volt battery sensor .

12. Open wire check (LIN (BATT SENSOR)/LIN line) 1

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

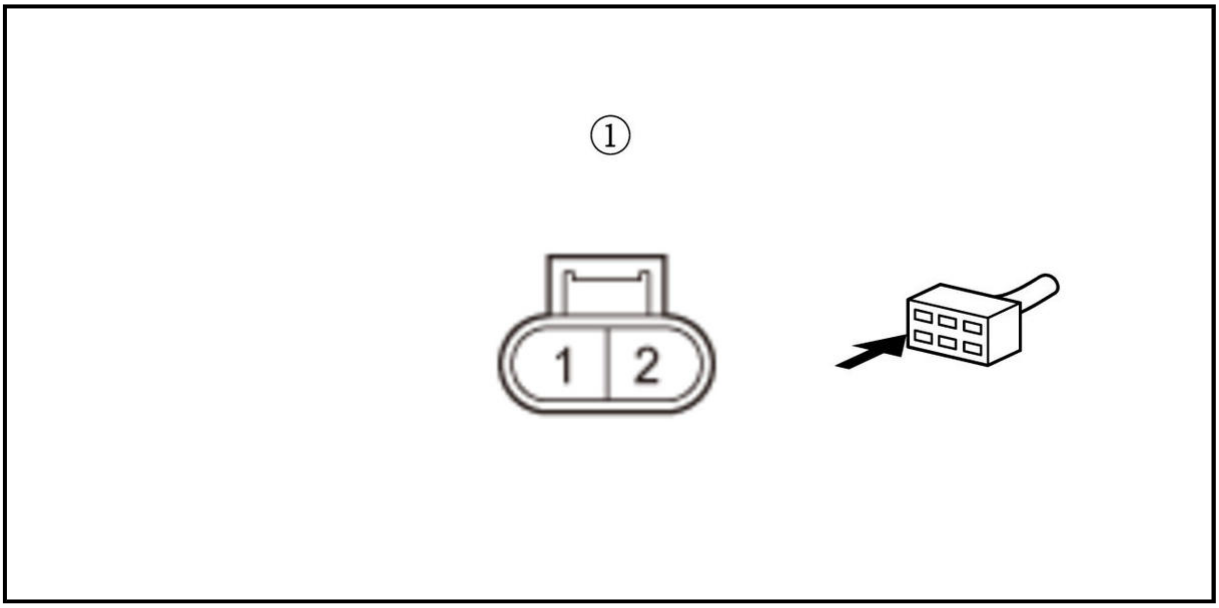
-2. Disconnect the following connectors.

12 volt battery sensor 2P connector
PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	12 volt battery sensor 2P connector: disconnected
	Shutter grille (upper/lower) 4P connector: disconnected
	PCM connector A (50P): disconnected

Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the 12 volt battery sensor.

13. Determine possible failure area (LIN (BATT SENSOR)/LIN line shorted, others)

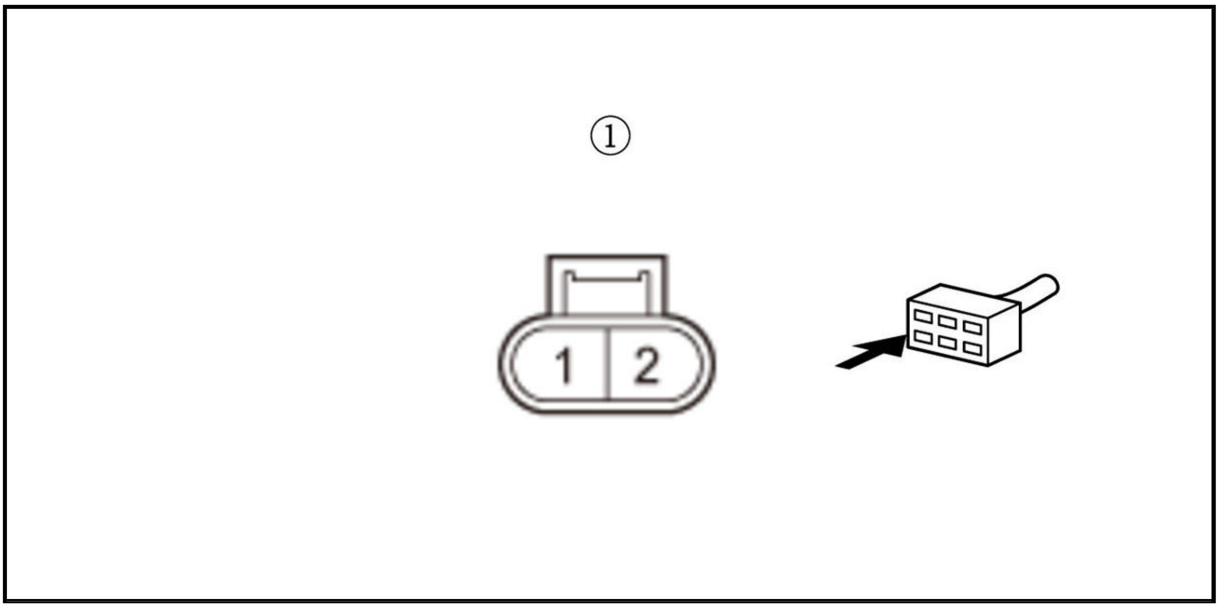
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 15.

NO

Go to step 14.

14. Shorted wire check (LIN (BATT SENSOR)/LIN line)

    -1. Jump the SCS line with the HDS, and wait more than 1 minute.

    Continue to check for continuity between 12 volt battery sensor 2P connector terminal No. 2 and body ground, while disconnecting these connectors, one at a time:

    - PCM connector A (50P)
    - Alternator 1P connector
    - Shutter grille (upper) 4P connector
    - Shutter grille (lower) 4P connector
    - DC-DC converter connector A (3P) (with auto idle stop system)

    Does continuity go away when one of the above connectors is disconnected?

    YES

    The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

    NO

    Repair a short in the LIN (BATT SENSOR)/LIN wire between the 12 volt battery sensor, the alternator, the shutter grille (with shutter grille), the DC-DC converter (with auto idle stop system), and the PCM (A10).

15. Determine possible failure area (12 volt battery sensor, others)

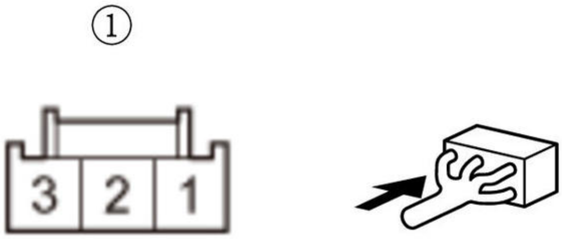
    -1. Reconnect the 12 volt battery sensor 2P connector.

    -2. Disconnect the following connector.

DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 16.

NO

Replace the 12 volt battery sensor .

16. Open wire check (LIN (BATT SENSOR)/LIN line) 1

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

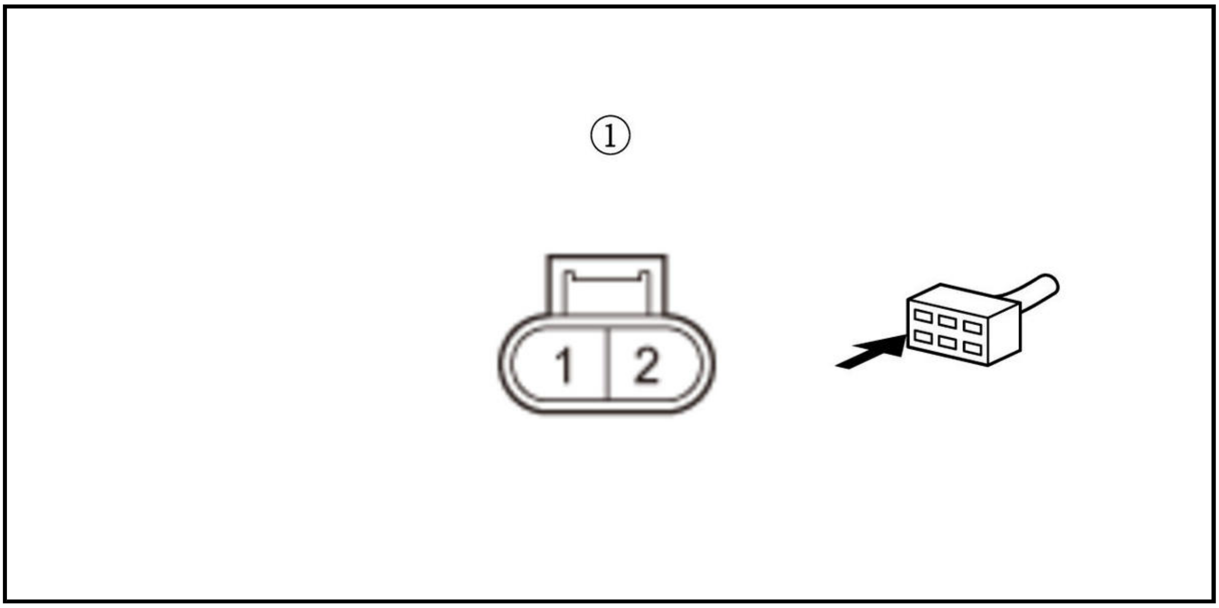
-2. Disconnect the following connectors.

12 volt battery sensor 2P connector
PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	12 volt battery sensor 2P connector: disconnected
	DC-DC converter connector A (3P): disconnected

	PCM connector A (50P): disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the 12 volt battery sensor.

17. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A24**

Is the fuse OK?

YES

Go to step 18.

NO

Repair a short in the +B HORN wire between the 12 volt battery sensor and the No. A24 fuse. Also replace the No. A24 fuse.

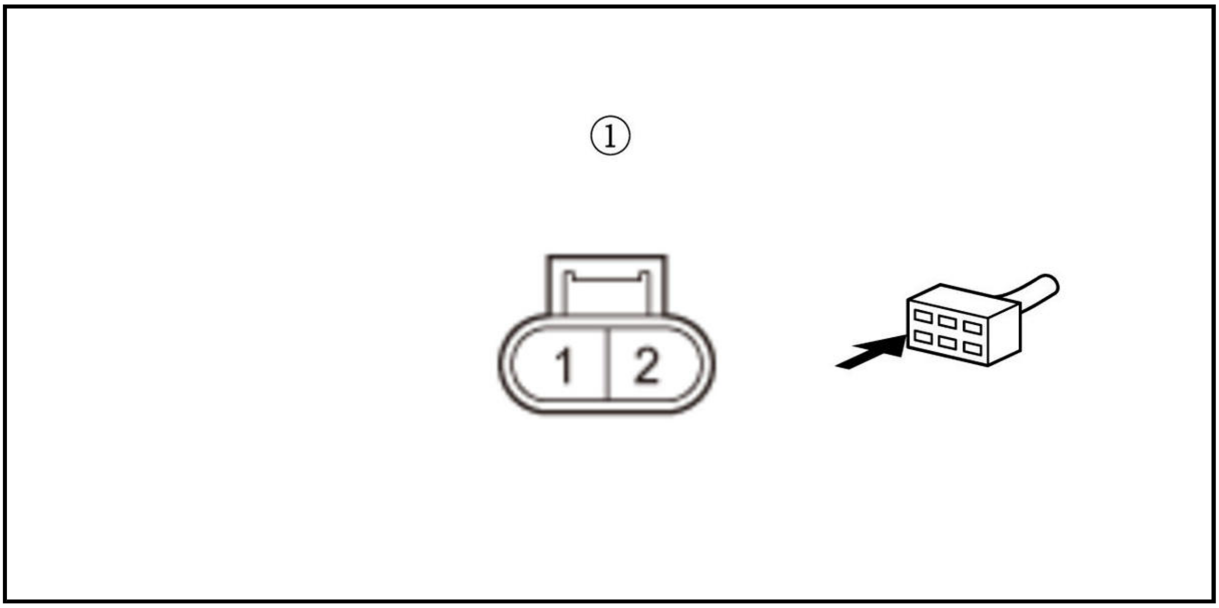
18. Open wire check (+B HORN line)

-1. Disconnect the following connector.

12 volt battery sensor 2P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 19.

NO

Repair an open in the +B HORN wire between the 12 volt battery sensor and the **No. A24 fuse** .

19. Open wire check (LIN (BATT SENSOR)/LIN line) 2

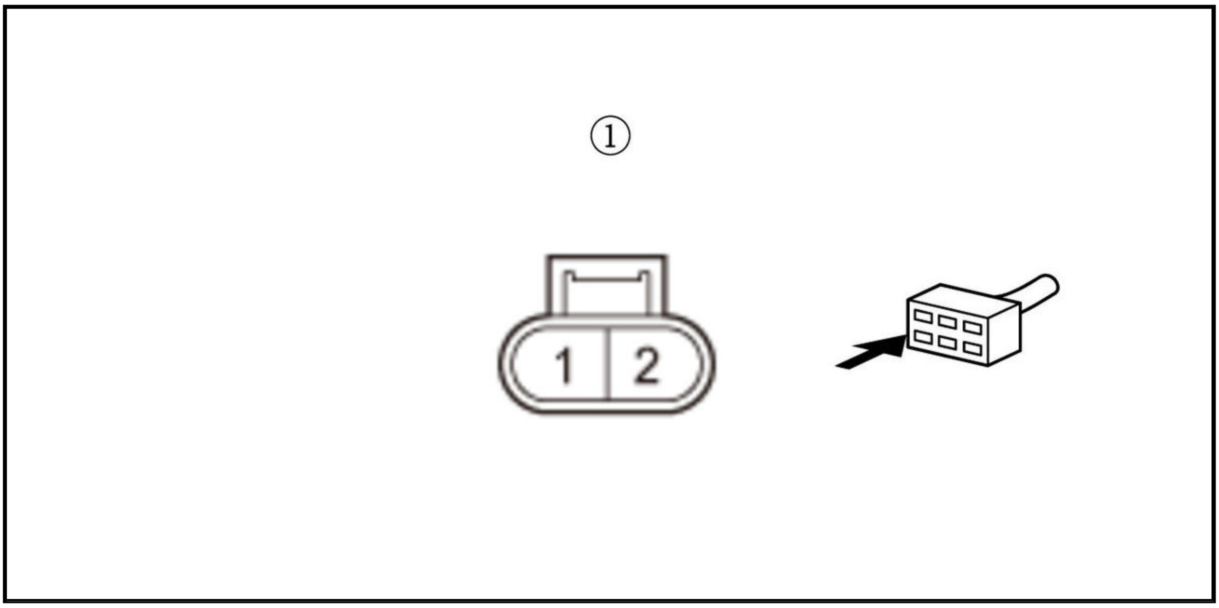
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. **Replace the 12 volt battery sensor** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the 12 volt battery sensor.

DTC P16E3 (2.4 L ENGINE) (2017 2018 2019)

DTC P16E3 : PGM-FI-Battery Sensor LIN Communication Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Check for loose terminals on the 12 volt battery sensor (12 volt battery negative (-) terminal).

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 60 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

Is DTC P16E3 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 12 volt battery sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check 1

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI-ACG LIN Communication Error	B	B

Is DTC P16E2 indicated?

YES

Go to step 4

NO

Go to step 3.

3. DTC check 2 (with shutter grille)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

Is DTC P16E8 indicated?

YES

Go to step 8.

NO

Go to step 12.

4. Determine possible failure area (LIN (BATT SENSOR)/LIN line shorted, others)

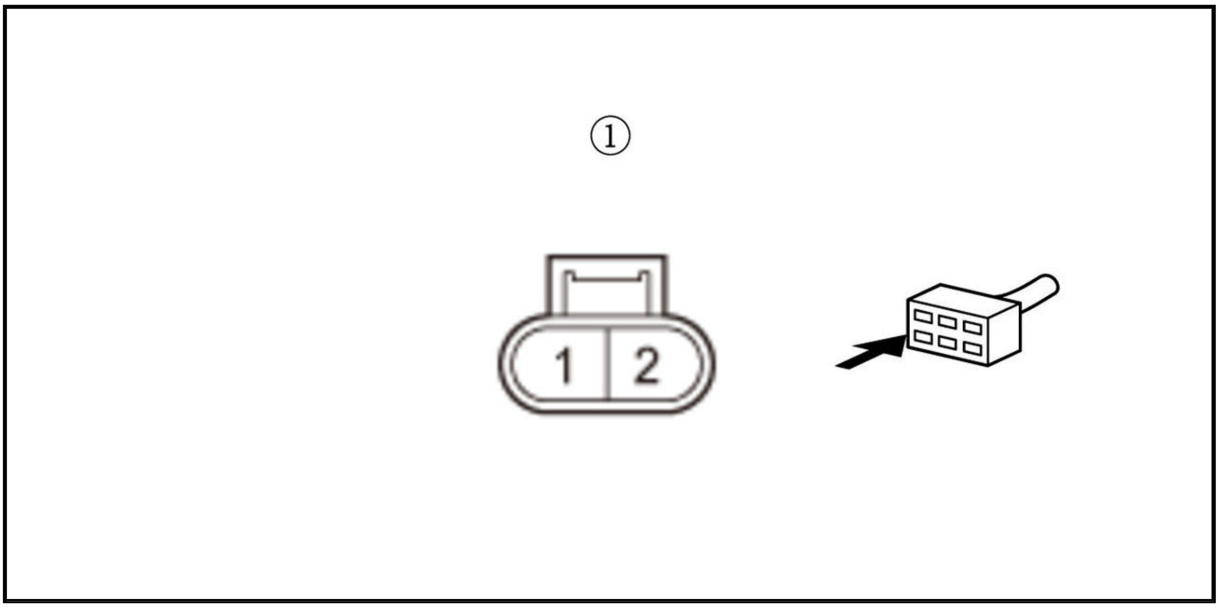
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 5.

NO

Go to step 6.

5. Shorted wire check (LIN (BATT SENSOR)/LIN line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between 12 volt battery sensor 2P connector terminal No. 2 and body ground, while disconnecting these connectors, one at a time:

   - Alternator 1P connector
   - PCM connector B (51P)
   - Shutter grille (upper) 4P connector (with shutter grille)
   - Shutter grille (lower) 4P connector (with shutter grille)

   Does continuity go away when one of the above connectors is disconnected?

   YES

   The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

   NO

   Repair a short in the LIN (BATT SENSOR)/LIN wire between the 12 volt battery sensor, the alternator, the shutter grille (with shutter grille), and the PCM (B40).

6. Determine possible failure area (12 volt battery sensor, others)

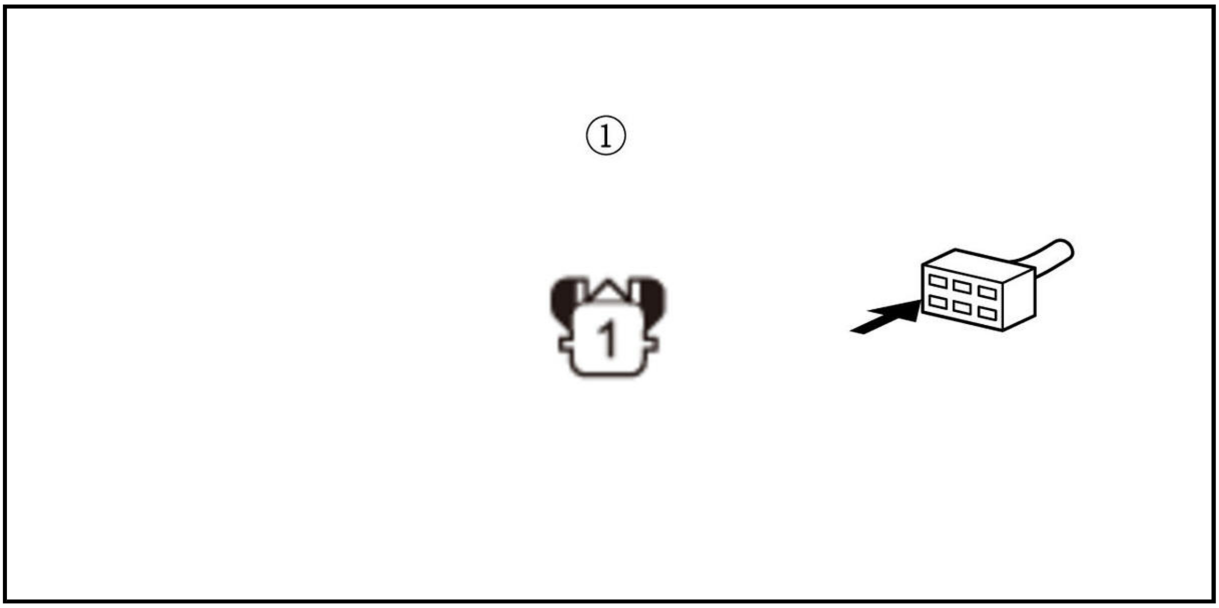
   -1. Reconnect the 12 volt battery sensor 2P connector.

   -2. Disconnect the following connector.

Alternator 1P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the 12 volt battery sensor .

NO

Go to step 7.

7. Open wire check (LIN (BATT SENSOR)/LIN line) 1

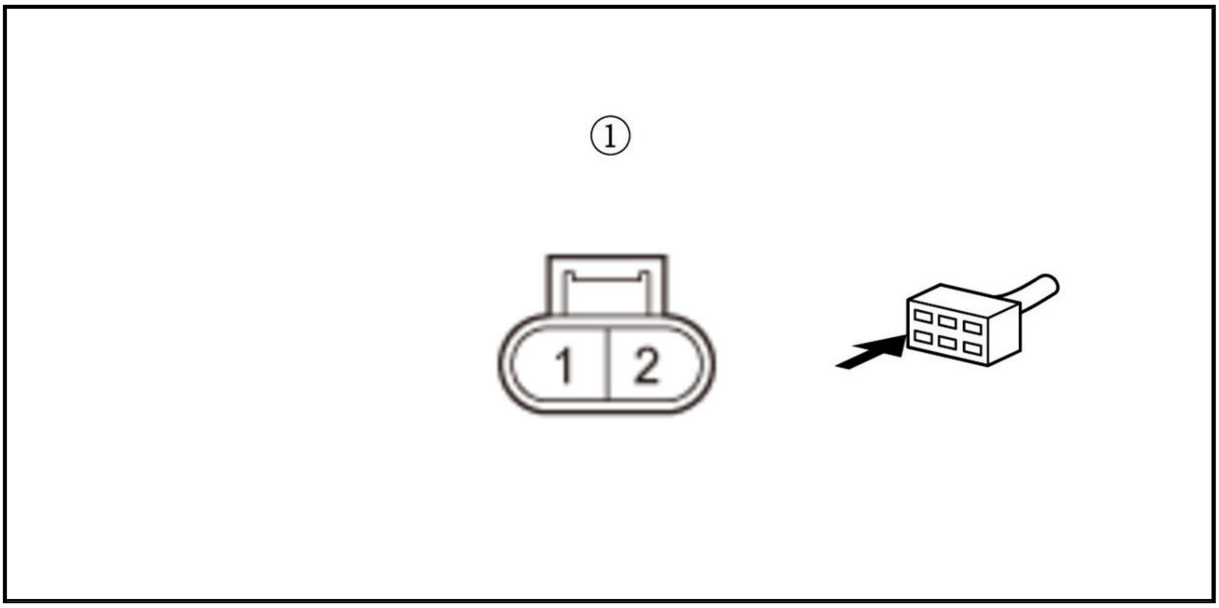
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

12 volt battery sensor 2P connector
PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Alternator 1P connector: disconnected
	12 volt battery sensor 2P connector: disconnected
	PCM connector B (51P): disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (B40) and the 12 volt battery sensor.

8. Determine possible failure area (LIN (BATT SENSOR)/LIN line shorted, others)

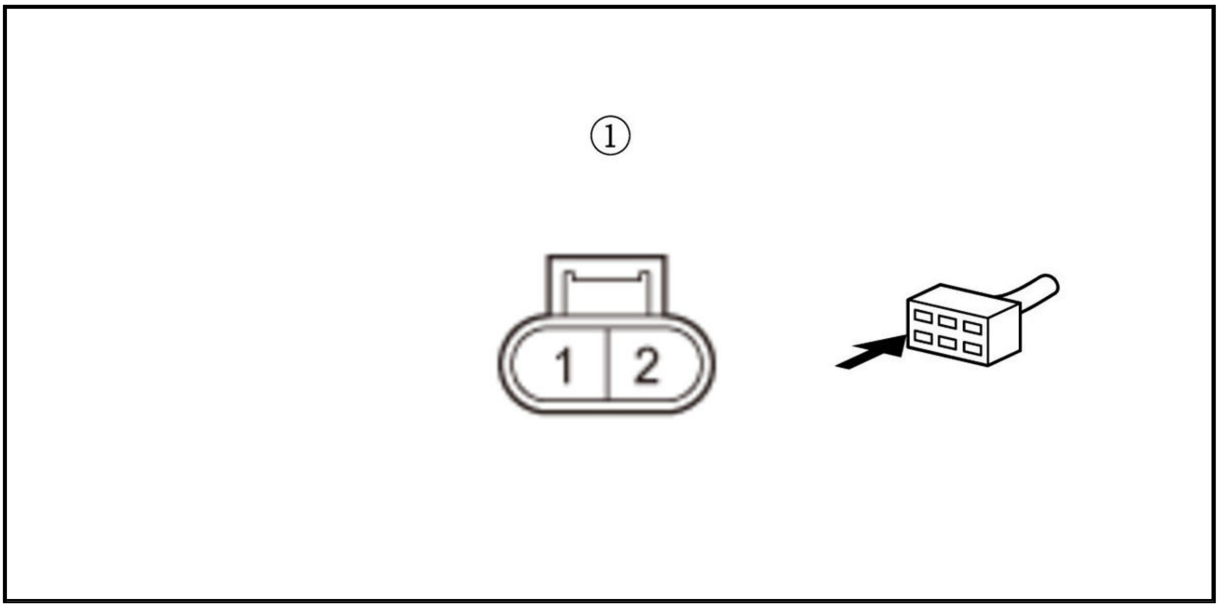
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 9.

NO

Go to step 10.

9. Shorted wire check (LIN (BATT SENSOR)/LIN line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between 12 volt battery sensor 2P connector terminal No. 2 and body ground, while disconnecting these connectors, one at a time:

   - PCM connector B (51P)
   - Alternator 1P connector
   - Shutter grille (upper) 4P connector
   - Shutter grille (lower) 4P connector

   Does continuity go away when one of the above connectors is disconnected?

   YES

   The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

   NO

   Repair a short in the LIN (BATT SENSOR)/LIN wire between the 12 volt battery sensor, the alternator, the shutter grille and the PCM (B40).

10. Determine possible failure area (12 volt battery sensor, others)

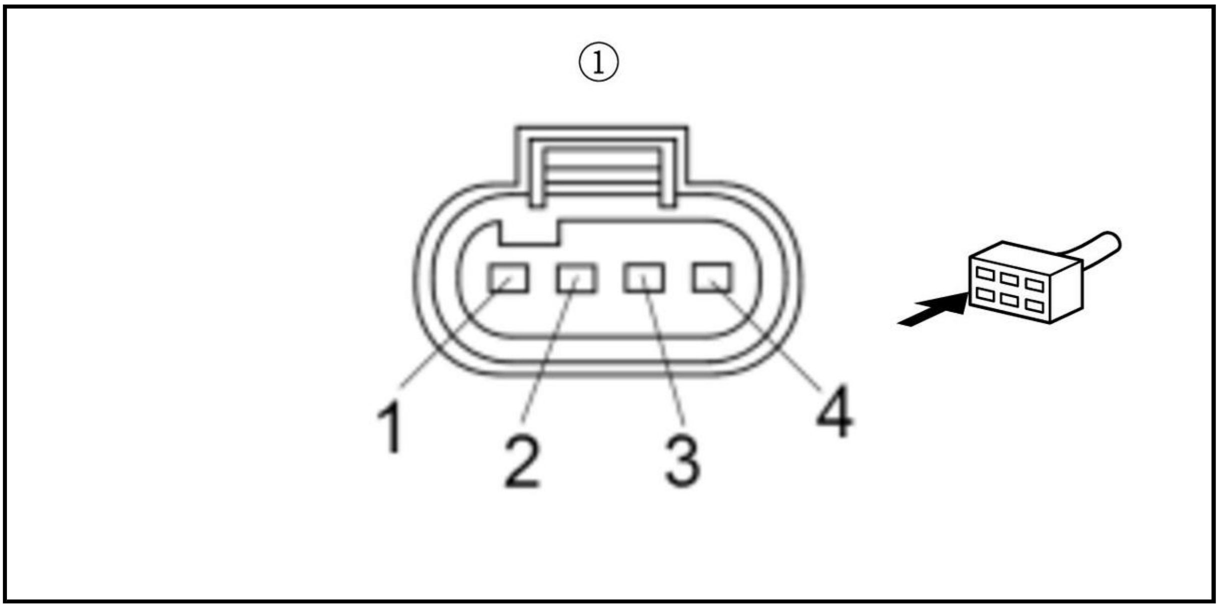
    -1. Reconnect the 12 volt battery sensor 2P connector.

    -2. Disconnect the following connector.

Shutter grille (upper/lower) 4P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the 12 volt battery sensor .

NO

Go to step 11.

11. Open wire check (LIN (BATT SENSOR)/LIN line) 1

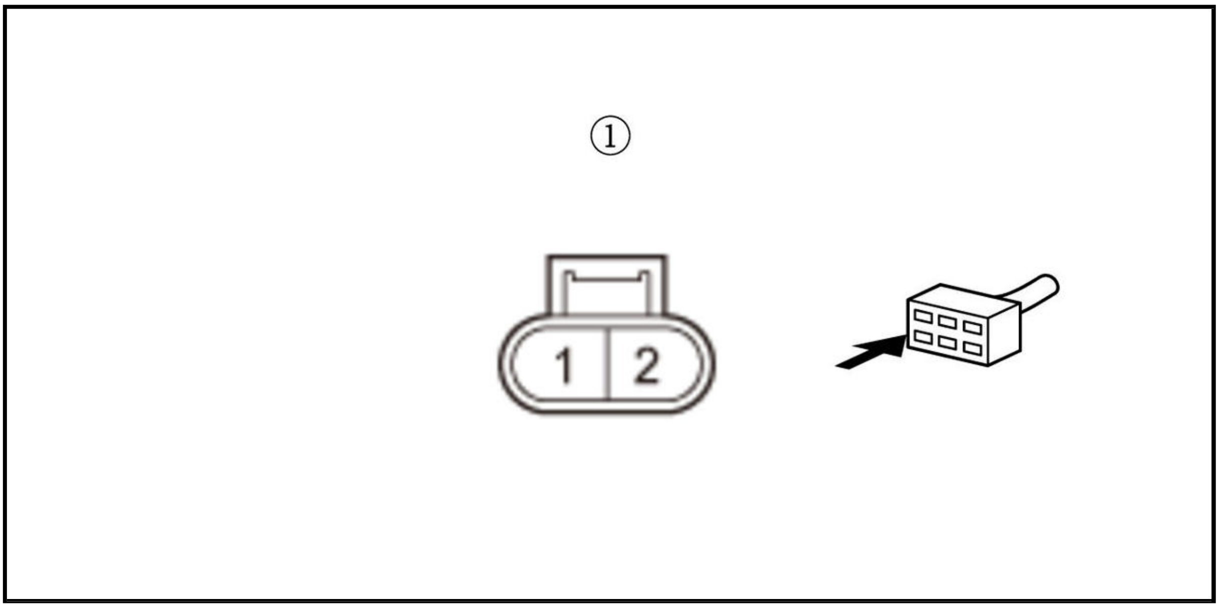
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

12 volt battery sensor 2P connector
PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	12 volt battery sensor 2P connector: disconnected
	Shutter grille (upper/lower) 4P connector: disconnected
	PCM connector B (51P): disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (B40) and the 12 volt battery sensor.

12. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A24 (10 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 13.

NO

Repair a short in the +B HORN wire between the 12 volt battery sensor and the No. A24 (10 A) fuse. Also replace the No. A24 (10 A) fuse.

13. Open wire check (+B HORN line)

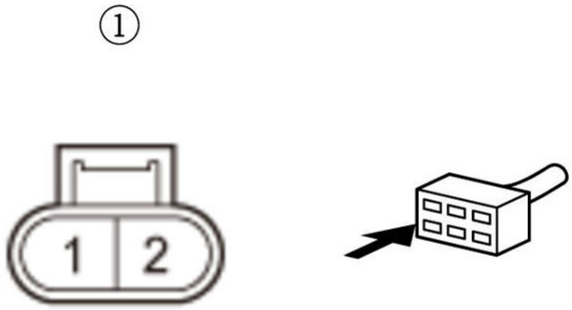
-1. Disconnect the following connector.

12 volt battery sensor 2P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 14.

NO

Repair an open in the +B HORN wire between the 12 volt battery sensor and the No. A24 (10 A) fuse in the under-hood fuse/relay box.

14. Open wire check (LIN (BATT SENSOR)/LIN line) 2

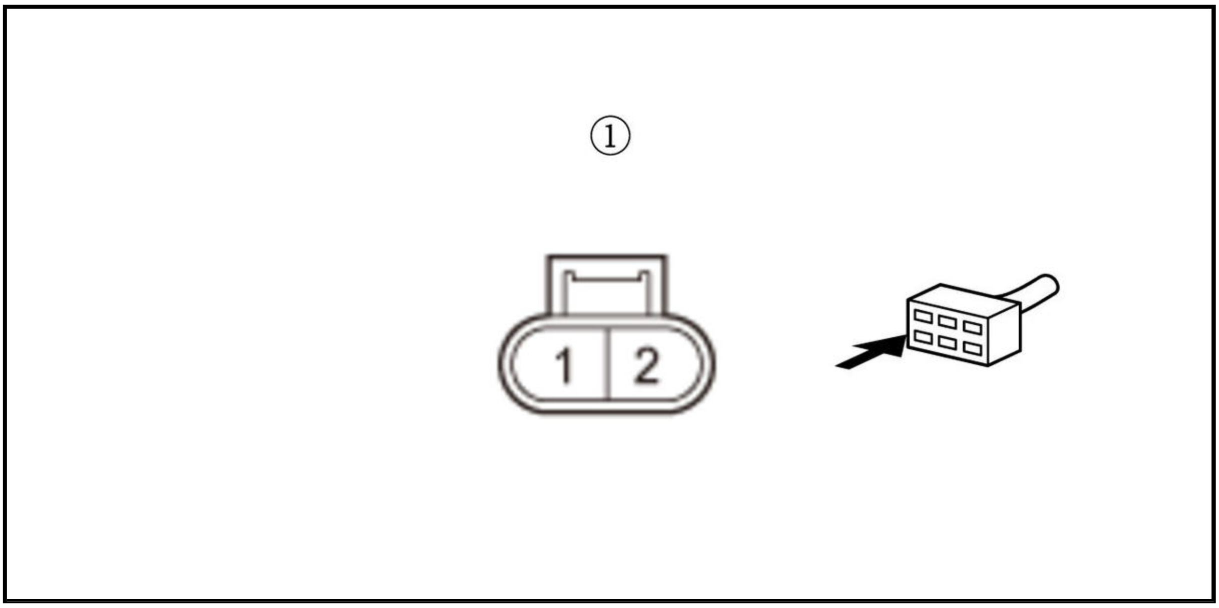
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR)/LIN wire is OK. **Replace the 12 volt battery sensor** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (B40) and the 12 volt battery sensor.

DTC P16E4 (1.5 L ENGINE)

DTC P16E4 : ACG High-temperature

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is stored when the alternator temperature is high.

DTC Description	Confirmed DTC	Pending DTC
P16E4 ACG High-temperature	B	B

DTC (PGM-FI)

1. Problem verification

-1. If the temperature of the engine and the alternator is high, open the hood to cool the engine compartment.

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the ON mode, and wait 1 minute.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E4 ACG High-temperature	B	B

Is DTC P16E4 indicated?

YES

The failure is duplicated. **Replace the alternator** .

NO

Intermittent failure, the system is OK at this time. Check the cause of the high temperature, and repair it.

DTC P16E4 (2.4 L ENGINE) (2017 2018 2019)

DTC P16E4 : ACG High-temperature

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is stored when the alternator temperature is high.

DTC Description	Confirmed DTC	Pending DTC
P16E4 ACG High-temperature	B	B

DTC (PGM-FI)

1. Problem verification

   -1. If the temperature of the engine and the alternator is high, open the hood to cool the engine compartment.

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E4 ACG High-temperature	B	B

Is DTC P16E4 indicated?

YES

The failure is duplicated. **Replace the alternator** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . Check the cause of the high temperature, and repair it.

DTC P16E5 (1.5 L ENGINE) (2020 2021)

DTC P16E5 : LIN Communication Error (PCM-DC-DC Converter)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16E5 LIN Communication Error (PCM-DC-DC Converter)	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E5 LIN Communication Error (PCM-DC-DC Converter)	B	B

   Is DTC P16E5 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the DC-DC converter and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check 1

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI-ACG LIN Communication Error	B	B

   Is DTC P16E2 indicated?

   YES

   Go to step 5

   NO

   Go to step 3.

3. DTC check 2

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

Is DTC P16E3 indicated?

YES

Go to step 9.

NO

Go to step 4.

4. DTC check 3

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

Is DTC P16E8 indicated?

YES

Go to step 13.

NO

Go to step 17.

5. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

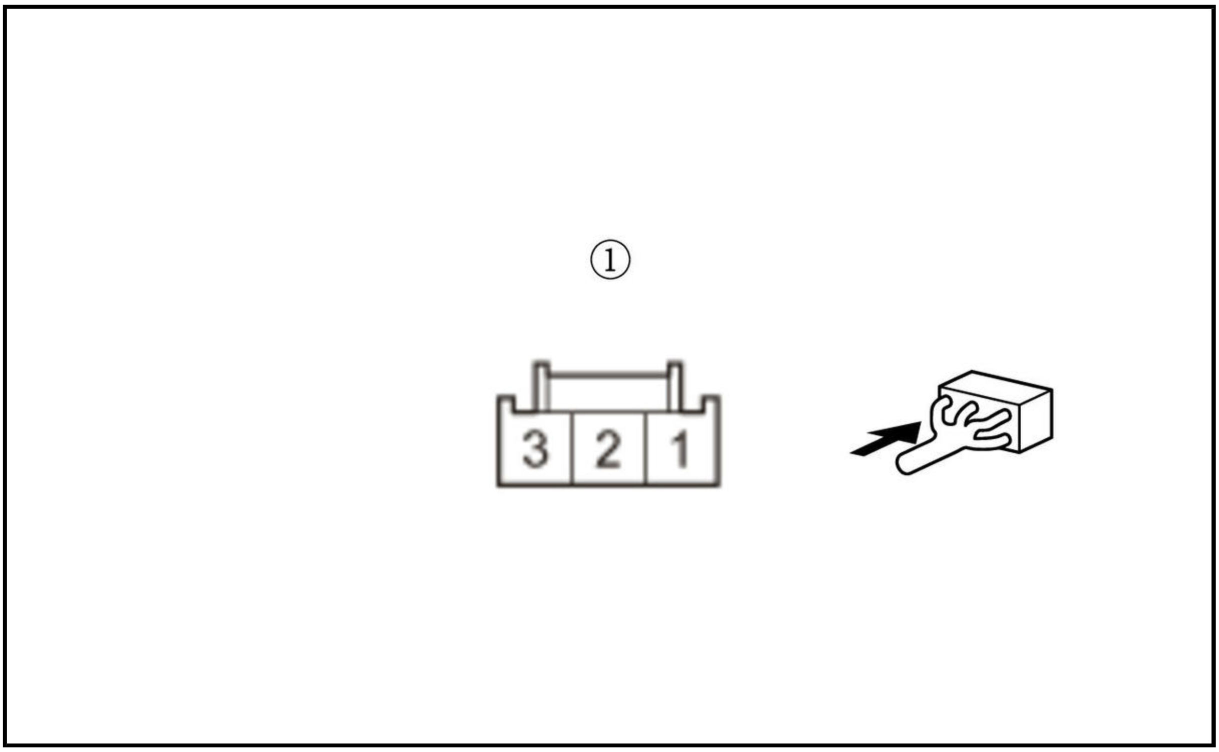
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

6. Shorted wire check (LIN (BATT SENSOR)/LIN line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between DC-DC converter connector A (3P) terminal No. 1 and body ground, while disconnecting these connectors, one at a time:

   - Alternator 1P connector
   - PCM connector A (50P)
   - 12 volt battery sensor 2P connector
   - Shutter grille (upper) 4P connector
   - Shutter grille (lower) 4P connector

   Does continuity go away when one of the above connectors is disconnected?

   YES

   The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

   NO

   Repair a short in the LIN (BATT SENSOR)/LIN wire between the DC-DC converter, the alternator, the PCM (A10), the shutter grille, and the 12 volt battery sensor.

7. Determine possible failure area (DC-DC converter, others)

-1. Reconnect the following connector.

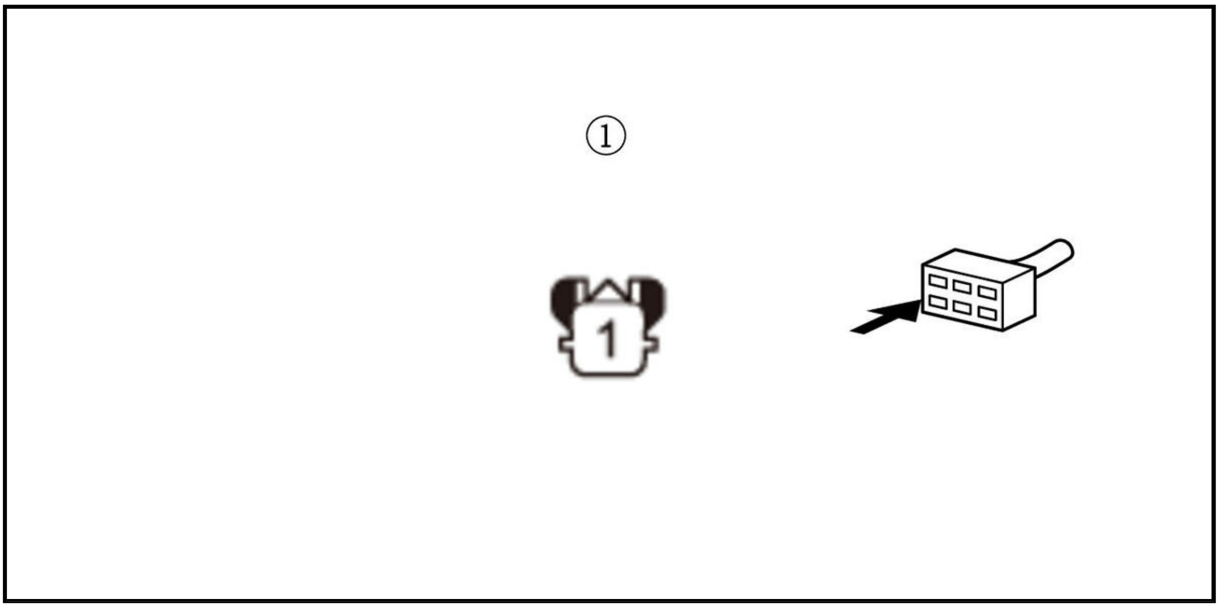
DC-DC converter connector A (3P)

-2. Disconnect the following connector.

Alternator 1P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 8.

NO

Replace the DC-DC converter .

8. Open wire check (LIN (BATT SENSOR)/LIN line) 1

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

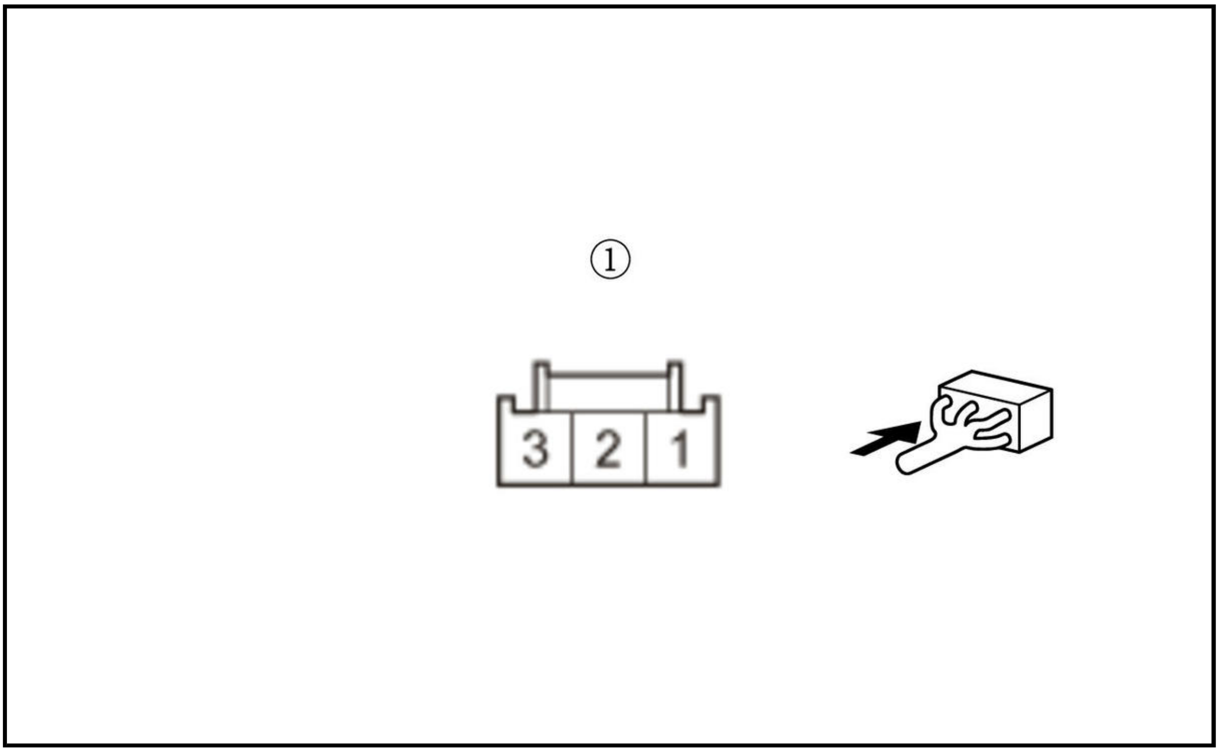
-2. Disconnect the following connectors.

PCM connector A (50P)
DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Alternator 1P connector: disconnected
	PCM connector A (50P): disconnected

	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the DC-DC converter.

9. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

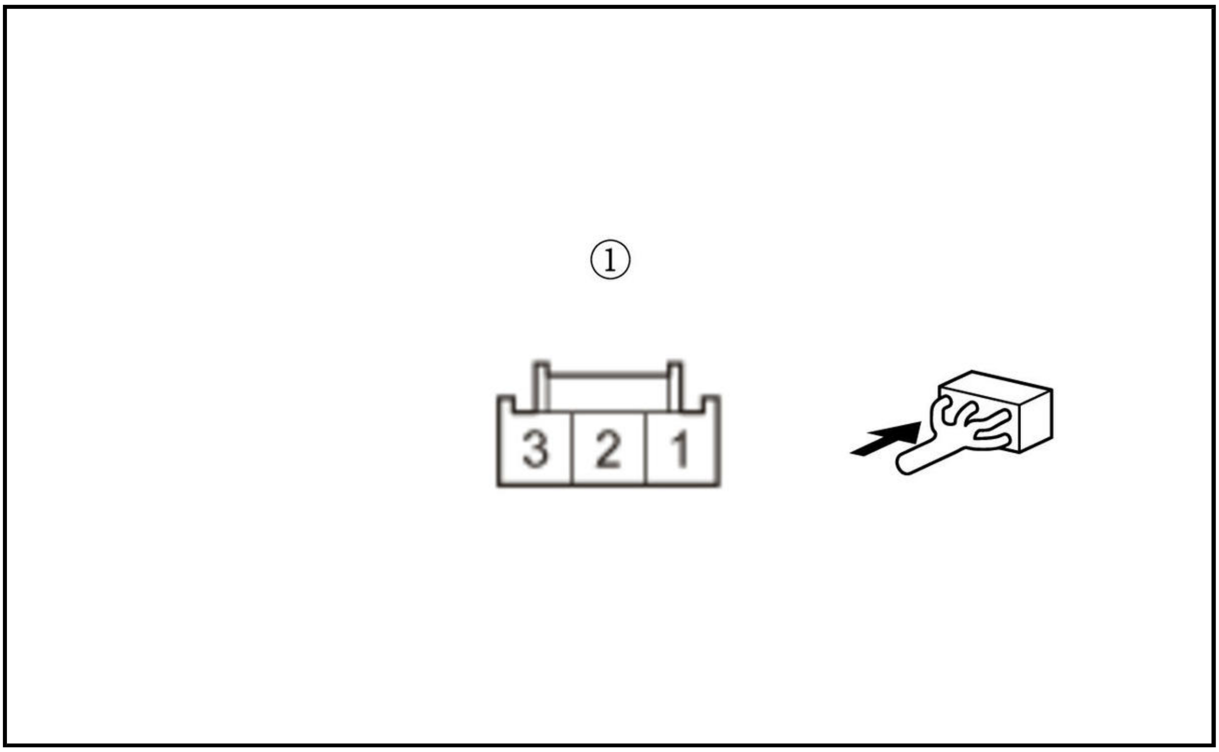
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 11.

NO

Go to step 10.

10. Shorted wire check (LIN (BATT SENSOR)/LIN line)

    -1. Jump the SCS line with the HDS, and wait more than 1 minute.

    Continue to check for continuity between DC-DC converter connector A (3P) terminal No. 1 and body ground, while disconnecting these connectors, one at a time:

    - Alternator 1P connector
    - PCM connector A (50P)
    - 12 volt battery sensor 2P connector
    - Shutter grille (upper) 4P connector
    - Shutter grille (lower) 4P connector

    Does continuity go away when one of the above connectors is disconnected?

    YES

    The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

    NO

    Repair a short in the LIN (BATT SENSOR)/LIN wire between the DC-DC converter, the alternator, the PCM (A10), the shutter grille, and the 12 volt battery sensor.

11. Determine possible failure area (DC-DC converter, others)

-1. Reconnect the following connector.

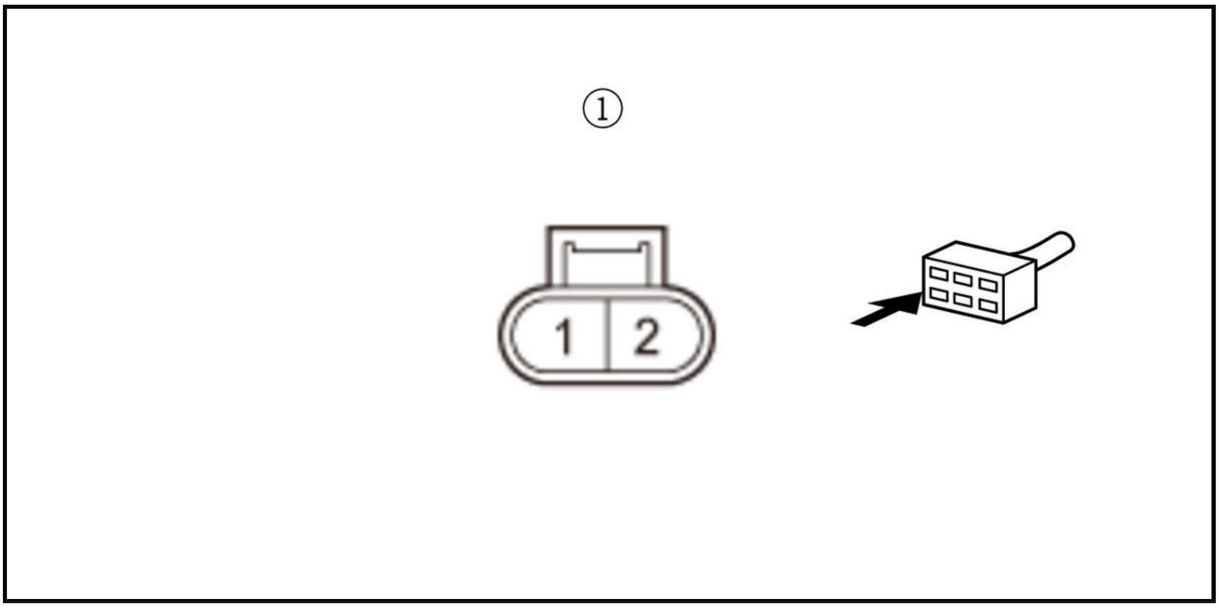
DC-DC converter connector A (3P)

-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 12.

NO

Replace the DC-DC converter .

12. Open wire check (LIN (BATT SENSOR)/LIN line) 1

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

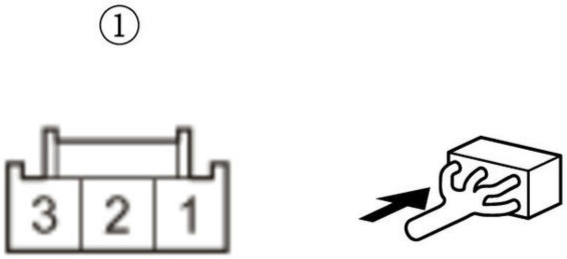
-2. Disconnect the following connectors.

PCM connector A (50P)
DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	12 volt battery sensor 2P connector: disconnected
	PCM connector A (50P): disconnected

	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the DC-DC converter.

13. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

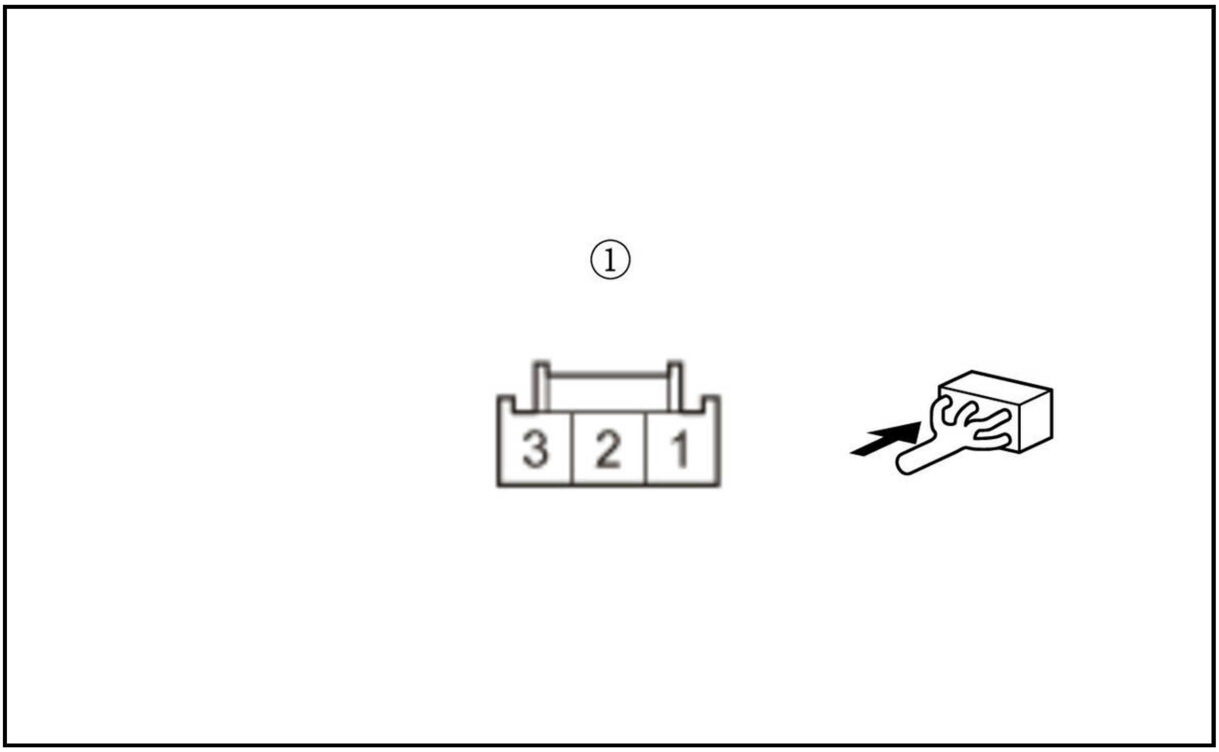
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 15.

NO

Go to step 14.

14. Shorted wire check (LIN (BATT SENSOR)/LIN line)

    -1. Jump the SCS line with the HDS, and wait more than 1 minute.

    Continue to check for continuity between DC-DC converter connector A (3P) terminal No. 1 and body ground, while disconnecting these connectors, one at a time:

    - Alternator 1P connector
    - PCM connector A (50P)
    - 12 volt battery sensor 2P connector
    - Shutter grille (upper) 4P connector
    - Shutter grille (lower) 4P connector

    Does continuity go away when one of the above connectors is disconnected?

    YES

    The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

    NO

    Repair a short in the LIN (BATT SENSOR)/LIN wire between the DC-DC converter, the alternator, the PCM (A10), the shutter grille, and the 12 volt battery sensor.

15. Determine possible failure area (DC-DC converter, others)

-1. Reconnect the following connector.

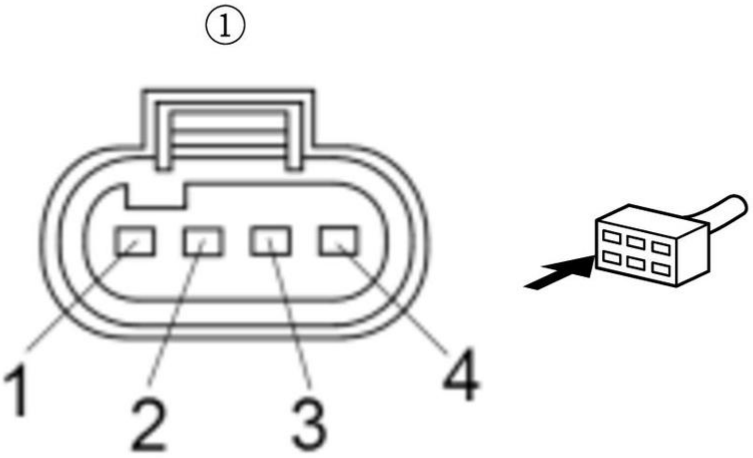
DC-DC converter connector A (3P)

-2. Disconnect the following connector.

Shutter grille (upper/lower) 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 16.

NO

Replace the DC-DC converter .

16. Open wire check (LIN (BATT SENSOR)/LIN line) 1

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

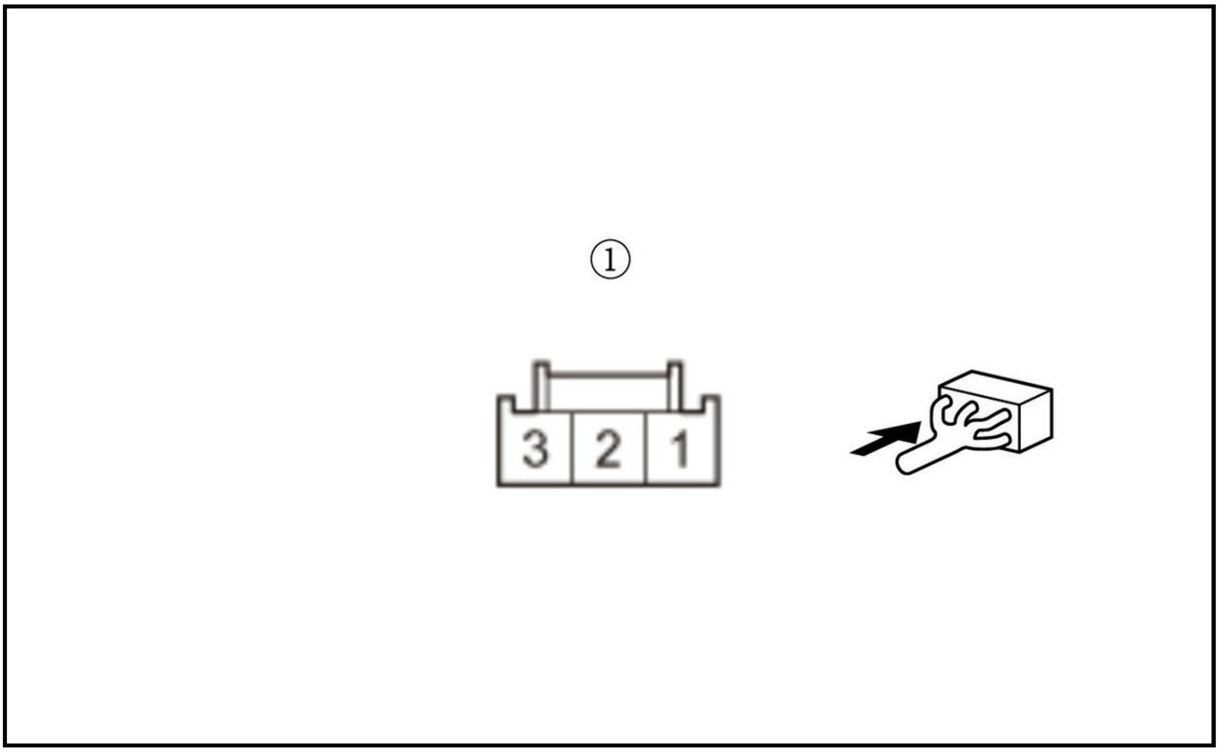
-2. Disconnect the following connectors.

PCM connector A (50P)
DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Shutter grille (upper/lower) 4P connector: disconnected
	PCM connector A (50P): disconnected

	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the DC-DC converter.

17. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. D21**

Is the fuse OK?

YES

Go to step 18.

NO

Repair a short in the IG1 ACG wire between the DC-DC converter and the No. D21 fuse. Also replace the No. D21 fuse.

18. Open wire check (IG1 ACG line)

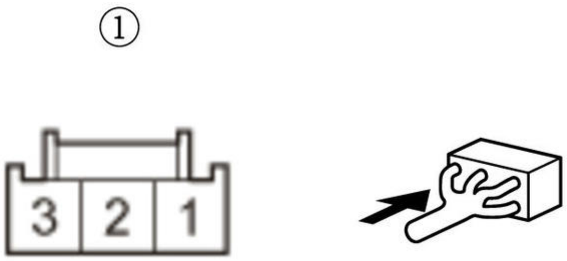
-1. Disconnect the following connector.

DC-DC converter connector A (3P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 19.

NO

Repair an open in the IG1 ACG wire between the DC-DC converter and the **No. D21 fuse** .

19. Open wire check (LIN (BATT SENSOR)/LIN line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

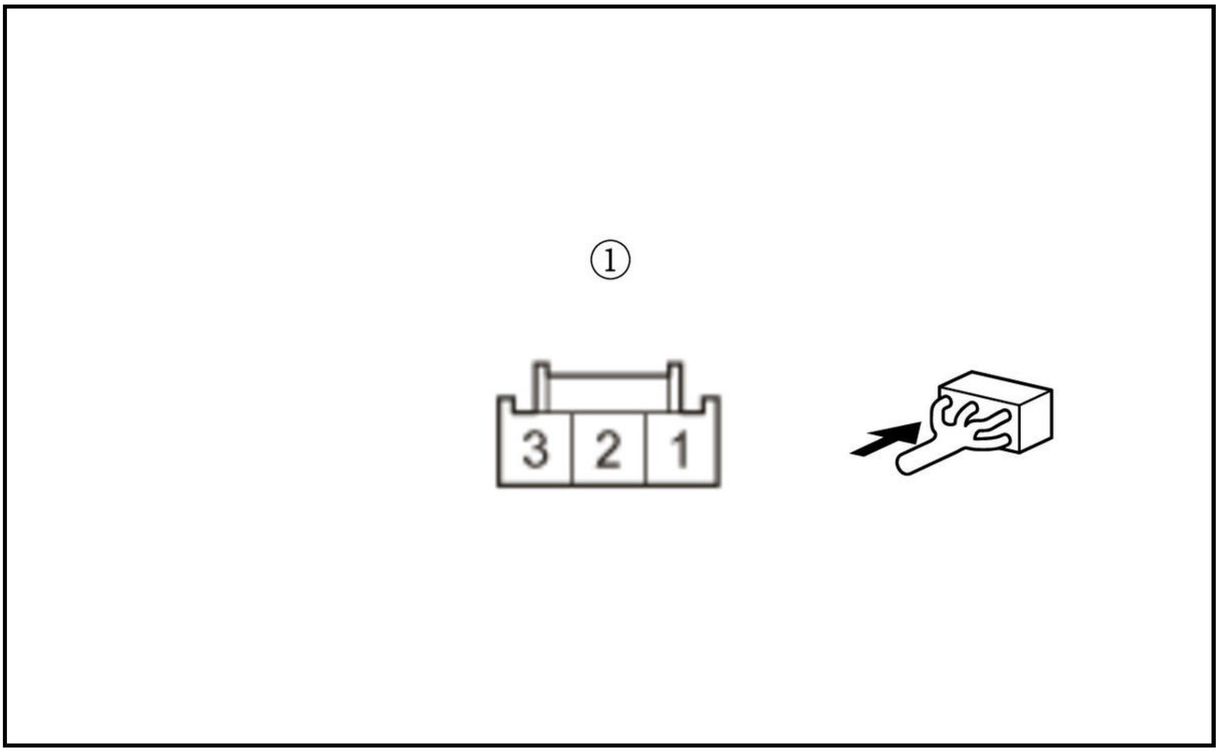
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	DC-DC converter connector A (3P): disconnected PCM connector A (50P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①

Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. **Replace the DC-DC converter** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the DC-DC converter.

DTC P16E6 (1.5 L ENGINE)

DTC P16E6 : Transmission Range Switch START Switch Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16E6 Transmission Range Switch START Switch Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Shift the transmission to other than P or N position/mode, and wait 5 seconds or more.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E6 Transmission Range Switch START Switch Circuit Malfunction	B	B

Is DTC P16E6 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmission range switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (short in ATPST/ATP-ST wire, others)

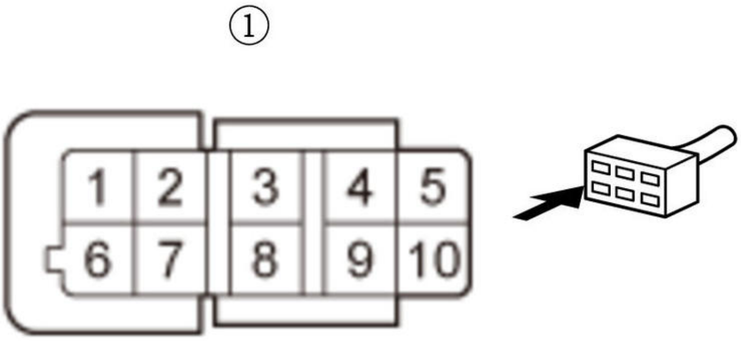
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmission range switch 10P connector: disconnected
Test point 1	Transmission range switch 10P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

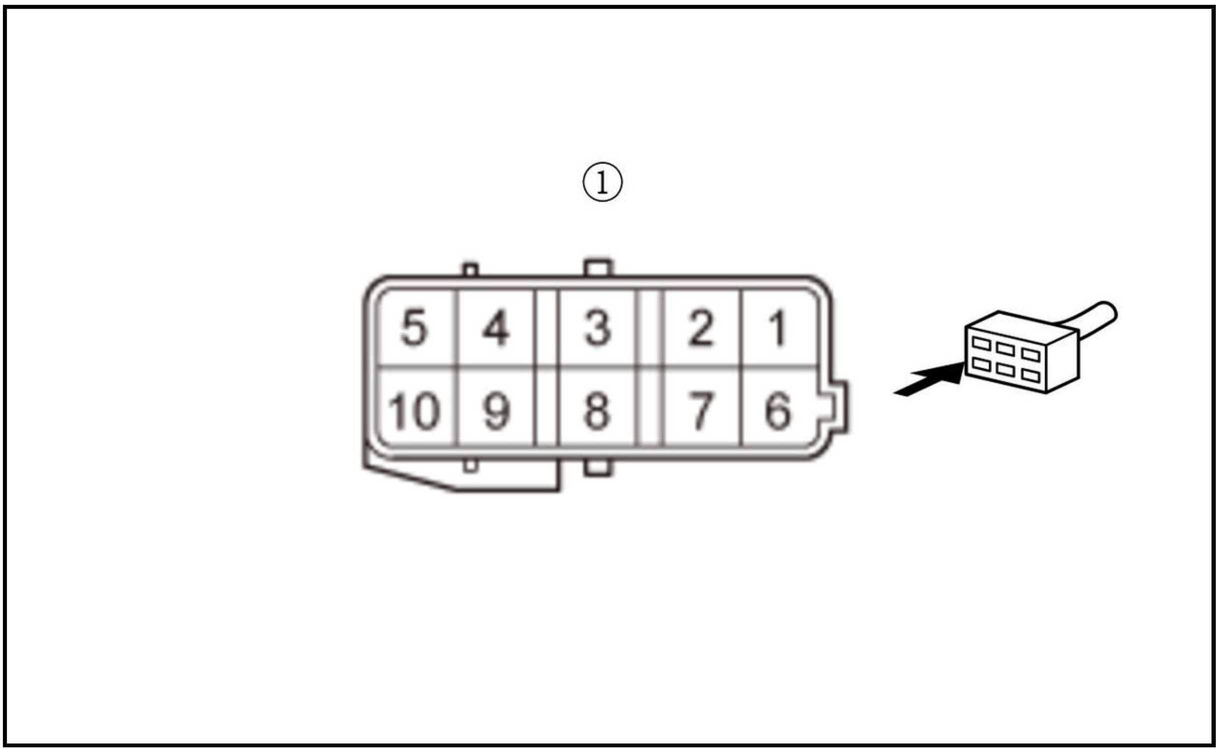
Go to step 3.

3. Transmission range switch check

-1. Shift the transmission to other than P or N position/mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmission range switch 10P connector: disconnected
Test point 1	Transmission range switch 10P connector (male terminals) No. 7: ① (transmission range switch side)
Test point 2	Transmission range switch 10P connector (male terminals) No. 1: ① (transmission range switch side)



Is there continuity?

YES

Replace the transmission range switch .

NO

Check for poor connections or loose terminals at the transmission range switch and the PCM, and test the transmission range switch . If they are OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

4. Shorted wire check (ATPST/ATP-ST line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Transmission range switch 10P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 67**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the ATPST/ATP-ST wire between the PCM (E67) and the transmission range switch.

NO

The ATPST/ATP-ST wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P16E8 (1.5 L ENGINE)

DTC P16E8 : PGM-FI-Shutter Grille LIN Communication Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

*1: Without wireless charger
*2: With wireless charger

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

Is DTC P16E8 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check 1

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI-ACG LIN Communication Error	B	B

   Is DTC P16E2 indicated?

   YES

   Go to step 5.

   NO

   Go to step 3.

3. DTC check 2

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

   Is DTC P16E3 indicated?

   YES

   Go to step 10.

   NO (Without auto idle stop system)

   Go to step 23.

   NO (With auto idle stop system)

   Go to step 4.

4. DTC check 3

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E5 LIN Communication Error (PCM-DC-DC Converter)	B	B

   Is DTC P16E5 indicated?

   YES

   Go to step 15.

NO

Go to step 20.

5. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

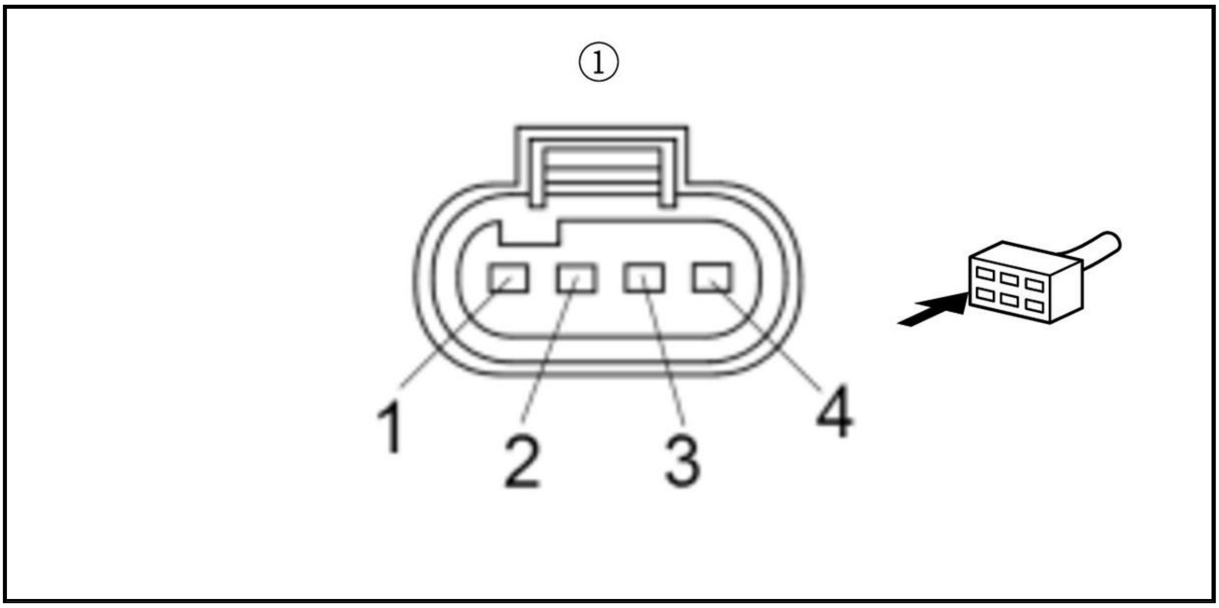
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

6. Shorted wire check (LIN (BATT SENSOR)/LIN line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between the shutter grille (upper/lower) 4P connector terminal and body ground, while disconnecting these connectors, one at a time:

   - PCM connector A (50P)
   - Alternator 1P connector
   - 12 volt battery sensor 2P connector
   - DC-DC converter connector A (3P) (With auto idle stop system)

Does continuity go away when one of the above connectors is disconnected?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

NO

Repair a short in the LIN (BATT SENSOR)/LIN wire between the PCM (A10), the alternator, the 12 volt battery sensor, the DC-DC converter (with auto idle stop system), and the shutter grille.

7. Determine possible failure area (shutter grille (upper), others)

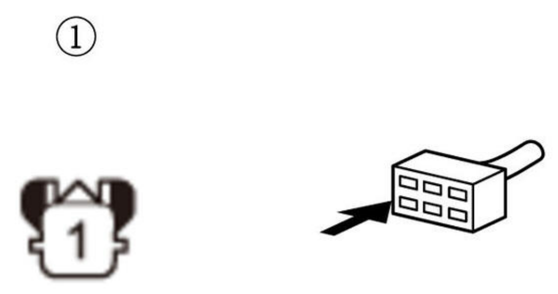
-1. Reconnect the shutter grille (upper) 4P connector.

-2. Disconnect the following connector.

Alternator 1P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 8.

NO

Replace the shutter grille (upper) .

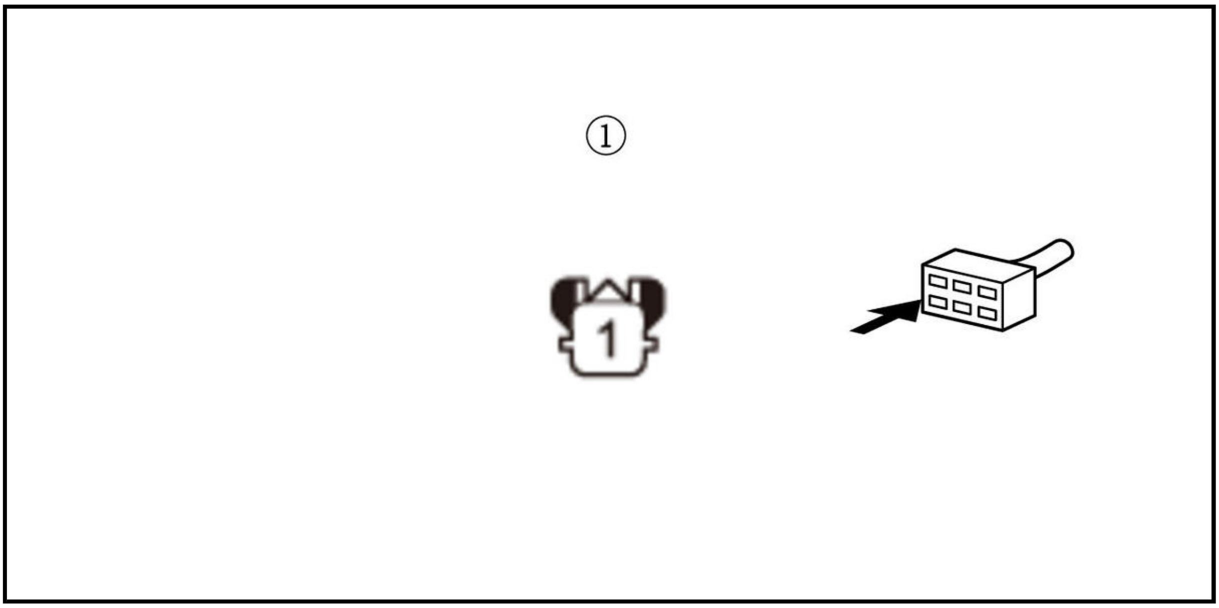
8. Determine possible failure area (shutter grille (lower), others)

-1. Reconnect the shutter grille (lower) 4P connector.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①

Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 9.

NO

Replace the shutter grille (lower) .

9. Open wire check (LIN (BATT SENSOR)/LIN line) 1

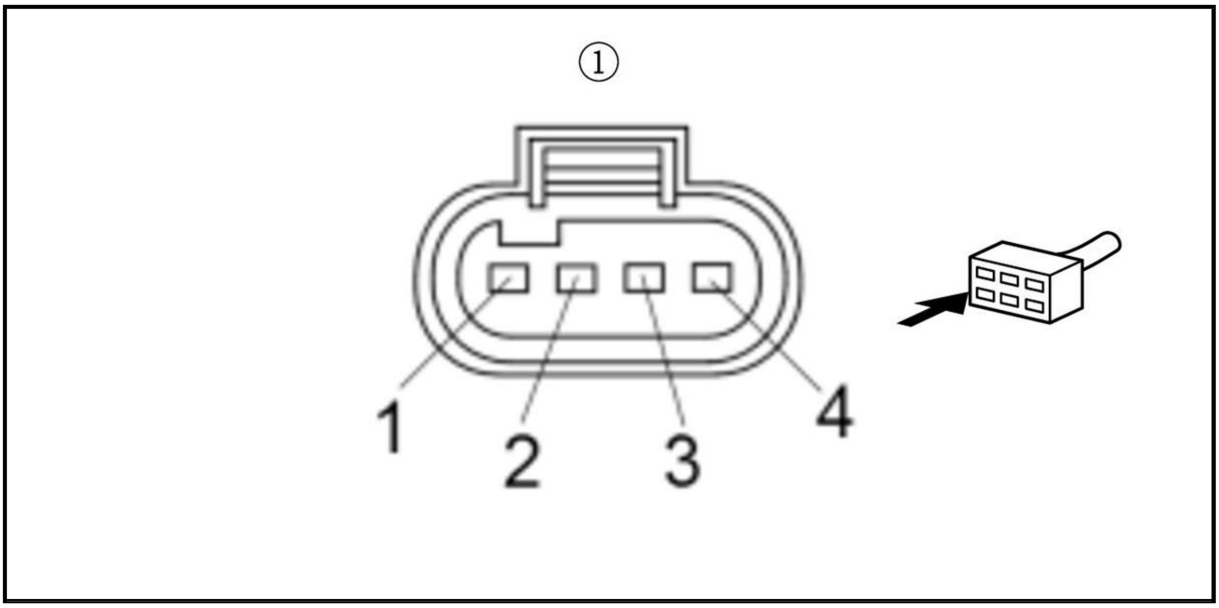
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector
PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
B	Alternator 1P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the shutter grille.

10. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

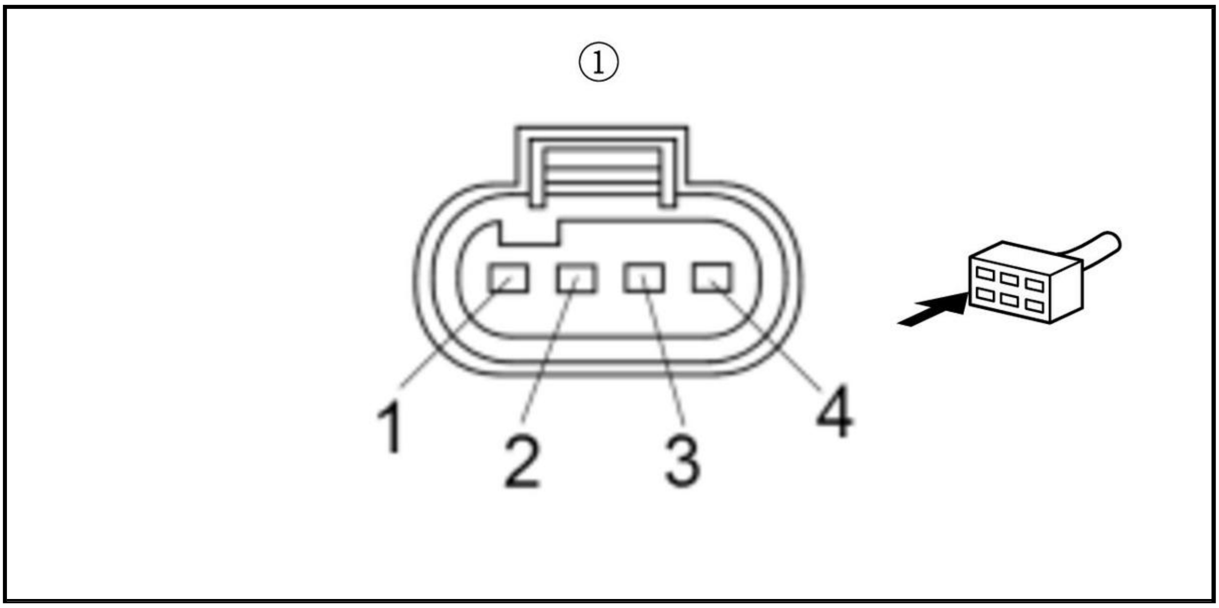
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 12.

NO

Go to step 11.

11. Shorted wire check (LIN (BATT SENSOR)/LIN line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Continue to check for continuity between the shutter grille (upper/lower) 4P connector terminal and body ground, while disconnecting these connectors, one at a time:

- PCM connector A (50P)
- 12 volt battery sensor 2P connector
- Alternator 1P connector
- DC-DC converter connector A (3P) (with auto idle stop system)

Does continuity go away when one of the above connectors is disconnected?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

NO

Repair a short in the LIN (BATT SENSOR)/LIN wire between the PCM (A10), the alternator, the 12 volt battery sensor, the DC-DC converter (with auto idle stop system), and the shutter grille.

12. Determine possible failure area (shutter grille (upper), others)

-1. Reconnect the shutter grille (upper) 4P connector.

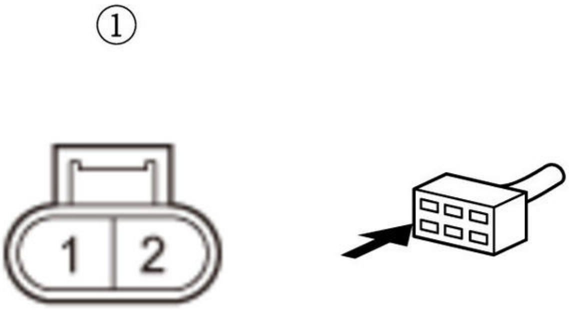
-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	Shutter grille (lower) 4P connector: disconnected

Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 13.

NO

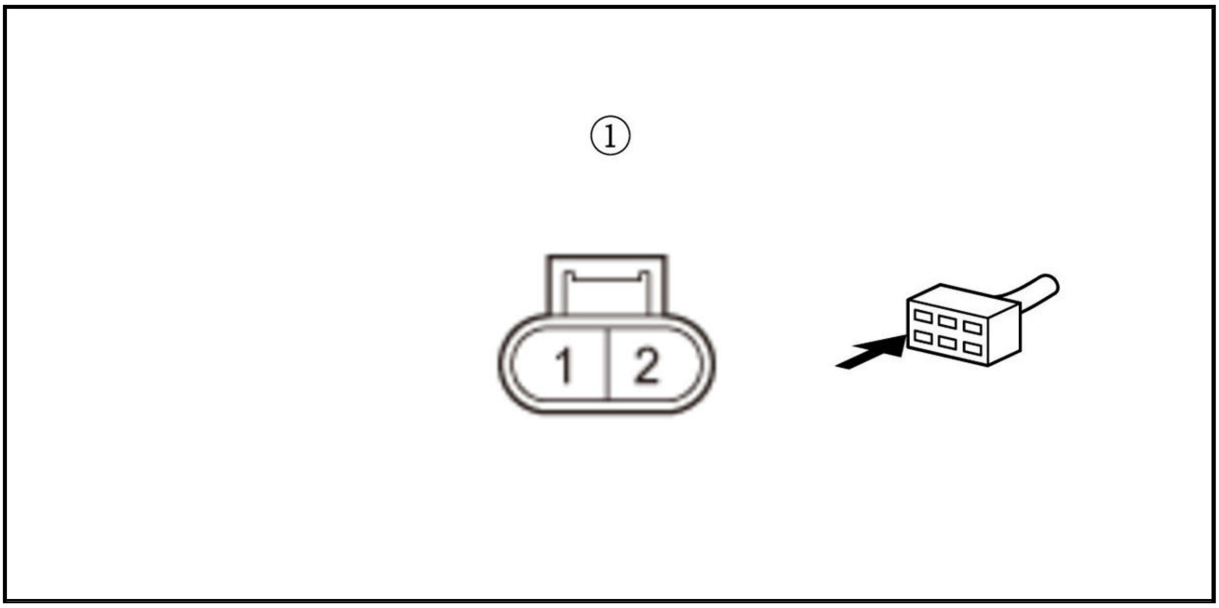
Replace the shutter grille (upper) .

13. Determine possible failure area (shutter grille (lower), others)

-1. Reconnect the shutter grille (lower) 4P connector.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 14.

NO

Replace the shutter grille (lower) .

14. Open wire check (LIN (BATT SENSOR)/LIN line) 1

    -1. Jump the SCS line with the HDS, and wait more than 1 minute.

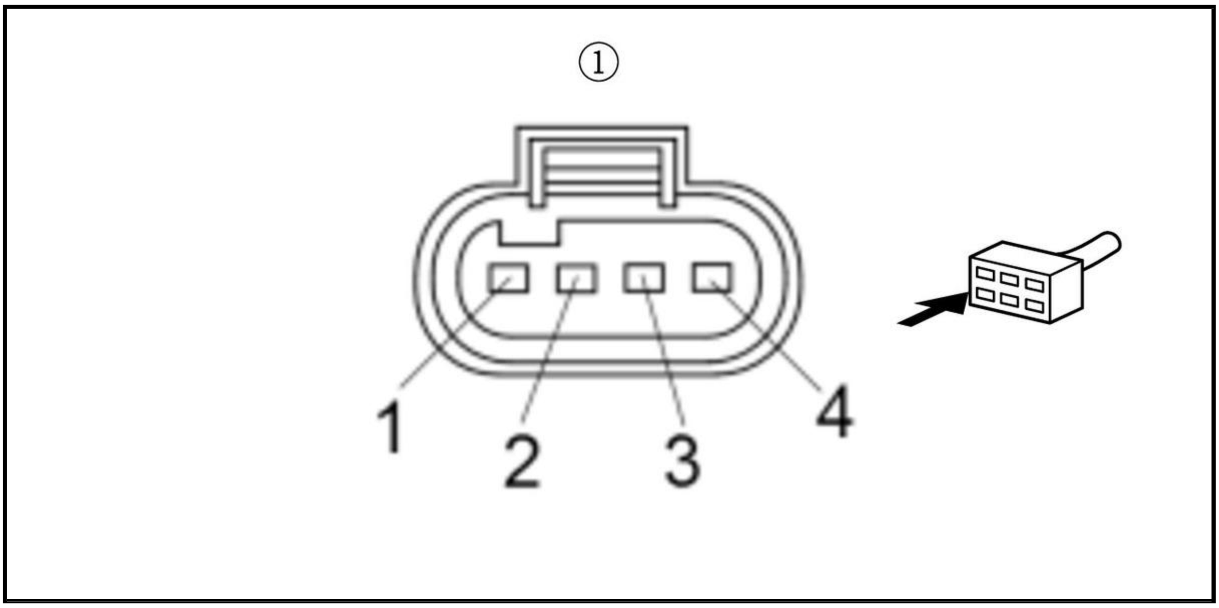
    -2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector
PCM connector A (50P)

    -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected

B	Shutter grille (upper/lower) 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the shutter grille.

15. Determine possible failure area (LIN (BATT SENSOR)/LIN line, others)

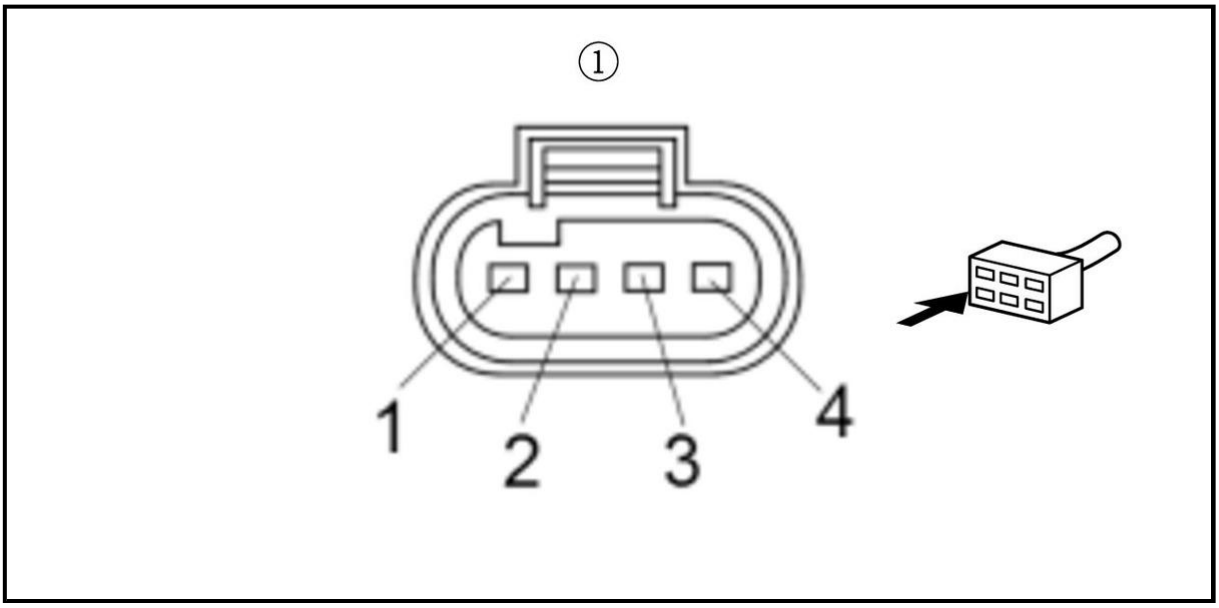
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 17.

NO

Go to step 16.

16. Shorted wire check (LIN (BATT SENSOR)/LIN line)

    -1. Jump the SCS line with the HDS, and wait more than 1 minute.

    Continue to check for continuity between the shutter grille (upper/lower) 4P connector terminal and body ground, while disconnecting these connectors, one at a time:

    - PCM connector A (50P)
    - 12 volt battery sensor 2P connector
    - Alternator 1P connector
    - DC-DC converter connector A (3P) (with auto idle stop system)

    Does continuity go away when one of the above connectors is disconnected?

    YES

    The LIN (BATT SENSOR)/LIN wire is OK. Replace the part that caused an open when it was disconnected.

    NO

    Repair a short in the LIN (BATT SENSOR)/LIN wire between the PCM (A10), the alternator, the 12 volt battery sensor, the DC-DC converter (with auto idle stop system), and the shutter grille.

17. Determine possible failure area (shutter grille (upper), others)

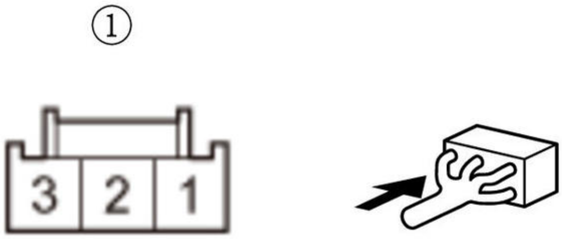
    -1. Reconnect the shutter grille (upper) 4P connector.

    -2. Disconnect the following connector.

DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector A (3P): disconnected
B	Shutter grille 4P (lower) connector: disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 18.

NO

Replace the shutter grille (upper) .

18. Determine possible failure area (shutter grille (lower), others)

-1. Reconnect the shutter grille (lower) 4P connector.

-2. Disconnect the following connector.

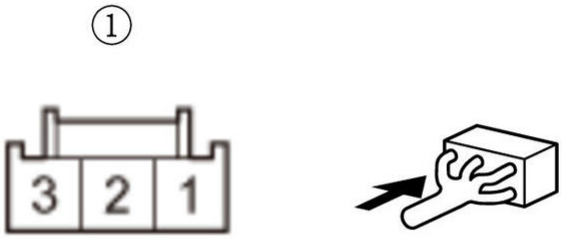
DC-DC converter connector A (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	DC-DC converter connector A (3P): disconnected
Test point 1	DC-DC converter connector A (3P) (female terminals) No. 1: ①

Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 19.

NO

Replace the shutter grille (lower) .

19. Open wire check (LIN (BATT SENSOR)/LIN line) 1

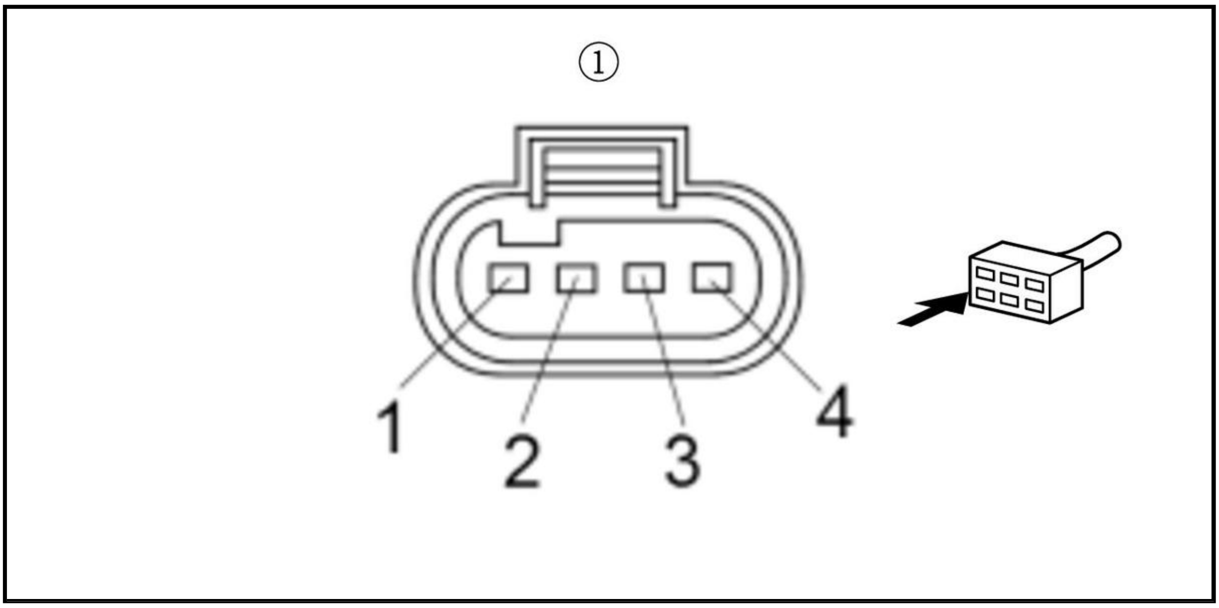
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector
PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DC-DC converter connector A (3P): disconnected
B	Shutter grille (upper/lower) 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the shutter grille.

20. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. G31** shutter grille (upper) *2
Fuse	**No. A23** shutter grille (upper)
Fuse	**No. A22** shutter grille (lower)

Is the fuse OK?

YES

Go to step 21.

NO

- Check for a short in the VMP wire between the No. A23 fuse and the shutter grille (upper). Also replace the No. A23 fuse. *1
- Check for a short in the VMP wire between the No. G31 fuse and the shutter grille (upper). Also replace the No. G31 fuse. *2
- Check for a short in the +B FI ECU MAIN wire between the No. A23 fuse and the G31 fuse. Also replace the No. A23 fuse. *2
- Check for a short in the +B FR FOG/VMP wire between the No. A22 fuse and the shutter grille (lower). Also replace the No. A22 fuse.

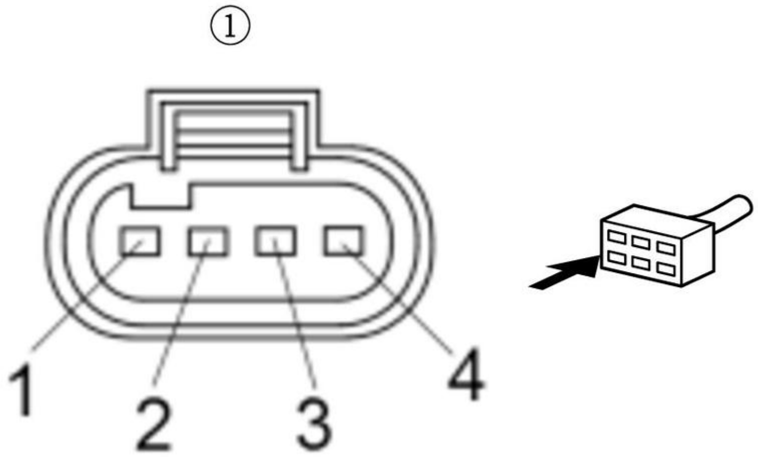
21. Determine possible failure area (LIN (BATT SENSOR) line, VMP line *1, +B FI ECU MAIN/VMP line *2, +B FR FOG/VMP line):

-1. Disconnect the following connector.

Shutter grille (upper/lower) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 1: ①
Test point 2	Shutter grille (upper/lower) 4P connector (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 23.

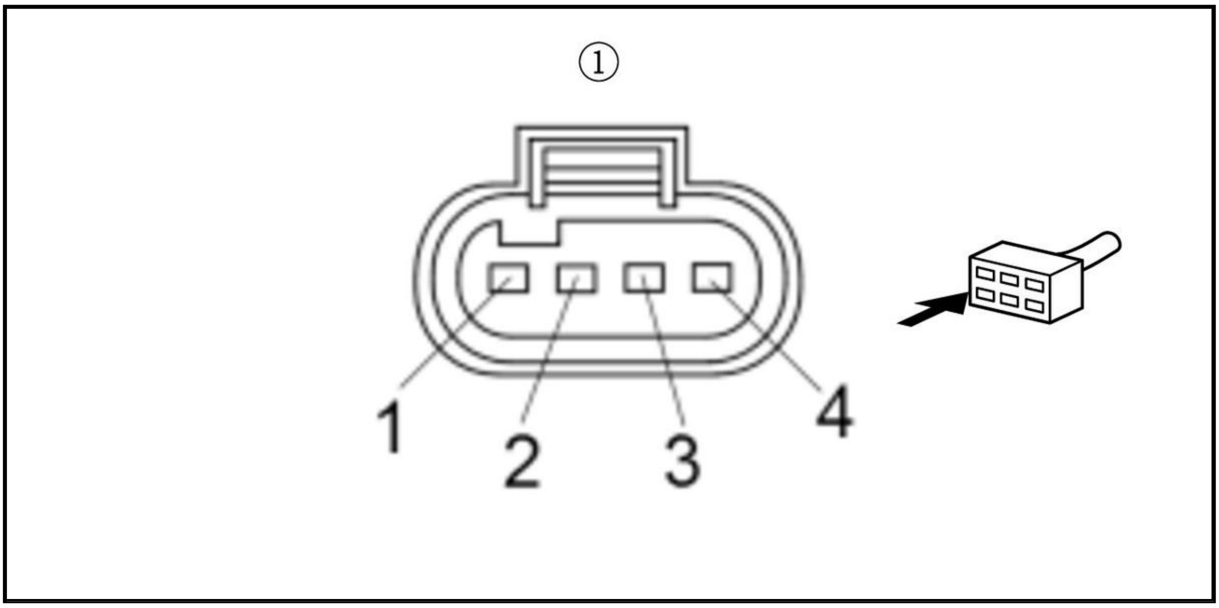
NO

Go to step 22.

22. Open wire check (VMP line *1, +B FI ECU MAIN/VMP line *2, +B FR FOG/VMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

1. **YES**
    - Repair an open in the GND wire between the shutter grille (upper) and G351.
    - Repair an open in the GND wire between the shutter grille (lower) and G251.

   NO
    - Repair an open in the VMP wire between the shutter grille (upper) and the **No. A23** fuse *1.
    - Repair an open in the VMP wire between the shutter grille (upper) and the **No. G31** fuse. *2
    - Repair an open in the +B FI ECU MAIN wire between the G31 fuse and the **No. A23** fuse. *2
    - Repair an open in the +B FR FOG/VMP wire between the shutter grille (lower) and the **No. A22** fuse.

23. Open wire check (LIN (BATT SENSOR)/LIN line) 2

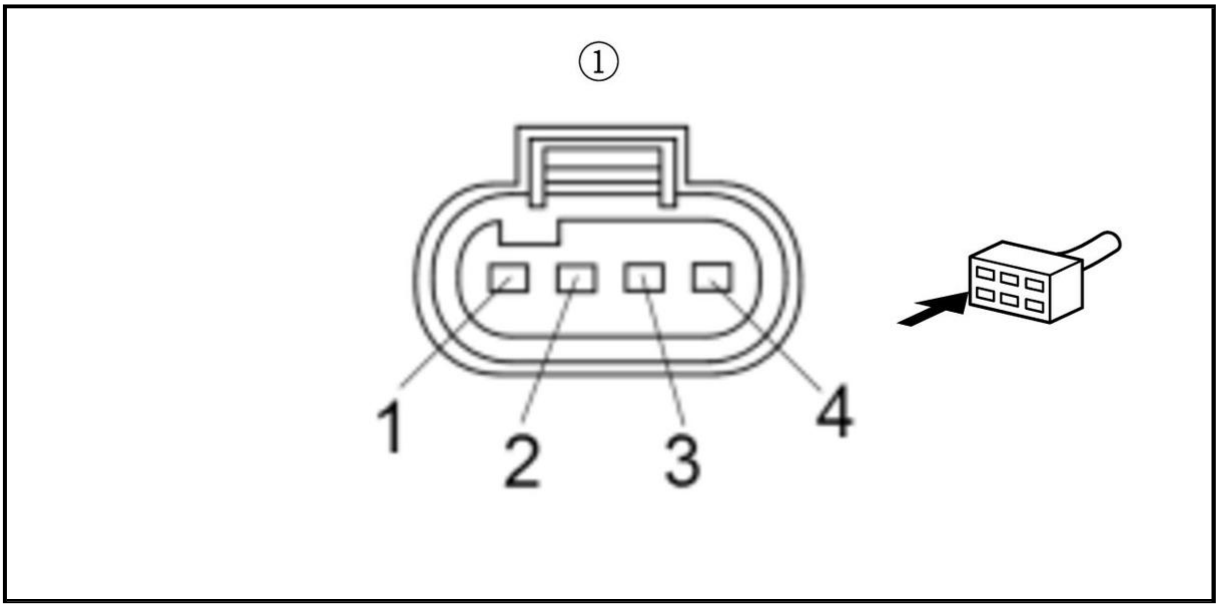
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN (BATT SENSOR)/LIN wire is OK. **Replace the shutter grille** .

NO

Repair an open in the LIN (BATT SENSOR)/LIN wire between the PCM (A10) and the shutter grille (upper/lower).

DTC TROUBLESHOOTING

DTC P16E8 (2.4 L ENGINE) (2017 2018 2019)

DTC P16E8 : PGM-FI-Shutter Grille LIN Communication Error

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

   Is DTC P16E8 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. DTC check 1

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E2 PGM-FI-ACG LIN Communication Error	B	B

   Is DTC P16E2 indicated?

   YES

   Go to step 4.

   NO

Go to step 3.

3. DTC check 2

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

Is DTC P16E3 indicated?

YES

Go to step 9.

NO

Go to step 14.

4. Determine possible failure area (LIN (BATT SENSOR) line, others)

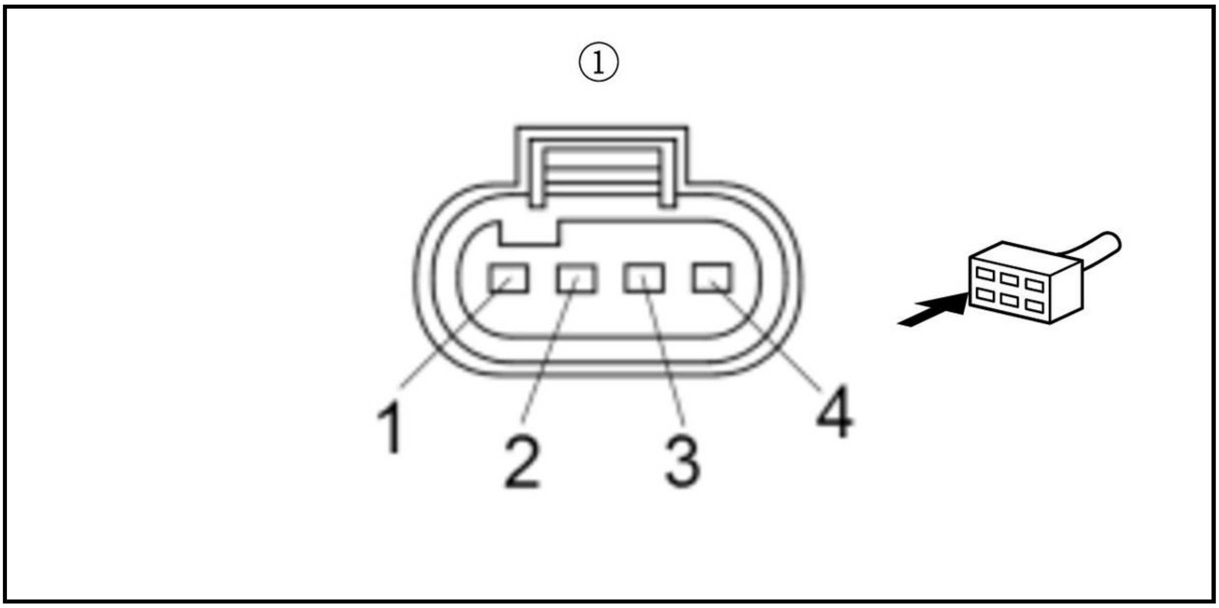
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 5.

NO

Go to step 6.

5. Shorted wire check (LIN (BATT SENSOR) line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between the shutter grille (upper/lower) 4P connector terminal and body ground, while disconnecting these connectors, one at a time:

   - PCM connector B (51P)
   - Alternator 1P connector
   - 12 volt battery sensor 2P connector

   Does continuity go away when one of the above connectors is disconnected?

   YES

   The LIN (BATT SENSOR) wire is OK. Replace the part that caused an open when it was disconnected.

   NO

   Repair a short in the LIN (BATT SENSOR) wire between the PCM (B40), the alternator, the 12 volt battery sensor, and the shutter grille.

6. Determine possible failure area (shutter grille (upper), others)

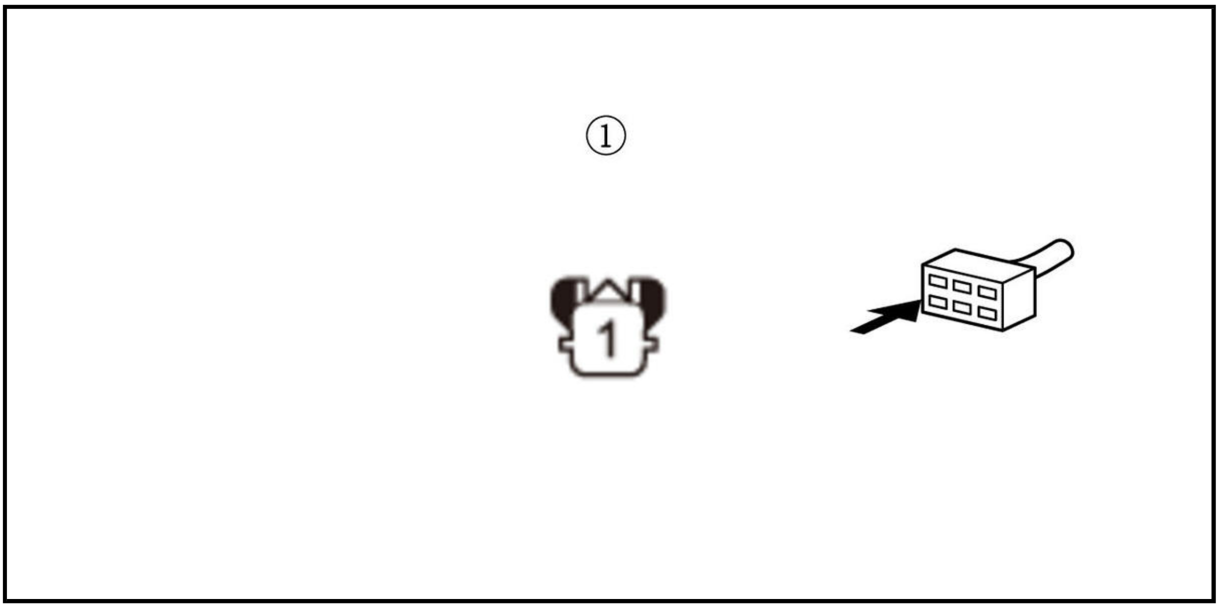
   -1. Reconnect the shutter grille (upper) 4P connector.

   -2. Disconnect the following connector.

Alternator 1P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the shutter grille (upper) .

NO

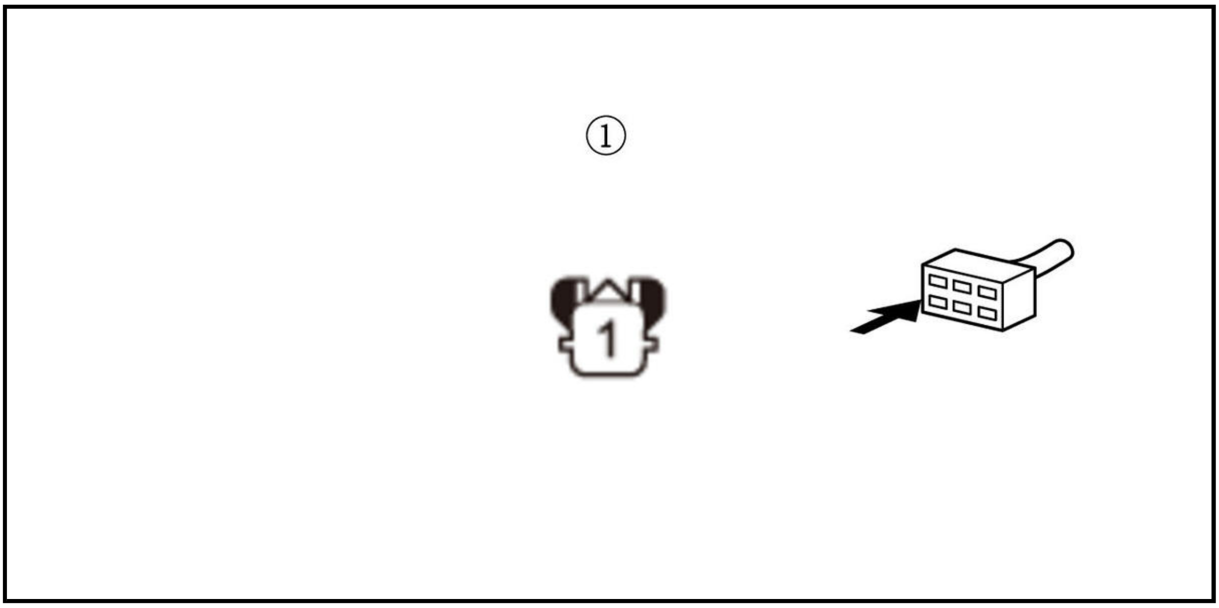
Go to step 7.

7. Determine possible failure area (shutter grille (lower), others)

-1. Reconnect the shutter grille (lower) 4P connector.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Alternator 1P connector: disconnected
Test point 1	Alternator 1P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the shutter grille (lower) .

NO

Go to step 8.

8. Open wire check (LIN (BATT SENSOR) line) 1

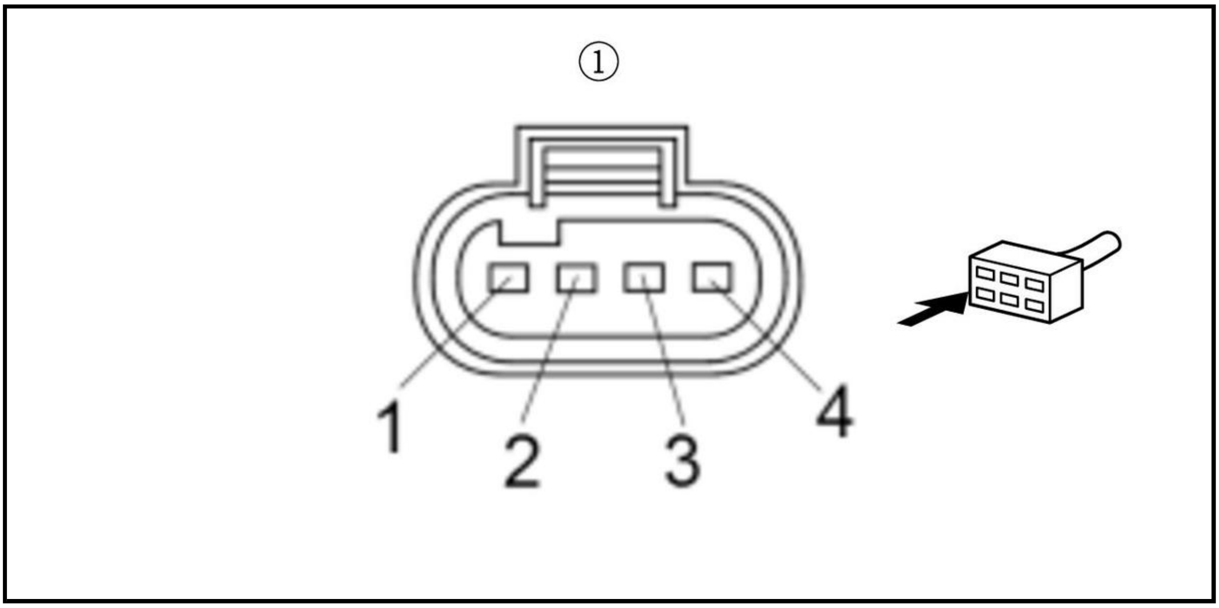
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector
PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
B	Alternator 1P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR) wire between the PCM (B40) and the shutter grille.

9. Determine possible failure area (LIN (BATT SENSOR) line, others)

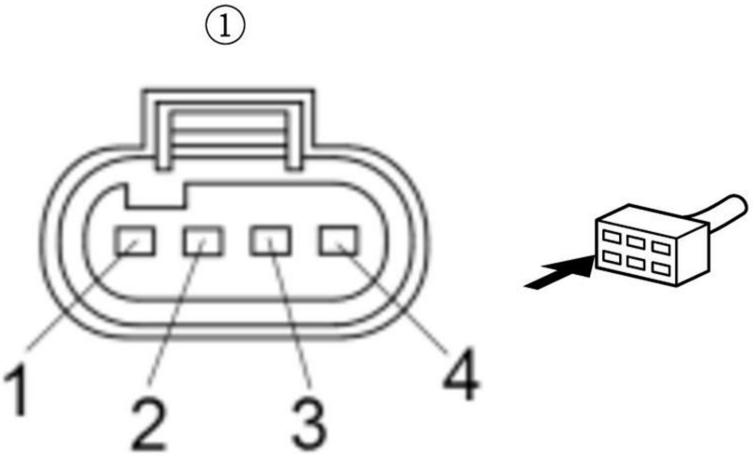
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 10.

NO

Go to step 11.

10. Shorted wire check (LIN (BATT SENSOR) line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Continue to check for continuity between the shutter grille (upper/lower) 4P connector terminal and body ground, while disconnecting these connectors, one at a time:

- PCM connector B (51P)
- 12 volt battery sensor 2P connector
- Alternator 1P connector

Does continuity go away when one of the above connectors is disconnected?

YES

The LIN (BATT SENSOR) wire is OK. Replace the part that caused an open when it was disconnected.

NO

Repair a short in the LIN (BATT SENSOR) wire between the PCM (B40), the alternator, the 12 volt battery sensor and the shutter grille.

11. Determine possible failure area (shutter grille (upper), others)

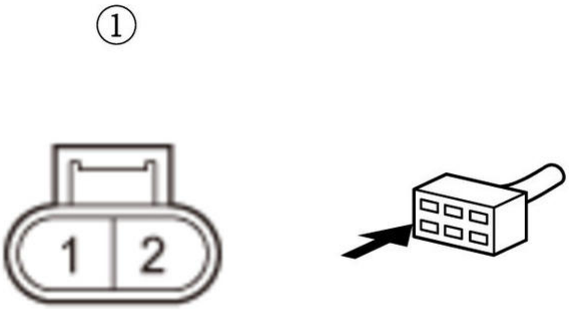
-1. Reconnect the shutter grille (upper) 4P connector.

-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	Shutter grille (lower) 4P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the shutter grille (upper) .

NO

Go to step 12.

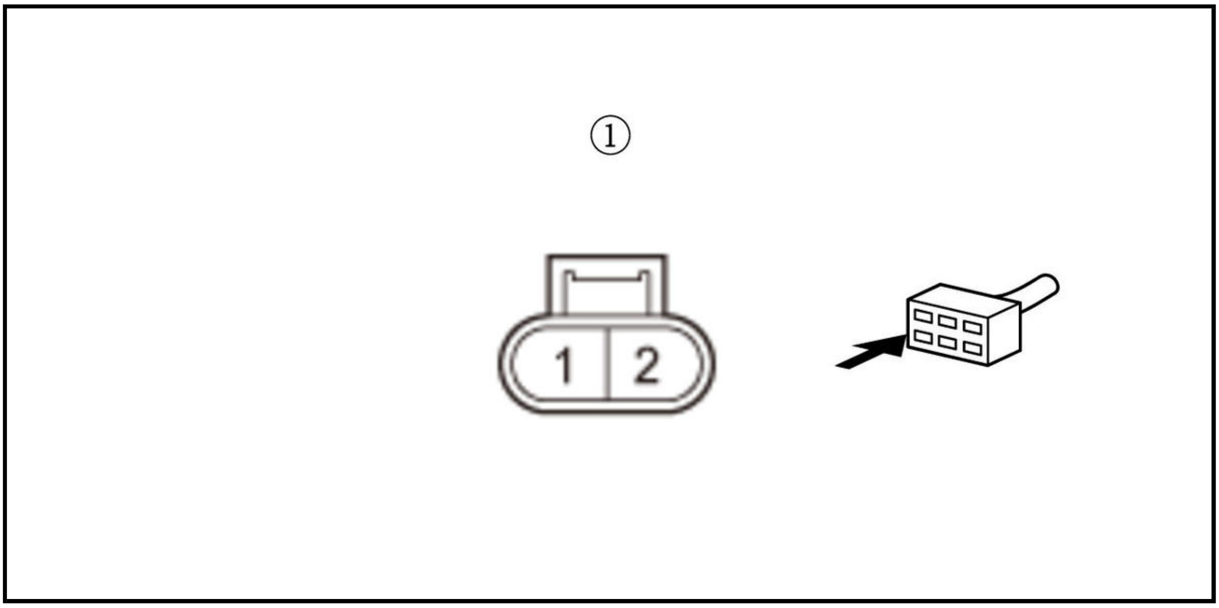
12. Determine possible failure area (shutter grille (lower), others)

-1. Reconnect the shutter grille (lower) 4P connector.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①

Test point 2	Body ground



Is there continuity?

YES

Replace the shutter grille (lower) .

NO

Go to step 13.

13. Open wire check (LIN (BATT SENSOR) line) 1

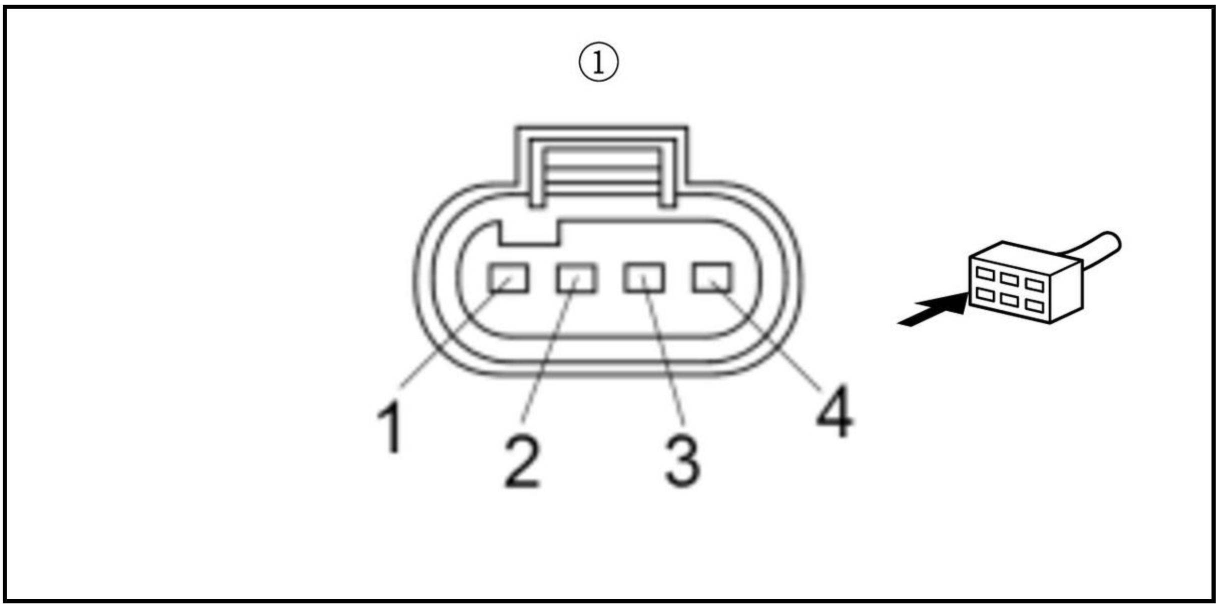
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

Shutter grille (upper/lower) 4P connector
PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	Shutter grille (upper/lower) 4P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN (BATT SENSOR) wire between the PCM (B40) and the shutter grille.

14. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A23** shutter grille (upper)
Fuse	**No. A22** shutter grille (lower)

Is the fuse OK?

YES

Go to step 15.

NO

- Check for a short in the VMP wire between the No. A23 fuse and the shutter grille (upper). Also replace the No. A23 fuse.
- Check for a short in the +B FR FOG/VMP wire between the No. A22 fuse and the shutter grille (lower). Also replace the No. A22 fuse.

15. Determine possible failure area (LIN (BATT SENSOR) line, +B FR FOG/VMP line)

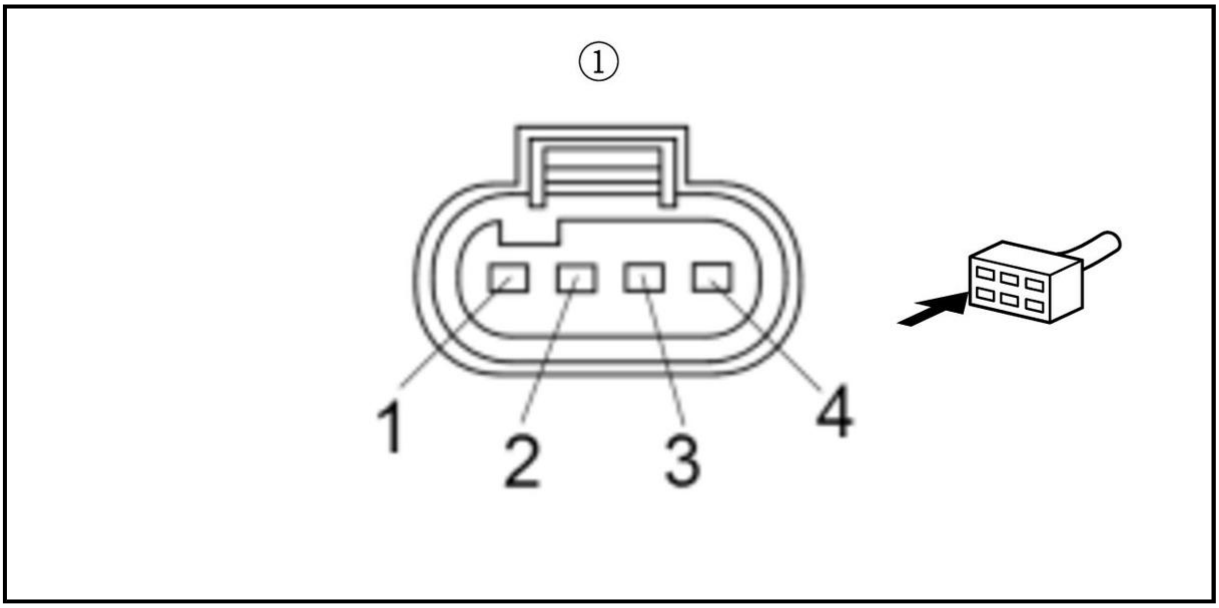
-1. Disconnect the following connector.

Shutter grille (upper/lower) 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 1: ①
Test point 2	Shutter grille (upper/lower) 4P connector (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 17.

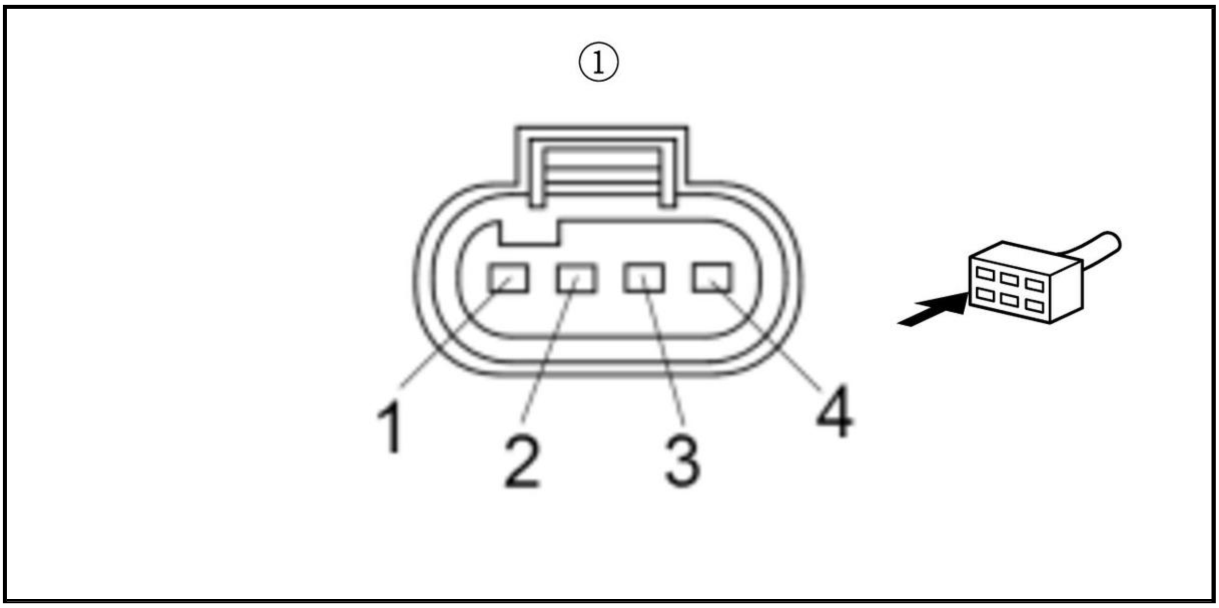
NO

Go to step 16.

16. Open wire check (+B FR FOG/VMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

1. **YES**

   - Repair an open in the GND wire between the shutter grille (upper) and G351.
   - Repair an open in the GND wire between the shutter grille (lower) and G251.

   NO

   - Repair an open in the VMP wire between the shutter grille (upper) and the **No. A23** fuse.
   - Repair an open in the +B FR FOG/VMP wire between the shutter grille (lower) and the **No. A22** fuse.

17. Open wire check (LIN (BATT SENSOR) line) 2

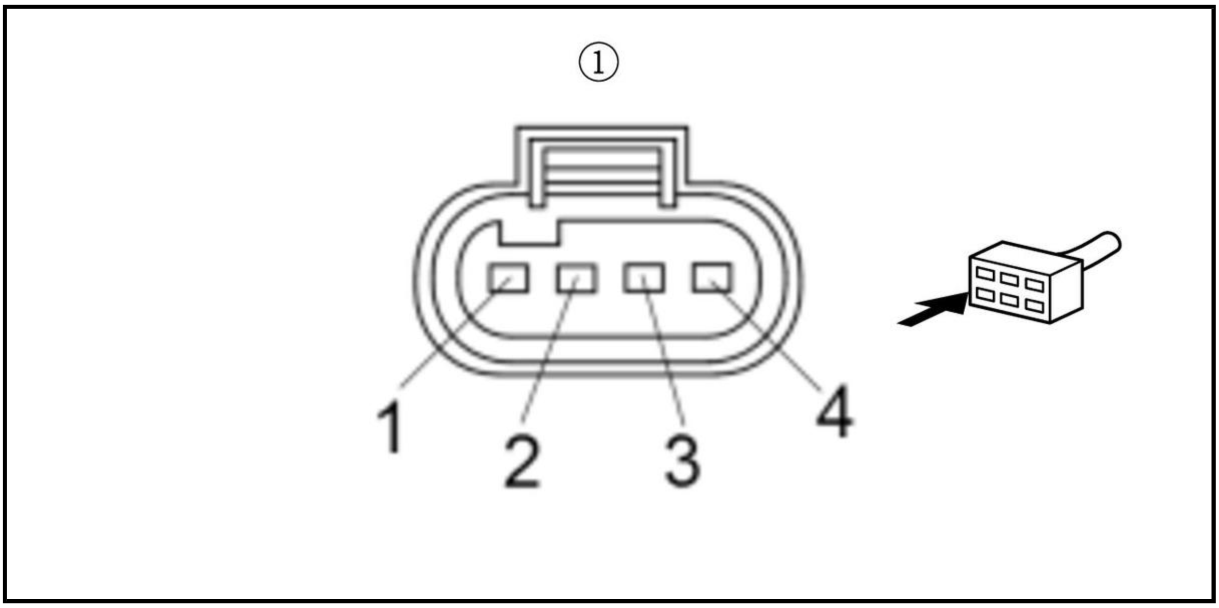
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille (upper/lower) 4P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Shutter grille (upper/lower) 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector B (51P) No. 40**



Is there continuity?

YES

The LIN (BATT SENSOR) wire is OK. **Replace the shutter grille** .

NO

Repair an open in the LIN (BATT SENSOR) wire between the PCM (B40) and the shutter grille (upper or lower).

DTC P16F0 (2.4 L ENGINE) (2017 2018 2019)

DTC P16F0 : PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16F0 PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F0 PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)	B	B

Is DTC P16F0 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Intermittent failure, the system is OK at this time. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot . Check for poor connections or loose terminals at the PCM.

DTC P16F2 (2.4 L ENGINE) (2017 2018 2019)

DTC P16F2 : PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P16F2 PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F2 PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)	B	B

Is DTC P16F2 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Intermittent failure, the system is OK at this time. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot . Check for poor connections or loose terminals at the PCM.

DTC P16F3 (1.5 L ENGINE)

DTC P16F3 : Starter Cut Relay 1 Control Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P16F3 Starter Cut Relay 1 Control Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Engine starting check

-1. Start the engine.

Does the engine start?

YES

Go to step 2.

NO

Go to step 4.

2. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F3 Starter Cut Relay 1 Control Circuit Low Voltage	B	B

Is DTC P16F3 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (starter cut relay 1 circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Shorted wire check (ST CUT RLY1 CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
Relay circuit board connector A (8P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board connector A (8P): disconnected
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 15**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the ST CUT RLY1 CL- wire between the PCM (A15) and the relay circuit board (starter cut relay 1 circuit).

NO

The ST CUT RLY1 CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Determine possible failure area (PCM, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 15**
Test point 2	Body ground

Is there battery voltage?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Go to step 5.

5. Open wire check (ST CUT RLY1 CL- line)

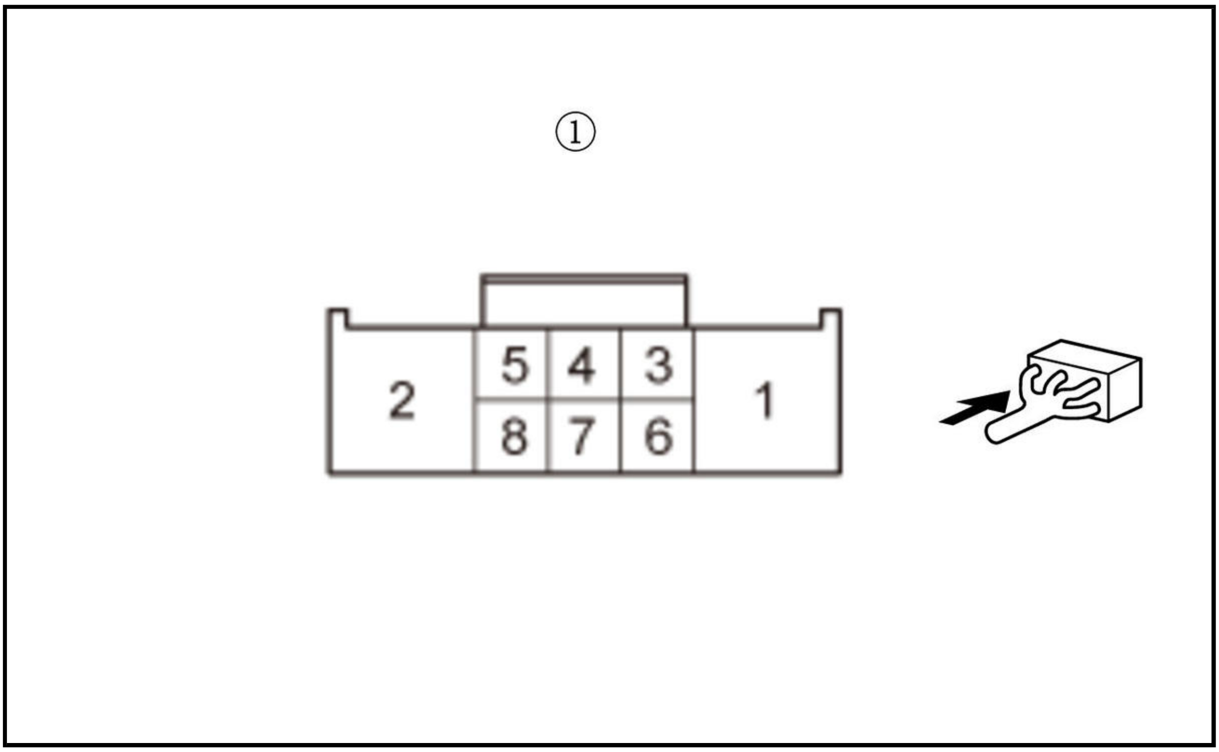
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Relay circuit board connector A (8P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Relay circuit board connector A (8P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 5: ①
Test point 2	**PCM connector A (50P) No. 15**



Is there continuity?

YES

The ST CUT RLY1 CL- wire is OK. Go to step 6.

NO

Repair an open in the ST CUT RLY1 CL- wire between the PCM (A15) and the relay circuit board (starter cut relay 1 circuit).

6. Fuse check

-1. Check the following fuse.

Fuse	No. D20 (10 A)

Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 7.

NO

Check for a short in the IG1 STARTER CUT wire between the No. D20 (10 A) fuse and the relay circuit board, and repair it as needed. Also replace the No. D20 (10 A) fuse.

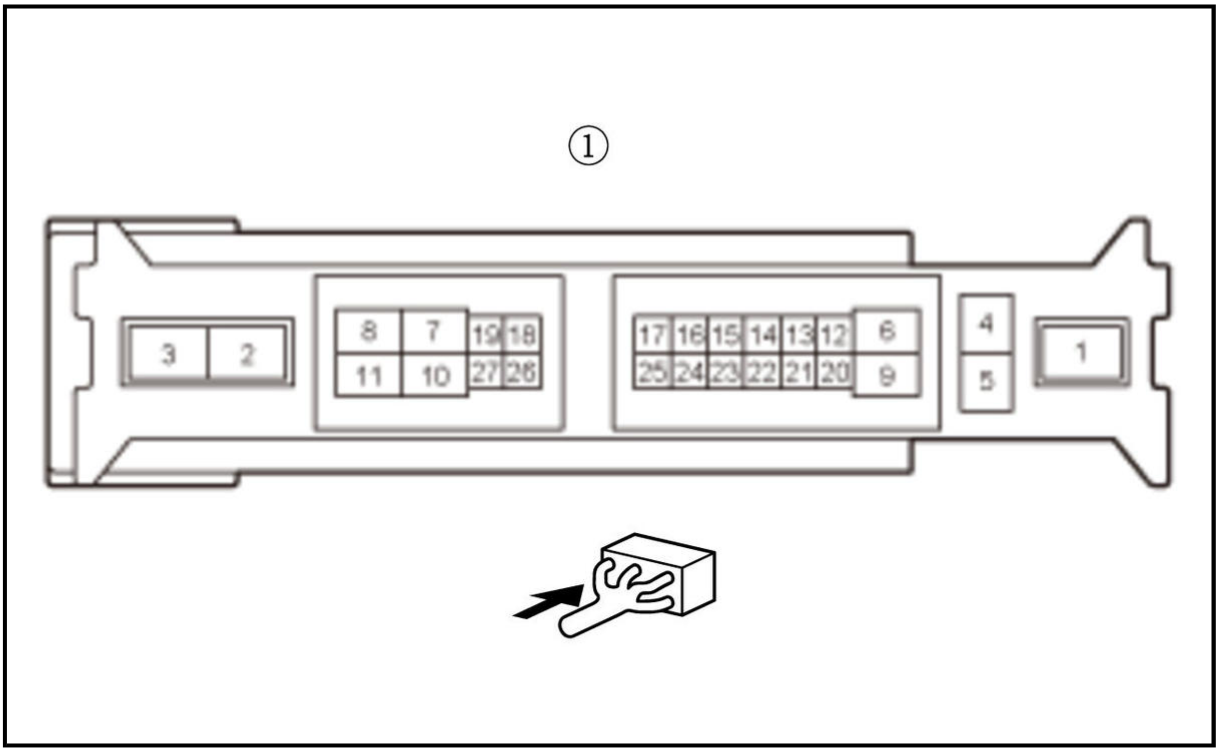
7. Open wire check (IG1 STARTER CUT line)

-1. Disconnect the following connectors.

Under-dash fuse/relay box connector C (27P)
Relay circuit board connector B (6P)

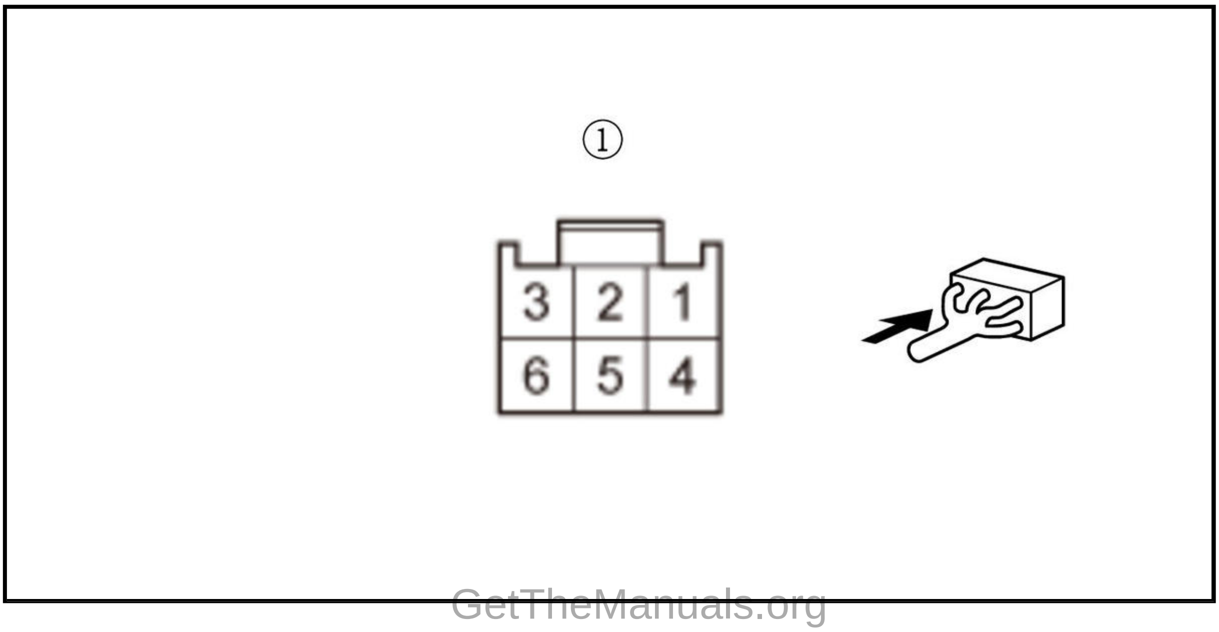
-2. Connect terminals A and B with a jumper wire.

Terminal A	Under-dash fuse/relay box connector C (27P) (female terminals) No. 23: ①
Terminal B	Body ground



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Relay circuit board connector A (8P): disconnected
	Relay circuit board connector B (6P): disconnected
	Under-dash fuse/relay box connector C (27P): disconnected
	Under-dash fuse/relay box connector C (27P) No. 23: jumped to body ground
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

The IG1 STARTER CUT wire is OK. **Replace the under-dash fuse/relay box** .

NO

Repair an open in the IG1 STARTER CUT wire between the under-dash fuse/relay box and the relay circuit board (starter cut relay 1 circuit).

DTC P16F3 (2.4 L ENGINE) (2017 2018 2019)

DTC P16F3 : Starter Cut Relay 1 Control Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16F3 Starter Cut Relay 1 Control Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Engine starting check

   -1. Start the engine.

   Does the engine start?

   YES

   Go to step 2.

   NO

   Go to step 4.

2. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F3 Starter Cut Relay 1 Control Circuit Low Voltage	B	B

   Is DTC P16F3 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (starter cut relay 1 circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Shorted wire check (ST CUT RLY1 CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (51P)
Relay circuit board connector A (8P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board connector A (8P): disconnected
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 33**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the ST CUT RLY1 CL- wire between the PCM (A33) and the relay circuit board (starter cut relay 1 circuit).

NO

The ST CUT RLY1 CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Determine possible failure area (PCM, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 33**
Test point 2	Body ground

Is there battery voltage?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Go to step 5.

5. Open wire check (ST CUT RLY1 CL- line)

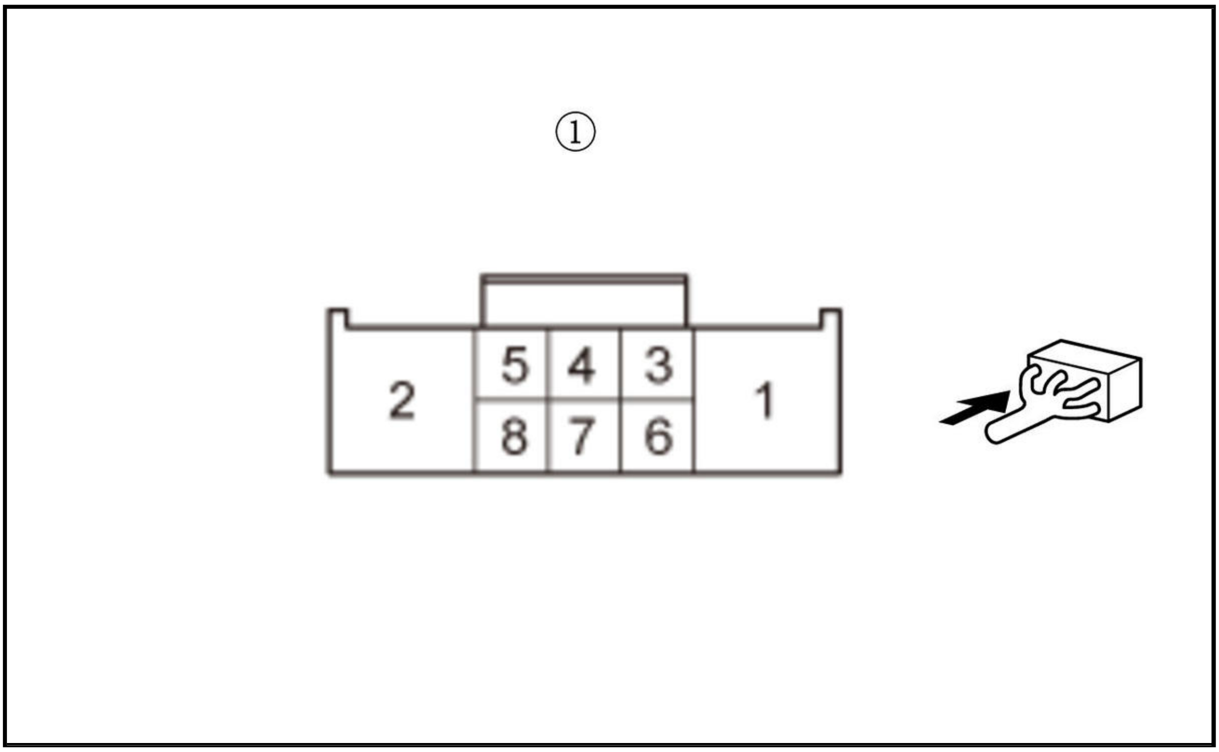
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Relay circuit board connector A (8P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (51P): disconnected Relay circuit board connector A (8P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 5: ①
Test point 2	**PCM connector A (51P) No. 33**



Is there continuity?

YES

The ST CUT RLY1 CL- wire is OK. Go to step 6.

NO

Repair an open in the ST CUT RLY1 CL- wire between the PCM (A33) and the relay circuit board (starter cut relay 1 circuit).

6. Fuse check

-1. Check the following fuse.

Fuse	No. D20 (10 A)

Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 7.

NO

Check for a short in the IG1 STARTER CUT wire between the No. D20 (10 A) fuse and the relay circuit board, and repair it as needed. Also replace the No. D20 (10 A) fuse.

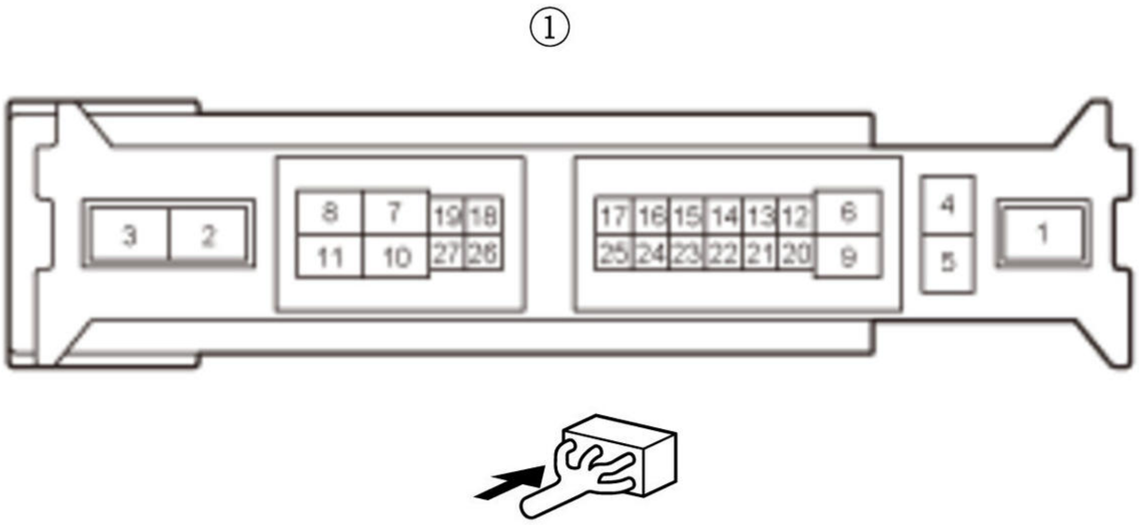
7. Open wire check (IG1 STARTER CUT line)

-1. Disconnect the following connectors.

Under-dash fuse/relay box connector C (27P)
Relay circuit board connector B (6P)

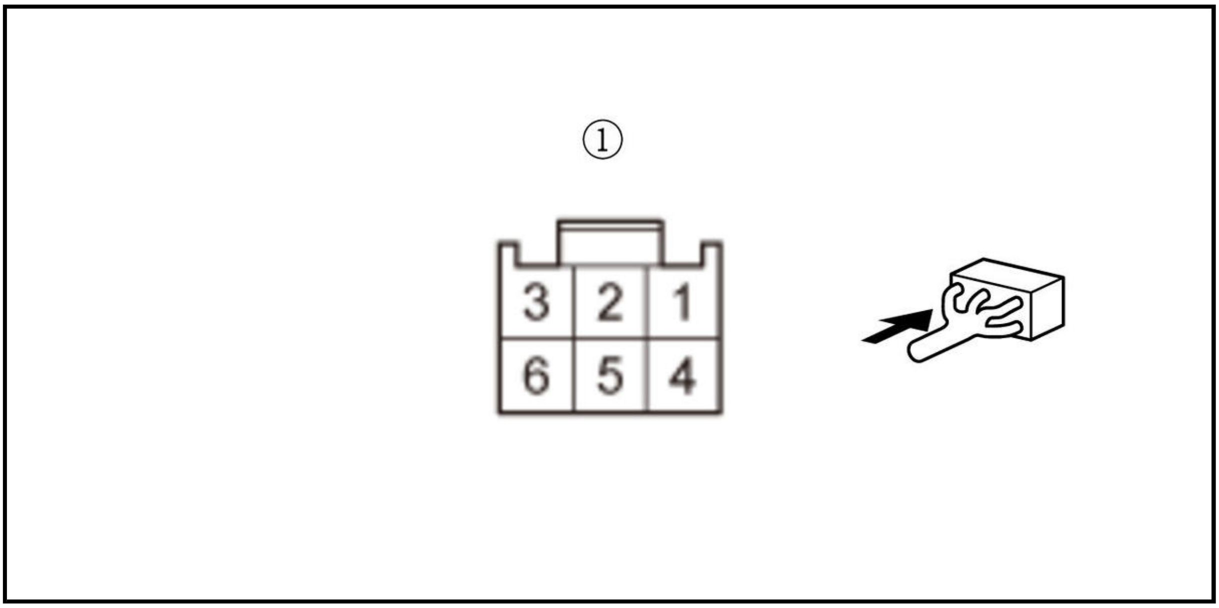
-2. Connect terminals A and B with a jumper wire.

Terminal A	Under-dash fuse/relay box connector C (27P) (female terminals) No. 23: ①
Terminal B	Body ground



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (51P): disconnected Relay circuit board connector A (8P): disconnected Relay circuit board connector B (6P): disconnected Under-dash fuse/relay box connector C (27P): disconnected Under-dash fuse/relay box connector C (27P) No. 23: jumped to body ground
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

The IG1 STARTER CUT wire is OK. **Replace the under-dash fuse/relay box** .

NO

Repair an open in the IG1 STARTER CUT wire between the under-dash fuse/relay box and the relay circuit board (starter cut relay 1 circuit).

DTC P16F4 (1.5 L ENGINE)

DTC P16F4 : Starter Cut Relay 2 Control Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16F4 Starter Cut Relay 2 Control Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Engine starting check

-1. Start the engine.

Does the engine start?

YES

Go to step 2.

NO

Go to step 4.

2. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F4 Starter Cut Relay 2 Control Circuit Low Voltage	B	B

Is DTC P16F4 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (starter cut relay 2 circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Shorted wire check (ST CUT RLY2 CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
Relay circuit board connector A (8P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board connector A (8P): disconnected
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 23**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the ST CUT RLY2 CL- wire between the PCM (A23) and the relay circuit board (starter cut relay 2 circuit).

NO

The ST CUT RLY2 CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Determine possible failure area (PCM, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 23**
Test point 2	Body ground

Is there battery voltage?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Go to step 5.

5. Open wire check (ST CUT RLY2 CL- line)

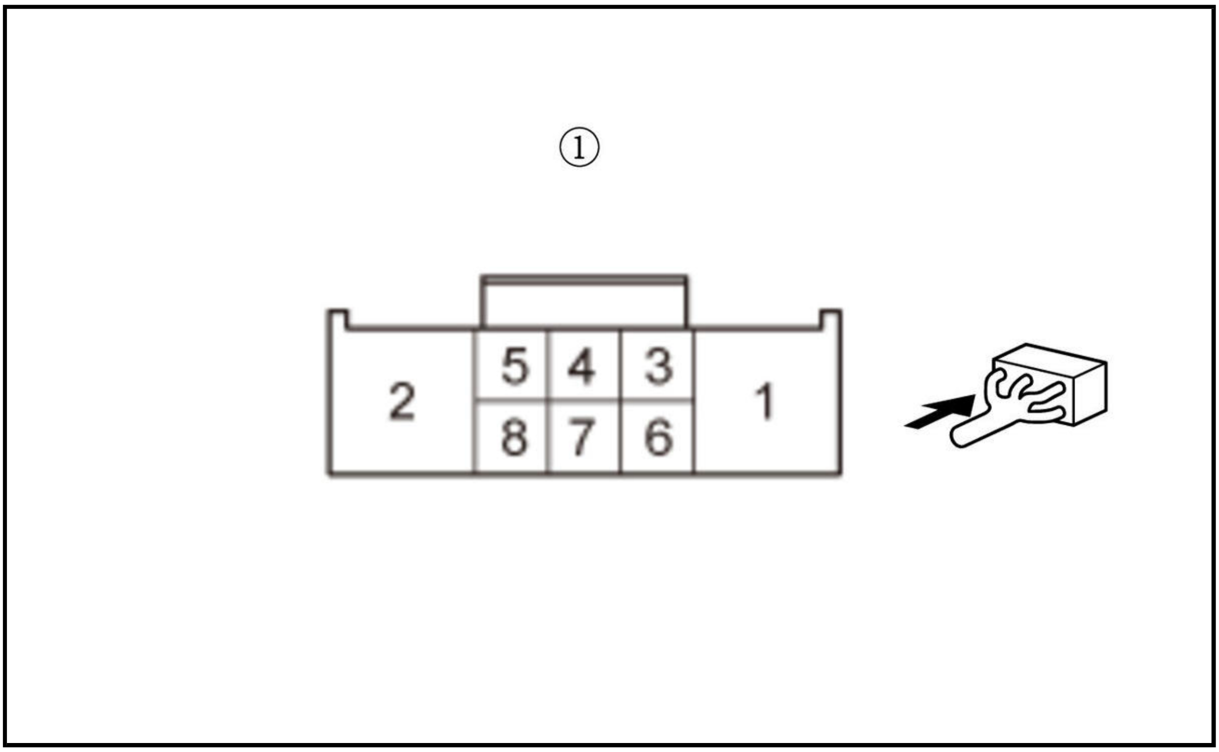
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Relay circuit board connector A (8P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Relay circuit board connector A (8P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 4 ①
Test point 2	**PCM connector A (50P) No. 23**



Is there continuity?

YES

The ST CUT RLY2 CL- wire is OK. Go to step 6.

NO

Repair an open in the ST CUT RLY2 CL- wire between the PCM (A23) and the relay circuit board (starter cut relay 2 circuit).

6. Fuse check

-1. Check the following fuse.

Fuse	No. D20 (10 A)

Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 7.

NO

Check for a short in the IG1 STARTER CUT wire between the No. D20 (10 A) fuse and the relay circuit board, and repair it as needed. Also replace the No. D20 (10 A) fuse.

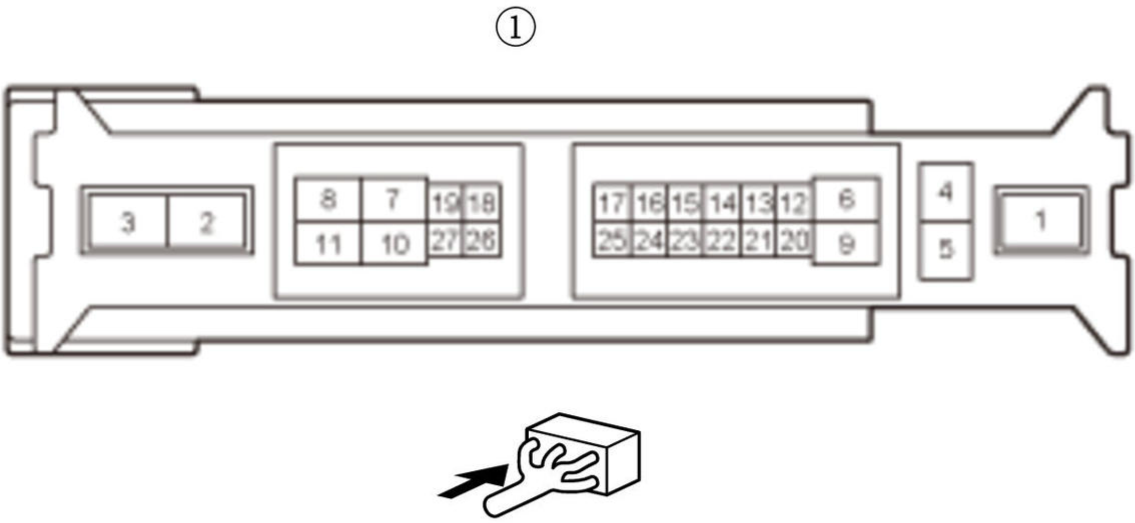
7. Open wire check (IG1 STARTER CUT line)

-1. Disconnect the following connectors.

Under-dash fuse/relay box connector C (27P)
Relay circuit board connector B (6P)

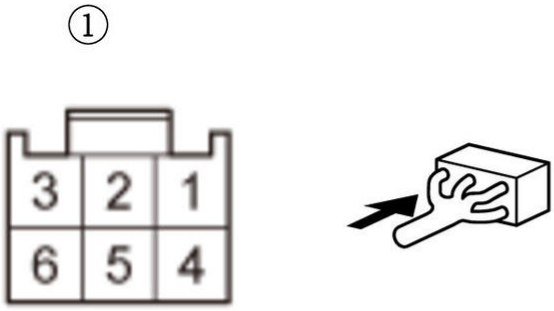
-2. Connect terminals A and B with a jumper wire.

Terminal A	Under-dash fuse/relay box connector C (27P) (female terminals) No. 23: ①
Terminal B	Body ground



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Relay circuit board connector A (8P): disconnected
	Relay circuit board connector B (6P): disconnected
	Under-dash fuse/relay box connector C (27P): disconnected
	Under-dash fuse/relay box connector C (27P) No. 23: jumped to body ground
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

The IG1 STARTER CUT wire is OK. **Replace the under-dash fuse/relay box** .

NO

Repair an open in the IG1 STARTER CUT wire between the under-dash fuse/relay box and the relay circuit board (starter cut relay 2 circuit).

DTC P16F4 (2.4 L ENGINE) (2017 2018 2019)

DTC P16F4 : Starter Cut Relay 2 Control Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16F4 Starter Cut Relay 2 Control Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Engine starting check

   -1. Start the engine.

   Does the engine start?

   YES

   Go to step 2.

   NO

   Go to step 4.

2. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F4 Starter Cut Relay 2 Control Circuit Low Voltage	B	B

   Is DTC P16F4 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (starter cut relay 2 circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Shorted wire check (ST CUT RLY2 CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (51P)
Relay circuit board connector A (8P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board connector A (8P): disconnected
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 34**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the ST CUT RLY2 CL- wire between the PCM (A34) and the relay circuit board (starter cut relay 2 circuit).

NO

The ST CUT RLY2 CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Determine possible failure area (PCM, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 34**
Test point 2	Body ground

Is there battery voltage?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Go to step 5.

5. Open wire check (ST CUT RLY2 CL- line)

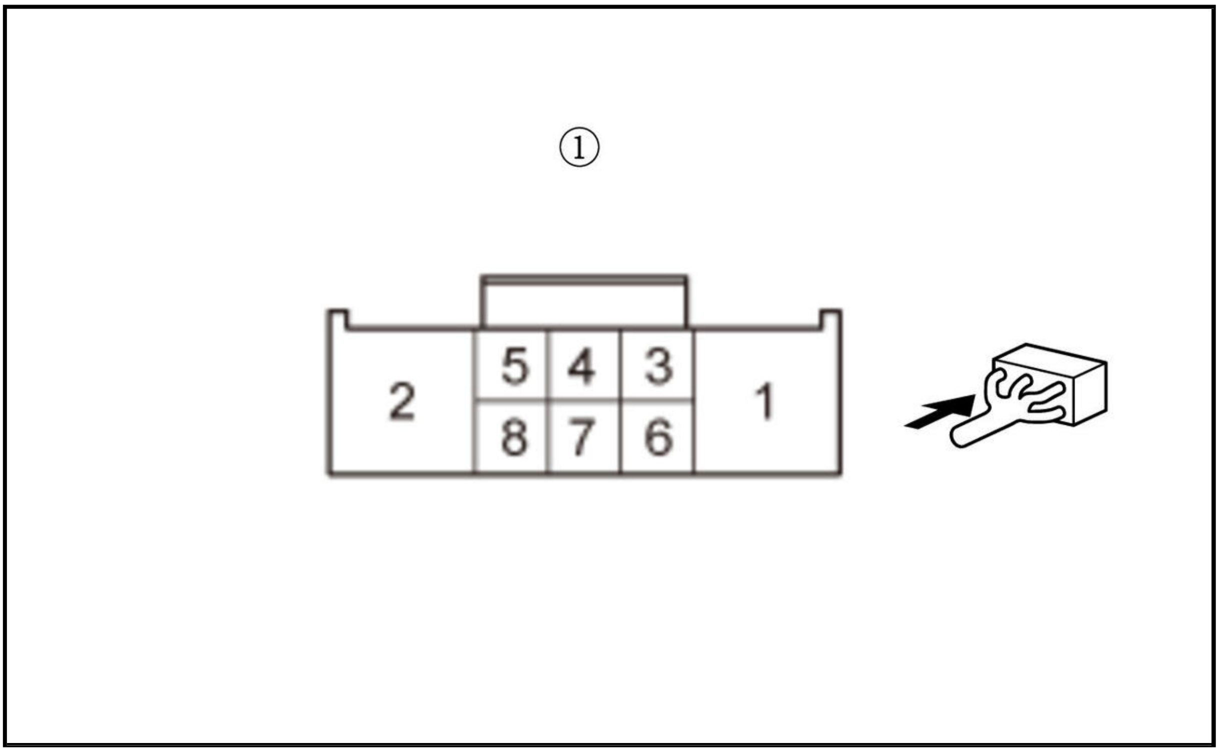
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Relay circuit board connector A (8P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (51P): disconnected Relay circuit board connector A (8P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 4 ①
Test point 2	PCM connector A (51P) No. 34



Is there continuity?

YES

The ST CUT RLY2 CL- wire is OK. Go to step 6.

NO

Repair an open in the ST CUT RLY2 CL- wire between the PCM (A34) and the relay circuit board (starter cut relay 2 circuit).

6. Fuse check

-1. Check the following fuse.

Fuse	No. D20 (10 A)

Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 7.

NO

Check for a short in the IG1 STARTER CUT wire between the No. D20 (10 A) fuse and the relay circuit board, and repair it as needed. Also replace the No. D20 (10 A) fuse.

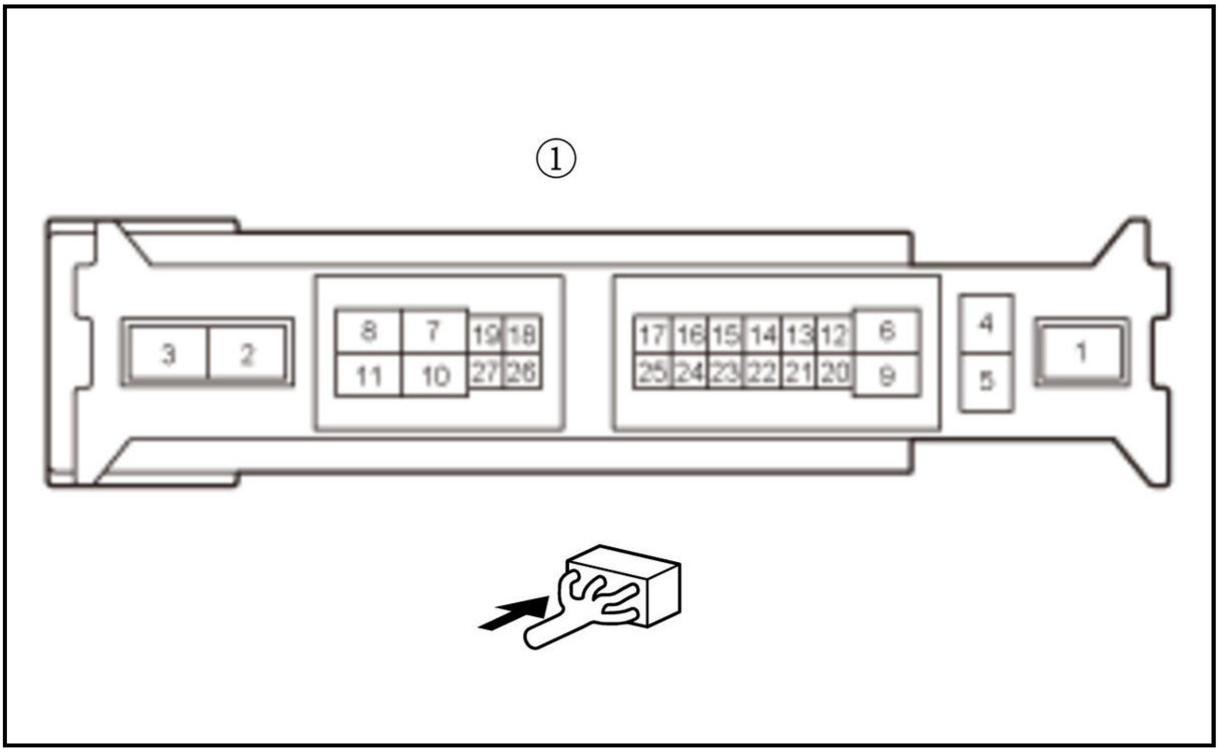
7. Open wire check (IG1 STARTER CUT line)

-1. Disconnect the following connectors.

Under-dash fuse/relay box connector C (27P)
Relay circuit board connector B (6P)

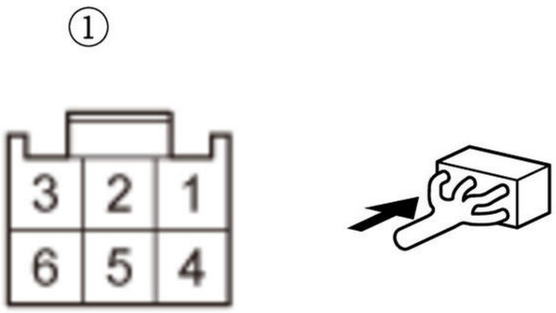
-2. Connect terminals A and B with a jumper wire.

Terminal A	Under-dash fuse/relay box connector C (27P) (female terminals) No. 23: ①
Terminal B	Body ground



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Relay circuit board connector A (8P): disconnected
	Relay circuit board connector B (6P): disconnected
	Under-dash fuse/relay box connector C (27P): disconnected
	Under-dash fuse/relay box connector C (27P) No. 23: jumped to body ground
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

The IG1 STARTER CUT wire is OK. Replace the under-dash fuse/relay box .

NO

Repair an open in the IG1 STARTER CUT wire between the under-dash fuse/relay box and the relay circuit board (starter cut relay 2 circuit).

DTC P16F5 (1.5 L ENGINE)

DTC P16F5 : Starter Cut Relay 1 Control Circuit High Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P16F5 Starter Cut Relay 1 Control Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F5 Starter Cut Relay 1 Control Circuit High Voltage	B	B

Is DTC P16F5 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (starter cut relay 1 circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove and test the relay circuit board** .

Is the relay OK?

YES

Go to step 3.

NO

Replace the relay circuit board .

3. Shorted wire check (ST CUT RLY1 CL- line to power)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Relay circuit board: removed
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 15**
Test point 2	Body ground

Is there 0.1 V or less?

YES

The ST CUT RLY1 CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short to power in the ST CUT RLY1 CL- wire between the PCM (A15) and the relay circuit board (starter cut relay 1 circuit).

DTC P16F5 (2.4 L ENGINE) (2017 2018 2019)

DTC P16F5 : Starter Cut Relay 1 Control Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16F5 Starter Cut Relay 1 Control Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F5 Starter Cut Relay 1 Control Circuit High Voltage	B	B

   Is DTC P16F5 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (starter cut relay 1 circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the relay circuit board** .

   Is the relay OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Shorted wire check (ST CUT RLY1 CL- line to power)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   -2. Disconnect the following connector.

PCM connector A (51P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Relay circuit board: removed PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 33**
Test point 2	Body ground

Is there 0.1 V or less?

YES

The ST CUT RLY1 CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short to power in the ST CUT RLY1 CL- wire between the PCM (A33) and the relay circuit board (starter cut relay 1 circuit).

DTC P16F6 (1.5 L ENGINE)

DTC P16F6 : Starter Cut Relay 2 Control Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16F6 Starter Cut Relay 2 Control Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F6 Starter Cut Relay 2 Control Circuit High Voltage	B	B

Is DTC P16F6 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (starter cut relay 2 circuit) and the PCM. **If the on-board snapshot of this DTC is**

recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Relay circuit board check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Shorted wire check (ST CUT RLY2 CL- line to power)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   -2. Disconnect the following connector.

PCM connector A (50P)

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Relay circuit board: removed
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 23**
Test point 2	Body ground

   Is there 0.1 V or less?

   YES

   The ST CUT RLY2 CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

   NG

   Repair a short to power in the ST CUT RLY2 CL- wire between the PCM (A23) and the relay circuit board (starter cut relay 2 circuit).

DTC P16F6 (2.4 L ENGINE) (2017 2018 2019)

DTC P16F6 : Starter Cut Relay 2 Control Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16F6 Starter Cut Relay 2 Control Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F6 Starter Cut Relay 2 Control Circuit High Voltage	B	B

   Is DTC P16F6 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board (starter cut relay 2 circuit) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Shorted wire check (ST CUT RLY2 CL- line to power)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   -2. Disconnect the following connector.

PCM connector A (51P)

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Relay circuit board: removed
	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 34**
Test point 2	Body ground

Is there 0.1 V or less?

YES

The ST CUT RLY2 CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NG

Repair a short to power in the ST CUT RLY2 CL- wire between the PCM (A34) and the relay circuit board (starter cut relay 2 circuit).

DTC P16F9 (2.4 L ENGINE) (2017 2018 2019)

DTC P16F9 : PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16F9 PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS, and wait 5 seconds.

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16F9 PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)	B	B

Is DTC P16F9 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P16FA (2.4 L ENGINE) (2017 2018 2019)

DTC P16FA : PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16FA PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS, and wait 5 seconds.

   -3. Start the engine.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16FA PCM Internal Circuit Malfunction (Starter Control Circuit Malfunction)	B	B

Is DTC P16FA indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P1717 (CVT (ECM/PCM))

DTC P1717 : Transmission Range Switch ATP RVS Switch (Open or Short)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1717 Transmission Range Switch ATP RVS Switch (Open or Short)	B	B	B

DTC (CVT)

1. Problem verification

   -1. **Make sure the shift cable is properly adjusted** .

   -2. Turn the vehicle to the ON mode.

   -3. Shift the transmission to R position/mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/T R Switch	ON	B	B	B
Reverse Switch (ATPRVS)	ON	B	B	B

Do the current condition (s) match the threshold?

YES

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission range switch and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

The failure is duplicated. Go to step 2.

2. Transmission range switch check

   -1. **Do the transmission range switch test** .

   Is the transmission range switch OK?

   YES

   The transmission range switch is OK. Go to step 3.

   NO

   Check for proper transmission range switch installation, then recheck. If the transmission range switch installation is OK, **replace the transmission range switch** .

3. Open wire check (RVS line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

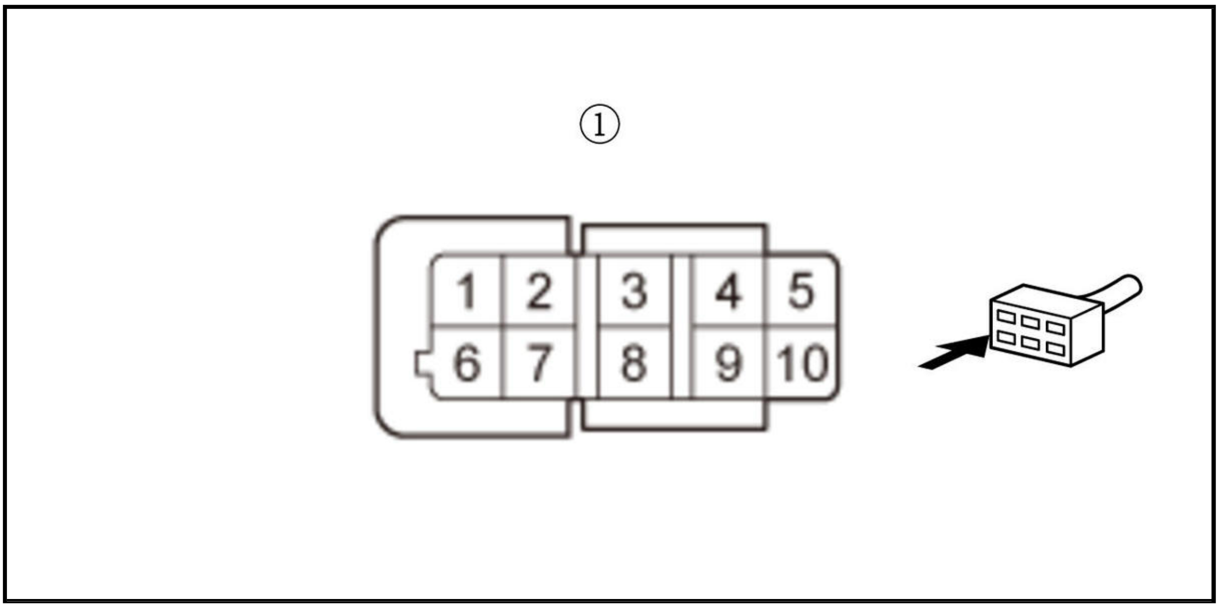
   -2. Disconnect the following connector.

Transmission range switch 10P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Transmission range switch 10P connector: disconnected
Test point 1	Transmission range switch 10P connector (female terminals) No. 10 : ①
Test point 2	Body ground



Is there voltage?

YES

The ATP-RVS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the RVS wire between the transmission range switch and the PCM.

DTC P1840 (CVT (ECM/PCM))

DTC P1840 : CVT Speed Sensor Circuit Forward Rotation Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1840 CVT Speed Sensor Circuit Forward Rotation Range/Performance	B	B	B

DTC (CVT)

1. CVT speed sensor check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

   -4. Start the engine.

   -5. **Enter the VSA maintenance mode** .

-6. Test-drive the vehicle in D position/mode, while monitoring the Direction of Secondary-shaft Rotation in the Data List with the HDS.

-7. Check the parameter below with the HDS.

Signal	Current conditions	
	Values	Unit
Direction of Secondary-shaft Rotation	B	B

Does the HDS indicate forward?

YES

The CVT speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Replace the CVT speed sensor .

DTC P1841 (CVT (ECM/PCM))

DTC P1841 : CVT Speed Sensor Circuit Reverse Rotation Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1841 CVT Speed Sensor Circuit Reverse Rotation Range/Performance	B	B	B

DTC (CVT)

1. CVT speed sensor check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

-4. Start the engine.

-5. **Enter the VSA maintenance mode** .

-6. Test-drive the vehicle in R position/mode, while monitoring the Direction of Secondary-shaft Rotation in the Data List with the HDS.

-7. Check the parameter below with the HDS.

Signal	Current conditions	
	Values	Unit
Direction of Secondary-shaft Rotation	B	B

Does the HDS indicate reverse?

YES

The CVT speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Replace the CVT speed sensor .

DTC P1844 (CVT (ECM/PCM))

DTC P1844 : CVT Input Shaft Speed Sensor Circuit Forward Rotation Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1844 CVT Input Shaft Speed Sensor Circuit Forward Rotation Range/Performance	B	B	B

DTC (CVT)

1. CVT drive pulley speed sensor check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

   -4. Start the engine.

   -5. **Enter the VSA maintenance mode** .

   -6. Test-drive the vehicle in D position/mode, while monitoring the Direction of Drive Pulley Rotation in the Data List with the HDS.

   -7. Check the parameter below with the HDS.

Signal	Current conditions	
	Values	Unit
Direction of Drive Pulley Rotation	B	B

Does the HDS indicate forward?

YES

The CVT drive pulley speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Replace the CVT drive pulley speed sensor .

DTC P1845 (CVT (ECM/PCM))

DTC P1845 : CVT Input Shaft Speed Sensor Circuit Reverse Rotation Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1845 CVT Input Shaft Speed Sensor Circuit Reverse Rotation Range/Performance	B	B	B

DTC (CVT)

1. CVT drive pulley speed sensor check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow the front wheels to rotate freely.

   -4. Start the engine.

   -5. **Enter the VSA maintenance mode** .

   -6. Test-drive the vehicle in R position/mode, while monitoring the Direction of Drive Pulley Rotation in the Data List with the HDS.

   -7. Check the parameter below with the HDS.

Signal	Current conditions	
	Values	Unit
Direction of Drive Pulley Rotation	B	B

Does the HDS indicate reverse?

YES

The CVT drive pulley speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Replace the CVT drive pulley speed sensor .

DTC P1890 (CVT (ECM/PCM))

DTC P1890 : CVT Speed Control System

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1890 CVT Speed Control System	B	B	B

DTC (CVT)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1890 CVT Speed Control System	B	B	B

   Is there any DTC (s) other than DTC P1890?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

   -4. Test-drive the vehicle in D position/mode, accelerate slowly until the vehicle speed reaches 37 mph (60 km/h) on a flat road, then keep the vehicle at speeds about 37 mph (60 km/h) for at least 60 seconds.

   -5. Monitor the OBD STATUS for P1890 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P1890 CVT Speed Control System	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. **Replace the transmission** .

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1898 (CVT (ECM/PCM))

DTC P1898 : CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B
P1898 CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
Pressure Control Valve Stuck OFF			

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle, then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

   -4. Turn the engine off. Repeat the test-drive in step 1-3 again.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B
P1898 CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF	B	B	B

   Are DTC P1898 and P0780 indicated?

   YES

   The failure is duplicated. Faulty CVT drive pulley pressure control solenoid valve and/or CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1899 (CVT (ECM/PCM))

DTC P1899 : CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B
P1899 CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Start the engine. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle, then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

-4. Turn the engine off. Repeat the test-drive in step 1-3 again.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B
P1899 CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON	B	B	B

Are DTC P1899 and P0780 indicated?

YES

The failure is duplicated. Faulty CVT drive pulley pressure control solenoid valve and/or CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P2073 (1.5 L ENGINE)

DTC P2073 : MAP Sensor Signal Higher Than Expected

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Before you begin, check for poor connections or a blockage at the intake air duct.

DTC Description	Confirmed DTC	Pending DTC
P2073 MAP Sensor Signal Higher Than Expected	B	B

DTC (PGM-FI)

1. Vacuum leak check:

   Check for vacuum leaks in these parts:

   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - All parts through the turbocharger joint to the throttle body

   Are there any vacuum leaks?

   YES

   Repair or replace the parts with vacuum or air leaks.

NO

Go to step 2.

2. MAP sensor performance check 1

 -1. Turn the vehicle to the ON mode.

 -2. Compare the value of the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B
TC Boost Pressure	B	B

Does the vehicle differ more than 26.7 kPa (7.9 inHg, 200 mmHg)?

YES

Replace the MAP sensor .

NO

Go to step 3.

3. MAP sensor performance check 2

 -1. Note the value of MAP Sensor in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

 -2. Start the engine and let it idle.

 -3. Check the MAP Sensor in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

Does the MAP Sensor change 0.67 kPa (0.2 inHg, 5 mmHg) or more?

YES

Go to step 4.

NO

Replace the MAP sensor .

4. Problem verification

 -1. Clear the DTC with the HDS.

 -2. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

 -3. Test-drive the vehicle under these conditions:

- Engine speed between 1, 700 rpm or more
- Transmission in D
- REL TP SENSOR above 42.2 deg
- Drive 5 seconds or more

Signal	Current conditions	
	Values	**Unit**
Engine Speed	B	B
REL TP Sensor	B	B

-4. Monitor the OBD STATUS for DTC P2073 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2073 MAP Sensor Signal Higher Than Expected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the MAP sensor** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 4-3 and recheck.

DTC P2073 (2.4 L ENGINE) (2017 2018 2019)

DTC P2073 : MAP Sensor Signal Higher Than Expected

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Before you begin, check for poor connections or a blockage at the intake air duct.

DTC Description	Confirmed DTC	Pending DTC
P2073 MAP Sensor Signal Higher Than Expected	B	B

DTC (PGM-FI)

1. Vacuum leak check:

   Check for vacuum leaks in these parts:

   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold

   Are there any vacuum leaks?

   YES

Repair or replace the parts with vacuum or air leaks.

NO

Go to step 2.

2. MAP sensor performance check

-1. Start the engine.

-2. Hold the engine speed at 3, 000 rpm without load (CVT in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.

-3. Check the parameter (s) below with the HDS for 5 seconds.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP Sensor	More than 53.3	kPa	B	B
	More than 400.0	mmHg		

Did the value maintain the malfunction threshold for 5 seconds or more?

YES

Replace the MAP sensor .

NO

Go to step 3.

3. Problem verification

-1. Clear the DTC with the HDS.

-2. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Engine speed between 1, 400-6, 700 rpm
- Transmission in D
- Drive at a steady speed between 55-75 mph (90-120 km/h) for 10 seconds, then decelerate (with the throttle fully closed) for 2 seconds or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

-3. Monitor the OBD STATUS for DTC P2073 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2073 MAP Sensor Signal Higher Than Expected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the MAP sensor** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 3-2 and recheck.

DTC P2074 (1.5 L ENGINE)

DTC P2074 : MAP Sensor Signal Lower Than Expected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2074 MAP Sensor Signal Lower Than Expected	B	B

DTC (PGM-FI)

1. MAP sensor performance check 1

-1. Turn the vehicle to the ON mode.

-2. Compare the value of the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B
TC Boost Pressure	B	B

Does the value differ more than 26.7 kPa (7.9 inHg, 200 mmHg)?

YES

Replace the MAP sensor .

NO

Go to step 2.

2. MAP sensor performance check 2

-1. Note the value of MAP Sensor in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

-2. Start the engine and let it idle.

-3. Check the MAP Sensor in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

Does the MAP Sensor change 0.67 kPa (0.2 inHg, 5 mmHg) or more?

YES

Go to step 3.

NO

Replace the MAP sensor .

3. Problem verification

-1. Clear the DTC with the HDS.

-2. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

-3. Test-drive the vehicle under these conditions:

- Engine speed at 1, 700 rpm or more
- Transmission in D
- REL TP SENSOR above 42.2 deg
- Drive 5 seconds or more

Signal	Current conditions	
	Values	**Unit**
Engine Speed	B	B
REL TP Sensor	B	B

-4. Monitor the OBD STATUS for DTC P2074 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2074 MAP Sensor Signal Lower Than Expected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the MAP sensor** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 3-2 and recheck.

DTC P2074 (2.4 L ENGINE) (2017 2018 2019)

DTC P2074 : MAP Sensor Signal Lower Than Expected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2074 MAP Sensor Signal Lower Than Expected	B	B

DTC (PGM-FI)

1. MAP sensor performance check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS for 5 seconds.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP Sensor	Less than 54.1	kPa	B	B
	Less than 406.0	mmHg		

Did the value maintain the malfunction threshold for 5 seconds or more?

YES

Replace the MAP sensor .

NO

Go to step 2.

2. Problem verification

-1. Clear the DTC with the HDS.

-2. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

-3. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Engine speed at 1, 400 rpm or more
- Transmission in D
- Drive at a steady speed at 15 mph (24 km/h) or more for 2 seconds or more with under half throttle

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

-4. Monitor the OBD STATUS for DTC P2074 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2074 MAP Sensor Signal Lower Than Expected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the MAP sensor** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 2-2 and recheck.

DTC P2096, P2097 (1.5 L ENGINE)

DTC P2096 : Post Catalyst Fuel Trim System Too Lean **DTC P2097** : Post Catalyst Fuel Trim System Too Rich

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are stored at the same time as DTC P2096 and/or P2097, troubleshoot those DTCs first, then recheck for P2096 or P2097.

  P0133, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0171, P0172, P2187: Fuel system

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0300: Random misfire

  P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

  P219C, P219D, P219E, P219F: No. 1-No. 4 cylinder A/F variation

DTC Description	Confirmed DTC	Pending DTC
P2096 Post Catalyst Fuel Trim System Too Lean	B	B
P2097 Post Catalyst Fuel Trim System Too Rich	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Test-drive the vehicle under these conditions:

   - Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
   - Transmission in D
   - Engine speed below 4, 000 rpm
   - Drive at a steady speed between 15-75 mph (24-120 km/h) for 65 seconds or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B

Signal	Current conditions	
	Values	Unit
VEHICLE SPEED	B	B

-6. Monitor the OBD STATUS for DTC P2096 and/or P2097 with the HDS.

DTC Description	OBD STATUS
P2096 Post Catalyst Fuel Trim System Too Lean	B
P2097 Post Catalyst Fuel Trim System Too Rich	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), secondary HO2S (Sensor 2), and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep the test conditions until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-5 and recheck.

2. Cylinder A/F variation check

-1. Start the engine.

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Check under these conditions:

- A/C off
- All electrical loads off

-4. Do the CYLINDER A/F TEST in the INSPECTION MENU three times with the HDS.

CYLINDER A/F TEST

Is the result OK?

YES

Go to step 3.

NO

Go to the troubleshooting for **DTC P219C, DTC P219D, DTC P219E, and/or DTC P219F** .

3. Exhaust system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for leakage, clogging, or blockage in the exhaust system.

Is there leakage in the exhaust system between the A/F sensor (Sensor 1) and secondary HO2S (Sensor 2), or any clogging or restrictions in the exhaust system?

YES

Repair or replace the exhaust system .

NO

Go to step 4.

4. A/F sensor (Sensor 1) check

-1. Substitute a known-good A/F sensor (Sensor 1) .

-2. Reconnect all connectors.

-3. Turn the vehicle to the ON mode.

-4. Reset the PCM with the HDS .

Reset PCM

-5. Do the PCM idle learn procedure .

-6. Start the engine.

-7. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-8. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Engine speed below 4, 000 rpm
- Drive at a steady speed between 15-75 mph (24-120 km/h) for 65 seconds or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

-9. Monitor the OBD STATUS for DTC P2096 and/or P2097 with the HDS.

DTC Description	OBD STATUS
P2096 Post Catalyst Fuel Trim System Too Lean	B

DTC Description	OBD STATUS
P2097 Post Catalyst Fuel Trim System Too Rich	B

Does the HDS indicate PASSED?

YES

Replace the original A/F sensor (Sensor 1) .

NO

If the HDS indicates FAILED, replace secondary HO2S (Sensor 2) . If the HDS indicates EXECUTING, keep the test conditions until a result comes on. If the HDS indicates OUT OF

CONDITION, go to step 4-8 and recheck.

DTC P2096, P2097 (2.4 L ENGINE) (2017 2018 2019)

DTC P2096 : Post Catalyst Fuel Trim System Too Lean **DTC P2097** : Post Catalyst Fuel Trim System Too Rich

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are stored at the same time as DTC P2096 and/or P2097, troubleshoot those DTCs first, then recheck for P2096 or P2097.

  P0133, P2195, P2237, P2238, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0171, P0172: Fuel system

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0300: Random misfire

  P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

  P219A: Air-Fuel Ratio Variation of Cylinder

DTC Description	Confirmed DTC	Pending DTC
P2096 Post Catalyst Fuel Trim System Too Lean	B	B
P2097 Post Catalyst Fuel Trim System Too Rich	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Test-drive the vehicle under these conditions:

   - Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
   - Transmission in D
   - Engine speed below 4, 000 rpm
   - Drive at a steady speed between 15-75 mph (24-120 km/h) for 94 seconds or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

-6. Monitor the OBD STATUS for DTC P2096 and/or P2097 with the HDS.

DTC Description	OBD STATUS
P2096 Post Catalyst Fuel Trim System Too Lean	B
P2097 Post Catalyst Fuel Trim System Too Rich	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), secondary HO2S (Sensor 2), and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep the test conditions until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-5 and recheck.

2. Cylinder A/F variation check

-1. Start the engine.

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. Check under these conditions:

- A/C off
- All electrical loads off

-4. Do the CYLINDER A/F TEST in the INSPECTION MENU three times with the HDS.

CYLINDER A/F TEST

Is the result OK?

YES

Go to step 3.

NO

Go to the troubleshooting for **DTC P219A**.

3. Exhaust system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for leakage, clogging, or blockage in the exhaust system.

Is there leakage in the exhaust system between the A/F sensor (Sensor 1) and secondary HO2S (Sensor 2), or any clogging or restrictions in the exhaust system?

YES

Repair or replace the exhaust system .

NO

Go to step 4.

4. A/F sensor (Sensor 1) check

-1. **Substitute a known-good A/F sensor (Sensor 1)** .

-2. Reconnect all connectors.

-3. Turn the vehicle to the ON mode.

-4. **Reset the PCM with the HDS** .

Reset PCM

-5. **Do the PCM idle learn procedure** .

-6. Start the engine.

-7. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-8. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Engine speed below 4, 000 rpm
- Drive at a steady speed between 15-75 mph (24-120 km/h) for 94 seconds or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B
VEHICLE SPEED	B	B

-9. Monitor the OBD STATUS for DTC P2096 and/or P2097 with the HDS.

DTC Description	OBD STATUS
P2096 Post Catalyst Fuel Trim System Too Lean	B
P2097 Post Catalyst Fuel Trim System Too Rich	B

Does the HDS indicate PASSED?

YES

Replace the original A/F sensor (Sensor 1) .

NO

If the HDS indicates FAILED, replace secondary HO2S (Sensor 2) . If the HDS indicates EXECUTING, keep the test conditions until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 4-8 and recheck.

DTC P2101 (1.5 L ENGINE)

DTC P2101 : ETCS Malfunction

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

DTC (PGM-FI)

1. ETCS system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the ETCS TEST in the INSPECTION MENU with the HDS.

   ETCS TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

   Is DTC P2101 indicated?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification:

   -1. Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

   - ENGINE SPEED
   - VEHICLE SPEED
   - APP SENSOR

   On-board Snapshot

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
APP SENSOR	B	B

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

Is DTC P2101 indicated?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Disconnect the throttle body duct from the throttle body** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode.

-7. Visually check the throttle valve operation while doing the ETCS TEST in the INSPECTION MENU with the HDS.

ETCS TEST

Does the throttle valve operate smoothly?

YES

Clean the throttle body . If DTC P2101 is indicated again, **replace the throttle body** .

NO

Go to step 4.

4. Open wire check (MTR1 line, MTR2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

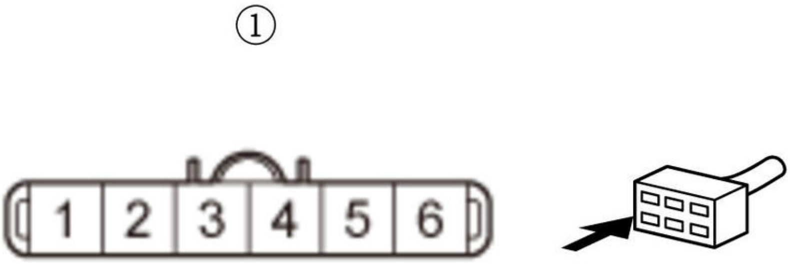
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Connect terminals A and B with a jumper wire.

Terminal A	Throttle body 6P connector (female terminals) No. 1: ①
Terminal B	Throttle body 6P connector (female terminals) No. 2: ①



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
B	Throttle body 6P connector No. 1 and No. 2: jumped
Test point 1	**PCM connector E (80P) No. 27**
Test point 2	**PCM connector E (80P) No. 28**

Is there continuity?

YES

Go to step 5.

NO

Repair an open in the MTR1 wire or the MTR2 wire between the PCM (E27, E28) and the throttle body.

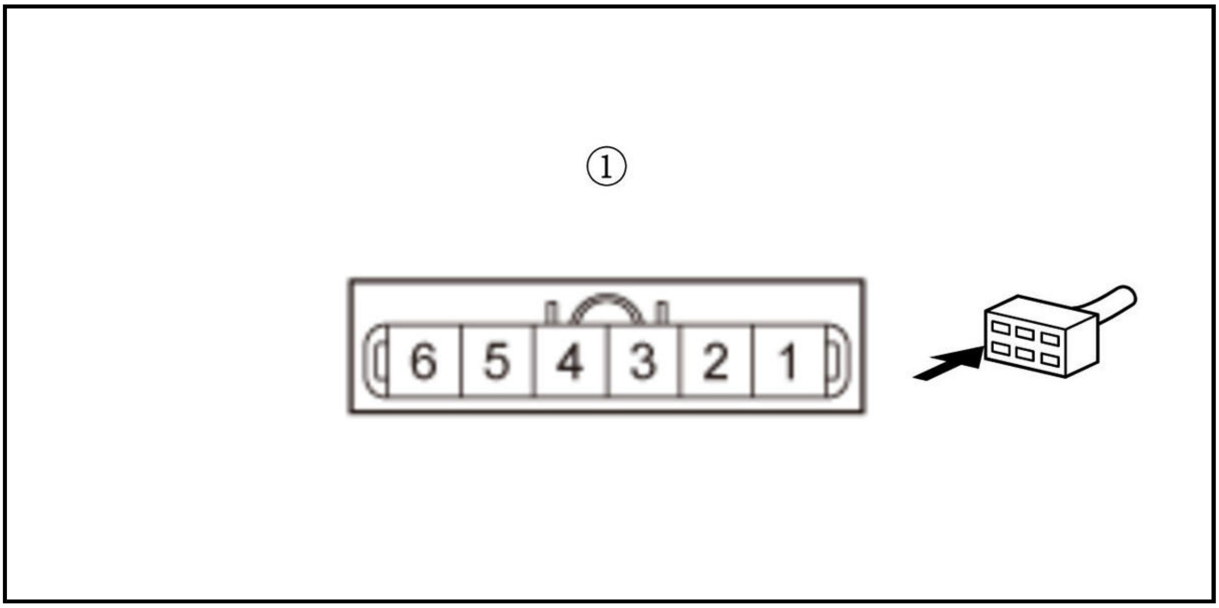
5. Throttle body internal circuit check

-1. Remove the jumper wire from the throttle body 6P connector.

-2. At the throttle body side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected

Test point 1	Throttle body 6P connector (male terminals) No. 1 (throttle body side): ①
Test point 2	Throttle body 6P connector (male terminals) No. 2 (throttle body side): ①



Is there about 1.0 kΩ or more?

YES

Replace the throttle body .

NO

The throttle body internal circuit is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

DTC P2101 (2.4 L ENGINE) (2017 2018 2019)

DTC P2101 : ETCS Malfunction

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

DTC (PGM-FI)

1. ETCS system check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Select the ETCS TEST in the INSPECTION MENU with the HDS.

ETCS TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

Is DTC P2101 indicated?

YES

The failure is duplicated. Go to step 3.

NO

The failure is not duplicated. Go to step 2.

2. Problem verification:

-1. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

- ENGINE SPEED
- VEHICLE SPEED
- APP SENSOR

On-board Snapshot

Signal	Current conditions	
	Values	Unit
ENGINE SPEED	B	B
VEHICLE SPEED	B	B
APP SENSOR	B	B

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

Is DTC P2101 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Disconnect the intake air duct from the throttle body** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Visually check the throttle valve operation while doing the ETCS TEST in the INSPECTION MENU with the HDS.

ETCS TEST

Does the throttle valve operate smoothly?

YES

Clean the throttle body . If DTC P2101 is indicated again, **replace the throttle body** .

NO

Go to step 4.

4. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

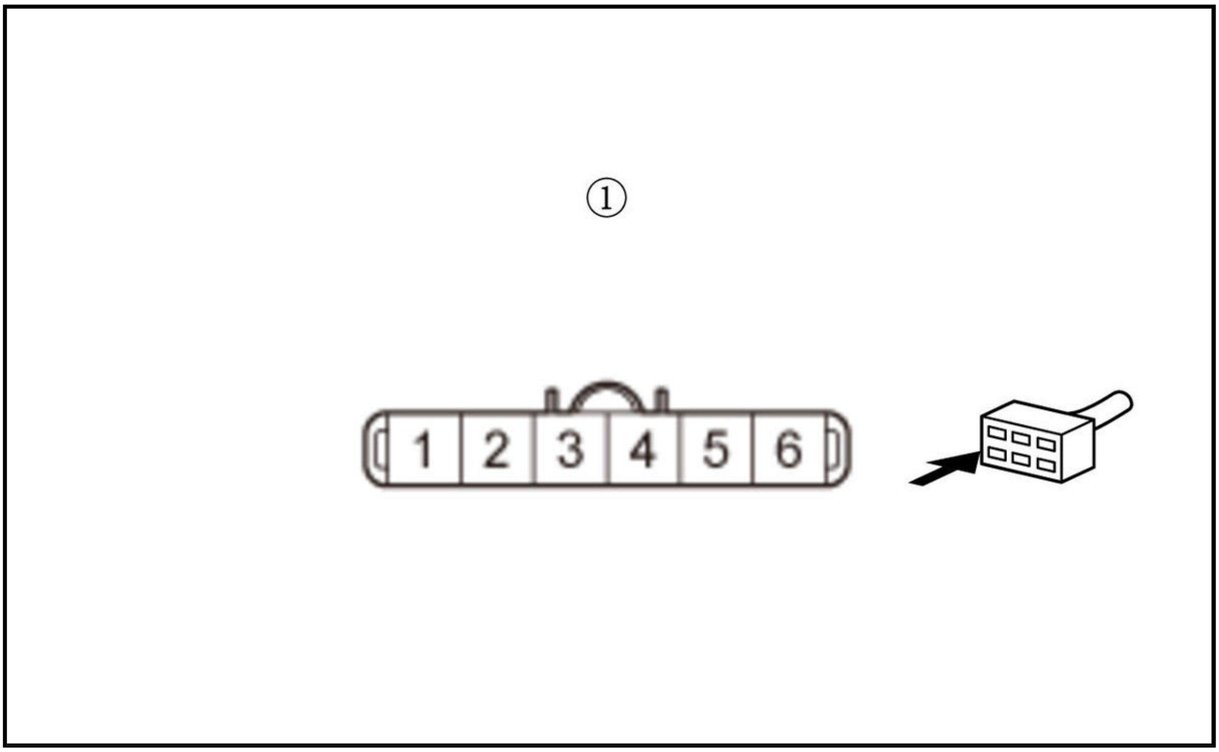
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector B (51P) No. 49**



Is there continuity?

YES

The SG3 wire is OK. Go to step 5.

NO

Repair an open in the SG3 wire between the PCM (B49) and the throttle body.

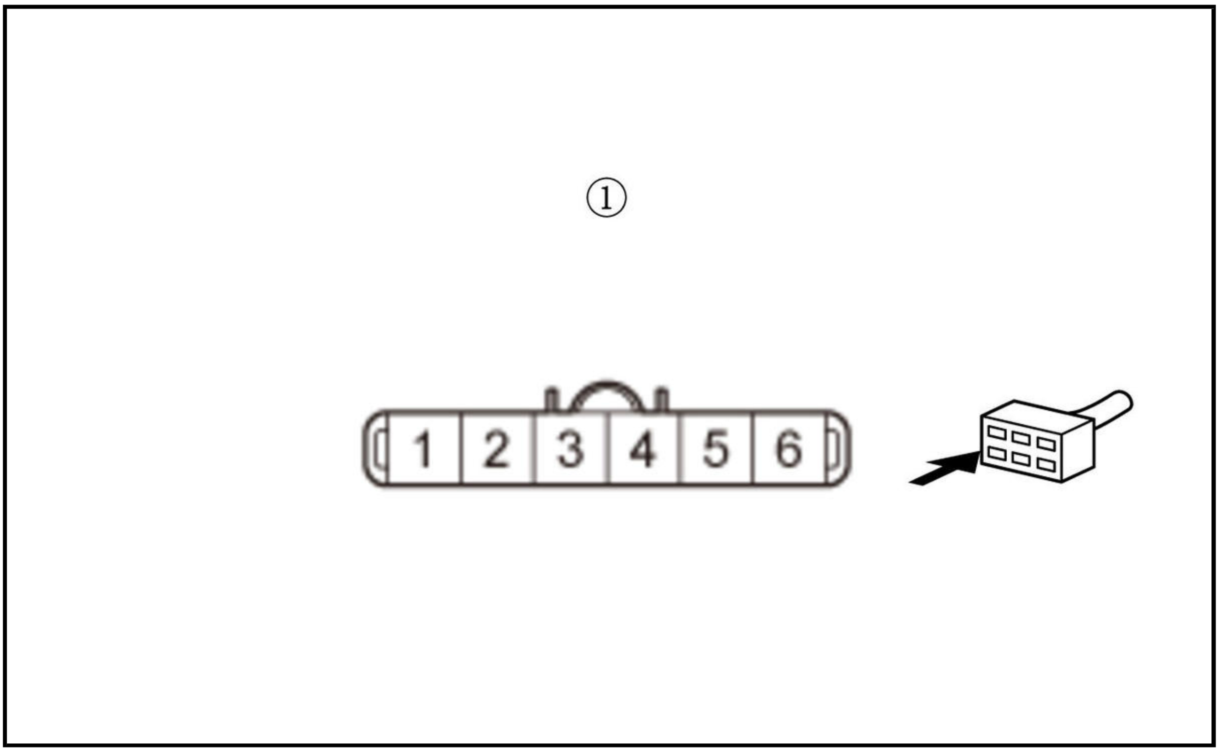
5. Open wire check (MTR 1 line, MTR 2 line)

-1. Disconnect the following connector.

PCM connector C (51P)

-2. Connect terminals A and B with a jumper wire.

Terminal A	Throttle body 6P connector (female terminals) No. 1: ①
Terminal B	Throttle body 6P connector (female terminals) No. 2: ①



-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	PCM connector C (51P): disconnected
B	Throttle body 6P connector: disconnected
B	Throttle body 6P connector No. 1 and No. 2: jumped
Test point 1	**PCM connector C (51P) No. 11**
Test point 2	**PCM connector C (51P) No. 12**

Is there continuity?

YES

The MTR 1 and MTR 2 wires are OK. Go to step 6.

NO

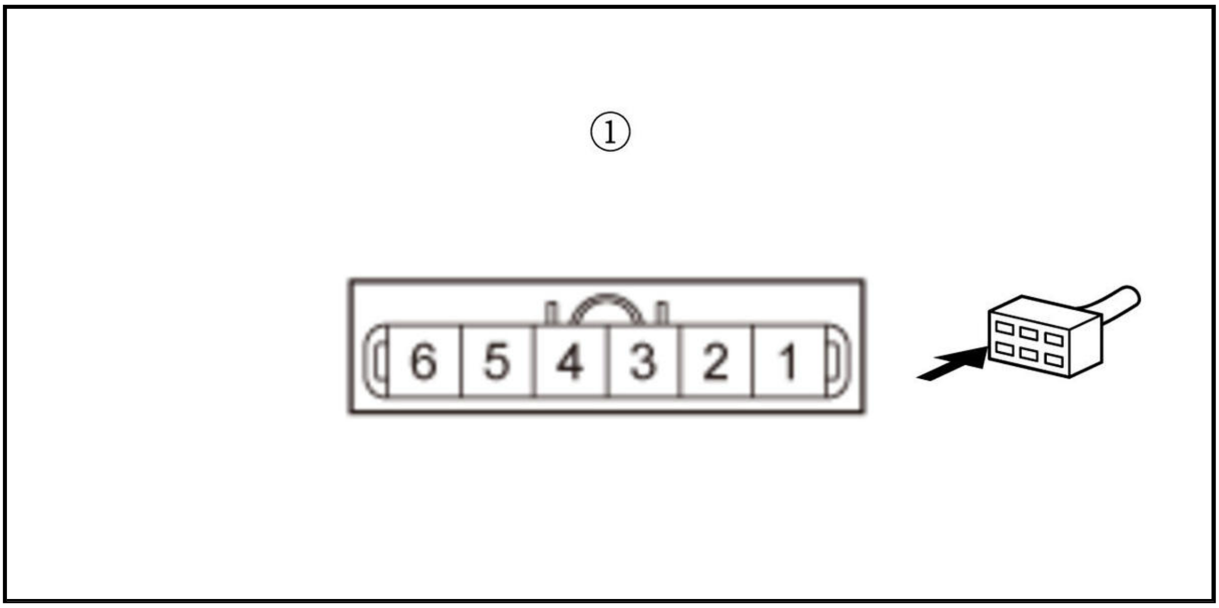
Repair an open in the MTR 1 wire or the MTR 2 wire between the PCM (C11, C12) and the throttle body.

6. Throttle body internal circuit check

-1. Remove the jumper wire from the throttle body 6P connector.

-2. At the throttle body side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	PCM connector C (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (male terminals) No. 1 (throttle body side): ①
Test point 2	Throttle body 6P connector (male terminals) No. 2 (throttle body side): ①



Is there about 1.0 kΩ or more?

YES

Replace the throttle body .

NO

The throttle body internal circuit is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P2108 (1.5 L ENGINE)

DTC P2108 : Throttle Actuator Control Module Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2108 is indicated alone, do the troubleshooting for DTC P1658 and P1659 using the on-board snapshot data for P2108.

- If any of the DTCs listed below are indicated at the same time as DTC P2108, troubleshoot those DTCs first, then recheck for P2108.
-
  - -

    P1658, P1659: Throttle Actuator Control

DTC Description	Confirmed DTC	Pending DTC
P2108 Throttle Actuator Control Module Performance	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B
P1659 ETCS Control Relay OFF Malfunction	B	B
P2108 Throttle Actuator Control Module Performance	B	B

   Are DTC P1658 or P1659 and P2108 indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC P1658** and **DTC P1659** .

DTC P2108 (2.4 L ENGINE) (2017 2018 2019)

DTC P2108 : Throttle Actuator Control Module Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2108 is indicated alone, do the troubleshooting for DTC P1658 and P1659 using the on-board snapshot data for P2108.
- If any of the DTCs listed below are indicated at the same time as DTC P2108, troubleshoot those DTCs first, then recheck for P2108.
-
  - -

    P1658, P1659: Throttle Actuator Control

DTC Description	Confirmed DTC	Pending DTC
P2108 Throttle Actuator Control Module Performance	B	B

DTC (PGM-FI)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B
P1659 ETCS Control Relay OFF Malfunction	B	B
P2108 Throttle Actuator Control Module Performance	B	B

Are DTC P1658 or P1659 and P2108 indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC P1658** and **DTC P1659** .

DTC P2118 (1.5 L ENGINE)

DTC P2118 : Throttle Actuator Current Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2118 Throttle Actuator Current Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Slowly press the accelerator pedal to the floor.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2118 Throttle Actuator Current Range/Performance Problem	B	B

Is DTC P2118 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM, then **clean the throttle body** . **If the on-board snapshot of this DTC is**

recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Open wire check (SG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

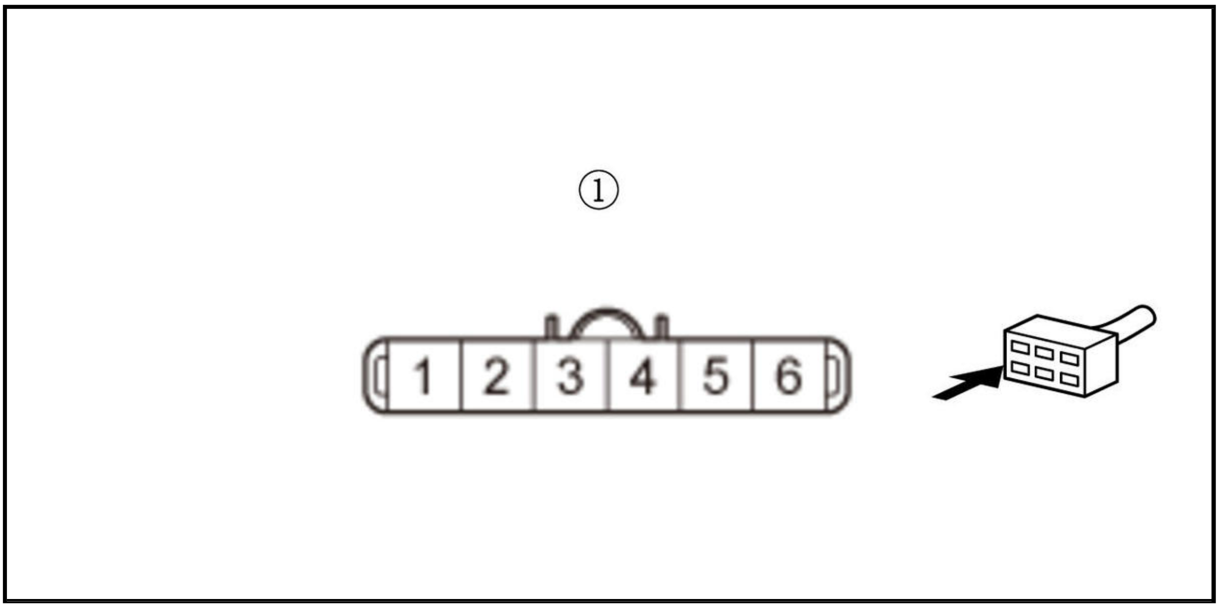
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 76**



Is there continuity?

YES

Go to step 3.

NO

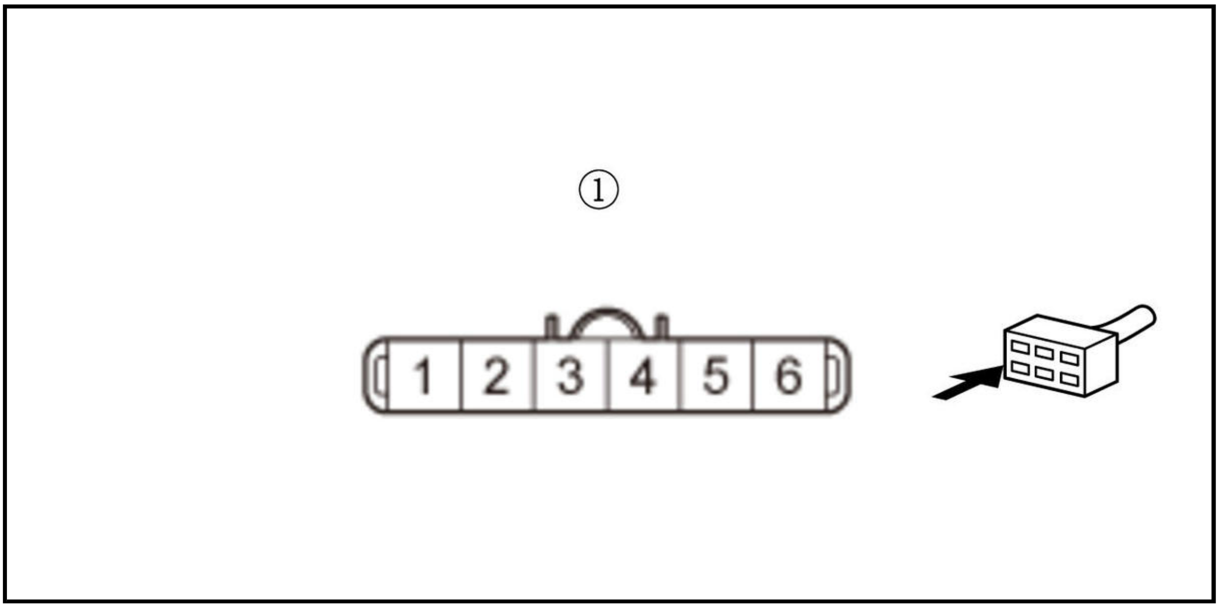
Repair an open in the SG3 wire between the PCM (E76) and the throttle body.

3. Shorted wire check (MTR1 line to MTR2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected

Test point 1	Throttle body 6P connector (female terminals) No. 1: ①
Test point 2	Throttle body 6P connector (female terminals) No. 2: ①



Is there continuity?

YES

Repair a short in the MTR1 wire to the MTR2 wire between the PCM (E27, E28) and the throttle body.

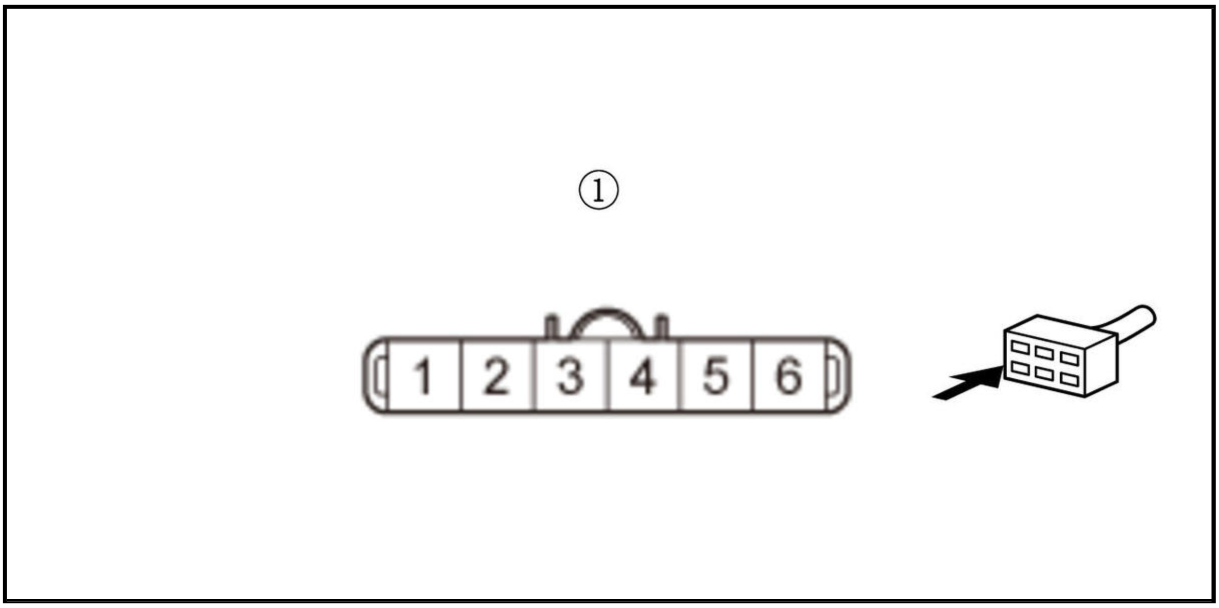
NO

Go to step 4.

4. Shorted wire check (MTR1 line, MTR2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 1 and No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the MTR1 wire or the MTR2 wire between the PCM (E27, E28) and the throttle body.

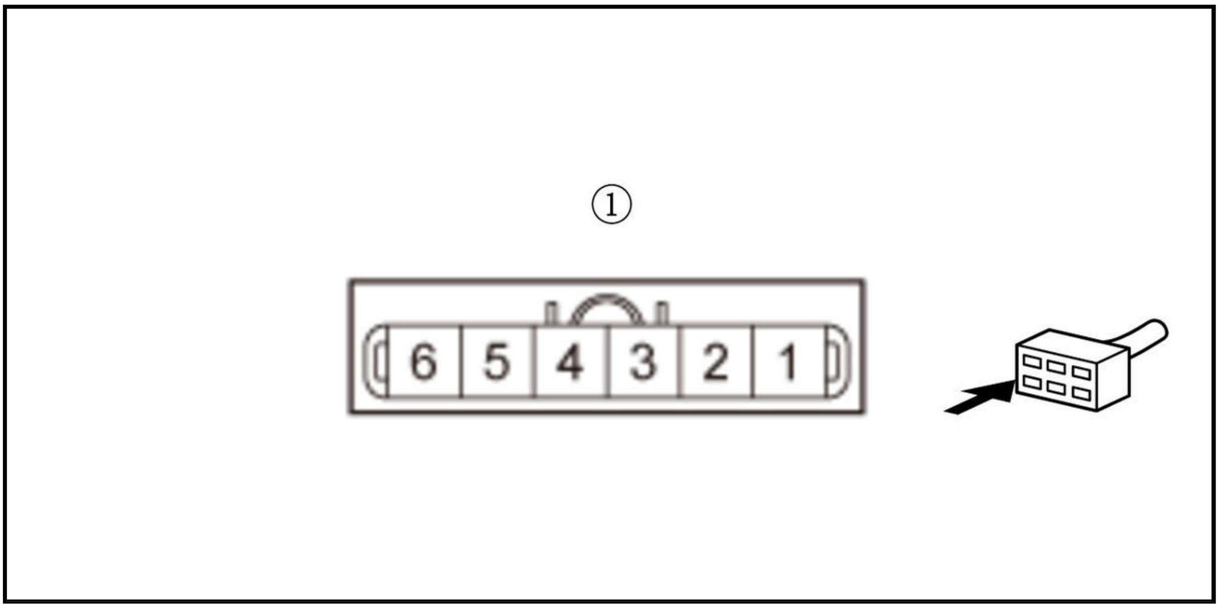
NO

Go to step 5.

5. Throttle body internal circuit check (short in wires)

-1. At the throttle body side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (male terminals) No. 1 (throttle body side): ①
Test point 2	Throttle body 6P connector (male terminals) No. 2 (throttle body side): ①



Is there about 1.2 Ω - 1.0 kΩ?

YES

Go to step 6.

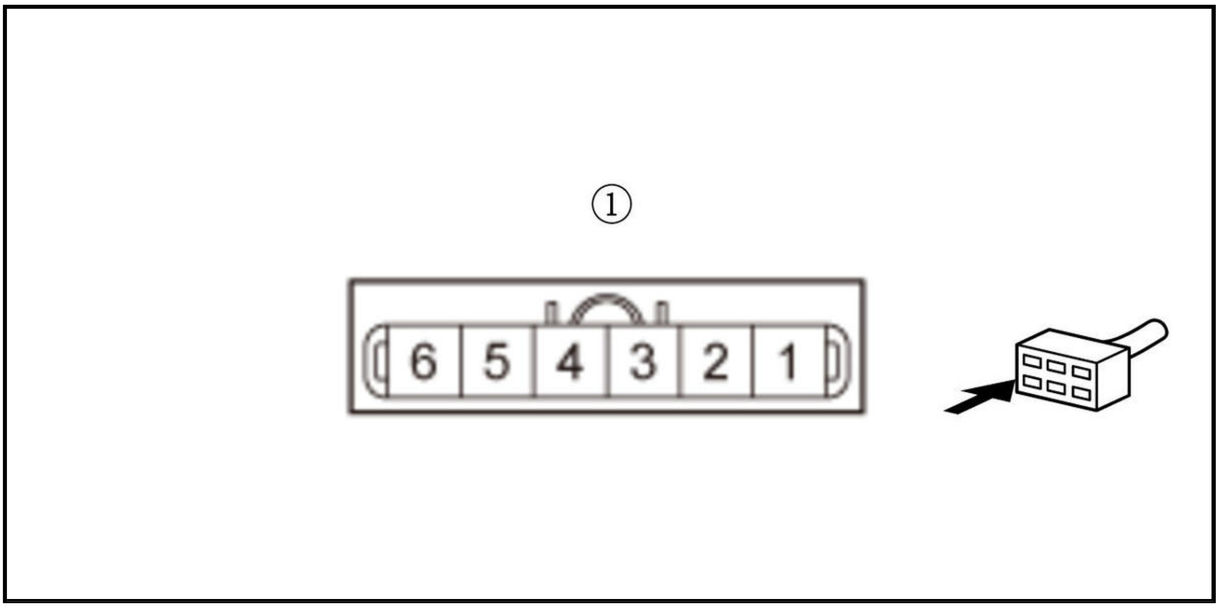
NO

Replace the throttle body .

6. Throttle body internal circuit check (short to ground)

-1. At the throttle body side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (male terminals) No. 1 and No. 2 (throttle body side): ①
Test point 2	Body ground



Is there continuity?

YES

Replace the throttle body .

NO

The throttle body internal circuit is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

DTC P2118 (2.4 L ENGINE) (2017 2018 2019)

DTC P2118 : Throttle Actuator Current Range/Performance Problem

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2118 Throttle Actuator Current Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Slowly press the accelerator pedal to the floor.

    -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2118 Throttle Actuator Current Range/Performance Problem	B	B

Is DTC P2118 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM, then **clean the throttle body** . **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (SG3 line)

    -1. Turn the vehicle to the OFF (LOCK) mode.

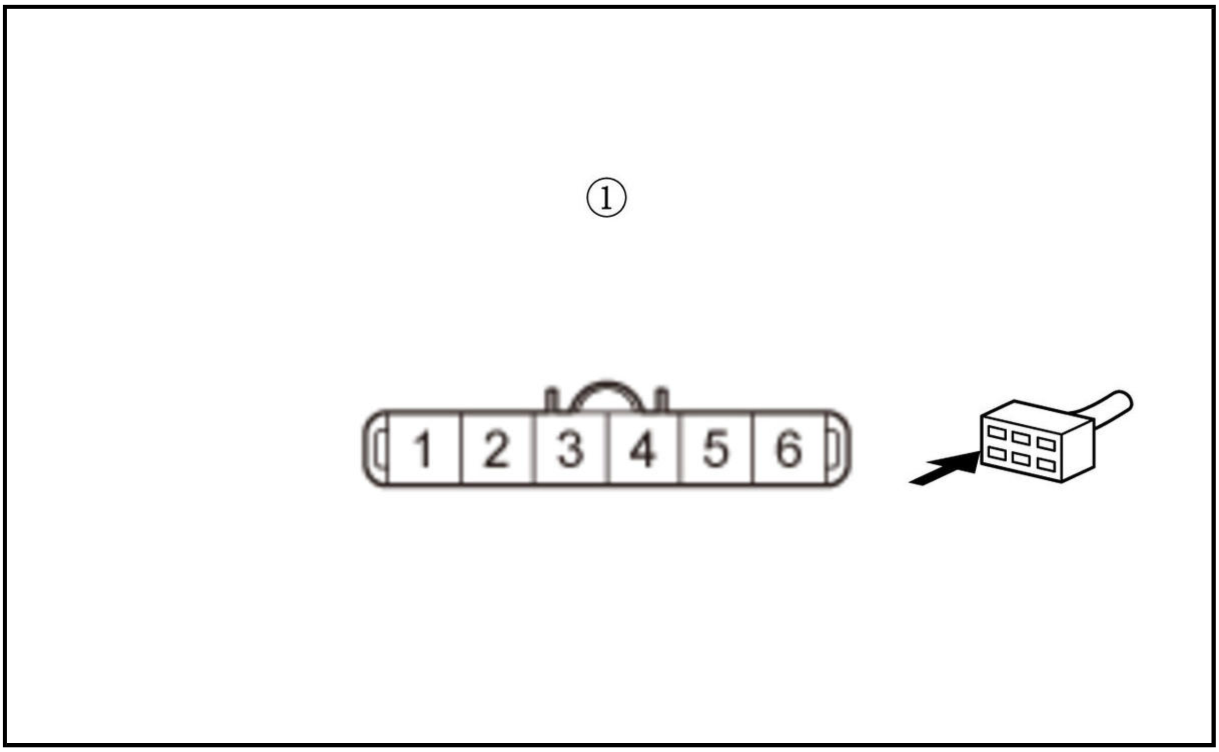
    -2. Jump the SCS line with the HDS, and wait more than 1 minute.

    -3. Disconnect the following connectors.

PCM connector B (51P)
Throttle body 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector B (51P) No. 49**



Is there continuity?

YES

The SG3 wire is OK. Go to step 3.

NO

Repair an open in the SG3 wire between the PCM (B49) and the throttle body.

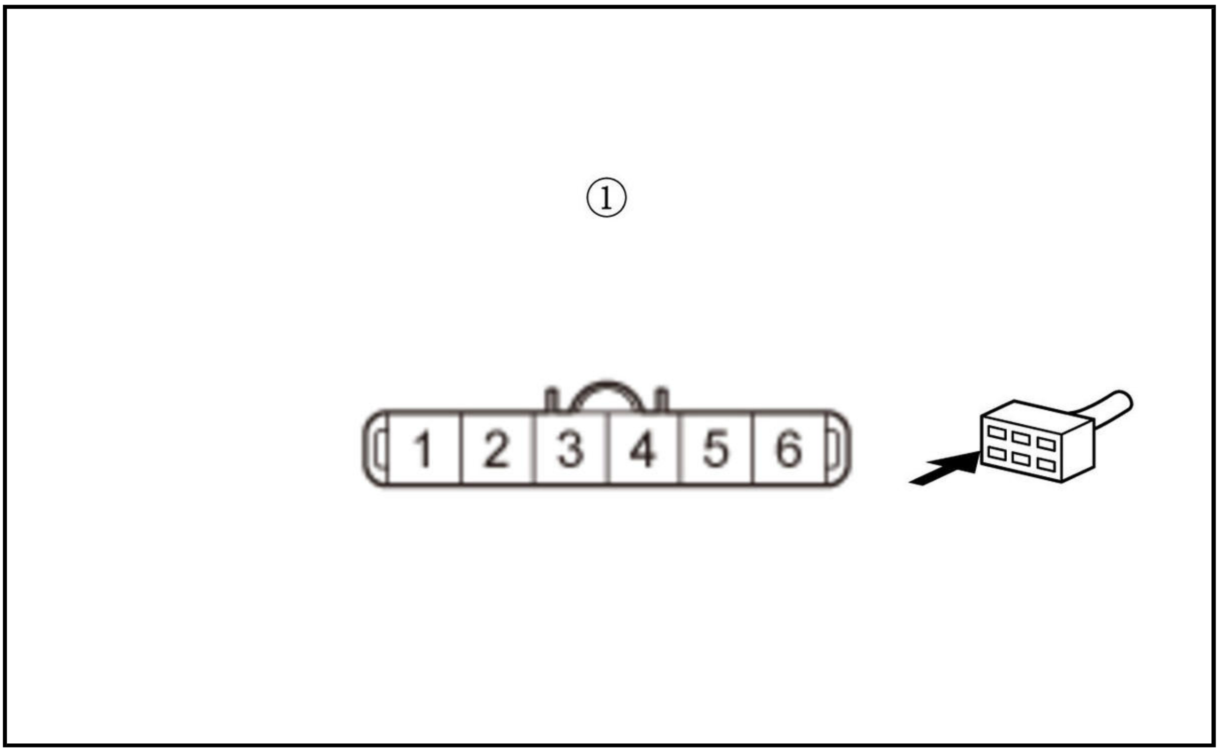
3. Shorted wire check (MTR 1 line to MTR 2 line)

-1. Disconnect the following connector.

PCM connector C (51P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	PCM connector C (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 1: ①
Test point 2	Throttle body 6P connector (female terminals) No. 2: ①



Is there continuity?

YES

Repair a short in the MTR 1 wire to the MTR 2 wire between the PCM (C11, C12) and the throttle body.

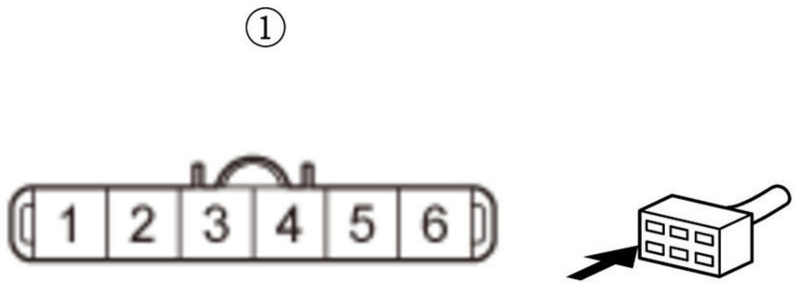
NO

Go to step 4.

4. Shorted wire check (MTR 1 line, MTR 2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	PCM connector C (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 1 and No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the MTR 1 wire or the MTR 2 wire between the PCM (C11, C12) and the throttle body.

NO

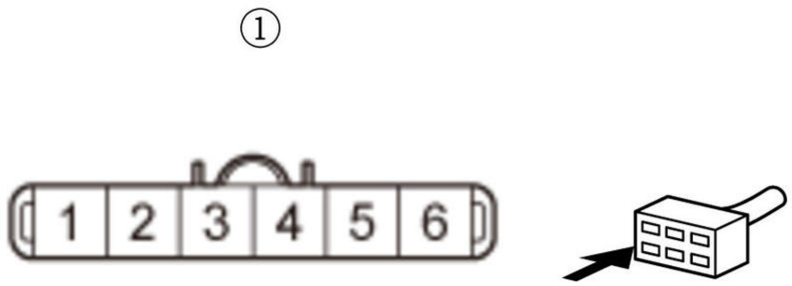
The MTR 1 and MTR 2 wires are not shorted. Go to step 5.

5. Open wire check (MTR 1 line, MTR 2 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Throttle body 6P connector (female terminals) No. 1: ①

Terminal B	Throttle body 6P connector (female terminals) No. 2: ①



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	PCM connector B (51P): disconnected
B	PCM connector C (51P): disconnected
B	Throttle body 6P connector: disconnected
B	Throttle body 6P connector No. 1 and No. 2: jumped
Test point 1	**PCM connector C (51P) No. 11**
Test point 2	**PCM connector C (51P) No. 12**

Is there continuity?

YES

The MTR 1 and MTR 2 wires are OK. Go to step 6.

NO

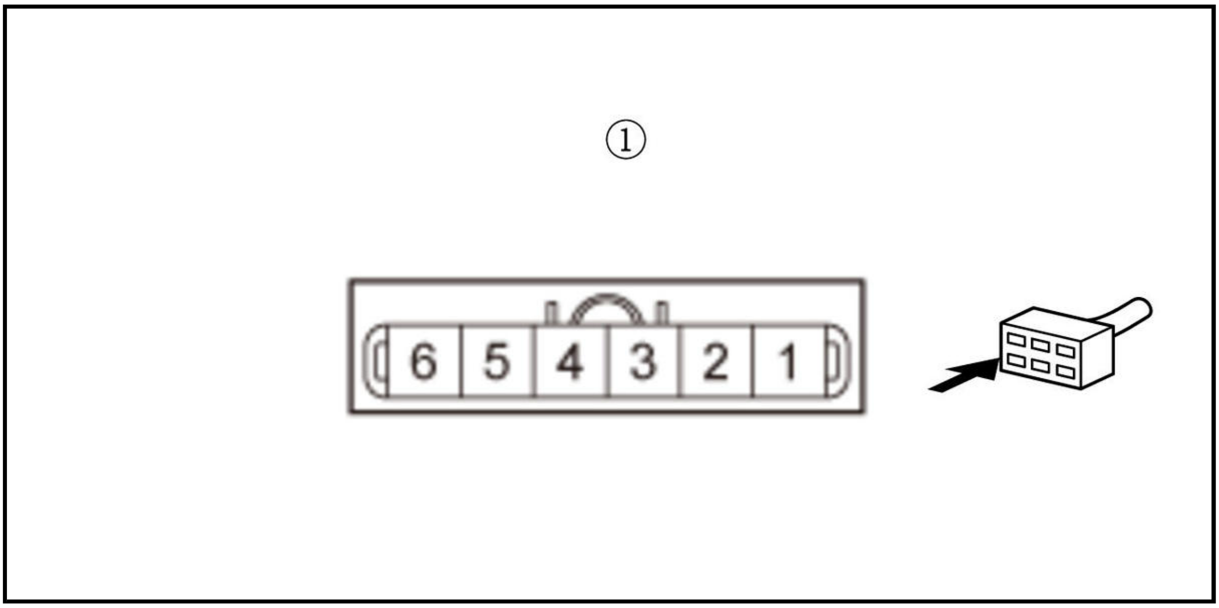
Repair an open in the MTR 1 wire or the MTR 2 wire between the PCM (C11, C12) and the throttle body.

6. Throttle body internal circuit check (short in wires)

-1. Remove the jumper wire from the throttle body 6P connector.

-2. At the throttle body side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (male terminals) No. 1 (throttle body side): ①
Test point 2	Throttle body 6P connector (male terminals) No. 2 (throttle body side): ①



Is there about 1.2 Ω-1.0 kΩ?

YES

Go to step 7.

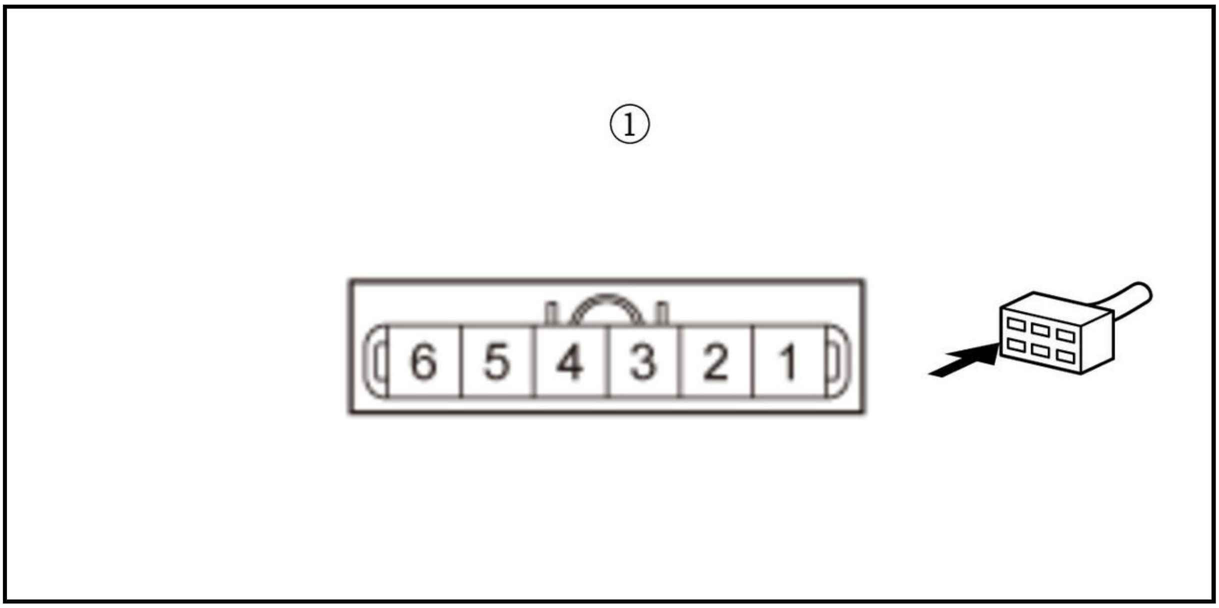
NO

Replace the throttle body .

7. Throttle body internal circuit check (short to ground)

-1. At the throttle body side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (male terminals) No. 1 and No. 2 (throttle body side): ①
Test point 2	Body ground



Is there continuity?

YES

Replace the throttle body .

NO

The throttle body internal circuit is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P2119 (1.5 L ENGINE)

DTC P2119 : Throttle Actuator Control Throttle Body Range/Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2119 is indicated alone, do the troubleshooting for DTC P1683 and P1684 using the on-board snapshot data for P2119.
- If any of the DTCs listed below are indicated at the same time as DTC P2119, troubleshoot those DTCs first, then recheck for P2119.
-
    - -

      P1683, P1684: Throttle Valve Spring

DTC Description	Confirmed DTC	Pending DTC
P2119 Throttle Actuator Control Throttle Body Range/Performance	B	B

DTC (PGM-FI)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B
P1684 Throttle Valve Return Spring Performance Problem	B	B
P2119 Throttle Actuator Control Throttle Body Range/Performance	B	B

Are DTC P1683 or P1684 and P2119 indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC P1683** and **DTC P1684** .

DTC P2119 (2.4 L ENGINE) (2017 2018 2019)

DTC P2119 : Throttle Actuator Control Throttle Body Range/Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2119 is indicated alone, do the troubleshooting for DTC P1683 and P1684 using the on-board snapshot data for P2119.
- If any of the DTCs listed below are indicated at the same time as DTC P2119, troubleshoot those DTCs first, then recheck for P2119.
-
    - -

      P1683, P1684: Throttle Valve Spring

DTC Description	Confirmed DTC	Pending DTC
P2119 Throttle Actuator Control Throttle Body Range/Performance	B	B

DTC (PGM-FI)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B
P1684 Throttle Valve Return Spring Performance Problem	B	B
P2119 Throttle Actuator Control Throttle Body Range/Performance	B	B

Are DTC P1683 or P1684 and P2119 indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC P1683** and **DTC P1684** .

DTC P2121 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P2121 : APP Sensor A (TP Sensor D) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2121 APP Sensor A (TP Sensor D) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR A	Less than 0.69	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR A	More than 4.99	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 8.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (VCC4 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

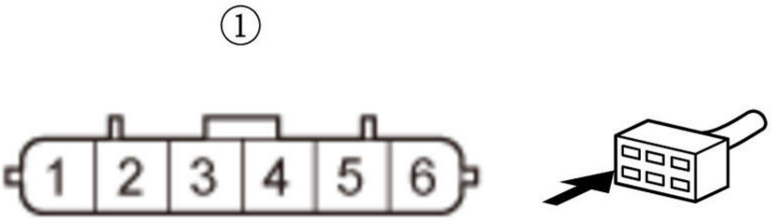
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (APS1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

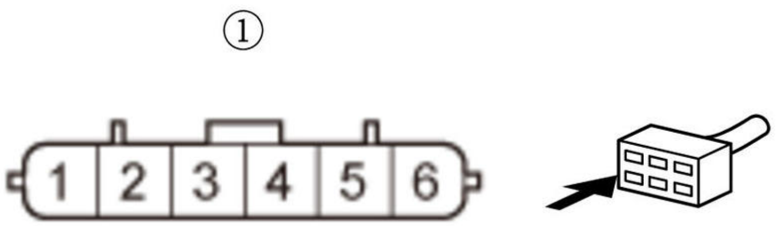
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the APS1 wire between the PCM (A32) and the APP sensor.

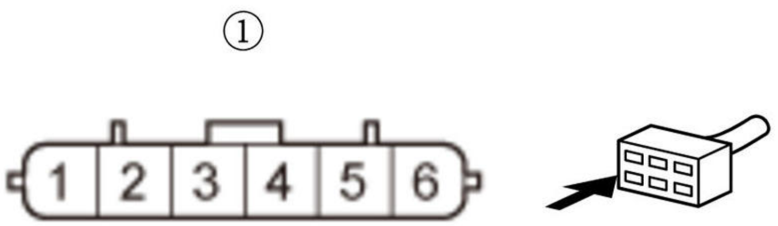
NO

The APS1 wire is not shorted. Go to step 5.

5. Open wire check (APS1 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 6: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 6: jumped to body ground
Test point 1	**PCM connector A (50P) No. 32**
Test point 2	Body ground

Is there continuity?

YES

The APS1 wire is OK. Go to step 6.

NO

Repair an open in the APS1 wire between the PCM (A32) and the APP sensor.

6. PCM internal circuit check

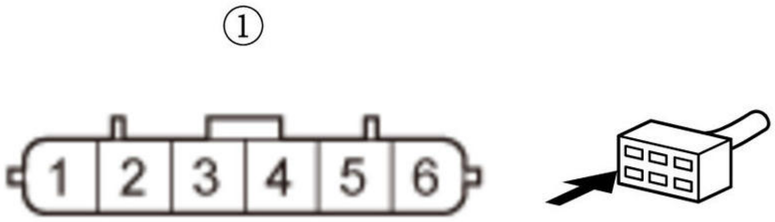
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	APP sensor 6P connector (female terminals) No. 6: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR A	Less than 0.69	V	B	B

Do the current condition (s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the accelerator pedal module .

7. Open wire check (VCC4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

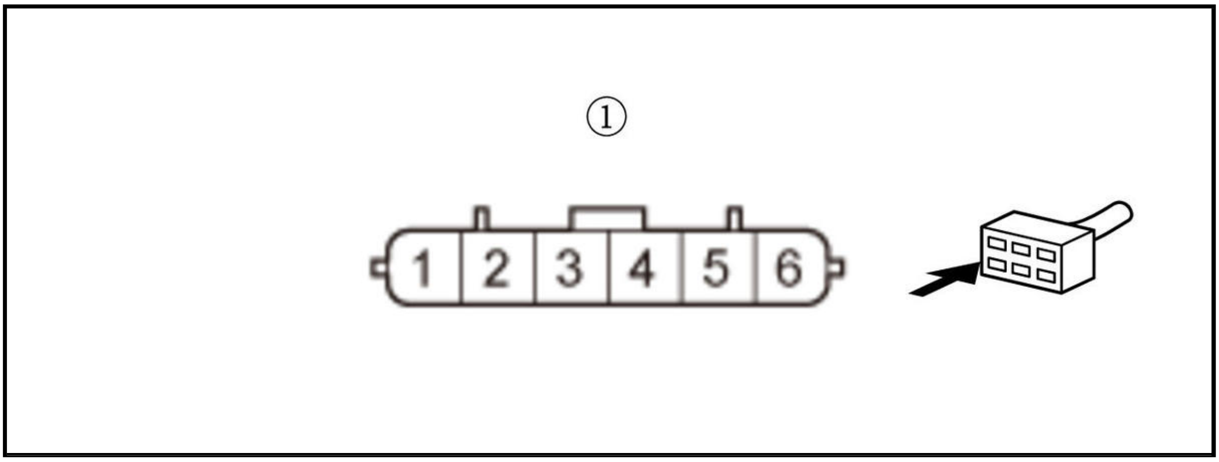
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 4: jumped to body ground
Test point 1	**PCM connector A (50P) No. 45**
Test point 2	Body ground

Is there continuity?

YES

The VCC4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC4 wire between the PCM (A45) and the APP sensor.

8. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

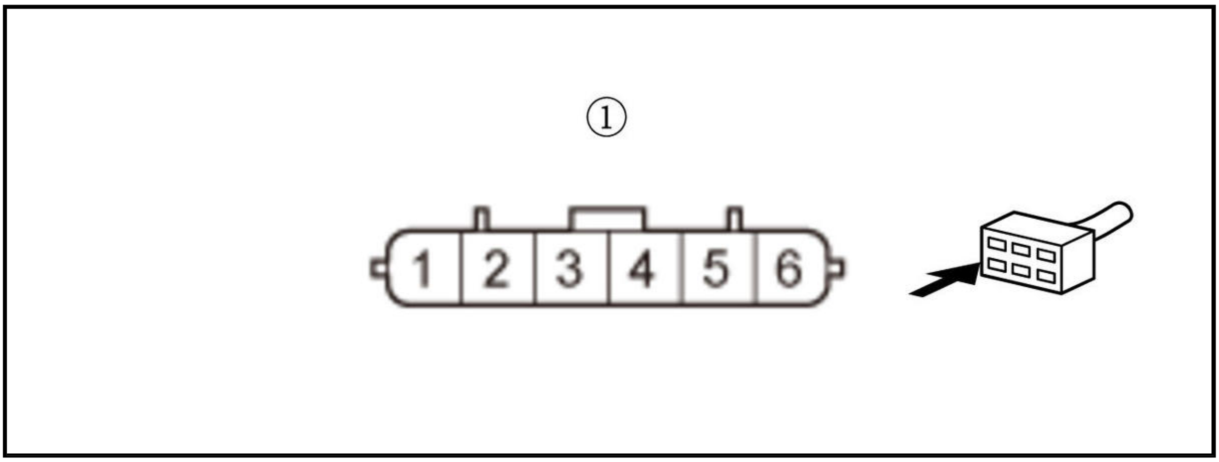
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Replace the accelerator pedal module .

NO

Go to step 9.

9. Open wire check (SG4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

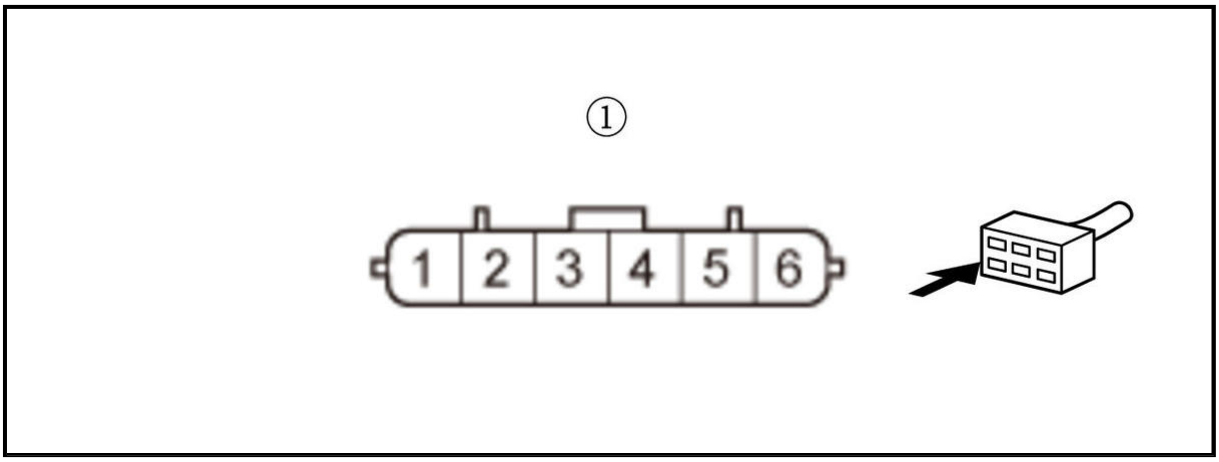
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 5: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 5: jumped to body ground
Test point 1	**PCM connector A (50P) No. 46**
Test point 2	Body ground

Is there continuity?

YES

The SG4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG4 wire between the PCM (A46) and the APP sensor.

DTC P2121 (2.4 L ENGINE) (2018 2019)

DTC P2121 : APP Sensor A (TP Sensor D) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2121 APP Sensor A (TP Sensor D) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR A	Less than 0.66	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
APP SENSOR A	More than 4.9	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 8.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (VCC4 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

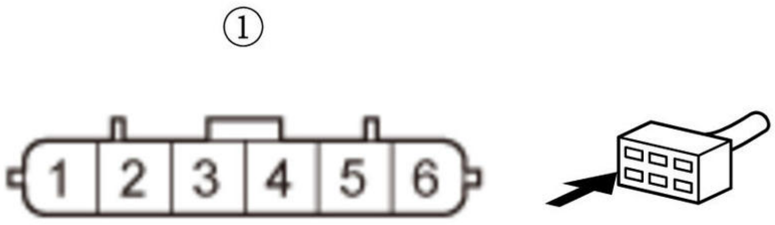
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (APS1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

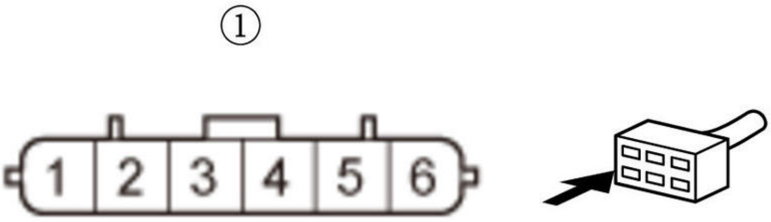
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the APS1 wire between the PCM (A45) and the APP sensor.

NO

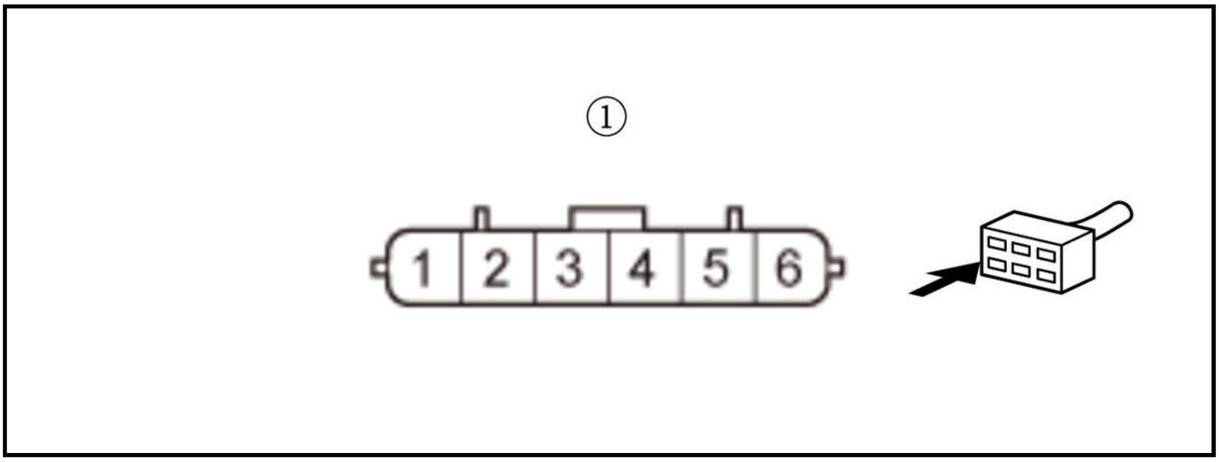
The APS1 wire is not shorted. Go to step 5.

5. Open wire check (APS1 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 6: ①

Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (51P): disconnected
B	APP sensor 6P connector No. 6: jumped to body ground
Test point 1	**PCM connector A (51P) No. 45**
Test point 2	Body ground

Is there continuity?

YES

The APS1 wire is OK. Go to step 6.

NO

Repair an open in the APS1 wire between the PCM (A45) and the APP sensor.

6. PCM internal circuit check

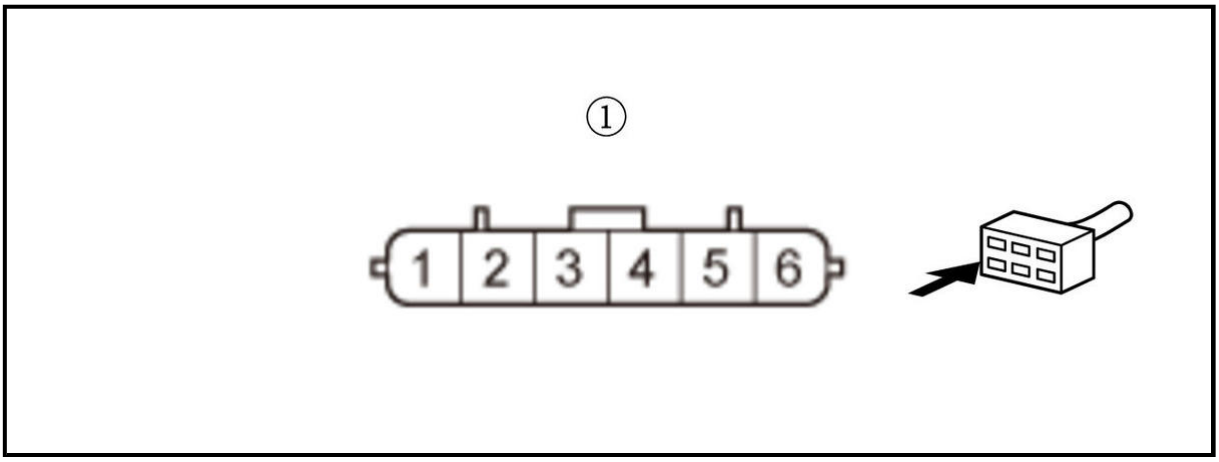
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (51P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	APP sensor 6P connector (female terminals) No. 6: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
APP SENSOR A	Less than 0.66	V	B	B

Do the current condition (s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the accelerator pedal module .

7. Open wire check (VCC4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

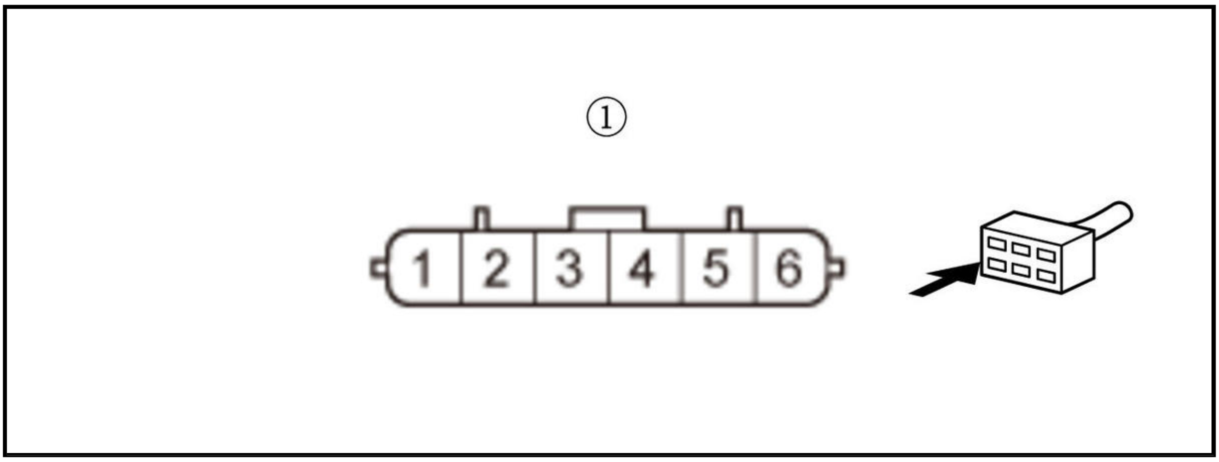
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (51P): disconnected
B	APP sensor 6P connector No. 4: jumped to body ground
Test point 1	**PCM connector A (51P) No. 31**
Test point 2	Body ground

Is there continuity?

YES

The VCC4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC4 wire between the PCM (A31) and the APP sensor.

8. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

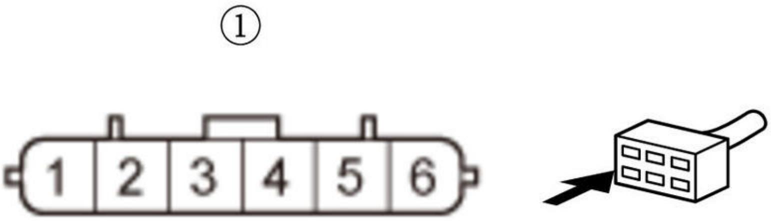
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Replace the accelerator pedal module .

NO

Go to step 9.

9. Open wire check (SG4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

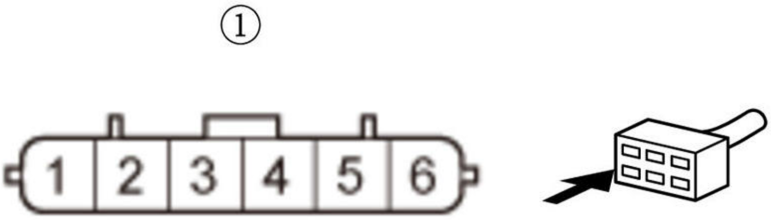
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 5: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (51P): disconnected

B	APP sensor 6P connector No. 5: jumped to body ground
Test point 1	PCM connector A (51P) No. 30
Test point 2	Body ground

Is there continuity?

YES

The SG4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the SG4 wire between the PCM (A30) and the APP sensor.

DTC P2122 (1.5 L ENGINE)

DTC P2122 : APP Sensor A (TP Sensor D) Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2122 APP Sensor A (TP Sensor D) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR A	Less than 0.2	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Determine possible failure area (VCC4 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

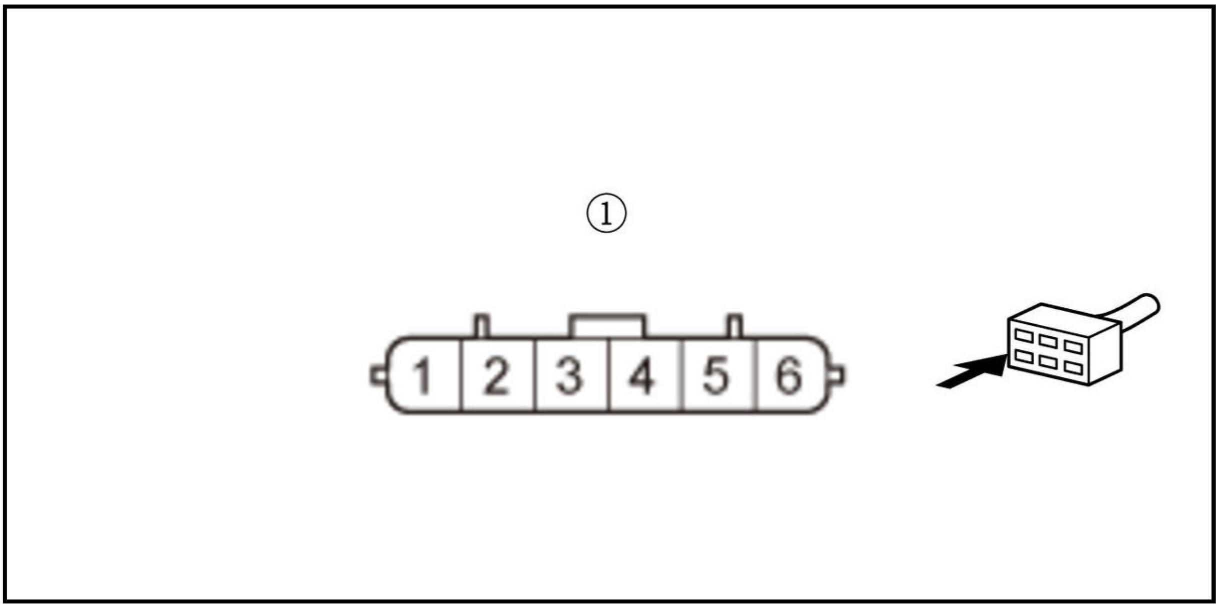
   -2. Disconnect the following connector.

APP sensor 6P connector

   -3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Go to step 3.

NO

Go to step 6.

3. Shorted wire check (APS1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

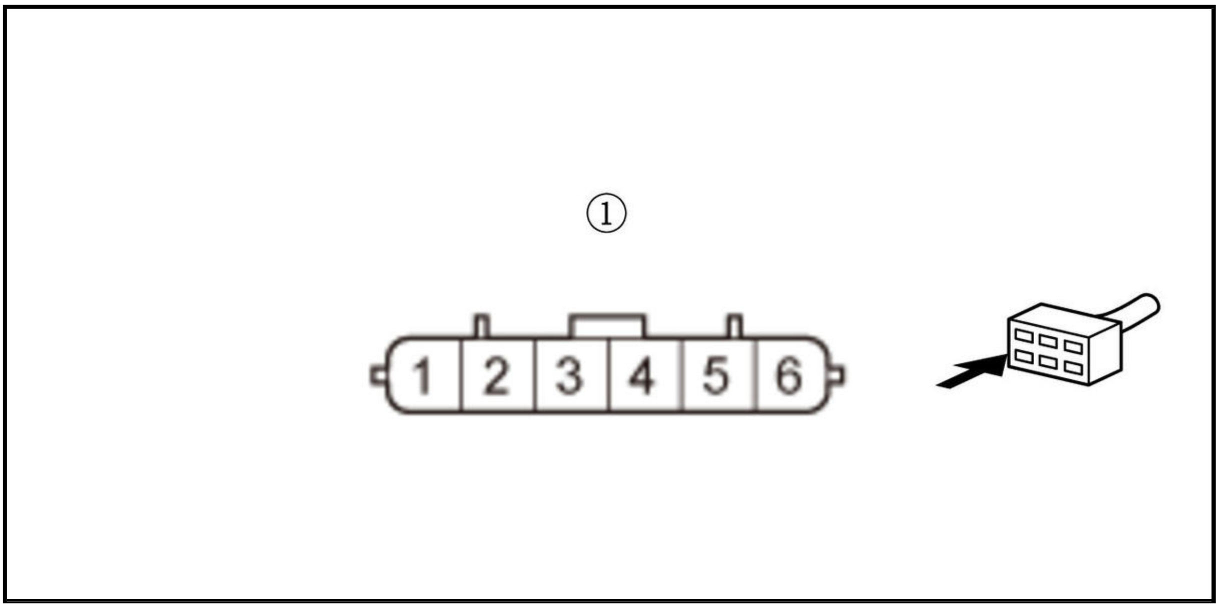
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the APS1 wire between the PCM (A32) and the APP sensor.

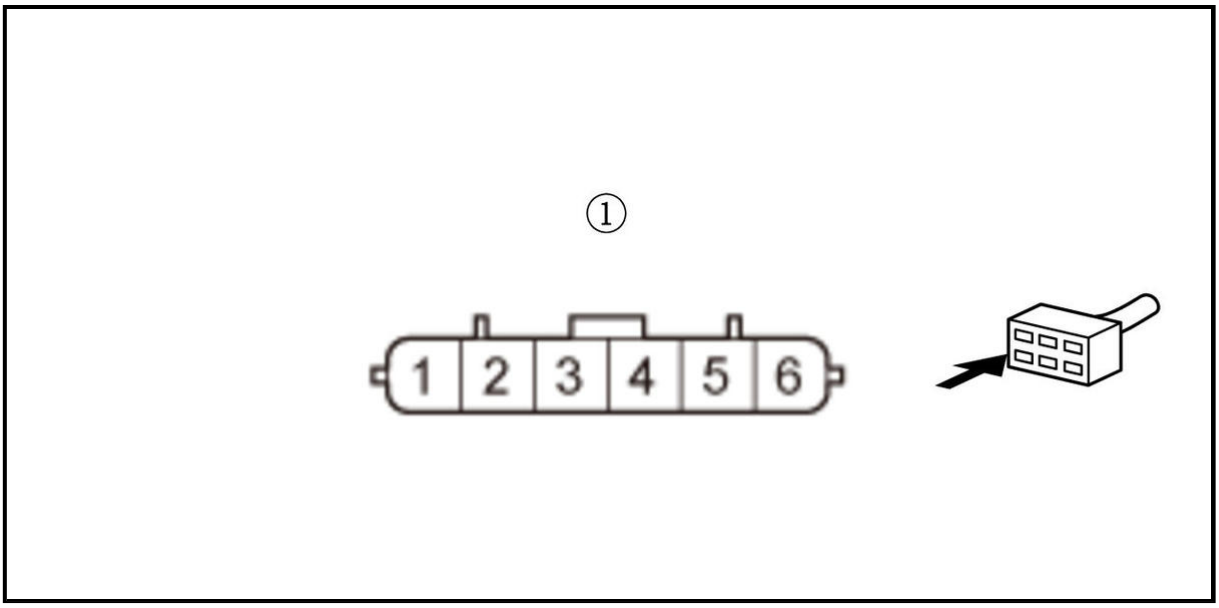
NO

Go to step 4.

4. Open wire check (APS1 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 6: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 6: jumped to body ground

B	PCM connector A (50P): disconnected
Test point 1	PCM connector A (50P) No. 32
Test point 2	Body ground

Is there continuity?

YES

Go to step 5.

NO

Repair an open in the APS1 wire between the PCM (A32) and the APP sensor.

5. PCM internal circuit check

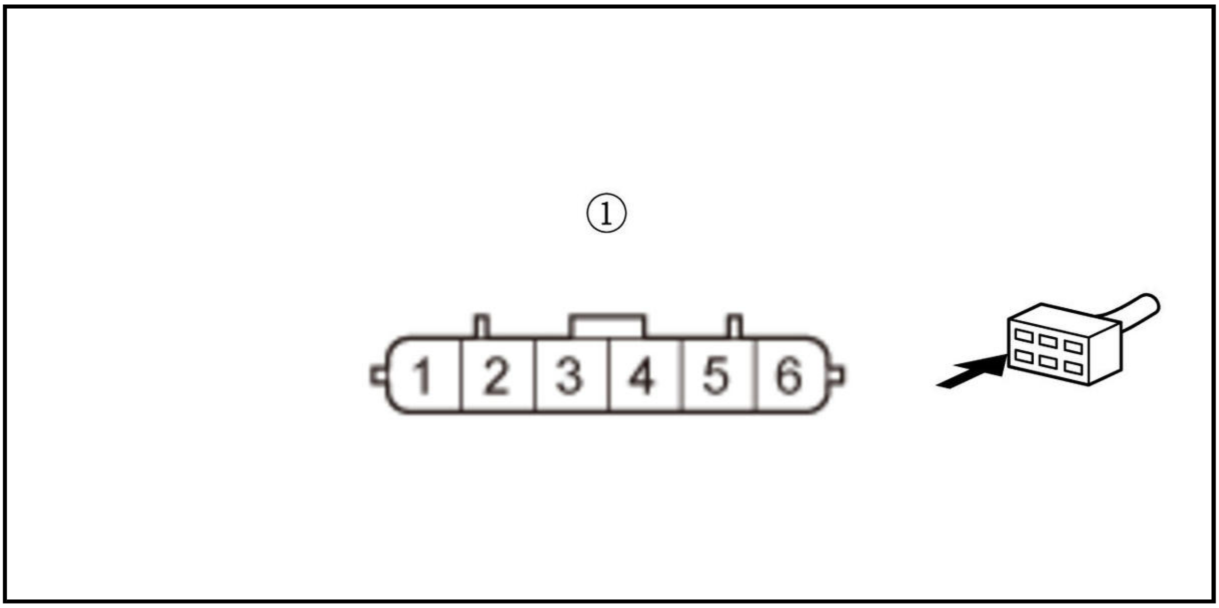
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	APP sensor 6P connector (female terminals) No. 6: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
APP SENSOR A	Less than 0.2	V	B	B

Do the current condition (s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the APP sensor .

6. Open wire check (VCC4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

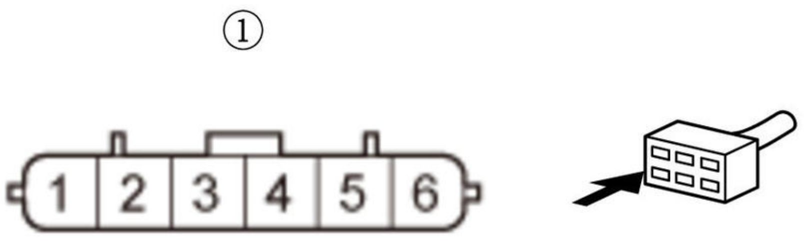
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected

B	APP sensor 6P connector No. 4: jumped to body ground
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 45**
Test point 2	Body ground

Is there continuity?

YES

The VCC4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC4 wire between the PCM (A45) and the APP sensor.

DTC P2122 (2.4 L ENGINE) (2017 2018 2019)

DTC P2122 : APP Sensor A (TP Sensor D) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2122 APP Sensor A (TP Sensor D) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR A	Less than 0.2	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC4 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

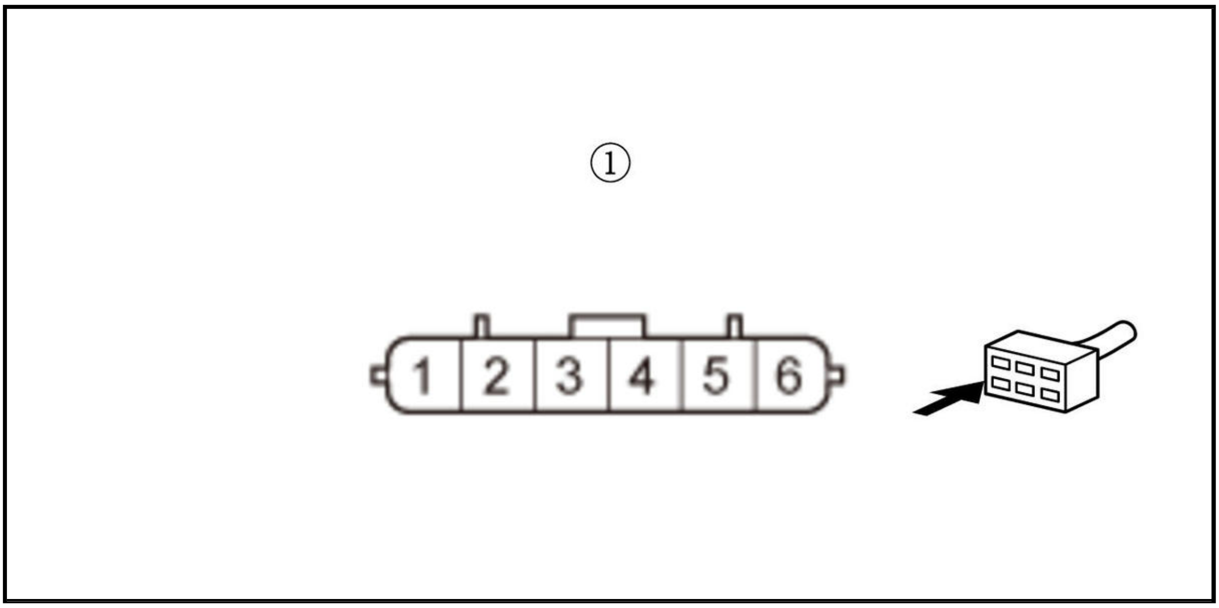
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Go to step 3.

NO

Go to step 6.

3. Shorted wire check (APS1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

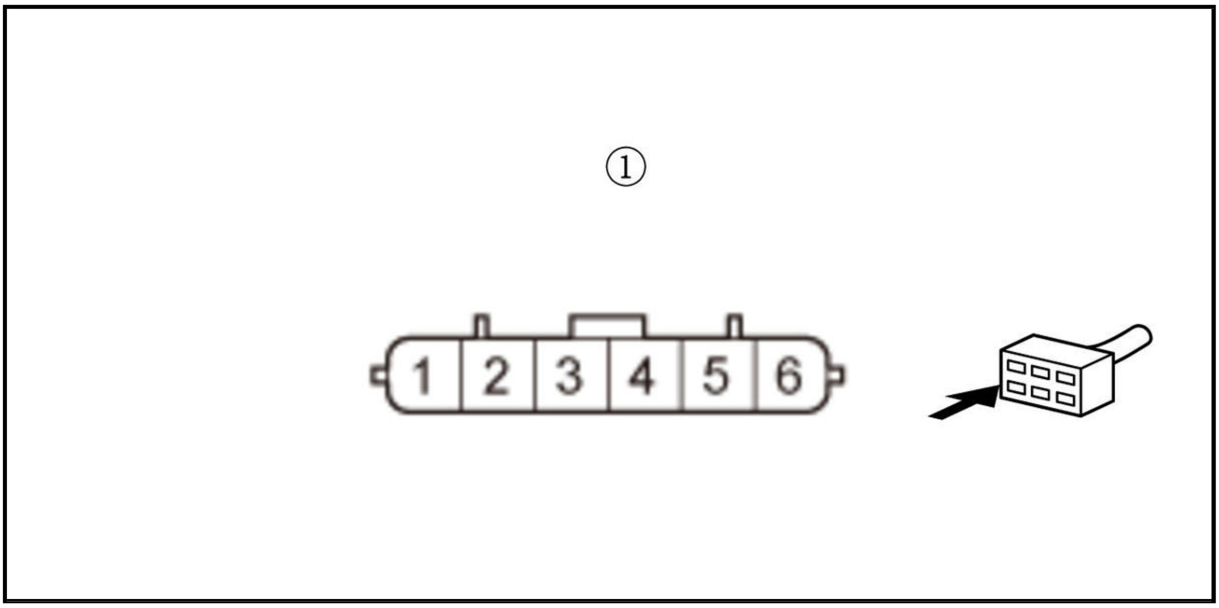
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the APS1 wire between the PCM (A45) and the APP sensor.

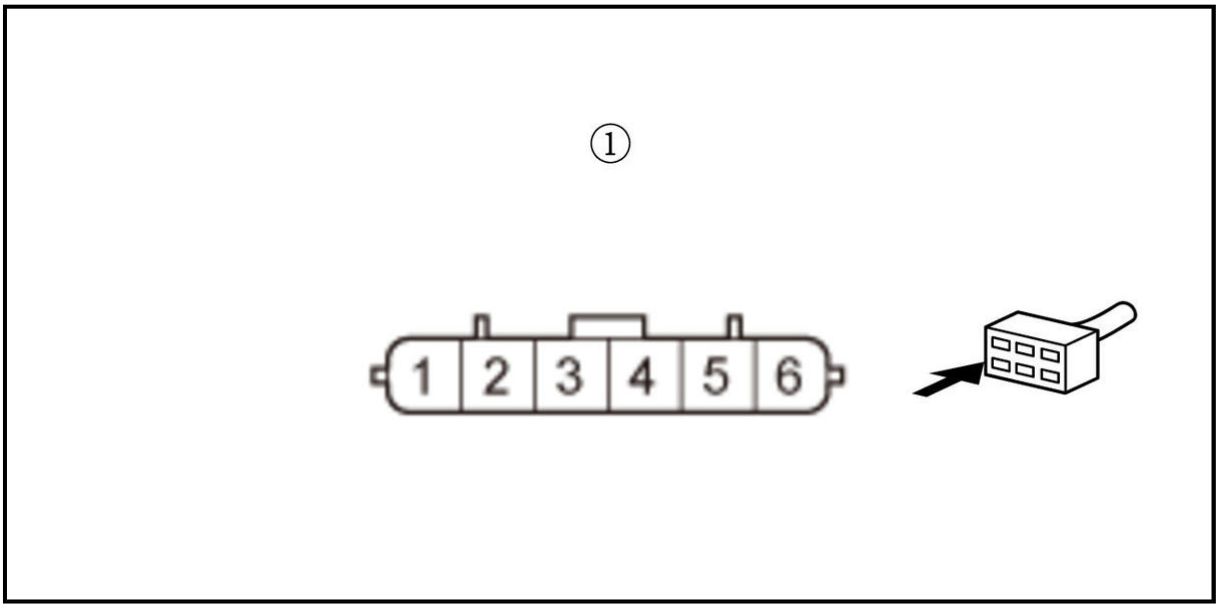
NO

The APS1 wire is not shorted. Go to step 4.

4. Open wire check (APS1 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 6: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 6: jumped to body ground

B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 45**
Test point 2	Body ground

Is there continuity?

YES

The APS1 wire is OK. Go to step 5.

NO

Repair an open in the APS1 wire between the PCM (A45) and the APP sensor.

5. PCM internal circuit check

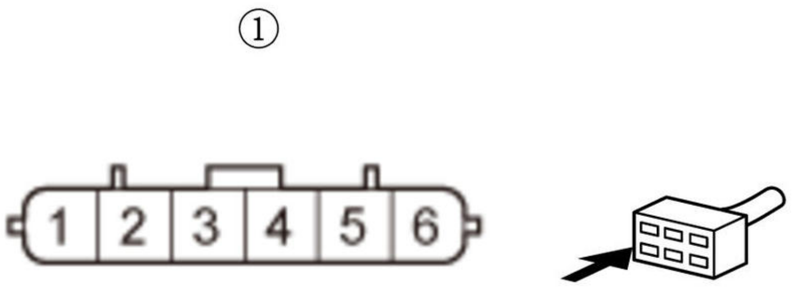
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (51P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	APP sensor 6P connector (female terminals) No. 6: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
APP SENSOR A	Less than 0.2	V	B	B

Do the current condition (s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Replace the APP sensor .

6. Open wire check (VCC4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

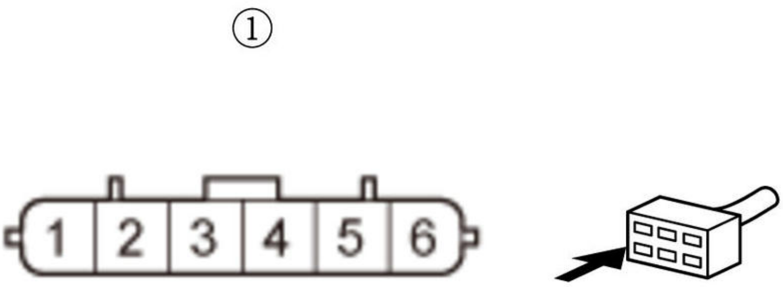
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 4: jumped to body ground
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 31**

Test point 2	Body ground

Is there continuity?

YES

The VCC4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VCC4 wire between the PCM (A31) and the APP sensor.

DTC P2123 (1.5 L ENGINE)

DTC P2123 : APP Sensor A (TP Sensor D) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2123 APP Sensor A (TP Sensor D) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR A	More than 4.9	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

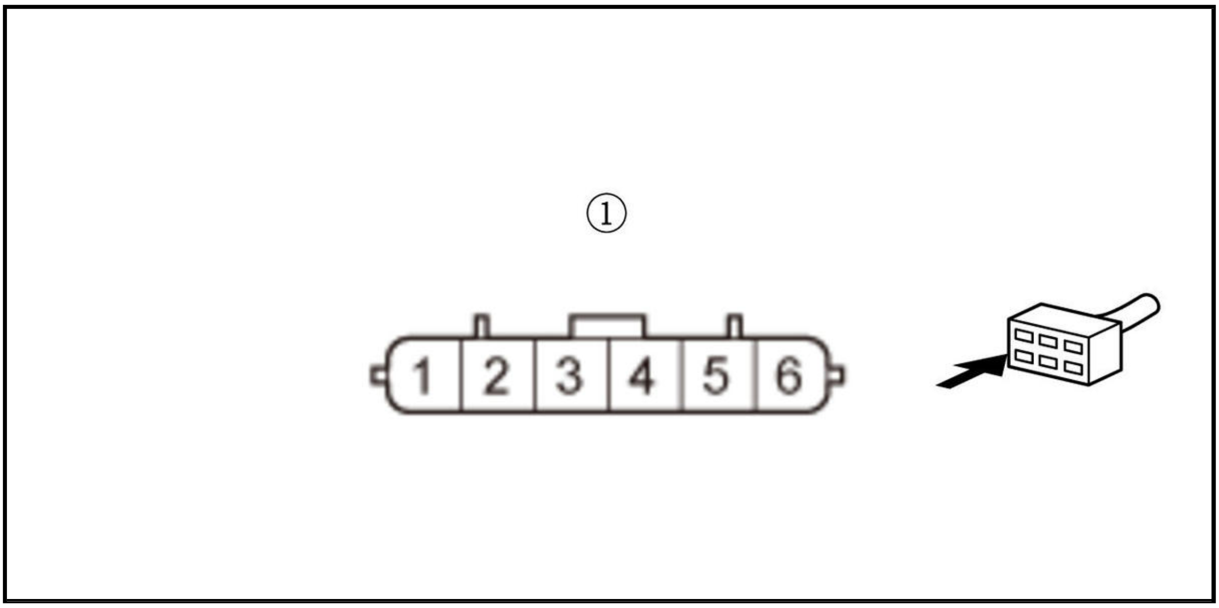
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Replace the APP sensor .

NO

Go to step 3.

3. Open wire check (SG4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

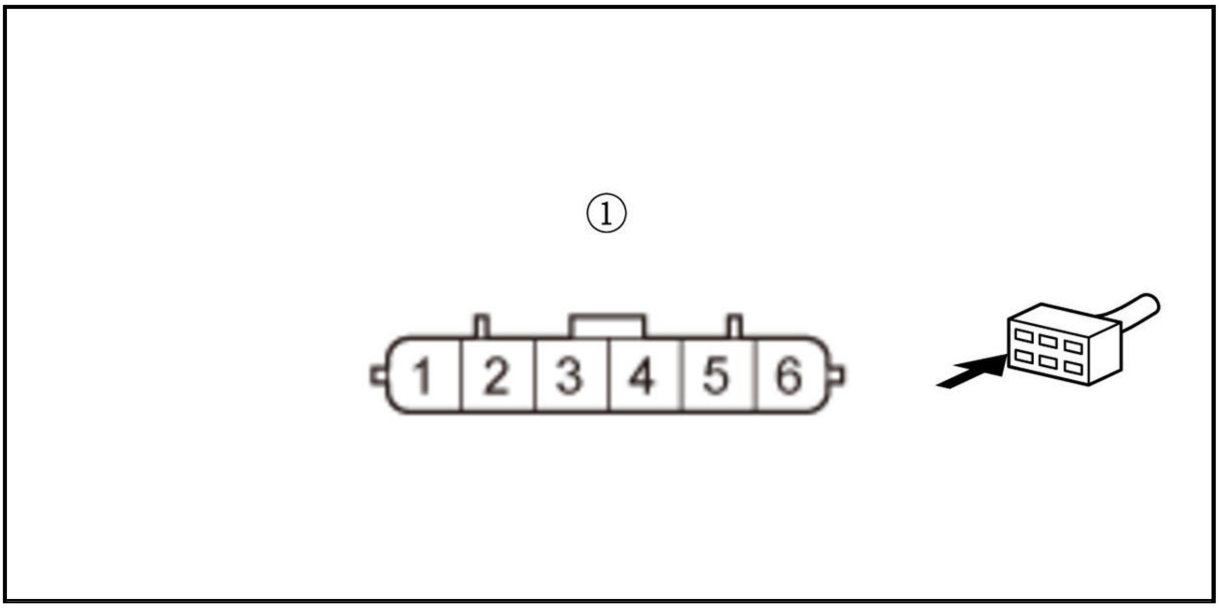
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 5: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 5: jumped to body ground
B	PCM connector A (50P): disconnected
Test point 1	PCM connector A (50P) No. 46
Test point 2	Body ground

Is there continuity?

YES

The SG4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the SG4 wire between the PCM (A46) and the APP sensor.

DTC P2123 (2.4 L ENGINE) (2017 2018 2019)

DTC P2123 : APP Sensor A (TP Sensor D) Circuit High Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2123 APP Sensor A (TP Sensor D) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
APP SENSOR A	More than 4.9	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

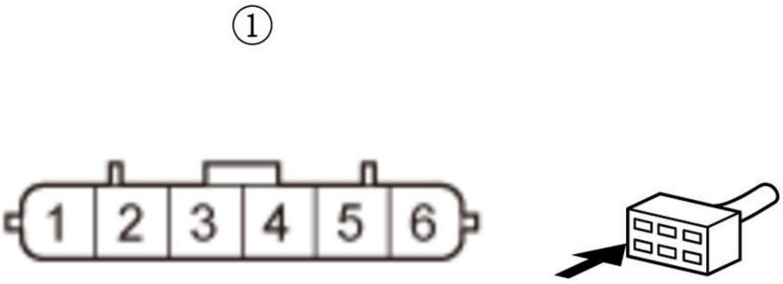
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Replace the APP sensor .

NO

Go to step 3.

3. Open wire check (SG4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

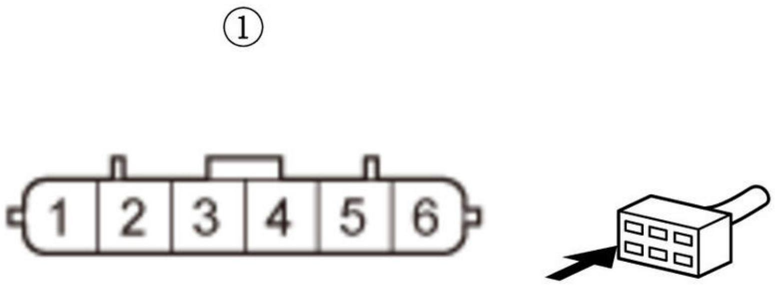
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 5: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 5: jumped to body ground
B	PCM connector A (51P): disconnected
Test point 1	PCM connector A (51P) No. 30
Test point 2	Body ground

Is there continuity?

YES

The SG4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Repair an open in the SG4 wire between the PCM (A30) and the APP sensor.

DTC P2126 : APP Sensor B (TP Sensor E) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2126 APP Sensor B (TP Sensor E) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	Less than 0.19	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Go to step 2.

2. Problem verification 2

   -1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	More than 2.62	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 8.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (VCC5 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

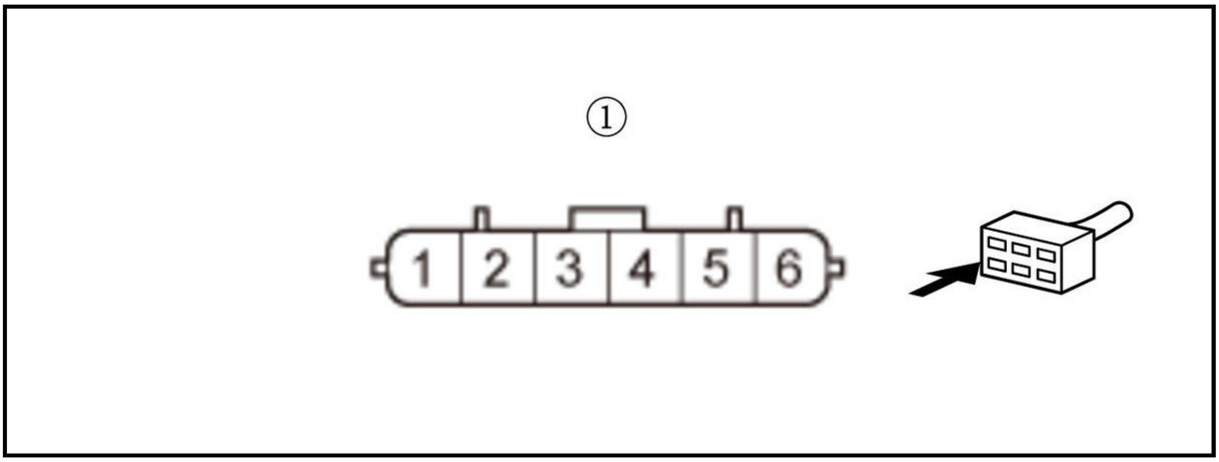
   -2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (APS2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

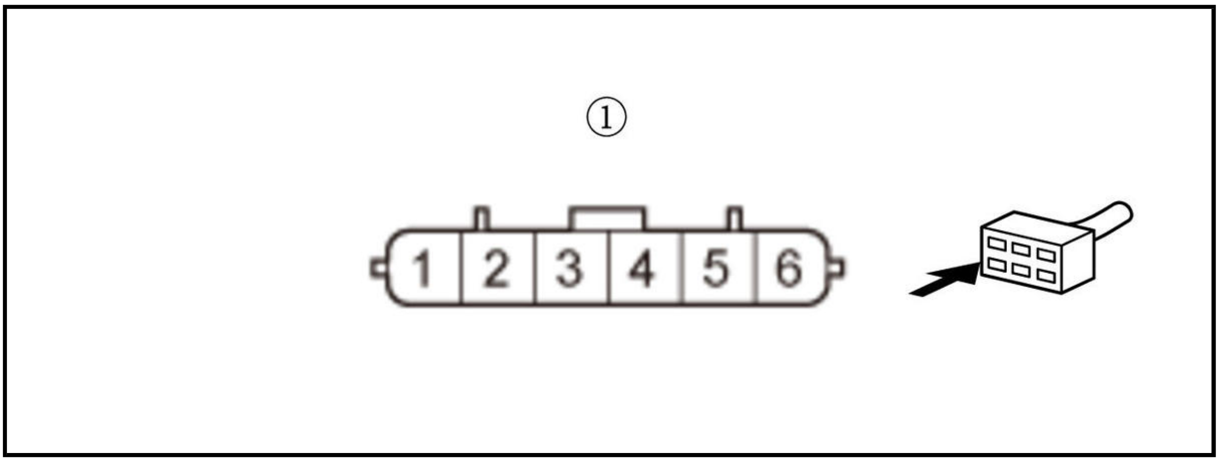
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the APS2 wire between the PCM (A34) and the APP sensor.

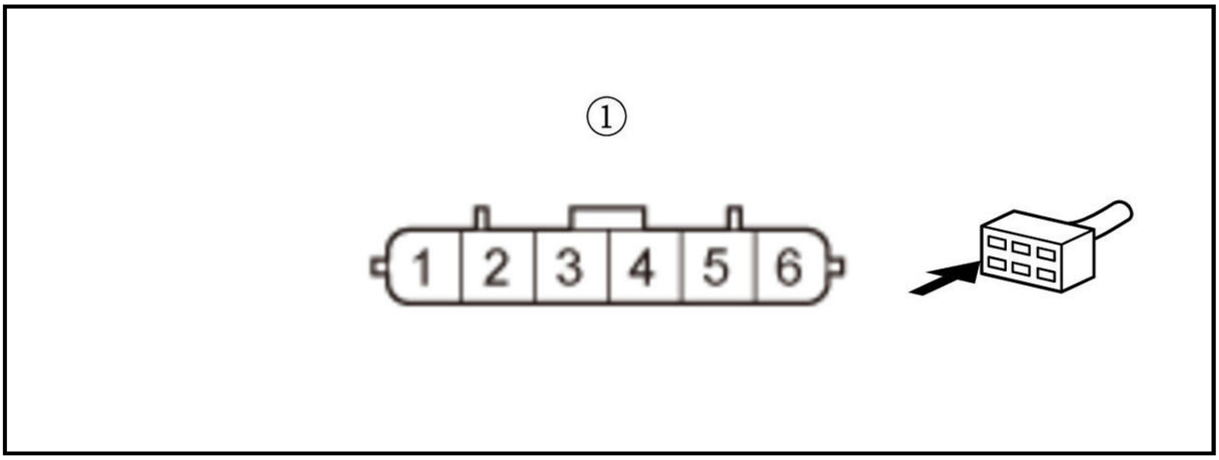
NO

The APS2 wire is not shorted. Go to step 5.

5. Open wire check (APS2 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 3: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 3: jumped to body ground
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 34**
Test point 2	Body ground

Is there continuity?

YES

The APS2 wire is OK. Go to step 6.

NO

Repair an open in the APS2 wire between the PCM (A34) and the APP sensor.

6. PCM internal circuit check

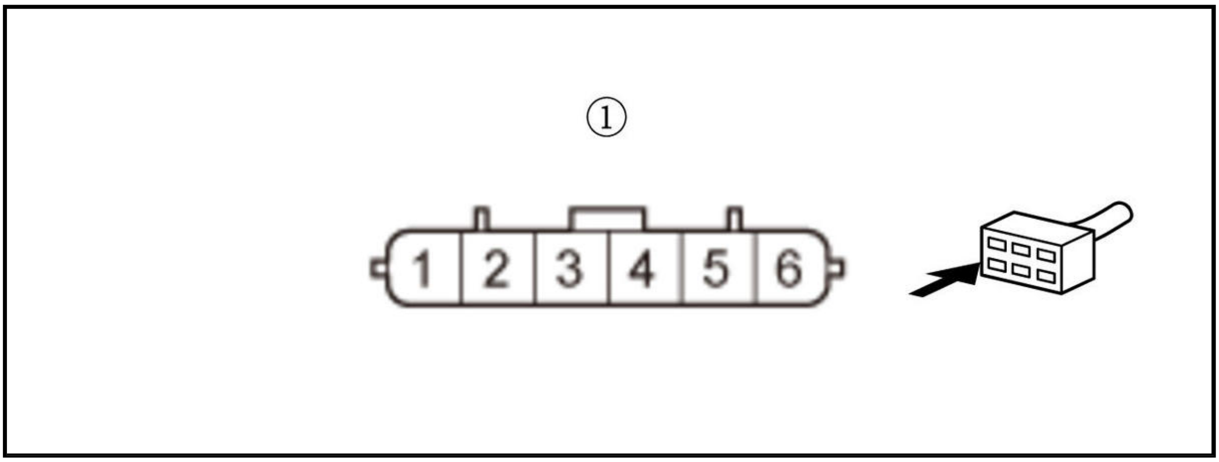
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	APP sensor 6P connector (female terminals) No. 3: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	Less than 0.19	V	B	B

Do the current condition (s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the accelerator pedal module .

7. Open wire check (VCC5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

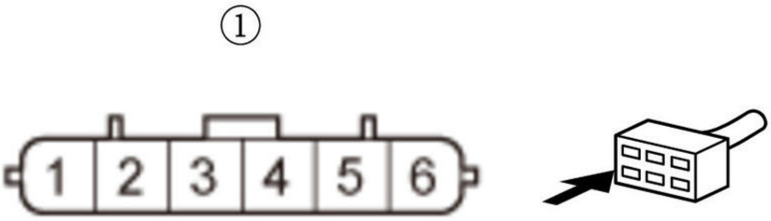
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 1: jumped to body ground
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 44**
Test point 2	Body ground

Is there continuity?

YES

The VCC5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC5 wire between the PCM (A44) and the APP sensor.

8. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

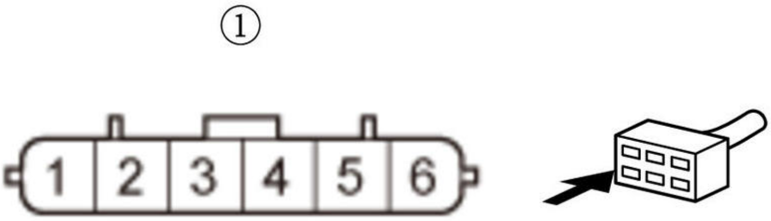
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Replace the accelerator pedal module .

NO

Go to step 9.

9. Open wire check (SG5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

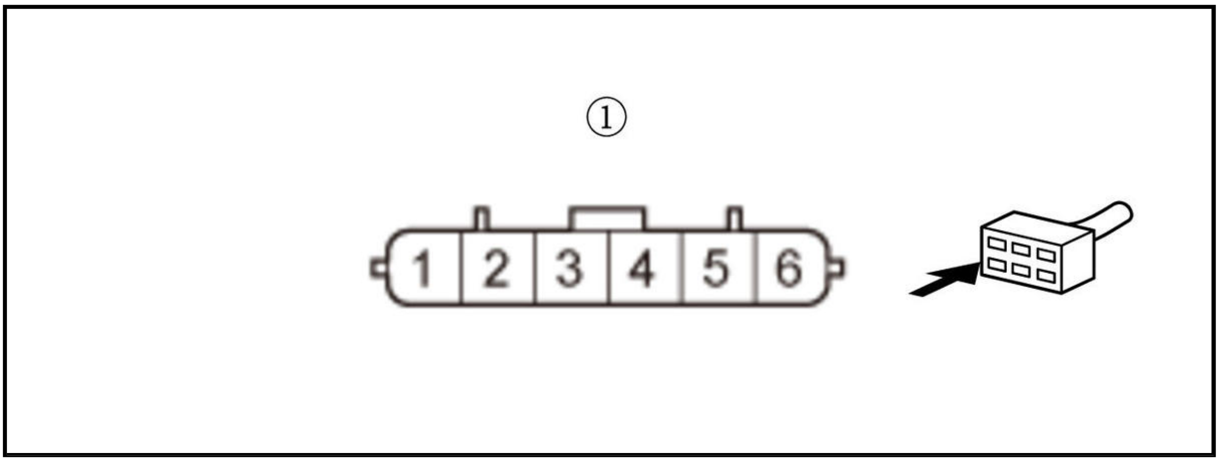
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 2: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 2: jumped to body ground
Test point 1	**PCM connector A (50P) No. 43**
Test point 2	Body ground

Is there continuity?

YES

The SG5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG5 wire between the PCM (A43) and the APP sensor.

DTC P2126 (2.4 L ENGINE) (2018 2019)

DTC P2126 : APP Sensor B (TP Sensor E) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2126 APP Sensor B (TP Sensor E) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	Less than 0.22	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	More than 2.54	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 8.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (VCC5 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

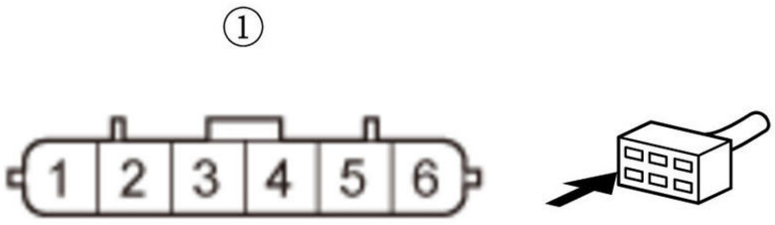
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (APS2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

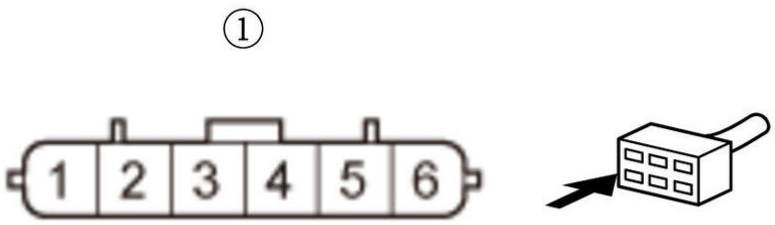
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the APS2 wire between the PCM (A38) and the APP sensor.

NO

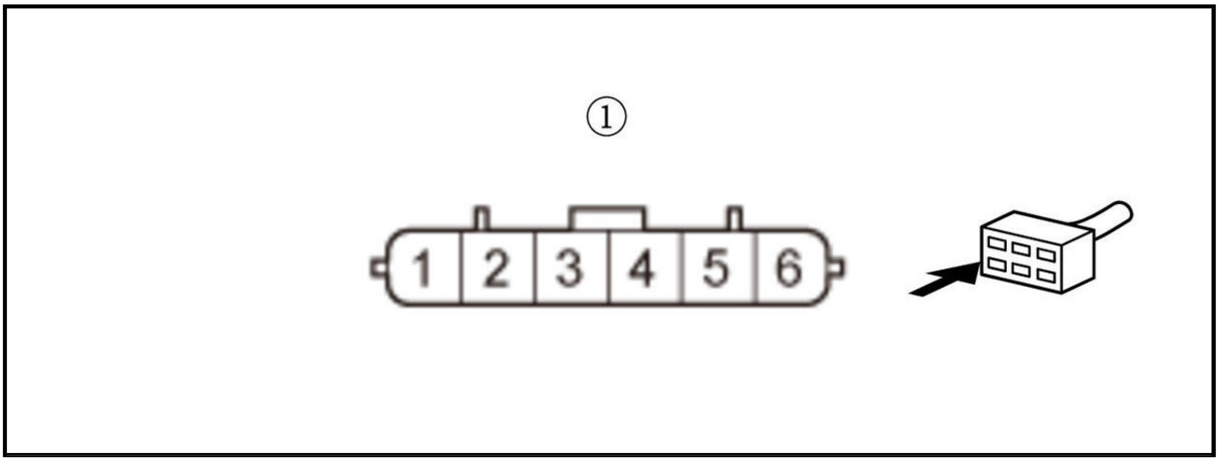
The APS2 wire is not shorted. Go to step 5.

5. Open wire check (APS2 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 3: ①

Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 3: jumped to body ground
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 38**
Test point 2	Body ground

Is there continuity?

YES

The APS2 wire is OK. Go to step 6.

NO

Repair an open in the APS2 wire between the PCM (A38) and the APP sensor.

6. PCM internal circuit check

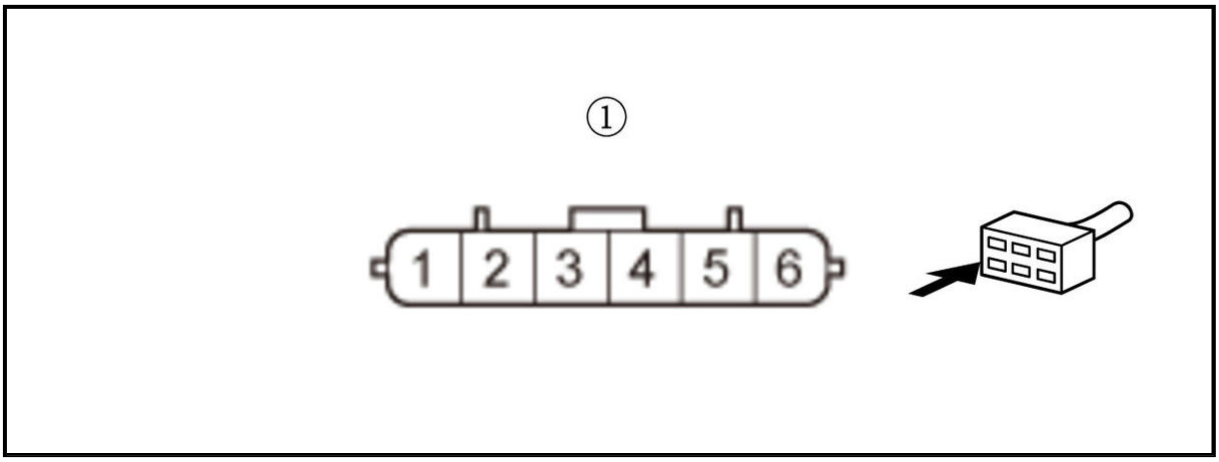
-1. Reconnect the following connector.

PCM connector A (51P)

-2. Remove the jumper wire from the APP sensor 6P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	APP sensor 6P connector (female terminals) No. 3: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
APP SENSOR B	Less than 0.22	V	B	B

Do the current condition (s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the accelerator pedal module .

7. Open wire check (VCC5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

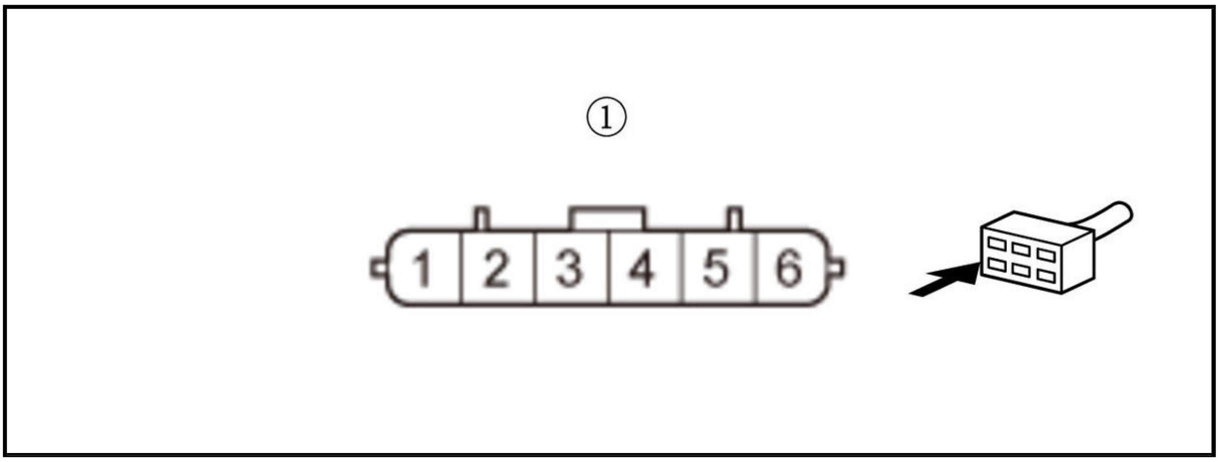
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 1: jumped to body ground
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 40**
Test point 2	Body ground

Is there continuity?

YES

The VCC5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC5 wire between the PCM (A40) and the APP sensor.

8. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

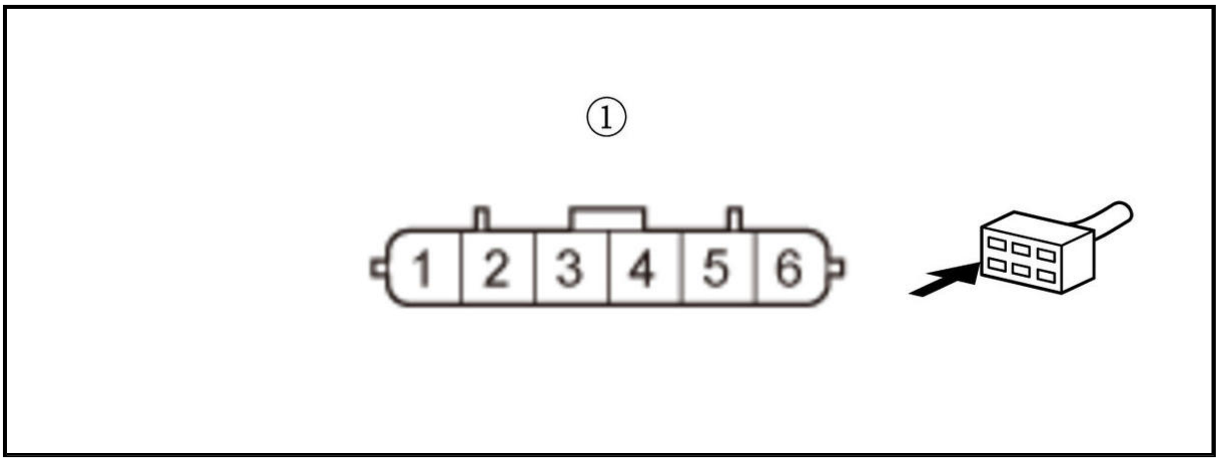
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Replace the accelerator pedal module .

NO

Go to step 9.

9. Open wire check (SG5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

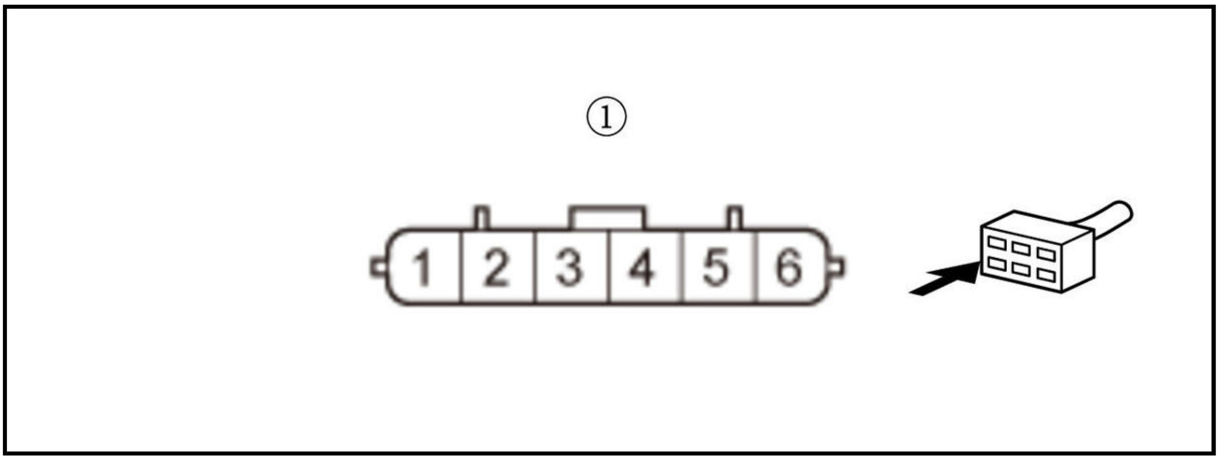
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 2: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (51P): disconnected

B	APP sensor 6P connector No. 2: jumped to body ground
Test point 1	PCM connector A (51P) No. 39
Test point 2	Body ground

Is there continuity?

YES

The SG5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG5 wire between the PCM (A39) and the APP sensor.

DTC P2127 (1.5 L ENGINE)

DTC P2127 : APP Sensor B (TP Sensor E) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2127 APP Sensor B (TP Sensor E) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	Less than 0.2	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC5 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

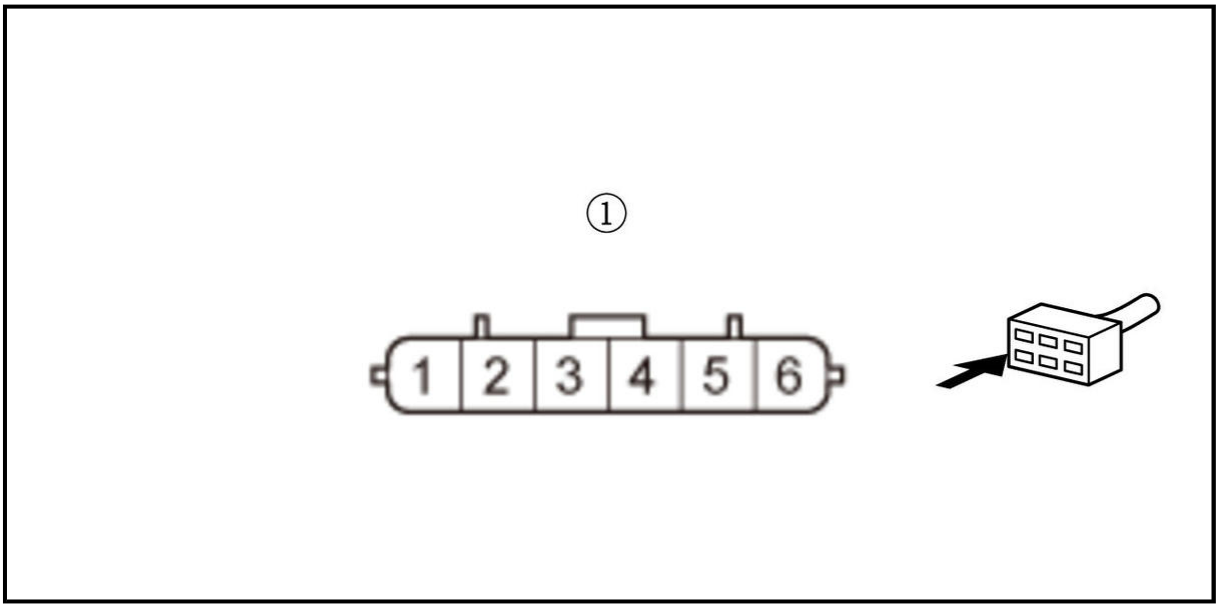
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Go to step 3.

NO

Go to step 6.

3. Shorted wire check (APS2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

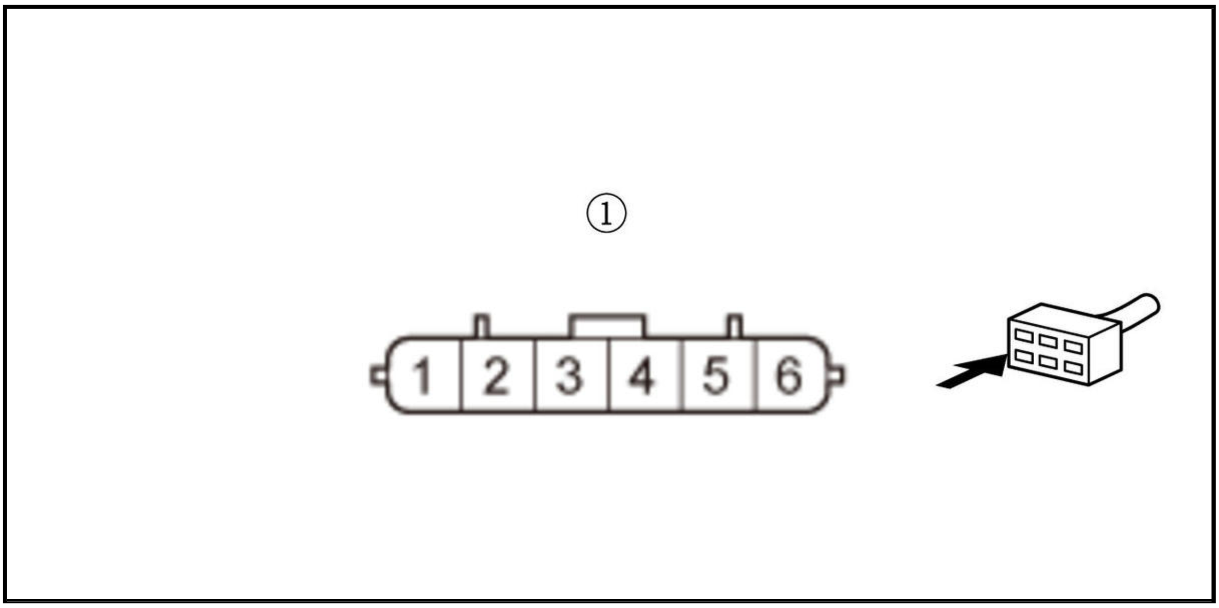
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the APS2 wire between the PCM (A34) and the APP sensor.

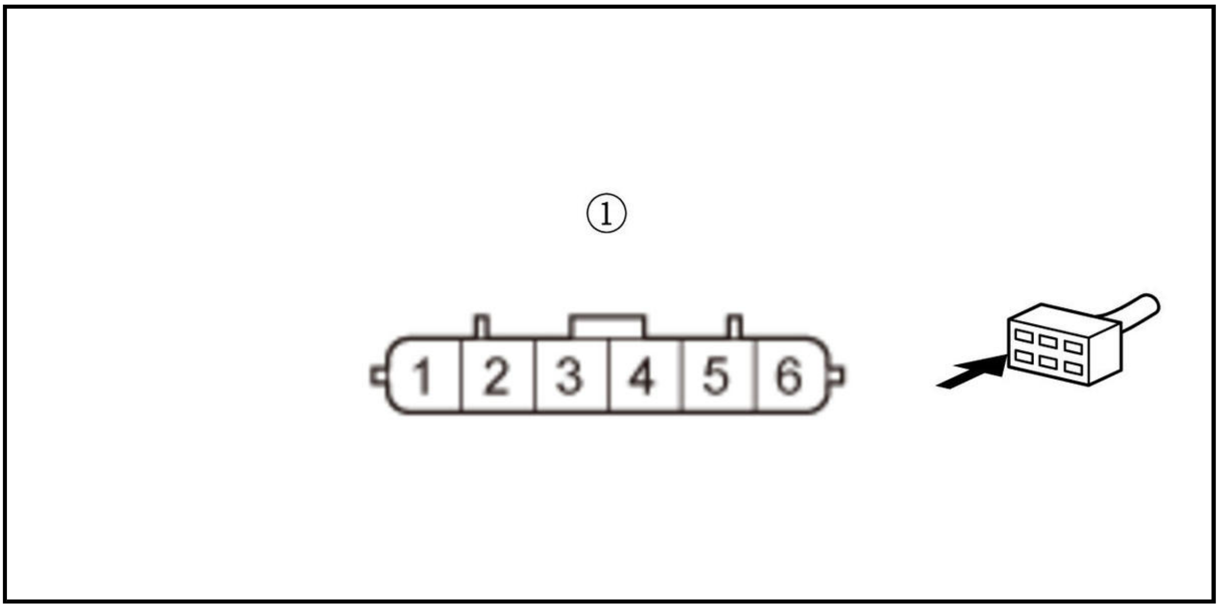
NO

Go to step 4.

4. Open wire check (APS2 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 3: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 3: jumped to body ground

B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 34**
Test point 2	Body ground

Is there continuity?

YES

Go to step 5.

NO

Repair an open in the APS2 wire between the PCM (A34) and the APP sensor.

5. PCM internal circuit check

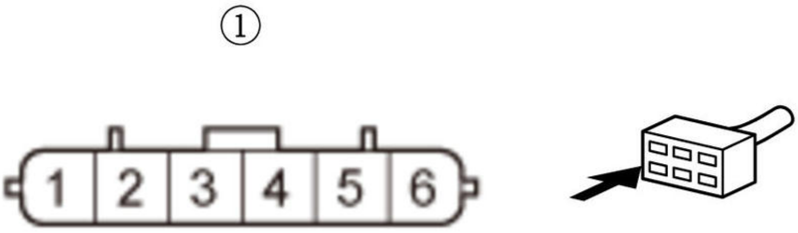
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	APP sensor 6P connector (female terminals) No. 3: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	Less than 0.2	V	B	B

Do the current condition (s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the APP sensor .

6. Open wire check (VCC5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

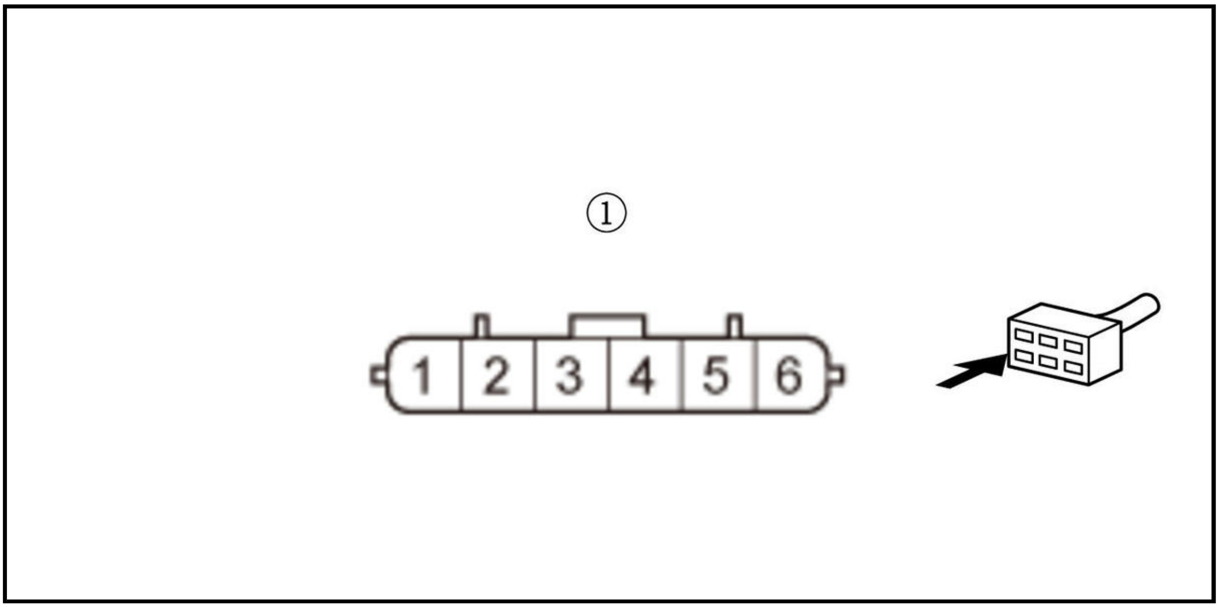
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected

B	APP sensor 6P connector No. 1: jumped to body ground
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 44**
Test point 2	Body ground

Is there continuity?

YES

The VCC5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC5 wire between the PCM (A44) and the APP sensor.

DTC P2127 (2.4 L ENGINE) (2017 2018 2019)

DTC P2127 : APP Sensor B (TP Sensor E) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2127 APP Sensor B (TP Sensor E) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	Less than 0.2	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC5 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

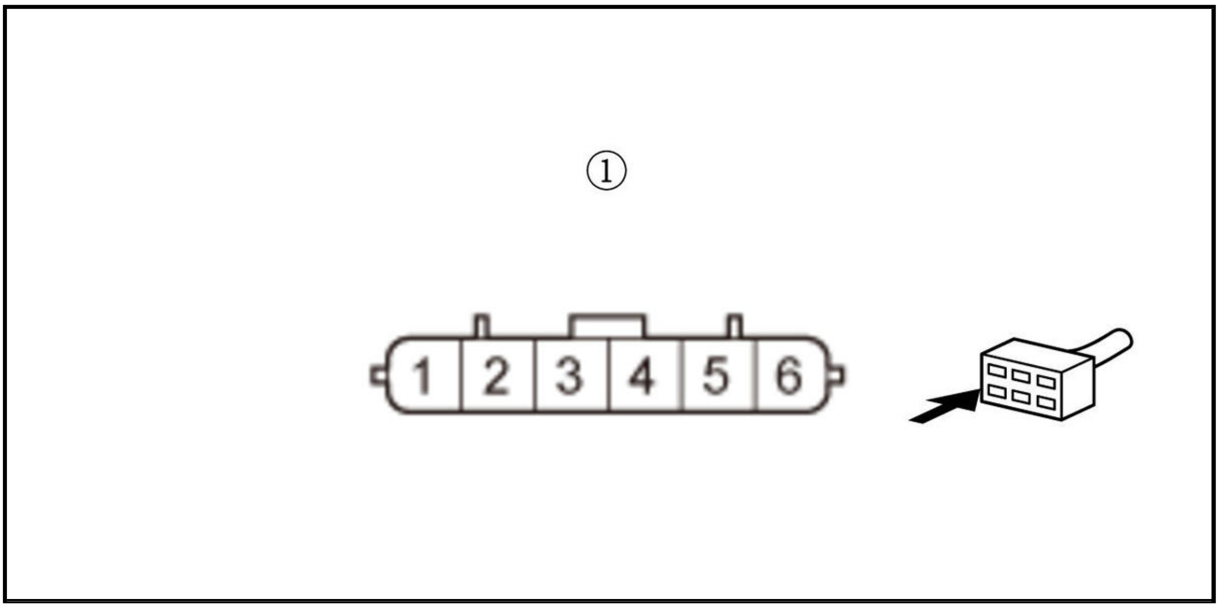
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Go to step 3.

NO

Go to step 6.

3. Shorted wire check (APS2 line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

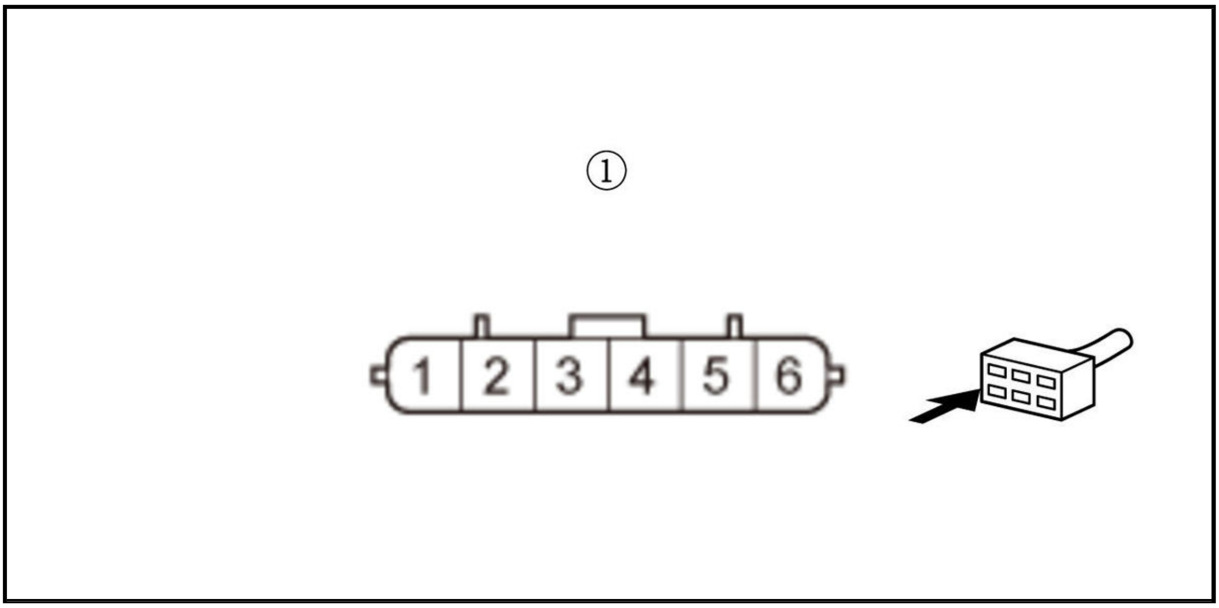
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (51P)

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the APS2 wire between the PCM (A38) and the APP sensor.

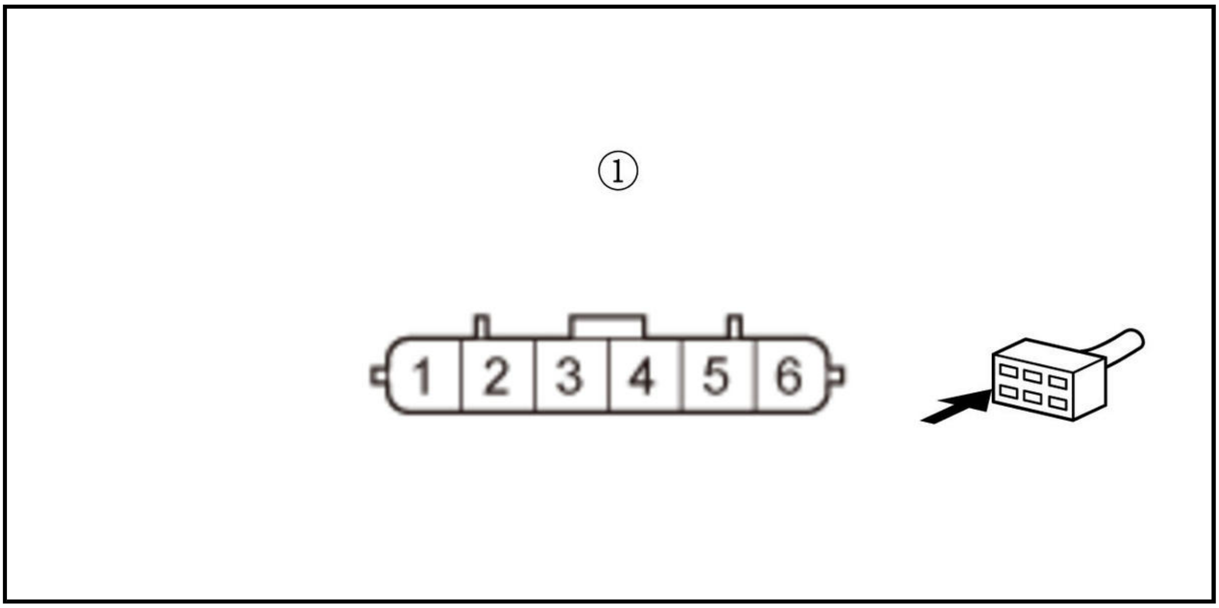
NO

The APS2 wire is not shorted. Go to step 4.

4. Open wire check (APS2 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 3: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 3: jumped to body ground

B	PCM connector A (51P): disconnected
Test point 1	PCM connector A (51P) No. 38
Test point 2	Body ground

Is there continuity?

YES

The APS2 wire is OK. Go to step 5.

NO

Repair an open in the APS2 wire between the PCM (A38) and the APP sensor.

5. PCM internal circuit check

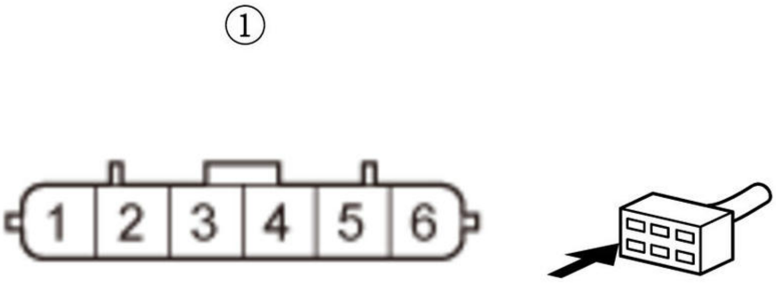
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (51P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	APP sensor 6P connector (female terminals) No. 3: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	Less than 0.2	V	B	B

Do the current condition (s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Replace the APP sensor .

6. Open wire check (VCC5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

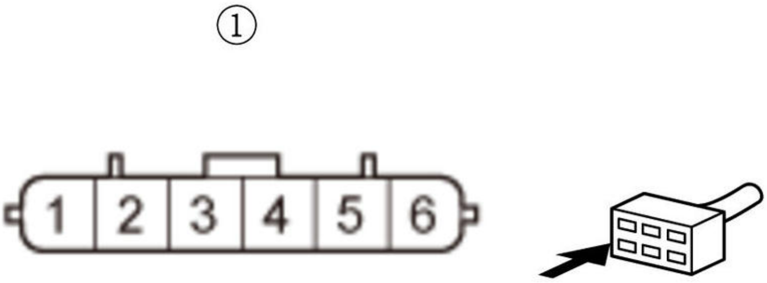
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 1: jumped to body ground
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 40**

Test point 2	Body ground

Is there continuity?

YES

The VCC5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VCC5 wire between the PCM (A40) and the APP sensor.

DTC P2128 (1.5 L ENGINE)

DTC P2128 : APP Sensor B (TP Sensor E) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2128 APP Sensor B (TP Sensor E) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	More than 4.0	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

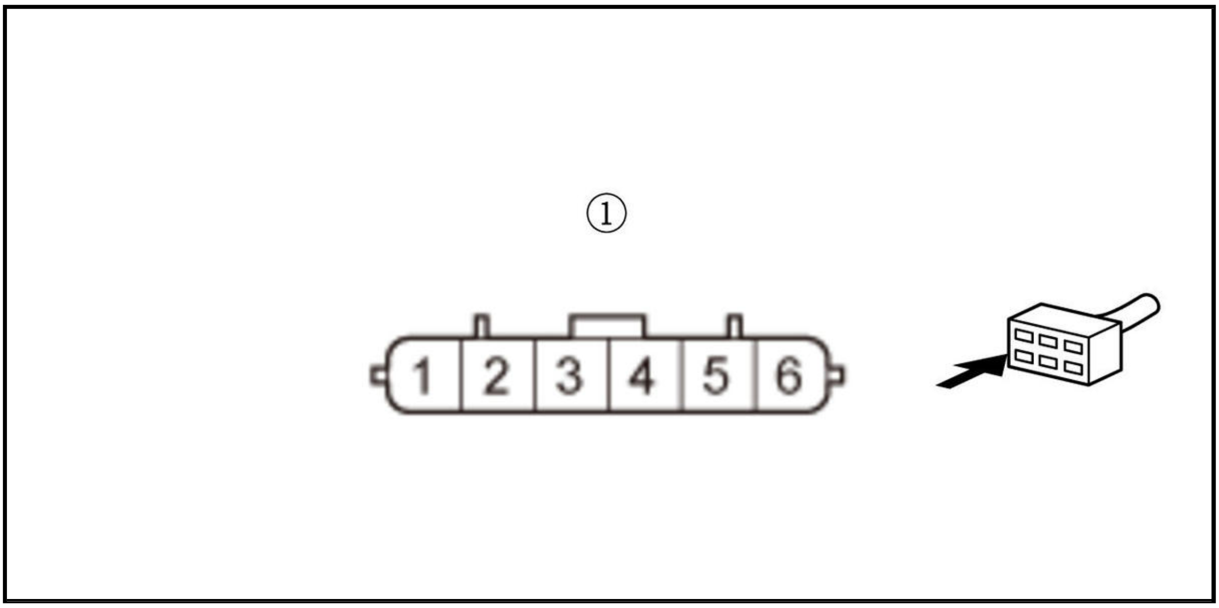
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Replace the APP sensor .

NO

Go to step 3.

3. Open wire check (SG5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

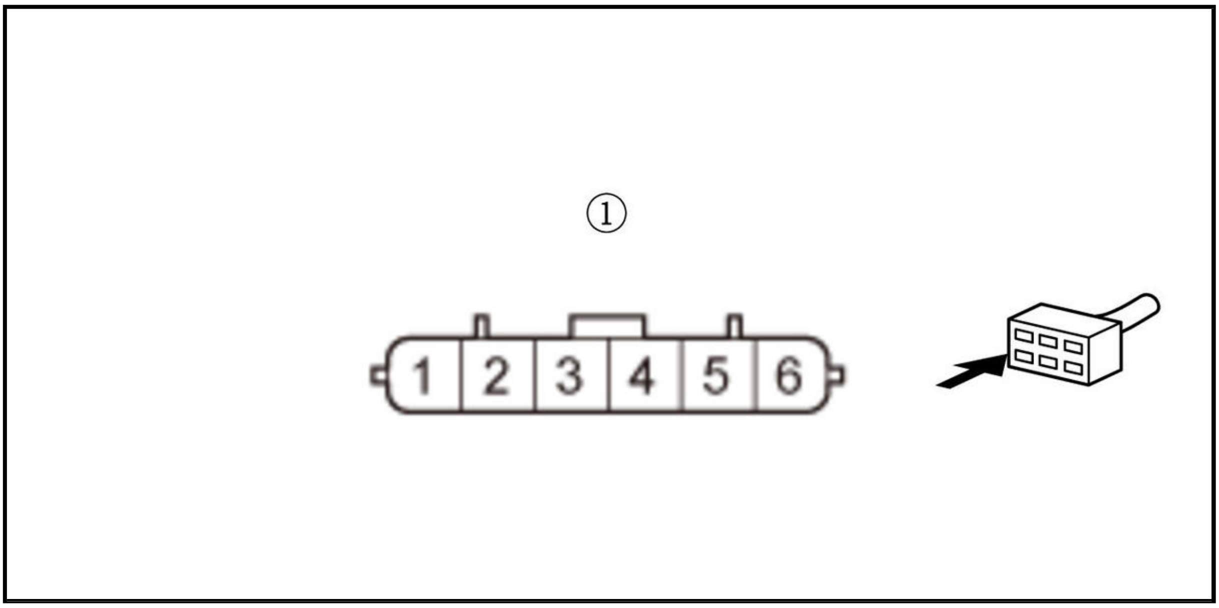
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 2: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 2: jumped to body ground
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 43**
Test point 2	Body ground

Is there continuity?

YES

The SG5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG5 wire between the PCM (A43) and the APP sensor.

DTC P2128 (2.4 L ENGINE) (2017 2018 2019)

DTC P2128 : APP Sensor B (TP Sensor E) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2128 APP Sensor B (TP Sensor E) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP SENSOR B	More than 4.0	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

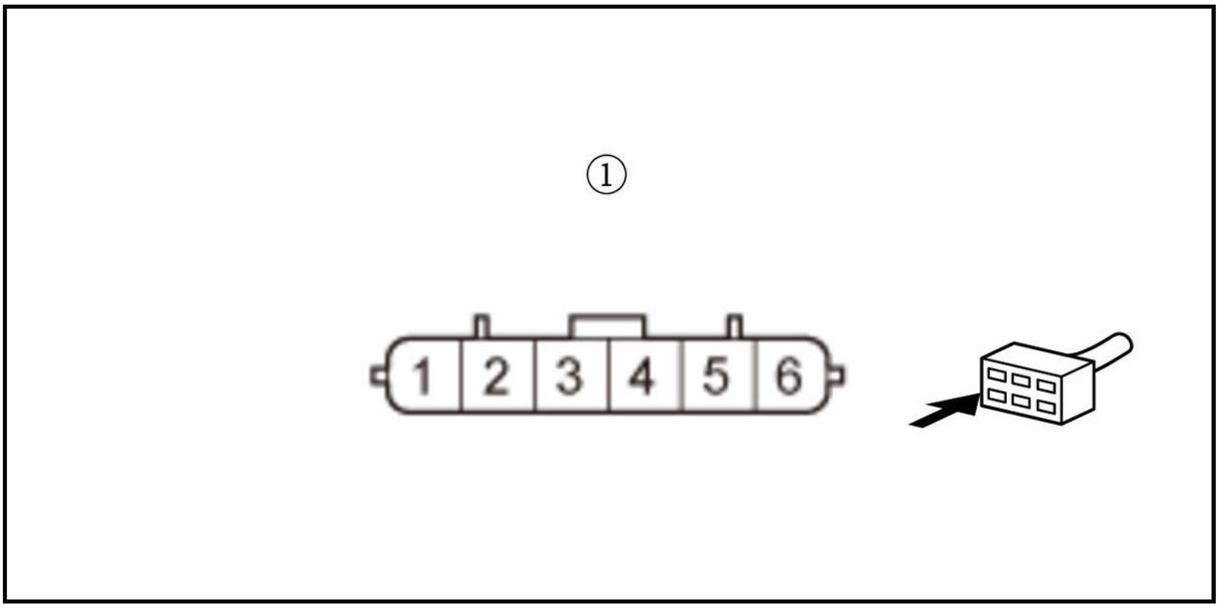
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Replace the APP sensor .

NO

Go to step 3.

3. Open wire check (SG5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

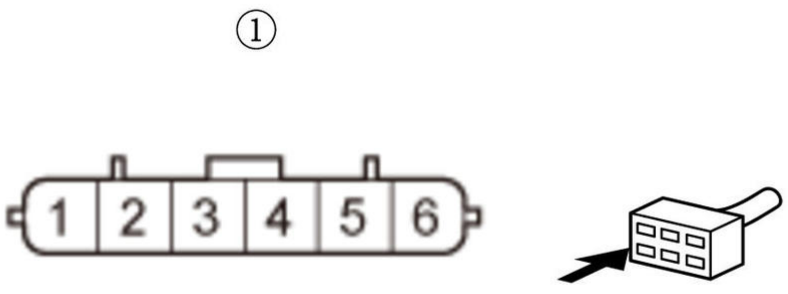
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 2: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	APP sensor 6P connector No. 2: jumped to body ground
B	PCM connector A (51P): disconnected
Test point 1	PCM connector A (51P) No. 39
Test point 2	Body ground

Is there continuity?

YES

The SG5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

NO

Repair an open in the SG5 wire between the PCM (A39) and the APP sensor.

DTC P2135 (1.5 L ENGINE)

DTC P2135 : TP Sensor A/B Incorrect Voltage Correlation

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2135 TP Sensor A/B Incorrect Voltage Correlation	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the ETCS TEST in the INSPECTION MENU with the HDS.

   ETCS TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2135 TP Sensor A/B Incorrect Voltage Correlation	B	B

   Is DTC P2135 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body operation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Disconnect the throttle body duct from the throttle body** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode.

   -6. Turn the vehicle to the ON mode.

-7. Visually check the throttle valve operation.

Does the valve temporarily move to its fully closed position?

YES

Replace the throttle body .

NO

Go to step 3.

3. Determine possible failure area (PCM, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 50**
Test point 2	**PCM connector E (80P) No. 51**

Is there continuity?

YES

Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Shorted wire check (THL1 line to THL2 line)

-1. Disconnect the following connector.

Throttle body 6P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	**PCM connector E (80P) No. 50**
Test point 2	**PCM connector E (80P) No. 51**

Is there continuity?

YES

Repair a short in the THL1 wire to the THL2 wire between the PCM connector terminals E50 (THL1 line) and E51 (THL2 line).

NO

The THL1 wire and the THL2 wire are OK. **Replace the throttle body** .

DTC P2135 (2.4 L ENGINE) (2017 2018 2019)

DTC P2135 : TP Sensor A/B Incorrect Voltage Correlation

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2135 TP Sensor A/B Incorrect Voltage Correlation	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the ETCS TEST in the INSPECTION MENU with the HDS.

   ETCS TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2135 TP Sensor A/B Incorrect Voltage Correlation	B	B

   Is DTC P2135 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body operation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Disconnect the intake air duct from the throttle body** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

-5. Visually check the throttle valve operation.

Does the valve temporarily move to its fully closed position?

YES

Replace the throttle body .

NO

Go to step 3.

3. Determine possible failure area (PCM, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 46**
Test point 2	**PCM connector B (51P) No. 47**

Is there continuity?

YES

Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

4. Shorted wire check (THL1 line to THL2 line)

-1. Disconnect the following connector.

Throttle body 6P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	**PCM connector B (51P) No. 46**
Test point 2	**PCM connector B (51P) No. 47**

Is there continuity?

YES

Repair a short in the THL1 wire to the THL2 wire between PCM connector terminals B46 (THL1 line) and B47 (THL2 line).

NO

The THL1 and THL2 wires are OK. Replace the throttle body .

DTC P2138 (1.5 L ENGINE)

DTC P2138 : APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2138 APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Press the accelerator pedal to the floor.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2138 APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation	B	B

Is DTC P2138 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Determine possible failure area (APP sensor, others)

   -1. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
APP SENSOR A	B	B
APP SENSOR B	B	B

Are they the same voltage?

YES

Go to step 3.

NO

Replace the APP sensor .

3. Determine possible failure area (PCM, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 32**
Test point 2	**PCM connector A (50P) No. 34**

Is there continuity?

YES

Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

4. Shorted wire check (APS1 line to APS2 line)

-1. Disconnect the following connector.

APP sensor 6P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector: disconnected
Test point 1	**PCM connector A (50P) No. 32**
Test point 2	**PCM connector A (50P) No. 34**

Is there continuity?

YES

Repair a short in the APS1 wire to the APS2 wire between the PCM connector terminals A32 (APS1 line) and A34 (APS2 line).

NO

The APS1 wire and the APS2 wire are OK. **Replace the APP sensor** .

DTC P2138 (2.4 L ENGINE) (2017 2018 2019)

DTC P2138 : APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2138 APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Press the accelerator pedal to the floor.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2138 APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation	B	B

   Is DTC P2138 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (short in APS lines, others)

   -1. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
APP SENSOR A	B	B
APP SENSOR B	B	B

   Are they the same voltage?

   YES

   Go to step 3.

   NO

Replace the APP sensor .

3. Determine possible failure area (PCM, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 45**
Test point 2	**PCM connector A (51P) No. 38**

Is there continuity?

YES

Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

4. Shorted wire check (APS1 line to APS2 line)

   -1. Disconnect the following connector.

APP sensor 6P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
B	APP sensor 6P connector: disconnected
Test point 1	**PCM connector A (51P) No. 45**
Test point 2	**PCM connector A (51P) No. 38**

Is there continuity?

YES

Repair a short in the APS1 wire to the APS2 wire between PCM connector terminals A45 (APS1 line) and A38 (APS2 line).

NO

The APS1 and APS2 wires are OK. **Replace the APP sensor** .

DTC P2148 (1.5 L ENGINE)

DTC P2148 : Injector Power Supply Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2148 Injector Power Supply Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2148 Injector Power Supply Circuit Malfunction	B	B

   Is DTC P2148 indicated?

   YES

   The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

   NO

   Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2175 (1.5 L ENGINE) (2020 2021)

DTC P2175 : Throttle Actuator Control System Low Air Flow Detected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2175 Throttle Actuator Control System Low Air Flow Detected	B	B

DTC (PGM-FI)

1. PGM-FI system check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any Pending or Confirmed DTCs other than P2175 indicated?

   YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Intake air duct visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for poor connection or blockage at the intake air duct.

Is it OK?

YES

Go to step 3.

NO

Reconnect or repair the intake air duct, or **replace it if needed** .

3. Air cleaner housing visual check

-1. **Check for poor connection or blockage at the air cleaner housing** .

Is it OK?

YES

Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. **Check for dirt or debris on the air cleaner element** .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	**Current conditions**	
	Values	**Unit**
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Start the engine, and let it idle for 10 seconds or more.

-5. Monitor the OBD STATUS for DTC P2175 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2175 Throttle Actuator Control System Low Air Flow Detected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the throttle body, MAF sensor/IAT sensor 1, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-2 and recheck.

6. Throttle body test

-1. Select the ETCS (TAC) TEST in the Function Test MENU with the HDS.

ETCS (TAC) TEST

Is the THROTTLE ACTUATOR CONTROL VALVE normal?

YES

Go to step 7.

NO

Replace the throttle body .

7. Throttle body visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Disconnect intake air duct from the throttle body** .

-3. Check for dirt, carbon, or damage in the throttle bore.

Is there dirt, carbon, or damage in the throttle bore?

YES

If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

NO

The throttle body is OK. Go to step 8.

8. MAP sensor performance check 1

-1. Turn the vehicle to the ON mode.

-2. Compare the value of the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B
TC Boost Pressure	B	B

Is the difference in value between the sensors 26.7 kPa (7.9 inHg, 200 mmHg) or more?

YES

Replace the MAP sensor .

NO

Go to step 9.

9. MAP sensor performance check 2

-1. Note the value of MAP Sensor (Hi Res) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

-2. Start the engine, and let it idle.

-3. Check the MAP Sensor (Hi Res) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

Does the MAP Sensor (Hi Res) change 0.67 kPa (0.2 inHg, 5 mmHg) or more?

YES

Go to step 10.

NO

Replace the MAP sensor .

10. Turbocharger boost sensor performance check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Compare the value of the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
TC BOOST PRESSURE	B	B
BARO SENSOR	B	B

Is the difference in value between the sensors 26.7 kPa (7.9 inHg, 200 mmHg) or more?

YES

Replace the turbocharger boost sensor .

NO

Go to step 11.

11. Turbocharger boost sensor performance check 2

    -1. Note the value of TC BOOST PRESSURE in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
TC BOOST PRESSURE	B	B

-2. Start the engine.

-3. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-4. Hold the engine speed at 4, 500 rpm without load.

-5. Check the parameter below with the HDS.

Signal	Current conditions	
	Values	Unit
TC BOOST PRESSURE	B	B

Does the value change 0.67 kPa (0.2 inHg, 5 mmHg) or more?

YES

Go to step 12.

NO

Replace the turbocharger boost sensor .

12. MAF sensor performance check

    -1. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

    -2. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF SENSOR	4.1-5.7	g/s	B	B

Do the current condition (s) match the threshold?

YES

The MAF sensor is OK. Go to step 13.

NO

Replace MAF sensor/IAT sensor 1 .

13. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of the IAT SENSOR (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT SENSOR (1)	B	B

-6. Compare the value of the IAT SENSOR (1) with the ambient temperature.

Does the value of the IAT SENSOR (1) differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P2176 (1.5 L ENGINE)

DTC P2176 : Throttle Actuator Control System Idle Position Not Learned

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2135 is stored at the same time as DTC P2176, troubleshoot DTC P2135 first, then recheck for DTC P2176.

DTC Description	Confirmed DTC	Pending DTC
P2176 Throttle Actuator Control System Idle Position Not Learned	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2176 Throttle Actuator Control System Idle Position Not Learned	B	B

Is DTC P2176 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM, then **clean the throttle body** . **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Disconnect the throttle body duct from the throttle body** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode.

-7. Visually check the throttle valve operation while doing the ETCS TEST in the INSPECTION MENU with the HDS.

ETCS TEST

Does the throttle valve move to its fully closed position?

YES

Go to step 3.

NO

Go to step 4.

3. Throttle body condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the throttle body** .

-3. Check for sludge or carbon on the throttle valve.

Is there sludge or carbon on the throttle valve?

YES

Clean the throttle body .

NO

Replace the throttle body .

4. Open wire check (MTR1 line, MTR2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

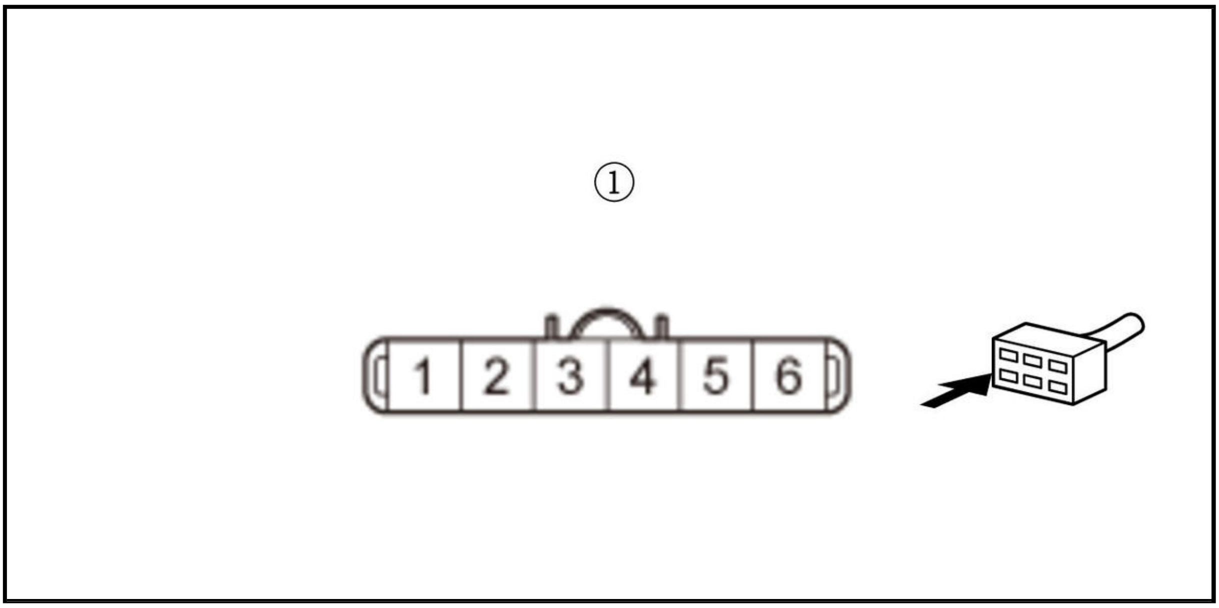
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Connect terminals A and B with a jumper wire.

Terminal A	Throttle body 6P connector (female terminals) No. 1: ①
Terminal B	Throttle body 6P connector (female terminals) No. 2: ①



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
B	Throttle body 6P connector No. 1 and No. 2: jumped
Test point 1	**PCM connector E (80P) No. 27**
Test point 2	**PCM connector E (80P) No. 28**

Is there continuity?

1. **YES**

   The MTR1 wire and the MTR2 wire are OK. **Substitute a known-good throttle body** , then recheck:

   - If DTC P2176 is not indicated, **replace the original throttle body** .
   - If DTC P2176 is indicated again, **replace the PCM** .

NO

Repair an open in the MTR1 wire and/or the MTR2 wire between the PCM (E27, E28) and the throttle body.

DTC P2176 (2.4 L ENGINE) (2017 2018 2019)

DTC P2176 : Throttle Actuator Control System Idle Position Not Learned

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If DTC P2135 is stored at the same time as DTC P2176, troubleshoot DTC P2135 first, then recheck for DTC P2176.

DTC Description	Confirmed DTC	Pending DTC
P2176 Throttle Actuator Control System Idle Position Not Learned	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2176 Throttle Actuator Control System Idle Position Not Learned	B	B

   Is DTC P2176 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM, then clean the throttle body . If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Throttle body operation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the intake air duct from the throttle body .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Visually check the throttle valve operation while doing the ETCS TEST in the INSPECTION MENU with the HDS.

ETCS TEST

Does the throttle valve move to its fully closed position?

YES

Go to step 3.

NO

Go to step 4.

3. Throttle body condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the throttle body** .

-3. Check for sludge or carbon on the throttle valve.

Is there sludge or carbon on the throttle valve?

YES

Clean the throttle body .

NO

Replace the throttle body .

4. Open wire check (MTR 1 line, MTR 2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

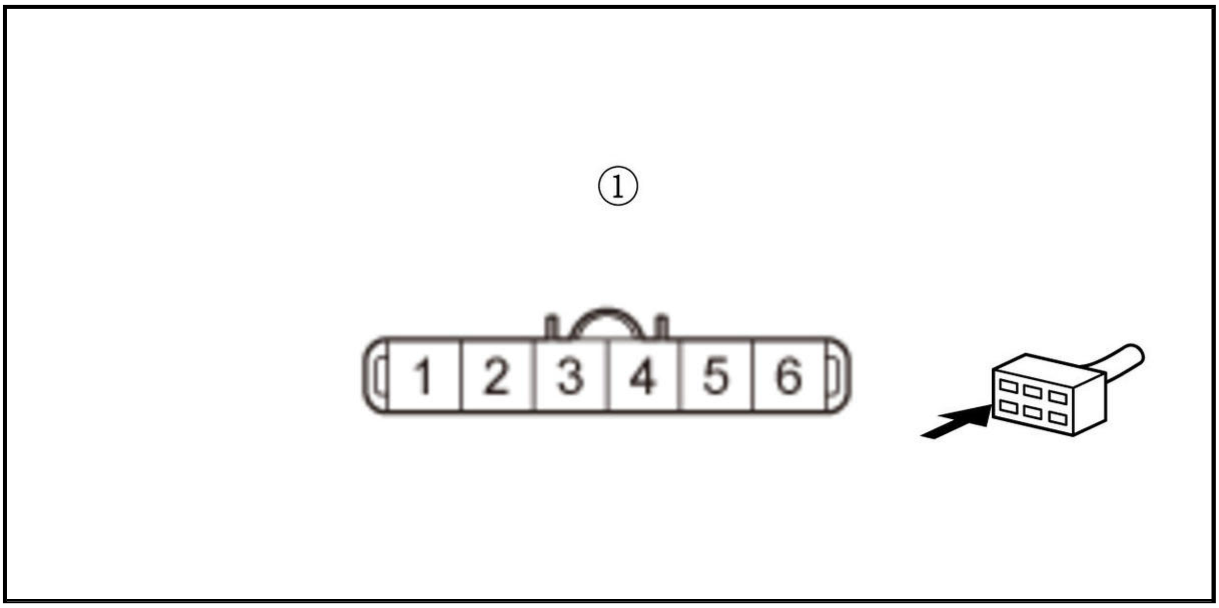
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector C (51P)
Throttle body 6P connector

-4. Connect terminals A and B with a jumper wire.

Terminal A	Throttle body 6P connector (female terminals) No. 1: ①
Terminal B	Throttle body 6P connector (female terminals) No. 2: ①



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
B	Throttle body 6P connector: disconnected
B	Throttle body 6P connector No. 1 and No. 2: jumped
Test point 1	**PCM connector C (51P) No. 11**
Test point 2	**PCM connector C (51P) No. 12**

Is there continuity?

1. **YES**

The MTR1 wire and the MTR2 wire are OK. **Substitute a known-good throttle body** , then recheck:

- If DTC P2176 is not indicated, **replace the original throttle body** .
- If DTC P2176 is indicated again, **replace the PCM** .

NO

Repair an open in the MTR 1 wire and/or the MTR 2 wire between the PCM (C11, C12) and the throttle body.

DTC P2182 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P2182 : ECT Sensor 2 Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2182 ECT Sensor 2 Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 2	Less than 0.14	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 2	More than 4.99	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 5.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (ECT sensor 2, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT Sensor 2 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 2	Less than 0.14	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Replace ECT sensor 2 .

4. Shorted wire check (TW2/TW2 SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

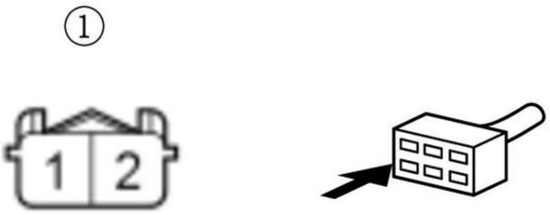
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT Sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TW2/TW2 SENSOR wire between the PCM (E54) and ECT sensor 2.

NO

The TW2/TW2 SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (ECT sensor 2, others)

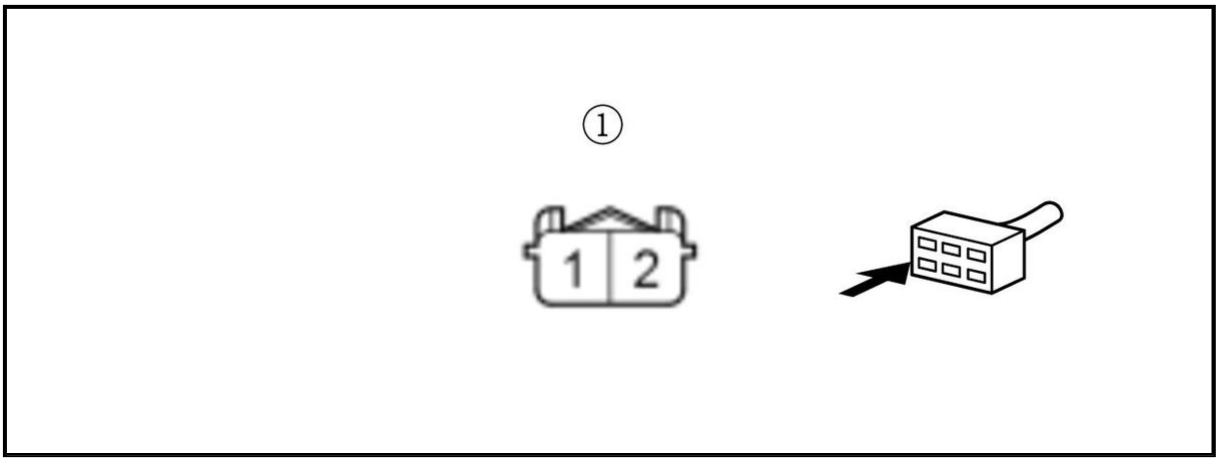
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 2 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 2 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 2 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 2	More than 4.99	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 6.

NO

Replace ECT sensor 2 .

6. Determine possible failure area (TW2/TW2 SENSOR line, others)

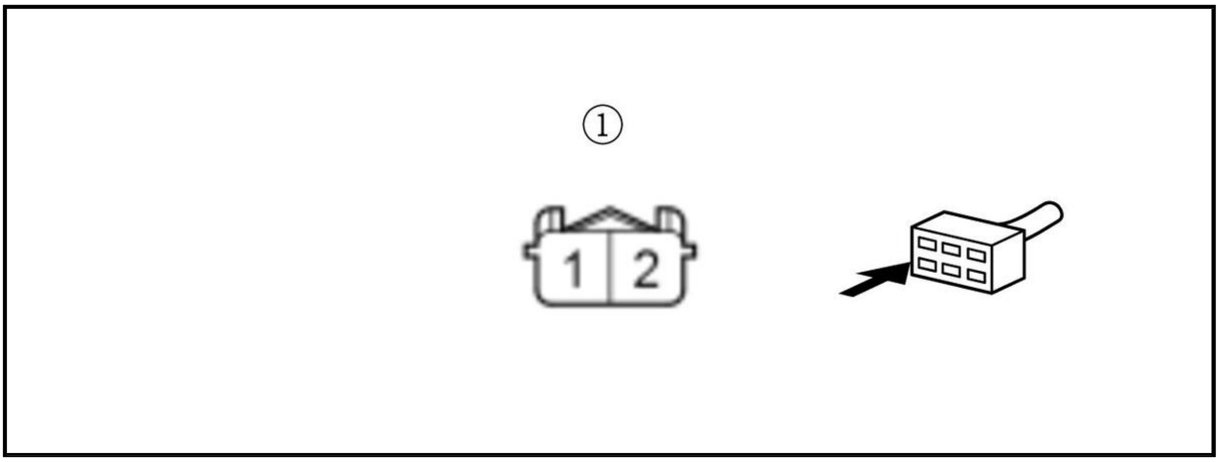
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the ECT sensor 2 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 2 2P connector: disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

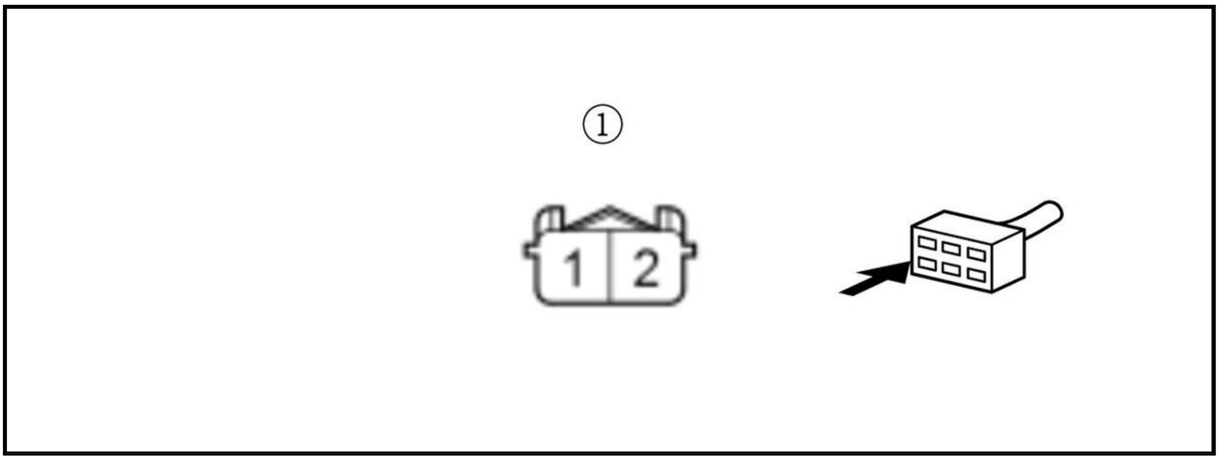
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 2	ECT sensor 2 2P connector (female terminals) No. 1: ①
Test point 1	**PCM connector E (80P) No. 45**



Is there continuity?

YES

The SG6 line is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and ECT sensor 2.

8. Open wire check (TW2/TW2 SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

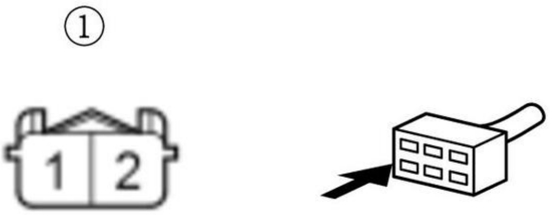
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 54**



Is there continuity?

YES

The TW2/TW2 SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TW2/TW2 SENSOR wire between the PCM (E54) and ECT sensor 2.

DTC P2182 (2.4 L ENGINE) (2018 2019)

DTC P2182 : ECT Sensor 2 Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2182 ECT Sensor 2 Out of Range	B	B

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 0.14	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

   -1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 5.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (ECT sensor 2, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

ECT Sensor 2 2P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 0.14	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Replace ECT sensor 2 .

4. Shorted wire check (TW2 SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

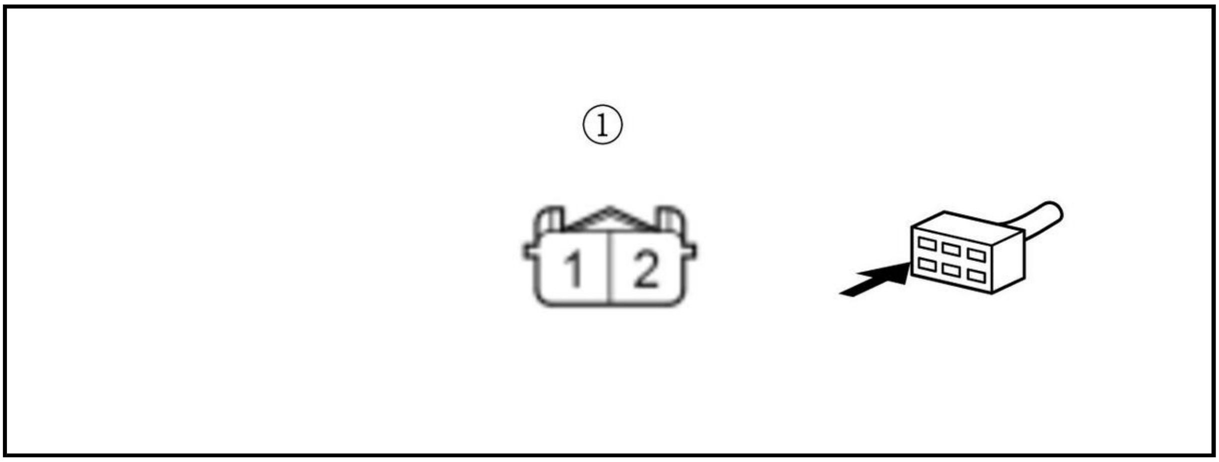
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT Sensor 2 2P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TW2 SENSOR wire between the PCM (A43) and ECT sensor 2.

NO

The TW2 SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

5. Determine possible failure area (ECT sensor 2, others)

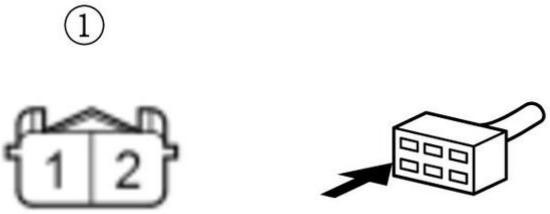
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 2 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 2 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 2 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 2	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 6.

NO

Replace ECT sensor 2 .

6. Determine possible failure area (TW2 SENSOR line, others)

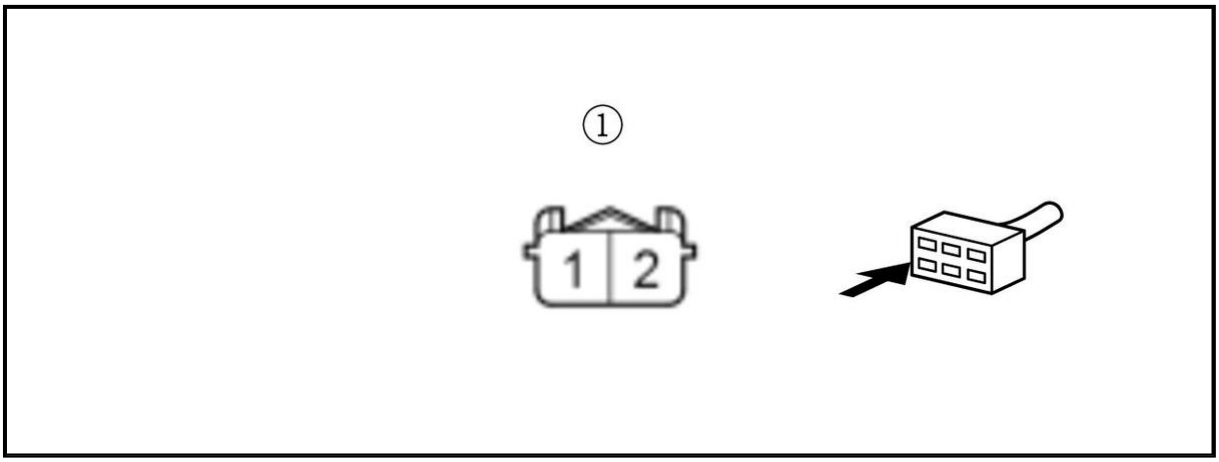
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the ECT sensor 2 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 2 2P connector: disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

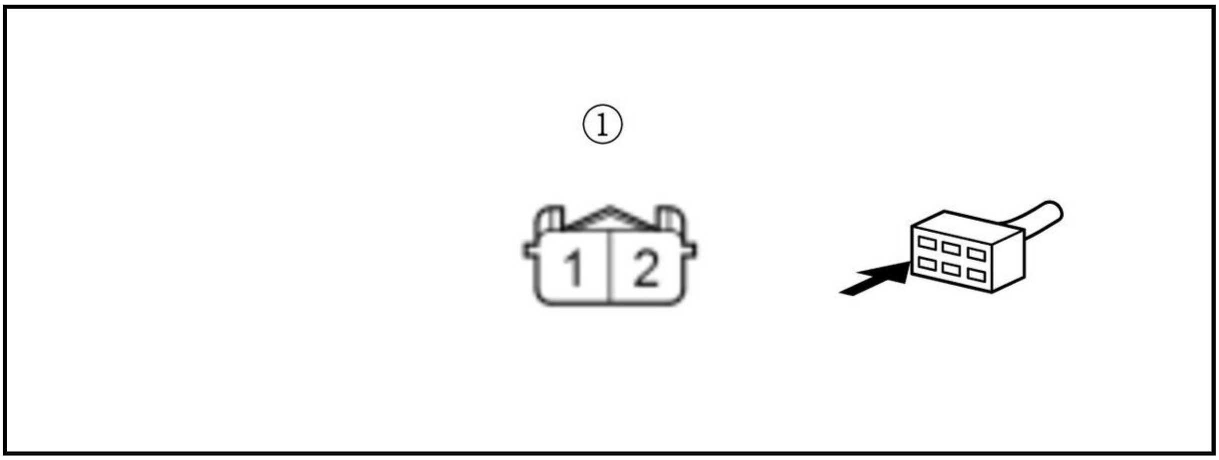
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 2	ECT sensor 2 2P connector (female terminals) No. 1: ①
Test point 1	**PCM connector A (51P) No. 28**



Is there continuity?

YES

The SG6 line is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (A28) and ECT sensor 2.

8. Open wire check (TW2 SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

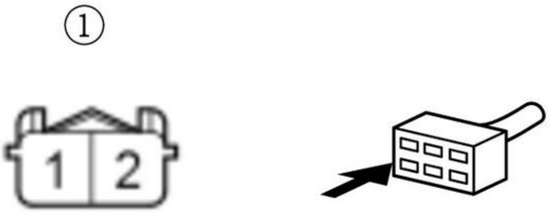
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (51P) No. 43**



Is there continuity?

YES

The TW2 SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TW2 SENSOR wire between the PCM (A43) and ECT sensor 2.

DTC P2183 (1.5 L ENGINE)

DTC P2183 : ECT Sensor 2 Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .

- If DTC P0111 is stored at the same time as DTC P2183, troubleshoot DTC P0111 first, then recheck for DTC P2183.

DTC Description	Confirmed DTC	Pending DTC
P2183 ECT Sensor 2 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals and terminals at these sensors:

   - ECT sensor 1
   - ECT sensor 2

   Are the connections and terminals OK?

   YES

   Go to step 2.

   NO

   Repair the connections or terminals.

2. PGM-FI system check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P011A ECT Sensor 1 Circuit Range/Performance Problem	B	B
P2183 ECT Sensor 2 Circuit Range/Performance Problem	B	B

   Are DTC P011A and P2183 indicated at the same time?

   YES

   Go to step 5.

   NO

   Go to step 3.

3. ECT sensor 2 performance check

   -1. Start the engine, and let it idle for 10 minutes.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 120	deg. F	B	B
	Less than 49	deg. C		

   Do the current condition (s) match the threshold?

YES

Replace ECT sensor 2 .

NO

Go to step 4.

4. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow ECT sensor 2 to cool to the ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of ECT SENSOR 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 2	B	B

Does the value of ECT SENSOR 2 differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

The failure is duplicated. Replace ECT sensor 2 .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

5. ECT sensor 1 performance check

-1. Start the engine, and let it idle for 10 minutes.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 120	deg. F	B	B
	Less than 49	deg. C		

Do the current condition (s) match the threshold?

YES

Replace ECT sensor 1 .

NO

ECT sensor 1 is OK at this time. Go to step 6.

6. ECT sensor 2 performance check

-1. Let the engine idle for 10 minutes.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 120	deg. F	B	B
	Less than 49	deg. C		

Do the current condition (s) match the threshold?

YES

Replace ECT sensor 2 .

NO

Go to step 7.

7. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the sensors to cool to the ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ECT SENSOR 2	B	B

-6. Compare the value of ECT SENSOR 1 to the ambient temperature, and the value of ECT SENSOR 2 to the ambient temperature individually.

Does either sensor differ more than 5.4 deg. F (3 deg. C) from the ambient temperature?

YES

Replace the sensor that differed more than 5.4 deg. F (3 deg. C) from the ambient temperature.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2183 (2.4 L ENGINE) (2017 2018 2019)

DTC P2183 : ECT Sensor 2 Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0111 is stored at the same time as DTC P2183, troubleshoot DTC P0111 first, then recheck for DTC P2183.

DTC Description	Confirmed DTC	Pending DTC
P2183 ECT Sensor 2 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals and terminals at these sensors:

   - ECT sensor 1
   - ECT sensor 2

   Are the connections and terminals OK?

   YES

   Go to step 2.

   NO

   Repair the connections or terminals.

2. PGM-FI system check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P011A ECT Sensor 1 Circuit Range/Performance Problem	B	B
P2183 ECT Sensor 2 Circuit Range/Performance Problem	B	B

   Are DTC P011A and P2183 indicated at the same time?

   YES

   Go to step 5.

   NO

   Go to step 3.

3. ECT sensor 2 performance check

   -1. Start the engine, and let it idle for 10 minutes.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 120	deg. F	B	B
	Less than 49	deg. C		

   Do the current condition (s) match the threshold?

   YES

   Replace ECT sensor 2 .

NO

Go to step 4.

4. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Allow ECT sensor 2 to cool to the ambient temperature.

   -3. Note the ambient temperature.

   -4. Turn the vehicle to the ON mode.

   -5. Quickly note the value of ECT SENSOR 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 2	B	B

Does the value of ECT SENSOR 2 differ 5.4 deg. F (3 deg. C) or more from the ambient temperature?

YES

The failure is duplicated. **Replace ECT sensor 2** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

5. ECT sensor 1 performance check

   -1. Start the engine, and let it idle for 10 minutes.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 1	Less than 120	deg. F	B	B
	Less than 49	deg. C		

Do the current condition (s) match the threshold?

YES

Replace ECT sensor 1 .

NO

ECT sensor 1 is OK at this time. Go to step 6.

6. ECT sensor 2 performance check

   -1. Let the engine idle for 10 minutes.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 120	deg. F	B	B
	Less than 49	deg. C		

Do the current condition (s) match the threshold?

YES

Replace ECT sensor 2 .

NO

Go to step 7.

7. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the sensors to cool to the ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ECT SENSOR 2	B	B

-6. Compare the value of ECT SENSOR 1 to the ambient temperature, and the value of ECT SENSOR 2 to the ambient temperature individually.

Does either sensor differ more than 5.4 deg. F (3 deg. C) from the ambient temperature?

YES

Replace the sensor that differed more than 5.4 deg. F (3 deg. C) from the ambient temperature.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2184 (1.5 L ENGINE)

DTC P2184 : ECT Sensor 2 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2184 ECT Sensor 2 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (ECT sensor 2, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT Sensor 2 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 2 .

3. Shorted wire check (TW2/TW2 SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

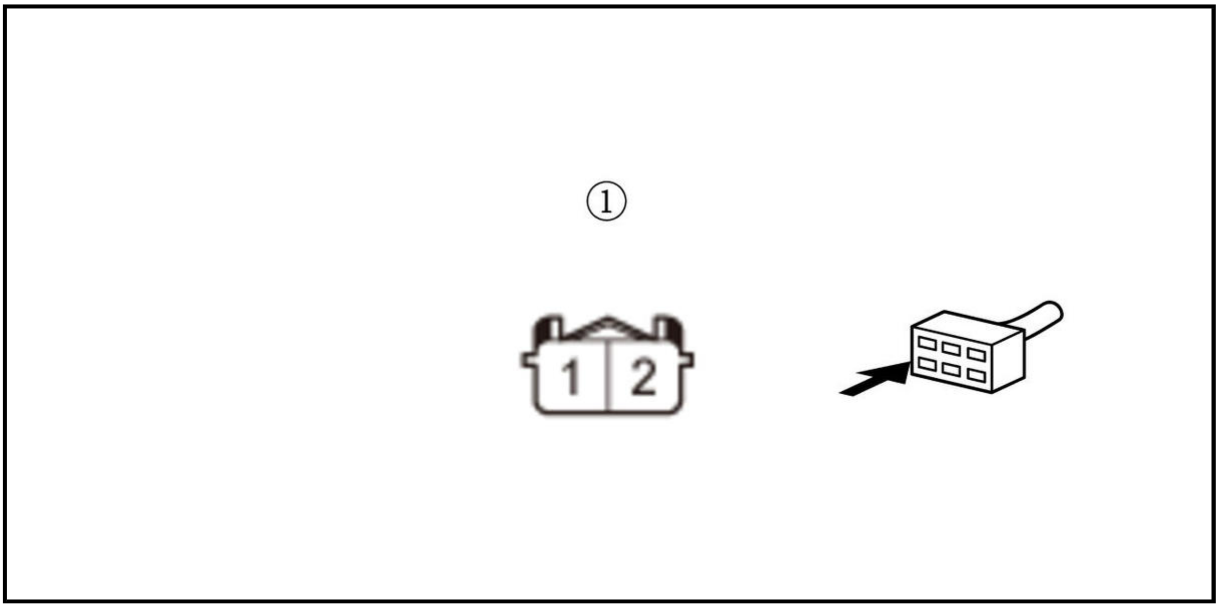
-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	ECT Sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TW2/TW2 SENSOR wire between the PCM (E54) and ECT sensor 2.

NO

The TW2/TW2 SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P2184 (2.4 L ENGINE) (2017 2018 2019)

DTC P2184 : ECT Sensor 2 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2184 ECT Sensor 2 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. ECT sensor 2 check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT Sensor 2 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 2 .

3. Shorted wire check (TW2 SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

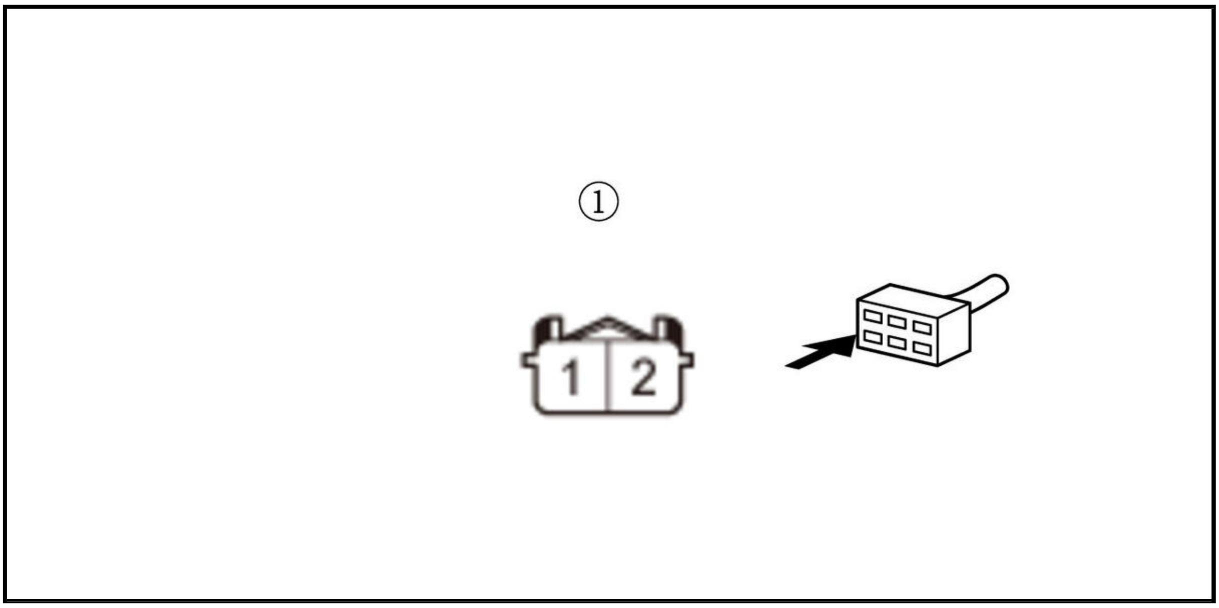
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT Sensor 2 2P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the TW2 SENSOR wire between the PCM (A43) and ECT sensor 2.

NO

The TW2 SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

DTC P2185 (1.5 L ENGINE)

DTC P2185 : ECT Sensor 2 Circuit High Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2185 ECT Sensor 2 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (ECT sensor 2, others)

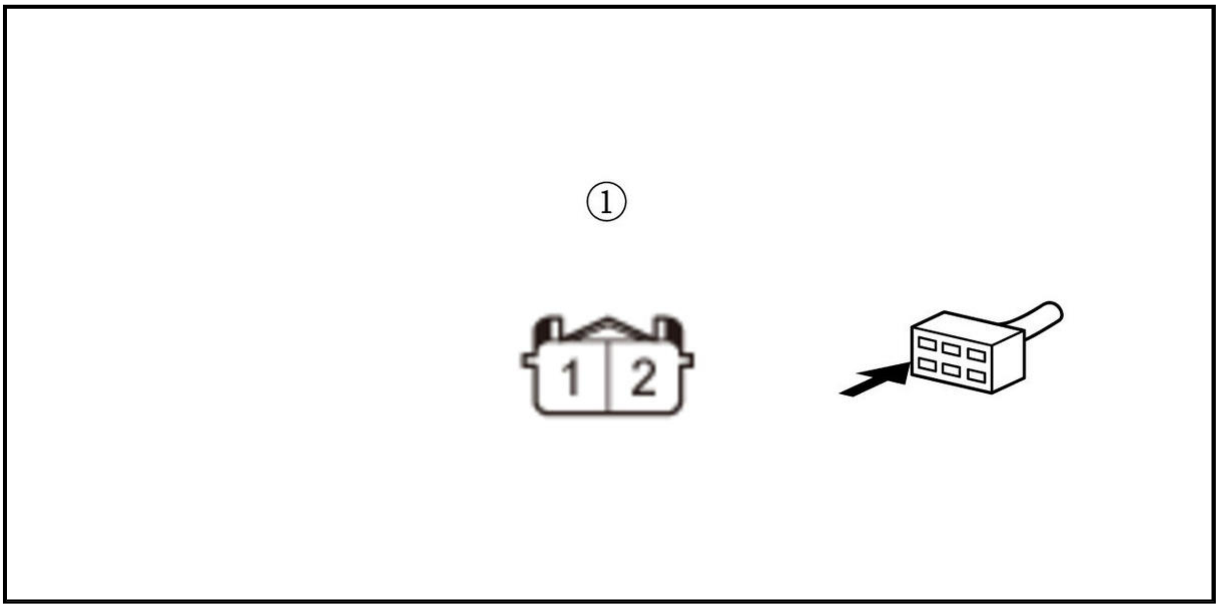
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 2 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 2 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 2 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 2 .

3. Determine possible failure area (TW2/TW2 SENSOR line, others)

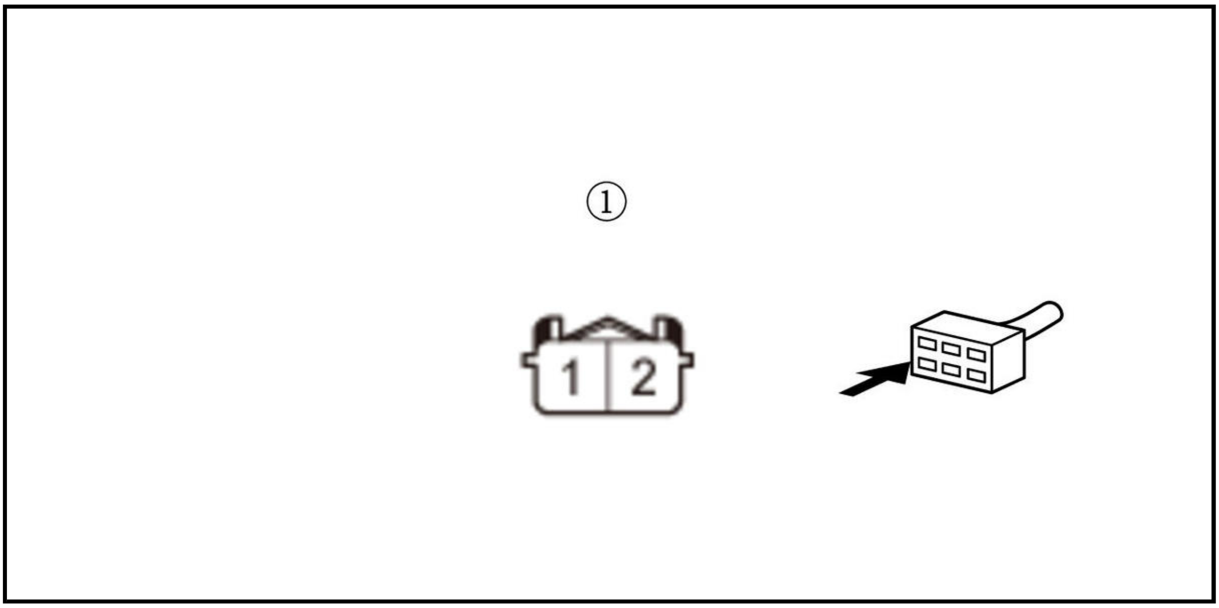
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the ECT sensor 2 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 2 2P connector: disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

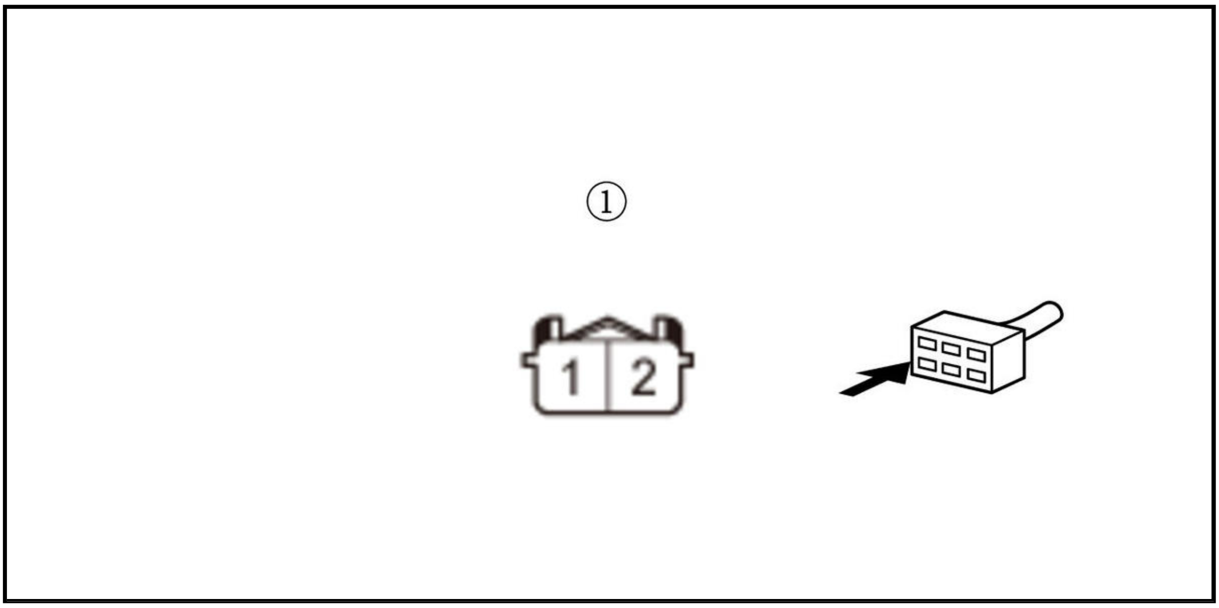
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 2	ECT sensor 2 2P connector (female terminals) No. 1: ①
Test point 1	**PCM connector E (80P) No. 45**



Is there continuity?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and ECT sensor 2.

5. Open wire check (TW2/TW2 SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

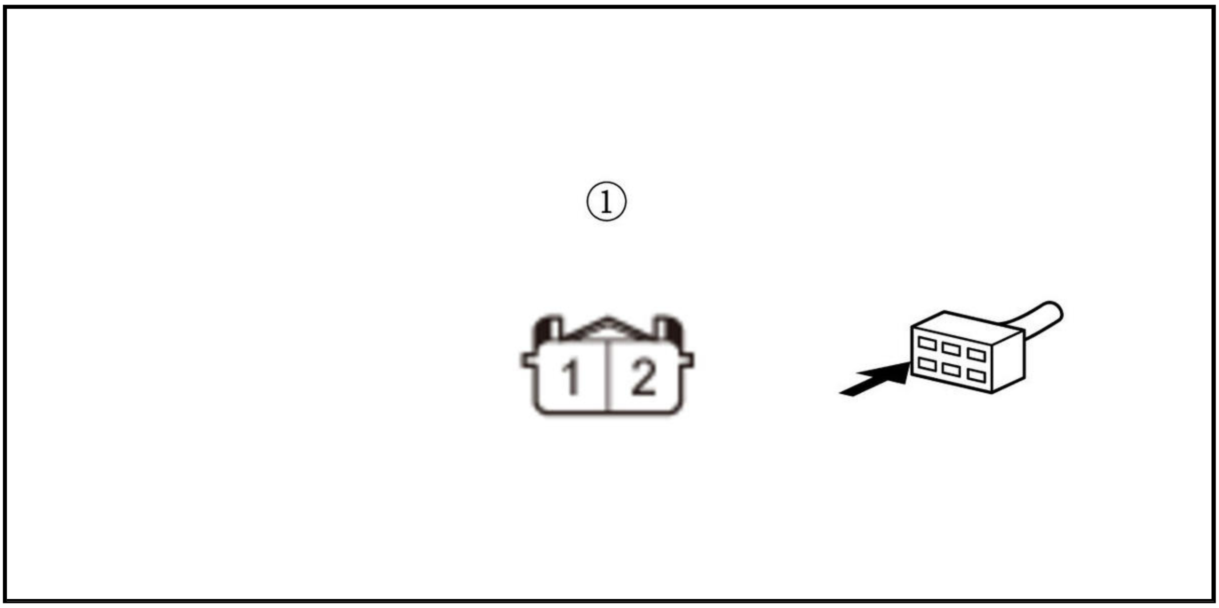
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 54**



Is there continuity?

YES

The TW2/TW2 SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TW2/TW2 SENSOR wire between the PCM (E54) and ECT sensor 2.

DTC P2185 (2.4 L ENGINE) (2017 2018 2019)

DTC P2185 : ECT Sensor 2 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2185 ECT Sensor 2 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT SENSOR 2	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (ECT sensor 2, others)

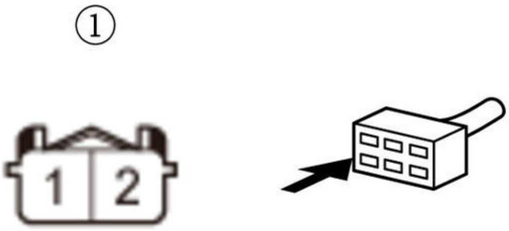
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 2 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 2 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 2 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT SENSOR 2	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 2 .

3. Determine possible failure area (TW2 SENSOR line, others)

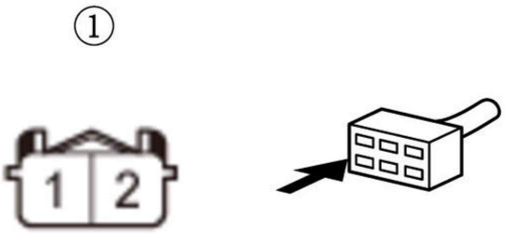
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the ECT sensor 2 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 2 2P connector: disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

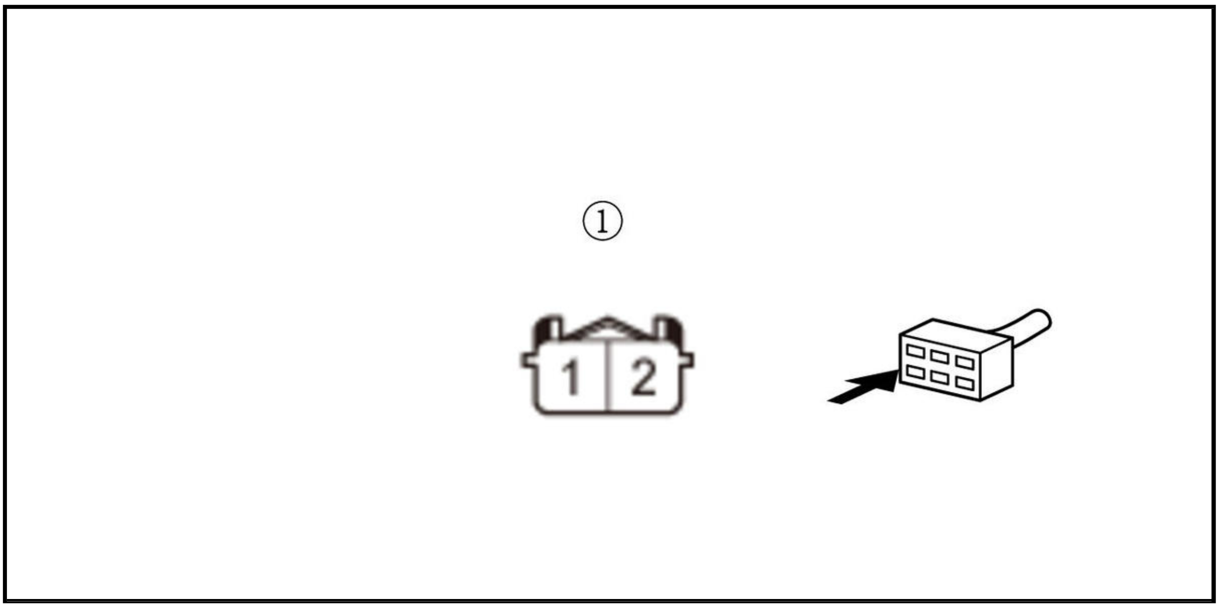
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 2	ECT sensor 2 2P connector (female terminals) No. 1: ①
Test point 1	PCM connector A (51P) No. 28



Is there continuity?

YES

The SG6 line is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (A28) and ECT sensor 2.

5. Open wire check (TW2 SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

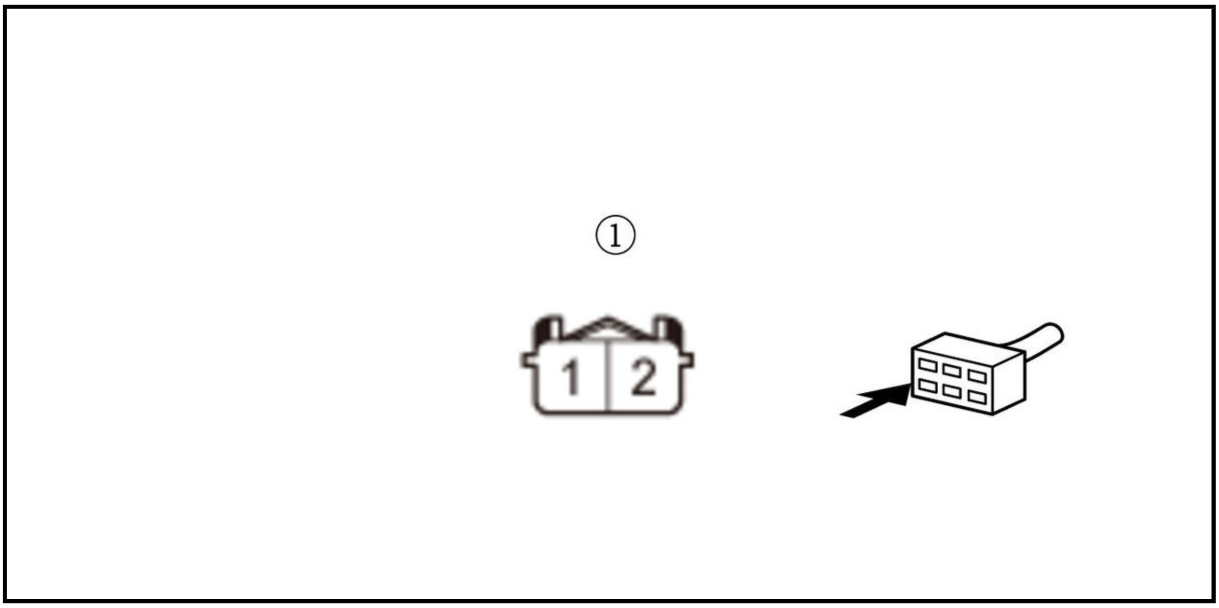
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector A (51P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (51P) No. 43**



Is there continuity?

YES

The TW2 SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the TW2 SENSOR wire between the PCM (A43) and ECT sensor 2.

DTC P2195 (1.5 L ENGINE)

DTC P2195 : A/F Sensor (Sensor 1) Signal Stuck Lean

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel, then clear the DTC with the HDS.
- If DTC P2101, P2118, P2135, P2138, P2176, or a combination of P2122 and P2127, P2122 and P2138 or P2127 and P2138 is stored at the same time as DTC P2195, troubleshoot those DTCs first, then recheck for DTC P2195.

DTC Description	Confirmed DTC	Pending DTC
P2195 A/F Sensor (Sensor 1) Signal Stuck Lean	B	B

DTC (PGM-FI)

1. MAF sensor/IAT sensor 1 visual check

-1. **Remove MAF sensor/IAT sensor 1** .

-2. Check for dirt or debris in MAF sensor/IAT sensor 1.

Is it dirty?

YES

Remove the debris. If needed, **replace MAF sensor/IAT sensor 1** .

NO

Go to step 2.

2. A/F sensor (Sensor 1) installation check

   -1. Check the installation of the A/F sensor (Sensor 1).

   Is the A/F sensor loose or disconnected from the TWC?

   YES

   Reinstall the A/F sensor (Sensor 1) .

   NO

   Go to step 3.

3. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2195 A/F Sensor (Sensor 1) Signal Stuck Lean	B	B

   Is DTC P2195 indicated?

   YES

   Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2195 (2.4 L ENGINE) (2017 2018 2019)

DTC P2195 : A/F Sensor (Sensor 1) Signal Stuck Lean

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel, then clear the DTC with the HDS.
- If DTC P2101, P2118, P2135, P2138, P2176, or a combination of P2122 and P2127, P2122 and P2138 or P2127 and P2138 is stored at the same time as DTC P2195, troubleshoot those DTCs first, then recheck for DTC P2195.

DTC Description	Confirmed DTC	Pending DTC
P2195 A/F Sensor (Sensor 1) Signal Stuck Lean	B	B

DTC (PGM-FI)

1. MAF sensor/IAT sensor 1 visual check

   -1. **Remove MAF sensor/IAT sensor 1** .

   -2. Check for dirt or debris in MAF sensor/IAT sensor 1.

   Is it dirty?

   YES

   Remove the debris. If needed, **replace MAF sensor/IAT sensor 1** .

   NO

   Go to step 2.

2. A/F sensor (Sensor 1) installation check

   -1. Check the installation of the A/F sensor (Sensor 1).

   Is the A/F sensor loose or disconnected from the TWC?

   YES

   Reinstall the A/F sensor (Sensor 1) .

   NO

   Go to step 3.

3. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2195 A/F Sensor (Sensor 1) Signal Stuck Lean	B	B

   Is DTC P2195 indicated?

   YES

   Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

   NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2199 (1.5 L ENGINE)

DTC P2199 : IAT Sensor 1-2 Incorrect Correlation

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2199 IAT Sensor1-2 Incorrect Correlation	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals of these connectors.

   - ECT sensor 1
   - ECT sensor 2
   - MAF sensor/IAT sensor 1
   - IAT sensor 2

   Are the connection and terminals OK?

   YES

   Replace IAT sensor 2 .

   NO

   Repair the connections or terminals, then recheck.

DTC P219A (2.4 L ENGINE) (2017 2018 2019)

DTC P219A : Air-Fuel Ratio Variation of Cylinder

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P219A, troubleshoot those DTCs first, the recheck for P219A.

  P0130, P0133, P1172, P2195, P2237, P2238, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0300: Random misfire

  P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder Ignition coil power circuit

DTC Description	Confirmed DTC	Pending DTC
P219A A/F Ratio Variation of Cylinder	B	B

1. Problem verification (CYLINDER A/F TEST with HDS)

   -1. Turn the vehicle to the ON mode.

   -2. Record the following HDS on-board snapshot parameters:

   - VEHICLE SPEED
   - ENGINE SPEED
   - MAP SENSOR
   - ECT SENSOR 1
   - APP SENSOR
   - AF FB (ST FUEL TRIM)

   On-board Snapshot

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   Check under these conditions:

   - A/C off
   - All electrical loads off

   -6. Do the CYLINDER A/F TEST three times in the INSPECTION MENU with the HDS.

   CYLINDER A/F TEST

   Is every result OK?

   YES

   Go to step 2.

   NO

   Go to step 3.

2. Problem verification (OBD STATUS check):

   Test-drive the vehicle in the range of these recorded on-board snapshot parameters:

   - VEHICLE SPEED
   - ENGINE SPEED
   - MAP SENSOR
   - ECT SENSOR 1
   - APP SENSOR
   - AF FB (ST FUEL TRIM)

   On-board Snapshot

Signal	Current conditions	
	Values	Unit
VEHICLE SPEED	B	B
ENGINE SPEED	B	B
MAP SENSOR	B	B
ECT SENSOR 1	B	B
APP SENSOR	B	B
AF FB (ST FUEL TRIM)	B	B

-2. Monitor the OBD STATUS for DTC P219A in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P219A A/F Ratio Variation of Cylinder	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot. If the HDS indicates EXECUTING, continue driving until a result appears. If the HDS indicates OUT OF CONDITION, go to step 2-1 and recheck.

3. Engine compression check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Do the cylinder compression test .

Is there a cylinder with lower compression than the other cylinders?

YES

Repair the engine compression problem.

NO

Go to step 4.

4. Valve clearance check

-1. Inspect the valve clearance .

Is the valve clearance OK?

YES

Go to step 5.

NO

Adjust the valve clearance .

5. Problem verification (CYLINDER A/F TEST with HDS)

-1. Start the engine.

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. Check under these conditions:

- A/C off
- All electrical loads off

-4. Do the CYLINDER A/F TEST three times in the INSPECTION MENU with the HDS.

CYLINDER A/F TEST

Is the result OK?

YES

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Go to step 6.

6. Injector check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Exchange the injector from the problem cylinder with one from another cylinder** .

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check under these conditions:

- A/C off
- All electrical loads off

-6. Do the CYLINDER A/F TEST three times in the INSPECTION MENU with the HDS.

CYLINDER A/F TEST

Is an injector failure indicated at the cylinder where the injector was exchanged?

YES

Replace all injectors as a set .

NO

Go to step 7.

7. Intake and exhaust manifold visual check

-1. Check for carbon build-up in the intake manifold and the exhaust manifold.

Is there carbon build-up in the intake manifold and/or exhaust manifold?

YES

Check the engine for oil leaks. If needed, repair the engine, also remove the carbon.

NO

Intermittent failure, the system is OK at this time. Check the engine for oil leaks.

DTC P219C, P219D, P219E, P219F (1.5 L ENGINE)

DTC P219C : No. 1 Cylinder Air-Fuel Ratio Variation **DTC P219D** : No. 2 Cylinder Air-Fuel Ratio Variation **DTC P219E** : No. 3 Cylinder Air-Fuel Ratio Variation **DTC P219F** : No. 4 Cylinder Air-Fuel Ratio Variation

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If any of the DTCs listed below are indicated at the same time as DTC P219C, P219D, P219E, and/or P219F, troubleshoot those DTCs first, then recheck for P219C, P219D, P219E, and/or P219F.

  P0130, P0133, P1172, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0300: Random misfire

  P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

  P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil (s)

DTC Description	Confirmed DTC	Pending DTC
P219C No. 1 Cylinder Air-Fuel Ratio Variation	B	B
P219D No. 2 Cylinder Air-Fuel Ratio Variation	B	B
P219E No. 3 Cylinder Air-Fuel Ratio Variation	B	B
P219F No. 4 Cylinder Air-Fuel Ratio Variation	B	B

DTC (PGM-FI)

1. Problem verification 1 (HDS parameter)

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Fuel factor study value of No1 cylinder	0.83-1.15	B	B	B
Fuel factor study value of No2 cylinder	0.83-1.15	B	B	B
Fuel factor study value of No3 cylinder	0.83-1.15	B	B	B
Fuel factor study value of No4 cylinder	0.83-1.15	B	B	B

NOTE: If the value of Fuel factor study valve is above the threshold, the PCM may detect an over-lean failure. If the value of Fuel factor study valve is below the threshold, the PCM may detect an over-rich failure.

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

The failure is duplicated. Go to step 4.

2. On-board snapshot check:

   Check the recorded on-board snapshot parameter (s) with the HDS.

   - Fuel factor study value of No1 cylinder
   - Fuel factor study value of No2 cylinder
   - Fuel factor study value of No3 cylinder
   - Fuel factor study value of No4 cylinder

   Do the parameter (s) of the recorded on-board snapshot match the threshold shown in step 1-2?

   YES

   Go to step 3.

   NO

   The failure is duplicated. Go to step 4.

3. Problem verification 2

   -1. Start the engine.

   -2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -3. Test-drive the vehicle under these conditions:

   - Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
   - Transmission in D
   - Drive at a steady engine speed between 1, 000-1, 200 rpm, then accelerate up to 3, 400 rpm at about 10-15 seconds, and repeat this 3 times or more if needed

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
Engine Speed	B	B

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Fuel factor study value of No1 cylinder	0.83-1.15	B	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Fuel factor study value of No2 cylinder	0.83-1.15	B	B	B
Fuel factor study value of No3 cylinder	0.83-1.15	B	B	B
Fuel factor study value of No4 cylinder	0.83-1.15	B	B	B

Do the current condition (s) match the threshold?

YES

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same condition with the on-board snapshot** .

NO

Go to step 4.

4. Engine compression check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the cylinder compression test** .

Is there a cylinder with lower compression than the other cylinders?

YES

Repair the engine compression problem.

NO

Go to step 5.

5. Valve clearance check

-1. **Inspect the valve clearance** .

Is the valve clearance OK?

YES

Go to step 6.

NO

Adjust the valve clearance .

6. Injector check

-1. **Exchange the injector from the problem cylinder with one from another cylinder** .

-2. Start the engine.

-3. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-4. Check under these conditions:

- A/C off
- All electrical loads off

-5. Do the CYLINDER A/F TEST three times in the INSPECTION MENU with the HDS.

CYLINDER A/F TEST

Is an injector failure indicated at the cylinder where the injector was exchanged?

YES

Replace all injector as a set .

NO

Go to step 7.

7. Intake and exhaust manifold visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for carbon build-up in the intake manifold and the exhaust manifold.

Is there carbon build-up in the intake manifold and/or exhaust manifold?

YES

Check the engine for oil leaks. If needed, repair the engine, also remove the carbon.

NO

Intermittent failure, the system is OK at this time. Check the engine for oil leaks.

DTC P2226 (1.5 L ENGINE)

DTC P2226 : BARO Sensor Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2226 BARO Sensor Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS, and wait 2 seconds.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 2 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2226 BARO Sensor Circuit Malfunction	B	B

Is DTC P2226 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time.

DTC P2227 (2.4 L ENGINE) (2017 2018 2019)

DTC P2227 : BARO Sensor Circuit Out of Range High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2227 BARO Sensor Circuit Out of Range High	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2227 BARO Sensor Circuit Out of Range High	B	B

Is DTC P2227 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2228 (1.5 L ENGINE)

DTC P2228 : BARO Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2228 BARO Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BARO SENSOR	Less than 44	kPa	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2228 (2.4 L ENGINE) (2017 2018 2019)

DTC P2228 : BARO Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2228 BARO Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2228 BARO Sensor Circuit Low Voltage	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2229 (1.5 L ENGINE)

DTC P2229 : BARO Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2229 BARO Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BARO SENSOR	More than 116	kPa	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2229 (2.4 L ENGINE) (2017 2018 2019)

DTC P2229 : BARO Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2229 BARO Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BARO SENSOR	More than 4.89	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2237 (1.5 L ENGINE)

DTC P2237 : A/F Sensor (Sensor 1) IP Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2237 A/F Sensor (Sensor 1) IP Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2237 A/F Sensor (Sensor 1) IP Circuit High Voltage	B	B

   Is DTC P2237 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (IP line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

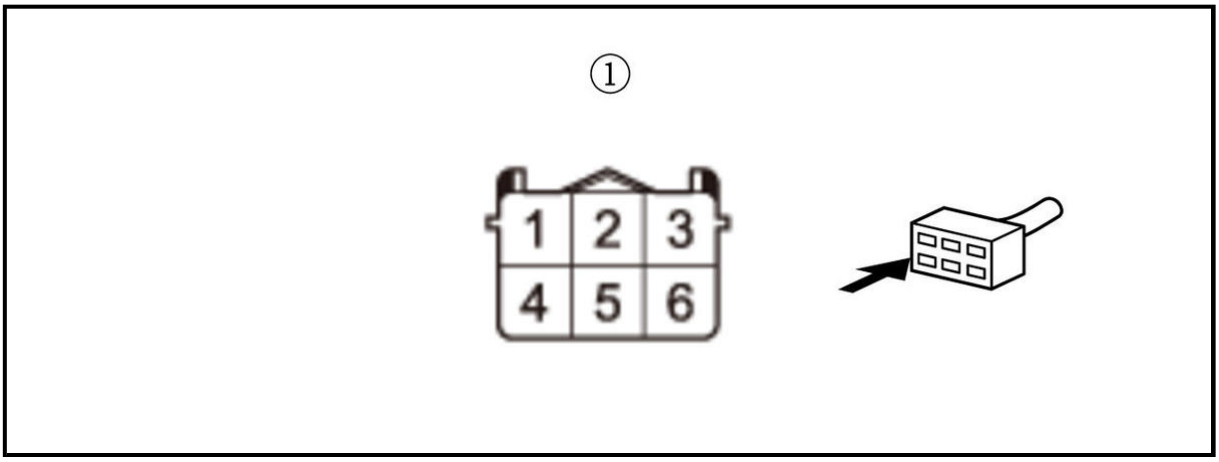
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 48**



Is there continuity?

YES

Go to step 3.

NO

Repair an open in the IP wire between the PCM (E48) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

PCM connector E (80P)

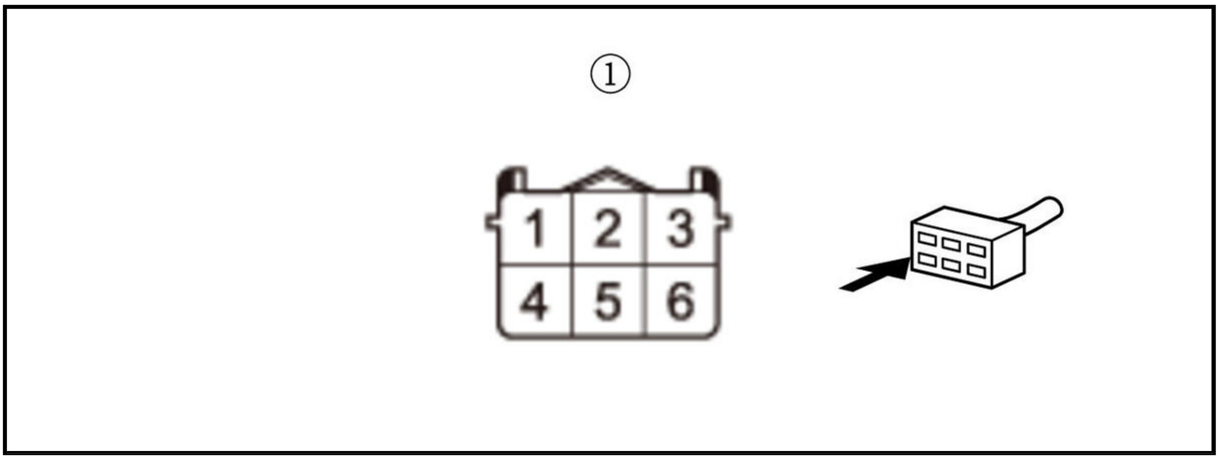
-2. Exit the SCS mode with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Measure the voltage between test points 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2237 (2.4 L ENGINE) (2017 2018 2019)

DTC P2237 : A/F Sensor (Sensor 1) AFS Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2237 A/F Sensor (Sensor 1) AFS Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2237 A/F Sensor (Sensor 1) AFS Circuit High Voltage	B	B

Is DTC P2237 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the relay circuit board (PGM-FI subrelay circuit), and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (AFS+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

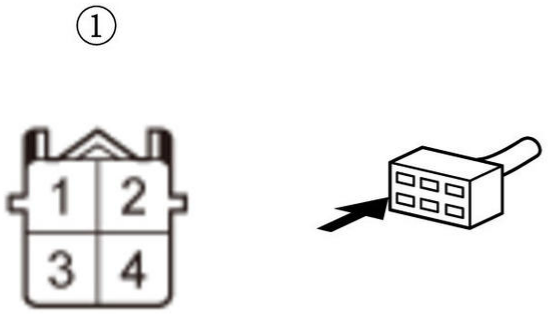
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

A/F sensor (Sensor 1) 4P connector	
PCM connector C (51P)	

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	A/F sensor (Sensor 1) 4P connector (female terminals) No. 2: ①
Test point 2	**PCM connector C (51P) No. 48**



Is there continuity?

YES

The AFS+ wire is OK. Go to step 3.

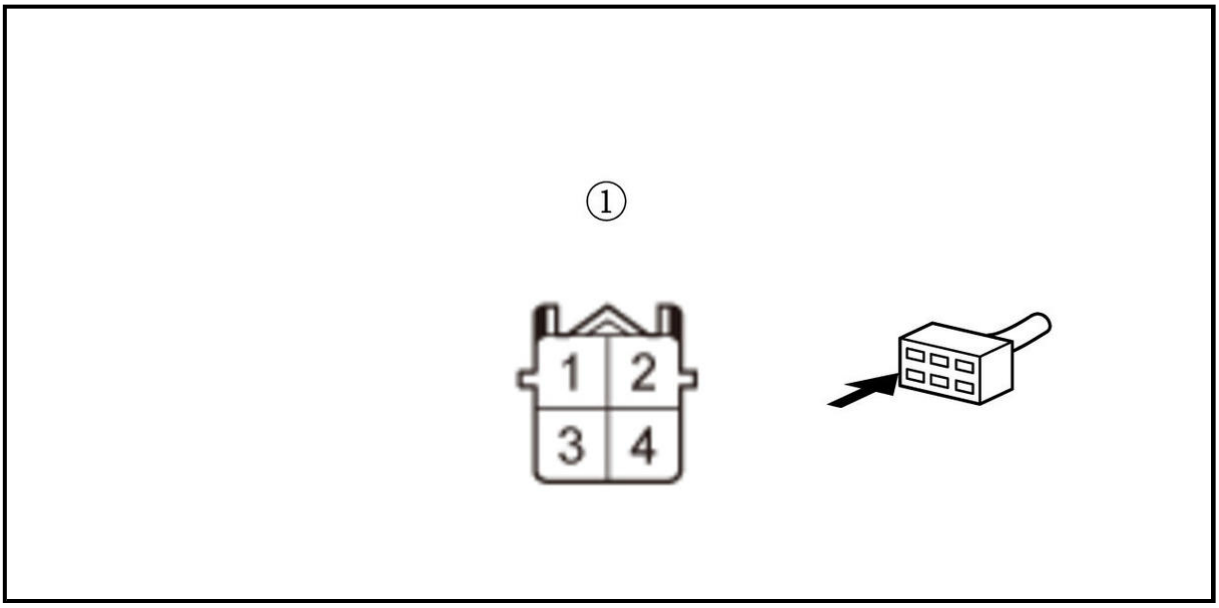
NO

Repair an open in the AFS+ wire between the PCM (C48) and the A/F sensor (Sensor 1).

3. Open wire check (AFS- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 4P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	A/F sensor (Sensor 1) 4P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 47**



Is there continuity?

YES

The AFS- wire is OK. Go to step 4.

NO

Repair an open in the AFS- wire between the PCM (C47) and the A/F sensor (Sensor 1).

4. A/F sensor (Sensor 1) check

-1. **Substitute a known-good A/F sensor (Sensor 1)** .

-2. Reconnect all connectors.

-3. Turn the vehicle to the ON mode.

-4. **Reset the PCM with the HDS** .

Reset PCM

-5. **Do the PCM idle learn procedure** .

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2237 A/F Sensor (Sensor 1) AFS Circuit High Voltage	B	B

Is DTC P2237 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Replace the original A/F sensor (Sensor 1) .

DTC P2238 (1.5 L ENGINE)

DTC P2238 : A/F Sensor (Sensor 1) IP Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2238 A/F Sensor (Sensor 1) IP Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2238 A/F Sensor (Sensor 1) IP Circuit Low Voltage	B	B

   Is DTC P2238 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (IP line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 48**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the IP wire between the PCM (E48) and the A/F sensor (Sensor 1).

NO

Go to step 3.

3. A/F sensor (Sensor 1) check

-1. **Substitute a known-good A/F sensor (Sensor 1)** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. **Reset the PCM with the HDS** .

Reset PCM

-6. **Do the PCM idle learn procedure** .

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2238 A/F Sensor (Sensor 1) IP Circuit Low Voltage	B	B

Is DTC P2238 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original A/F sensor (Sensor 1) .

DTC P2238 (2.4 L ENGINE) (2017 2018 2019)

DTC P2238 : A/F Sensor (Sensor 1) AFS+ Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2238 A/F Sensor (Sensor 1) AFS+ Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2238 A/F Sensor (Sensor 1) AFS+ Circuit Low Voltage	B	B

Is DTC P2238 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (AFS+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector C (51P)
A/F sensor (Sensor 1) 4P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
B	A/F sensor (Sensor 1) 4P connector: disconnected
Test point 1	**PCM connector C (51P) No. 48**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the AFS+ wire between the PCM (C48) and the A/F sensor (Sensor 1).

NO

The AFS+ wire is OK. Go to step 3.

3. PCM internal circuit check

-1. Reconnect PCM connector C (51P).

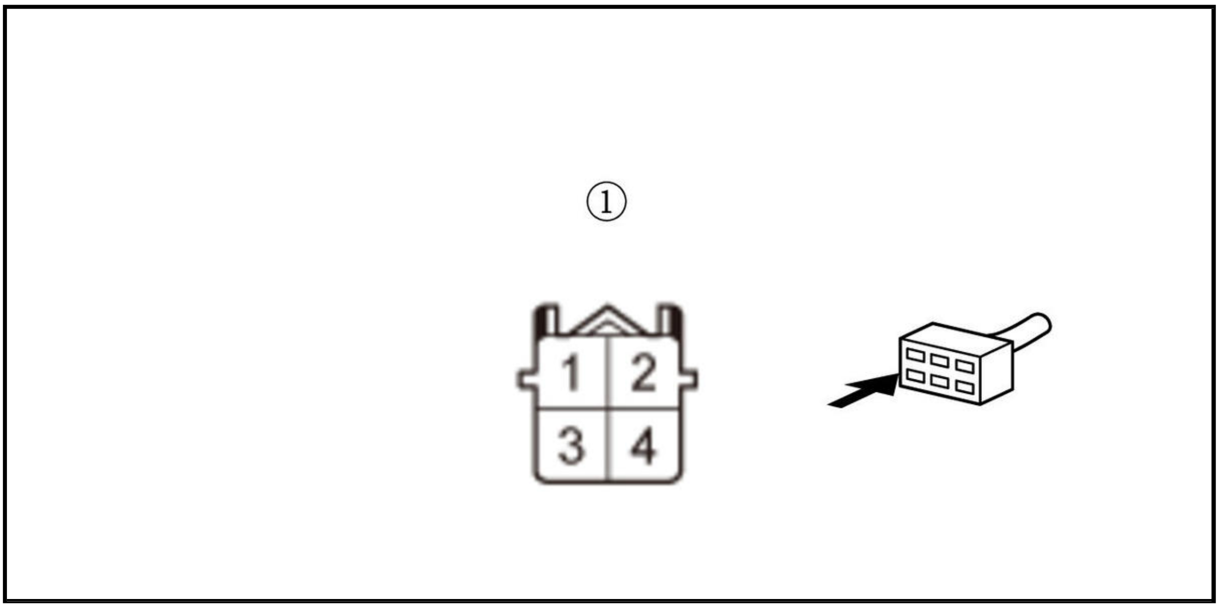
-2. Exit the SCS mode with the HDS.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/F sensor (Sensor 1) 4P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 4P connector (female terminals) No. 2: ①

Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2243 (1.5 L ENGINE)

DTC P2243 : A/F Sensor (Sensor 1) VCENT Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2243 A/F Sensor (B1) VCENT Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2243 A/F Sensor (B1) VCENT Circuit High Voltage	B	B

Is DTC P2243 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (VCENT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

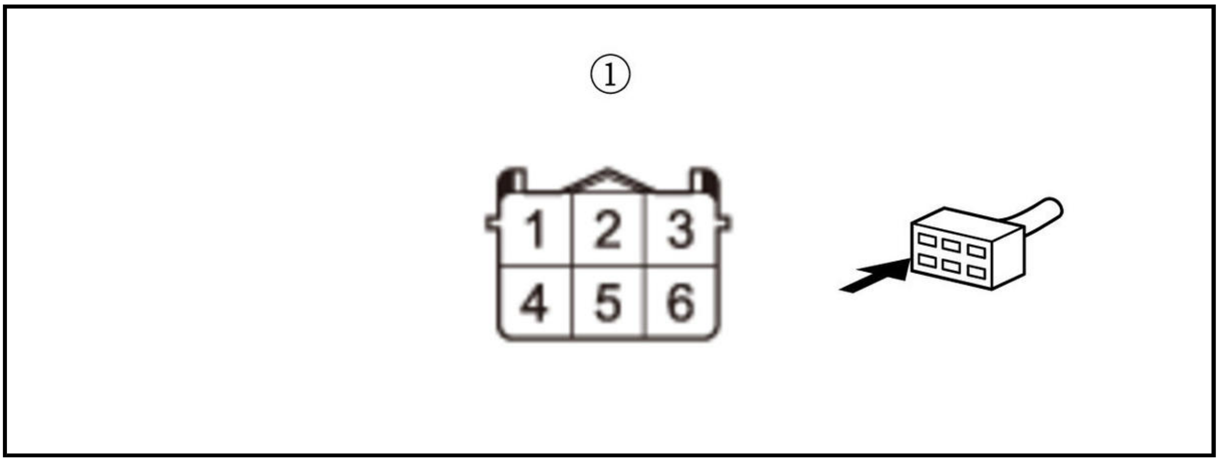
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 74**



Is there continuity?

YES

Go to step 3.

NO

Repair an open in the VCENT wire between the PCM (E74) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

PCM connector E (80P)

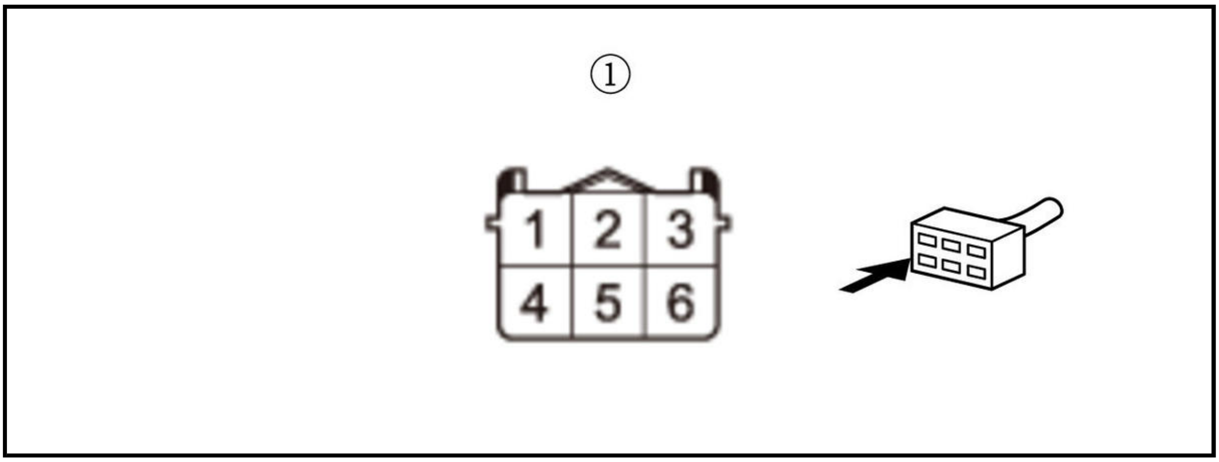
-2. Exit the SCS mode with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Measure the voltage between test points 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

The PCM internal circuit is OK. Replace the A/F sensor (Sensor 1) .

DTC P2245 (1.5 L ENGINE)

DTC P2245 : A/F Sensor (Sensor 1) VCENT Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2245 A/F Sensor (Sensor 1) VCENT Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2245 A/F Sensor (Sensor 1) VCENT Circuit Low Voltage	B	B

Is DTC P2245 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (VCENT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 74**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the VCENT wire between the PCM (E74) and the A/F sensor (Sensor 1).

NO

Go to step 3.

3. PCM internal circuit check

-1. Reconnect the following connector.

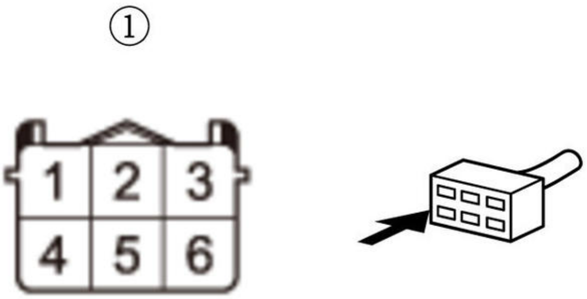
PCM connector E (80P)

-2. Exit the SCS mode with the HDS.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2251 (1.5 L ENGINE)

DTC P2251 : A/F Sensor (Sensor 1) VS Circuit High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2251 is stored at the same time as DTC P0134, troubleshoot DTC P2251 first, then recheck for P0134.

DTC Description	Confirmed DTC	Pending DTC
P2251 A/F Sensor (Sensor 1) VS Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2251 A/F Sensor (Sensor 1) VS Circuit High Voltage	B	B

Is DTC P2251 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (VS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

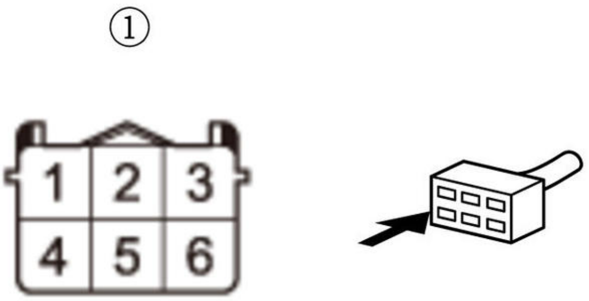
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 6: ①
Test point 2	**PCM connector E (80P) No. 73**



Is there continuity?

YES

Go to step 3.

NO

Repair an open in the VS wire between the PCM (E73) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

PCM connector E (80P)

-2. Exit the SCS mode with the HDS.

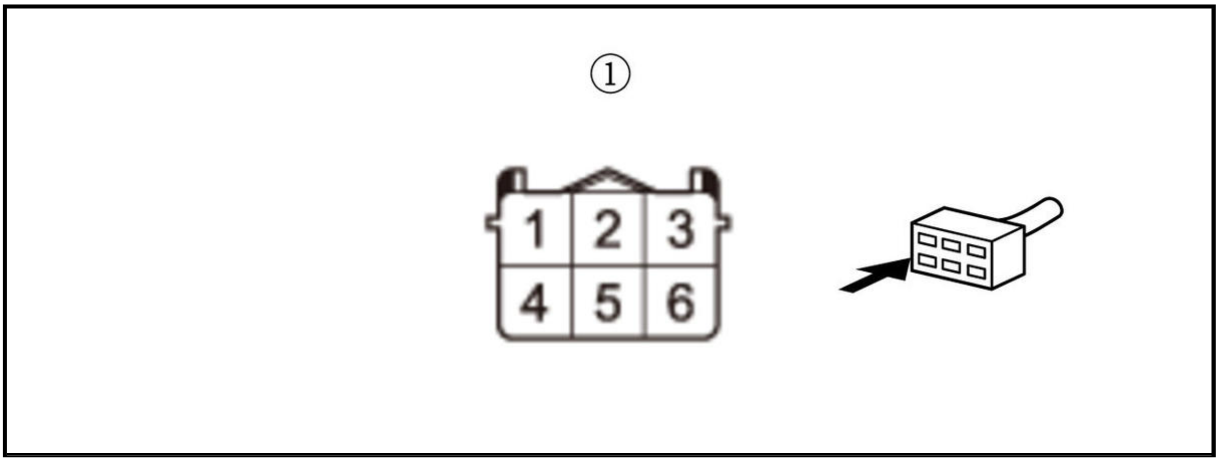
-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Measure the voltage between test points 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 6: ①

Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2252 (1.5 L ENGINE)

DTC P2252 : A/F Sensor (Sensor 1) VS Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2252 A/F Sensor (Sensor 1) VS Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2252 A/F Sensor (Sensor 1) VS Circuit Low Voltage	B	B

   Is DTC P2252 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (VS line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 73**
Test point 2	Body ground

   Is there continuity?

   YES

Repair a short in the VS wire between the PCM (E73) and the A/F sensor (Sensor 1).

NO

Go to step 3.

3. A/F sensor (Sensor 1) check

-1. **Substitute a known-good A/F sensor (Sensor 1)** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. **Reset the PCM with the HDS** .

Reset PCM

-6. **Do the PCM idle learn procedure** .

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2252 A/F Sensor (Sensor 1) VS Circuit Low Voltage	B	B

Is DTC P2252 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original A/F sensor (Sensor 1) .

DTC P2252 (2.4 L ENGINE) (2017 2018 2019)

DTC P2252 : A/F Sensor (Sensor 1) AFS- Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2252 A/F Sensor (Sensor 1) AFS- Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2252 A/F Sensor (Sensor 1) AFS- Circuit Low Voltage	B	B

Is DTC P2252 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (AFS- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector C (51P)
A/F sensor (Sensor 1) 4P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
B	A/F sensor (Sensor 1) 4P connector: disconnected
Test point 1	**PCM connector C (51P) No. 47**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the AFS- wire between the PCM (C47) and the A/F sensor (Sensor 1).

NO

The AFS- wire is OK. Go to step 3.

3. PCM internal circuit check

-1. Reconnect PCM connector C (51P).

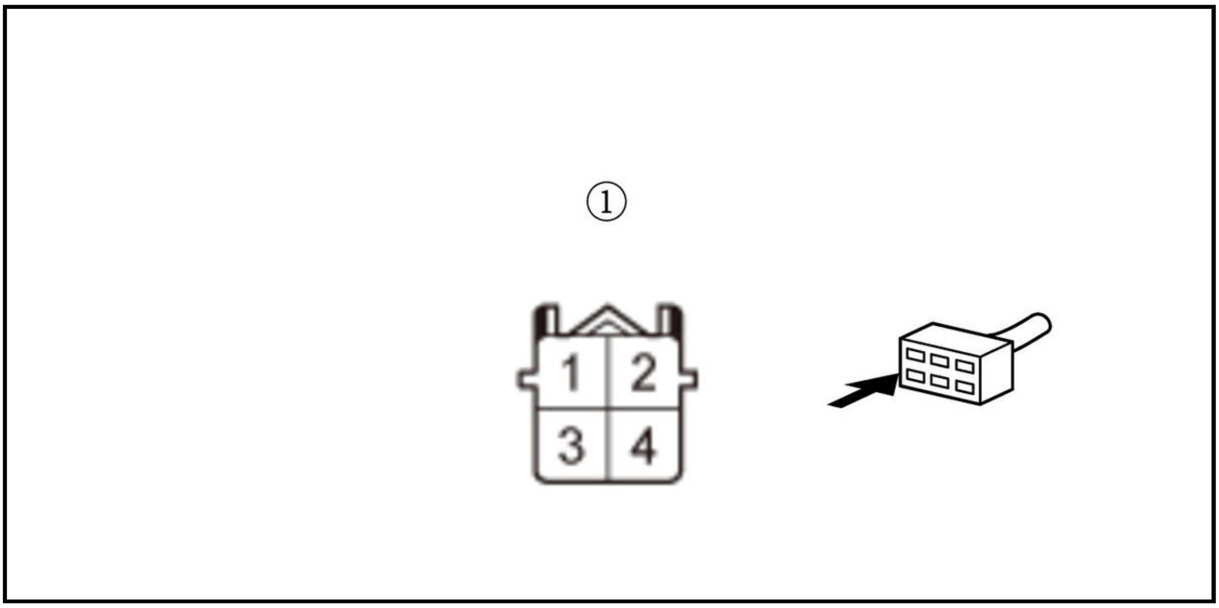
-2. Exit the SCS mode with the HDS.

-3. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle for 2 minutes.

-4. Measure the voltage between test points 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 4P connector: disconnected

Test point 1	A/F sensor (Sensor 1) 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2270 (1.5 L ENGINE)

DTC P2270 : Secondary HO2S (Sensor 2) Circuit Signal Stuck Lean

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2270 Secondary HO2 (Sensor 2) Circuit Signal Stuck Lean	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle for 2 minutes.

-6. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Engine speed between 1, 500 - 3, 000 rpm
- Drive 30 seconds or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B

-7. Monitor the OBD STATUS for DTC P2270 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P2270 Secondary HO2 (Sensor 2) Circuit Signal Stuck Lean	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the secondary HO2S (Sensor 2)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

DTC P2270 (2.4 L ENGINE) (2017 2018 2019)

DTC P2270 : Secondary HO2S (Sensor 2) Circuit Signal Stuck Lean

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2270 Secondary HO2S (Sensor 2) Circuit Signal Stuck Lean	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Test-drive under these conditions:

   - Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
   - Transmission in D

- Engine speed between 1, 500-3, 000 rpm
- Drive 30 seconds or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B

-6. Monitor the OBD STATUS for DTC P2270 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P2270 Secondary HO2S (Sensor 2) Circuit Signal Stuck Lean	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace secondary HO2S (Sensor 2)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

DTC P2279 (1.5 L ENGINE)

DTC P2279 : Intake Air System Leak

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0443 is stored at the same time as DTC P2279, troubleshoot DTC P0443 first, then recheck for DTC P2279.

DTC Description	Confirmed DTC	Pending DTC
P2279 Intake Air System Leak	B	B

DTC (PGM-FI)

1. Intake air system visual check:

   Check for vacuum leaks at these parts:

   - PCV valve
   - PCV hose
   - Purge (PCS) line
   - Throttle body
   - Intake manifold
   - All parts through the turbocharger joint to the throttle body

   Are the parts OK?

   YES

Go to step 2.

NO

Repair or replace any leaking part (s).

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle for 1 minute.

-4. Monitor the OBD STATUS for DTC P2279 with the HDS.

DTC Description	OBD Status
P2279 Intake Air System Leak	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Check the camshaft timing** and **adjust it if needed** . If the cam timing is OK, **check the valve clearance adjustment and set to specification** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for vacuum leaks at the PCV valve, the PCV hose, the purge (PCS) line, the throttle body, and the intake manifold. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 2-1 and recheck.

DTC P2401 (1.5 L ENGINE)

DTC P2401 : EVAP Leak Check Pump Control Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2401 EVAP Leak Check Pump Control Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST (ELCM)

Is the result OK?

YES

If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. Go to step 2.

2. Shorted wire check (ELCMP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

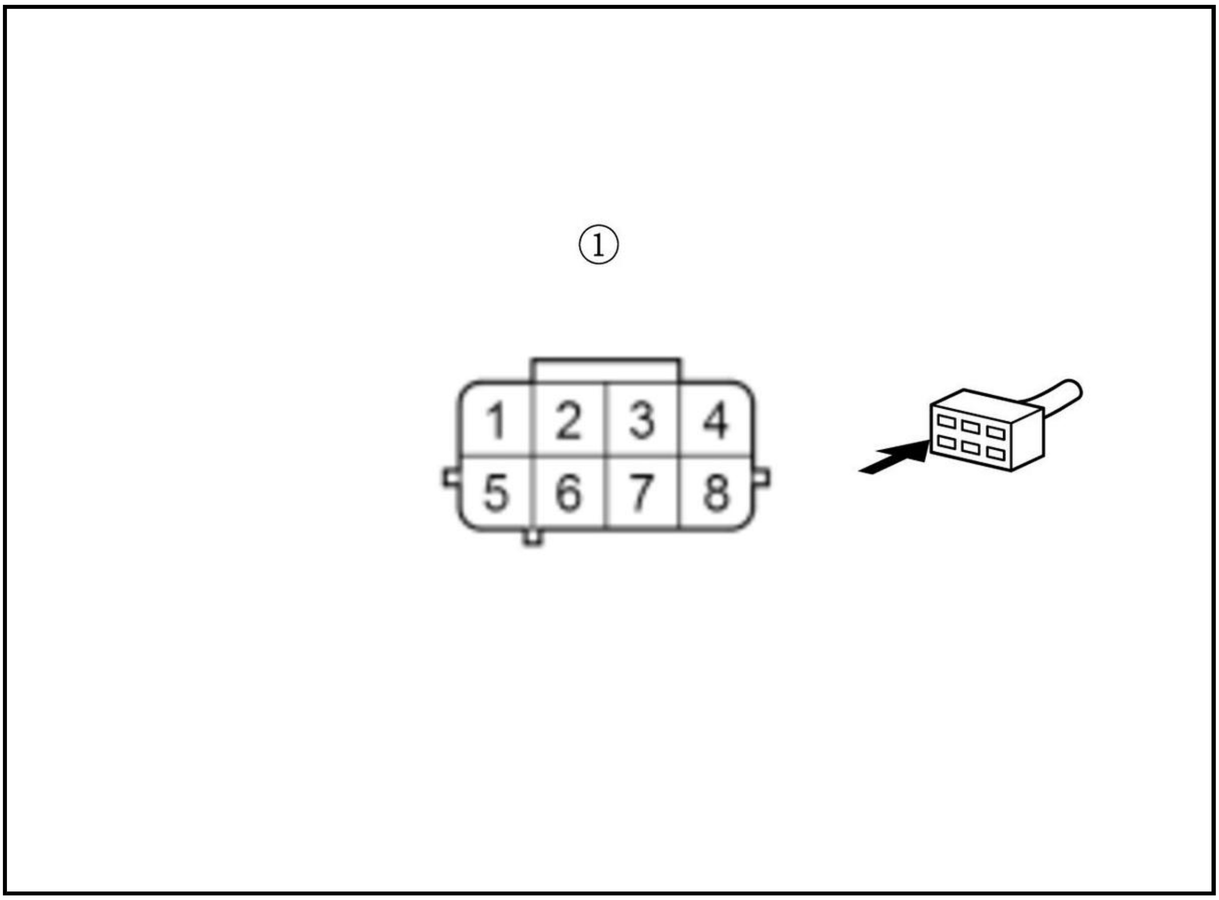
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

EVAP leak check module 8P connector
PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the ELCMP wire between the PCM (E47) and the EVAP leak check module.

NO

The ELCMP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P2402 (1.5 L ENGINE)

DTC P2402 : EVAP Leak Check Pump Control Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2402 EVAP Leak Check Pump Control Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST (ELCM)

Is the result OK?

YES

If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. Go to step 2.

2. Open wire check (GND line)

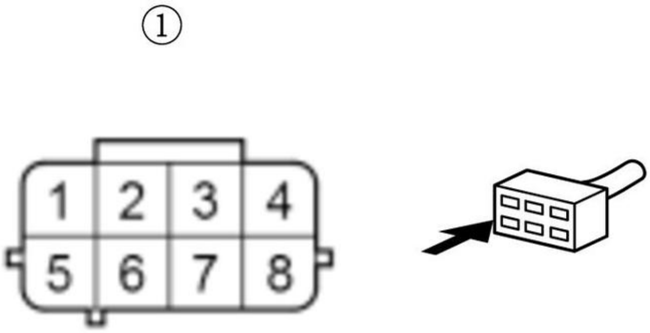
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 3.

NO

Repair an open in the GND wire between the EVAP leak check module and body ground (G504).

3. Open wire check (ELCMP line)

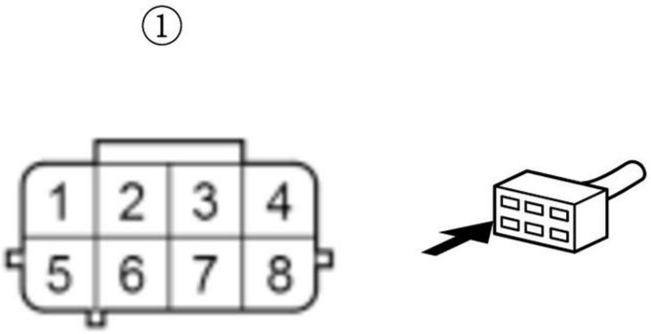
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 3: ①
Terminal B	Body ground



-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector: disconnected
	EVAP leak check module 8P connector No. 3: jumped to body ground
Test point 2	**PCM connector E (80P) No. 47**
Test point 1	Body ground

Is there continuity?

YES

Replace the EVAP leak check module .

NO

Repair an open in the ELCMP wire between the PCM (E47) and the EVAP leak check module.

DTC P2450 (1.5 L ENGINE)

DTC P2450 : EVAP System Purge Line Non-return Valve A Stuck Open

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2450 EVAP System Purge Line Non-return Valve A Stuck Open	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Purge Flow Check Test with the HDS.

   EVAP TEST (ELCM)

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2450 EVAP System Purge Line Non-return Valve A Stuck Open	B	B

   Is DTC P2450 indicated?

   YES

   Replace the EVAP canister purge valve .

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module, the EVAP canister purge valve, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P24B8 (1.5 L ENGINE) (2020 2021)

DTC P24B8 : EVAP Leak Check Module Absolute Pressure Sensor Out of Range

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .

- If DTC P24BA and/or P24BB are stored at the same time as DTC P24B8, troubleshoot those DTCs first, then recheck for DTC P24B8.

DTC Description	Confirmed DTC	Pending DTC
P24B8 EVAP Leak Check Module Absolute Pressure Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	More than 896	mmHg	B	B

   Do the current condition (s) match the malfunction threshold?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification 2

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24B8 EVAP Leak Check Module Absolute Pressure Sensor Out of Range	B	B

   Is DTC P24B8 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (VCC6 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

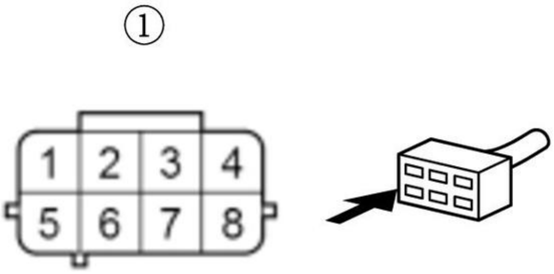
-2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	EVAP leak check module 8P connector (female terminals) No. 8: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 6.

4. Determine possible failure area (ELCMPA line, others)

-1. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
Absolute Pressure of ELCM Pressure Sensor	Less than 331	mmHg	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 8.

NO

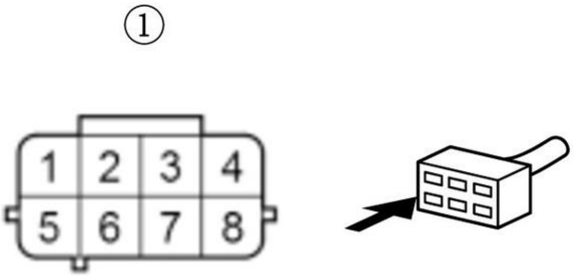
Go to step 5.

5. Determine possible failure area (EVAP leak check module, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	EVAP leak check module 8P connector (female terminals) No. 8: ①



-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Absolute Pressure of ELCM Pressure Sensor	More than 896	mmHg	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 9.

NO

Replace the EVAP leak check module .

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

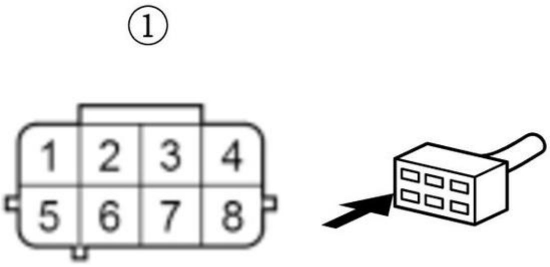
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector: disconnected
Test point 1	**PCM connector E (80P) No. 63**
Test point 2	EVAP leak check module 8P connector (female terminals) No. 6: ①



Is there 1.0 Ω or less?

YES

Go to step 7.

NO

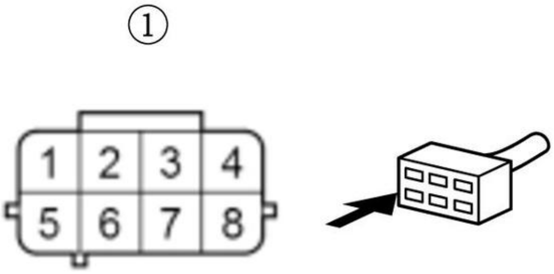
Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

7. Open wire check (SG6 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector E (80P): disconnected

Test point 1	**PCM connector E (80P) No. 45**
Test point 2	EVAP leak check module 8P connector (female terminals) No. 8: ①



Is there 1.0 Ω or less?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and the EVAP leak check module.

8. Shorted wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

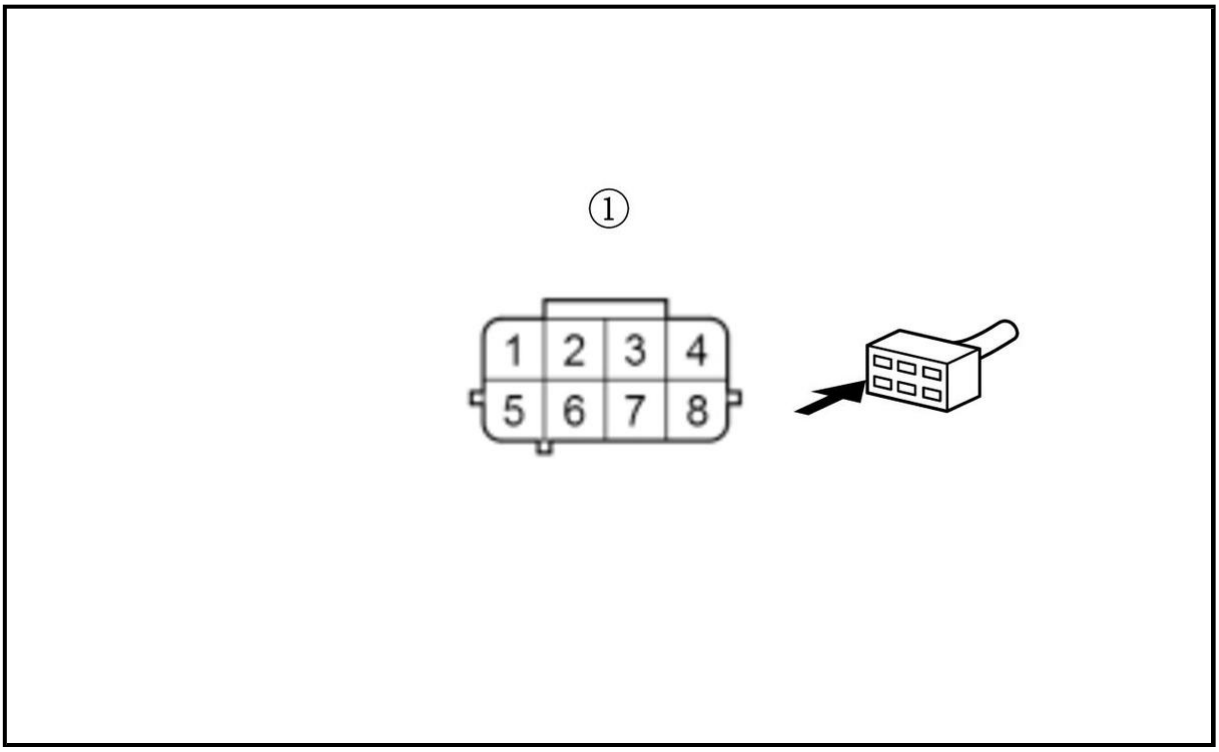
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

9. Open wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the EVAP leak check module 8P connector.

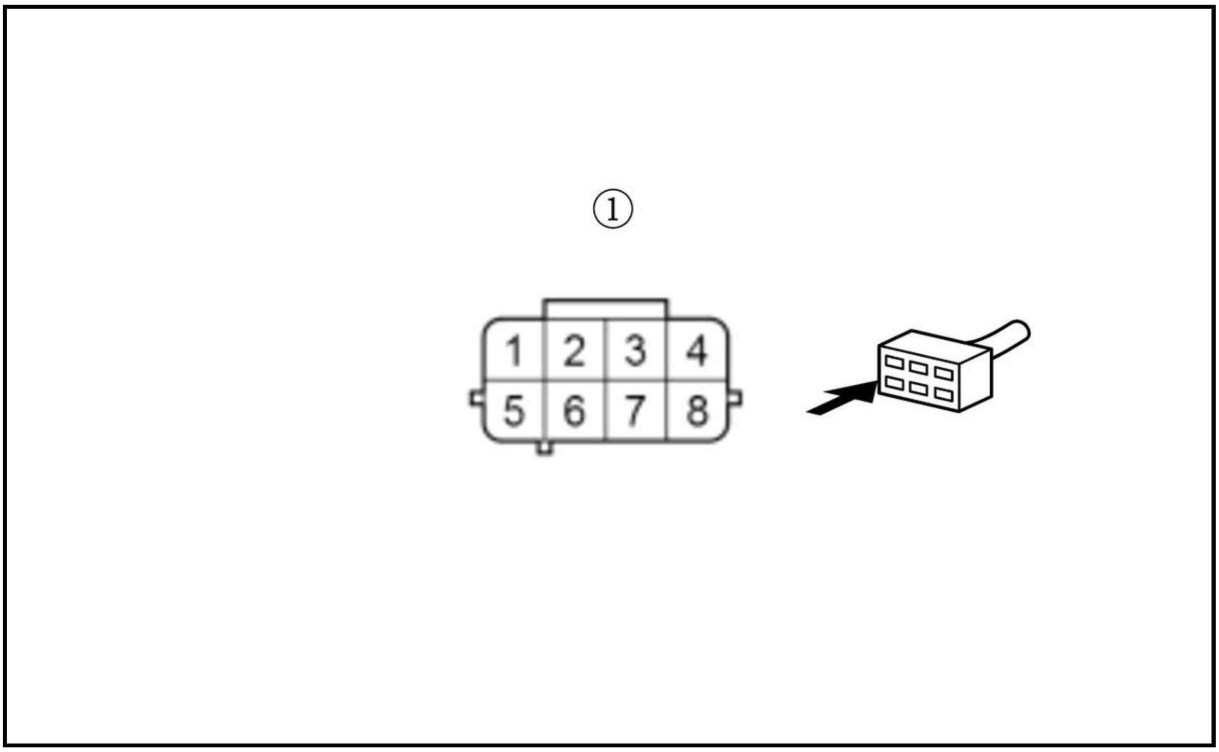
-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (50P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 42**
Test point 2	EVAP leak check module 8P connector (female terminals) No. 7: ①



Is there 1.0 Ω or less?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

DTC P24B9 (1.5 L ENGINE)

DTC P24B9 : EVAP Leak Check Module Absolute Pressure Sensor Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P24BA and/or P24BB is stored at the same time as DTC P24B9, troubleshoot those DTCs first, then recheck for DTC P24B9.

DTC Description	Confirmed DTC	Pending DTC
P24B9 EVAP Leak Check Module Absolute Pressure Sensor Range/Performance Problem	B	B

DTC (PGM-FI)

1. EVAP leak check module drain hose check

-1. **Remove the EVAP leak check module** and the **EVAP canister filter** , then check the blockage in the hoses and the EVAP canister filter.

Are the parts OK?

YES

Go to step 2.

NO

Remove the blockage from them, or replace the part (s) if needed.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24B9 EVAP Leak Check Module Absolute Pressure Sensor Range/Performance Problem	B	B

Is DTC P24B9 indicated?

YES

Replace the EVAP leak check module .

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P24BA (1.5 L ENGINE) (2017)

DTC P24BA : EVAP Leak Check Module Absolute Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P24BA EVAP Leak Check Module Absolute Pressure Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM	Less than 380	mmHg	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Pressure Sensor				

Do the current condition (s) match the malfunction threshold?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24BA EVAP Leak Check Module Absolute Pressure Sensor Circuit Low Voltage	B	B

Is DTC P24BA indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (ELCMPA line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	Less than 380	mmHg	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (ELCMPA line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

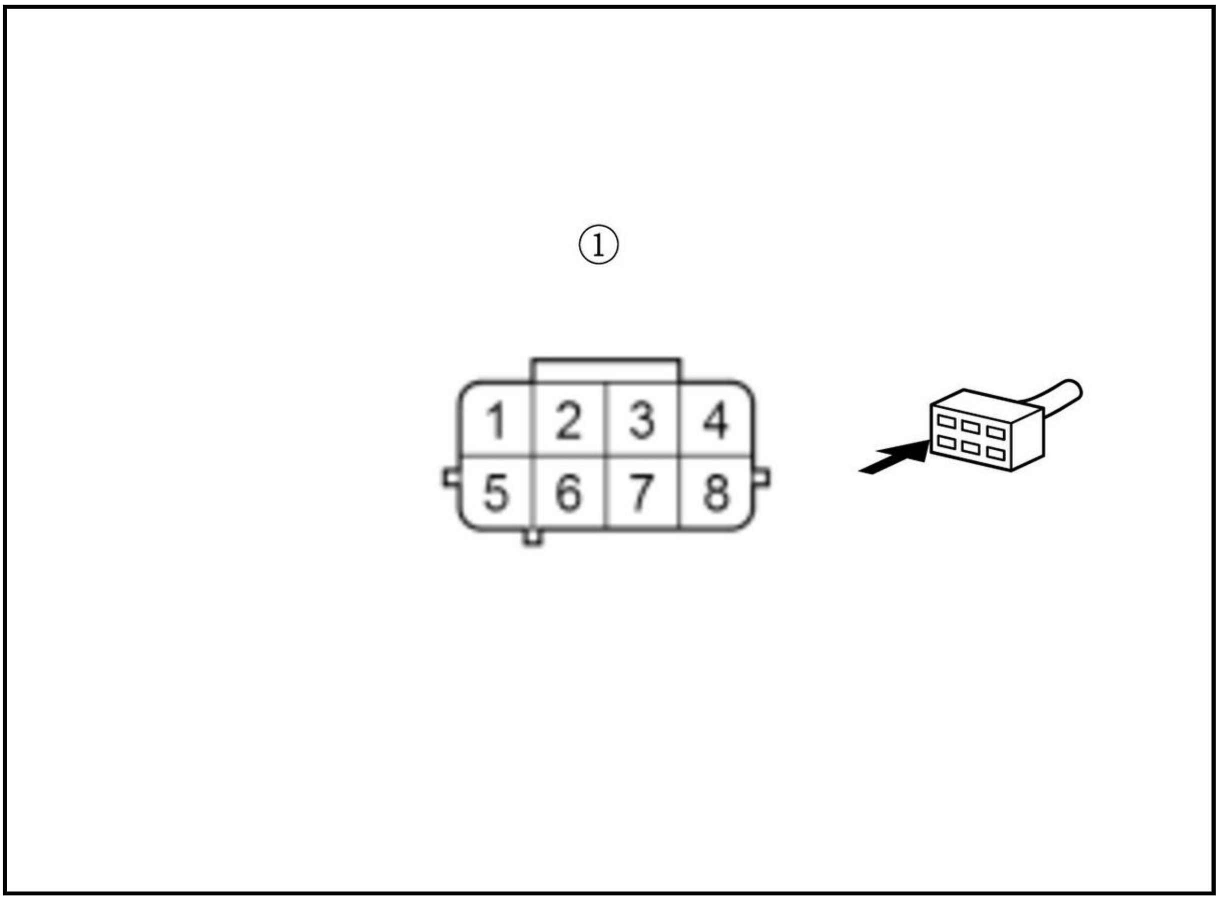
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (50P)

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

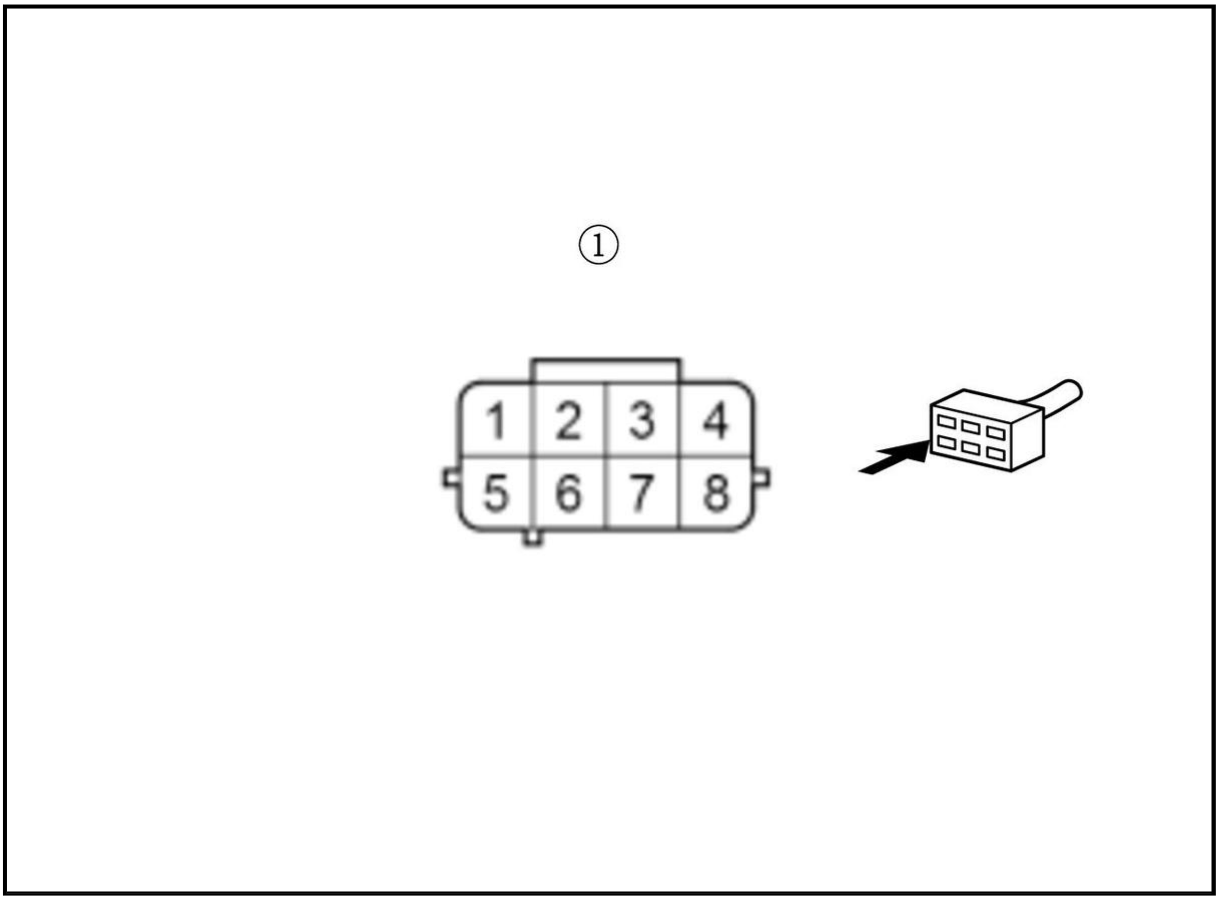
NO

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (EVAP leak check module pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the EVAP leak check module .

NO

Go to step 6.

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

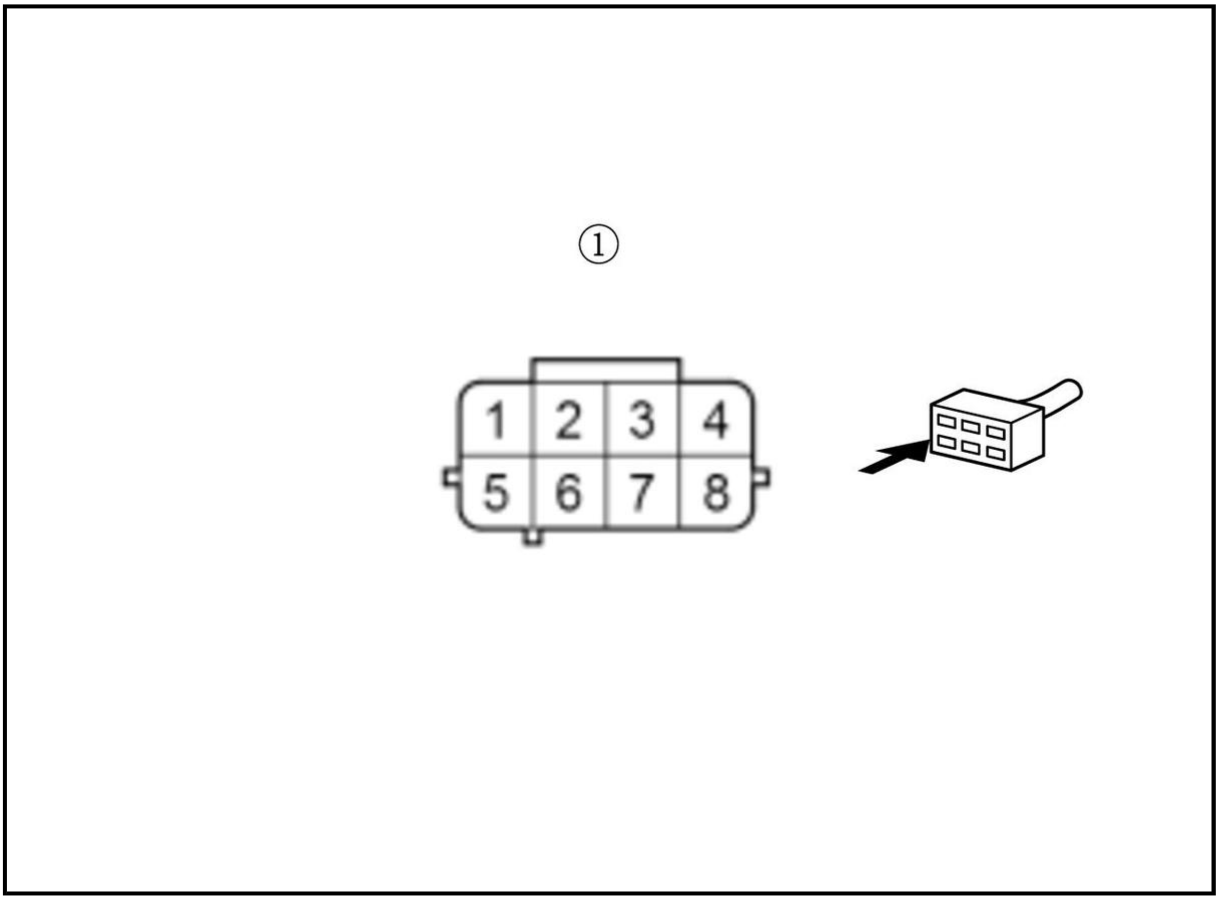
-3. Disconnect the following connector.

PCM connector E (80P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 6: ①

Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode EVAP leak check module 8P connector: disconnected EVAP leak check module 8P connector No. 6: jumped to body ground PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 63**

Test point 2	Body ground

Is there continuity?

YES

The VCC6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

DTC TROUBLESHOOTING

DTC P24BA (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P24BA : EVAP Leak Check Module Absolute Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC
P24BA EVAP Leak Check Module Absolute Pressure Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	Less than 331	mmHg	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24BA EVAP Leak Check Module Absolute Pressure Sensor Circuit Low Voltage	B	B

Is DTC P24BA indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Determine possible failure area (ELCMPA line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	Less than 331	mmHg	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

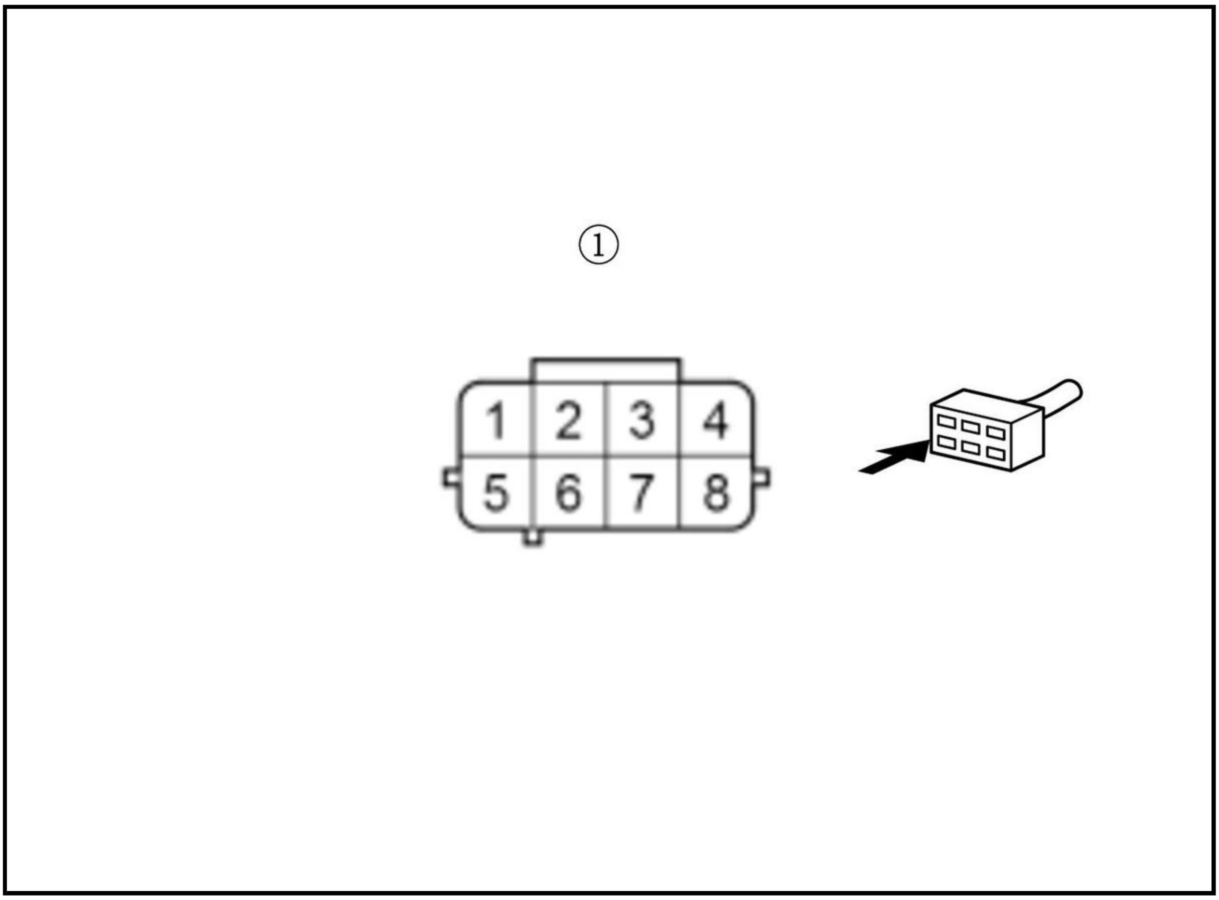
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

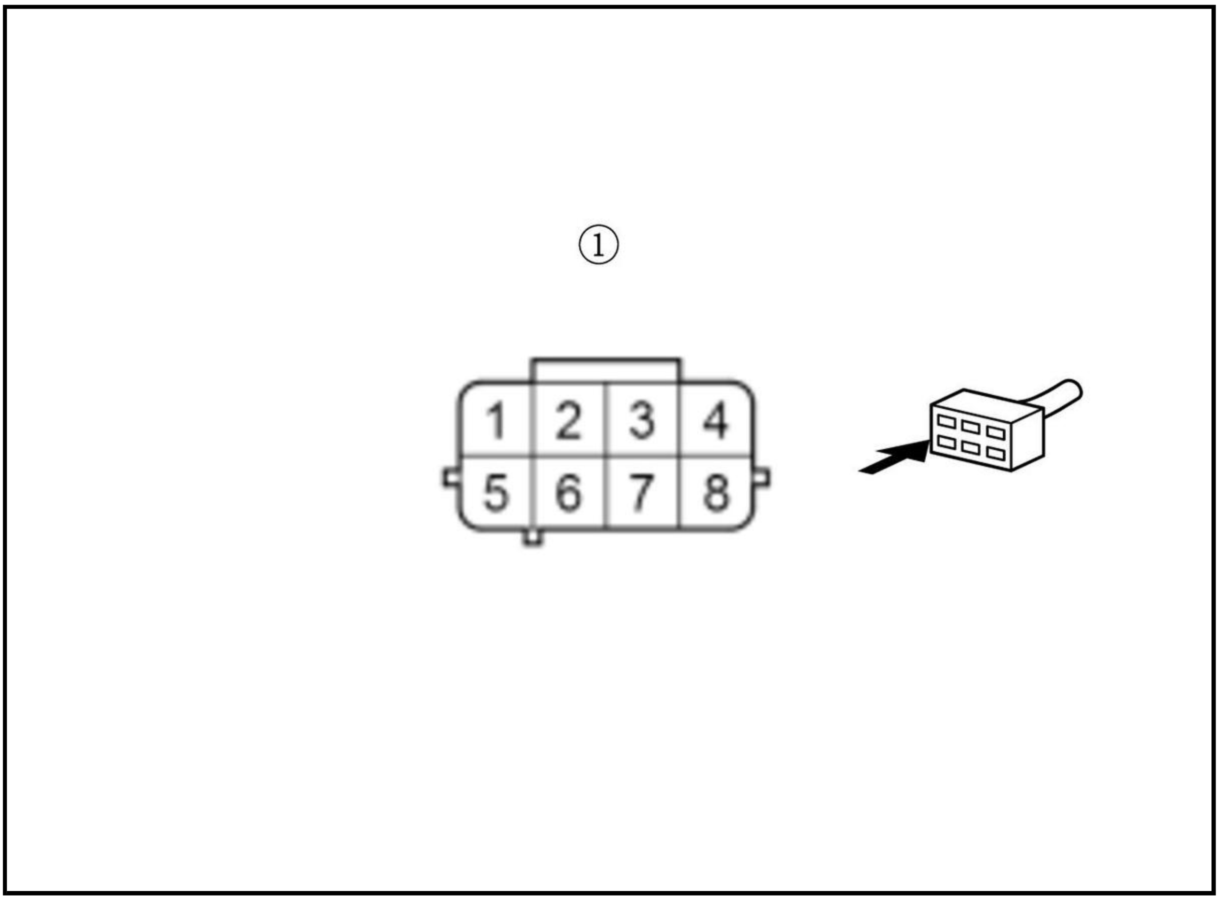
NO

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Determine possible failure area (EVAP leak check module pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the EVAP leak check module .

NO

Go to step 6.

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

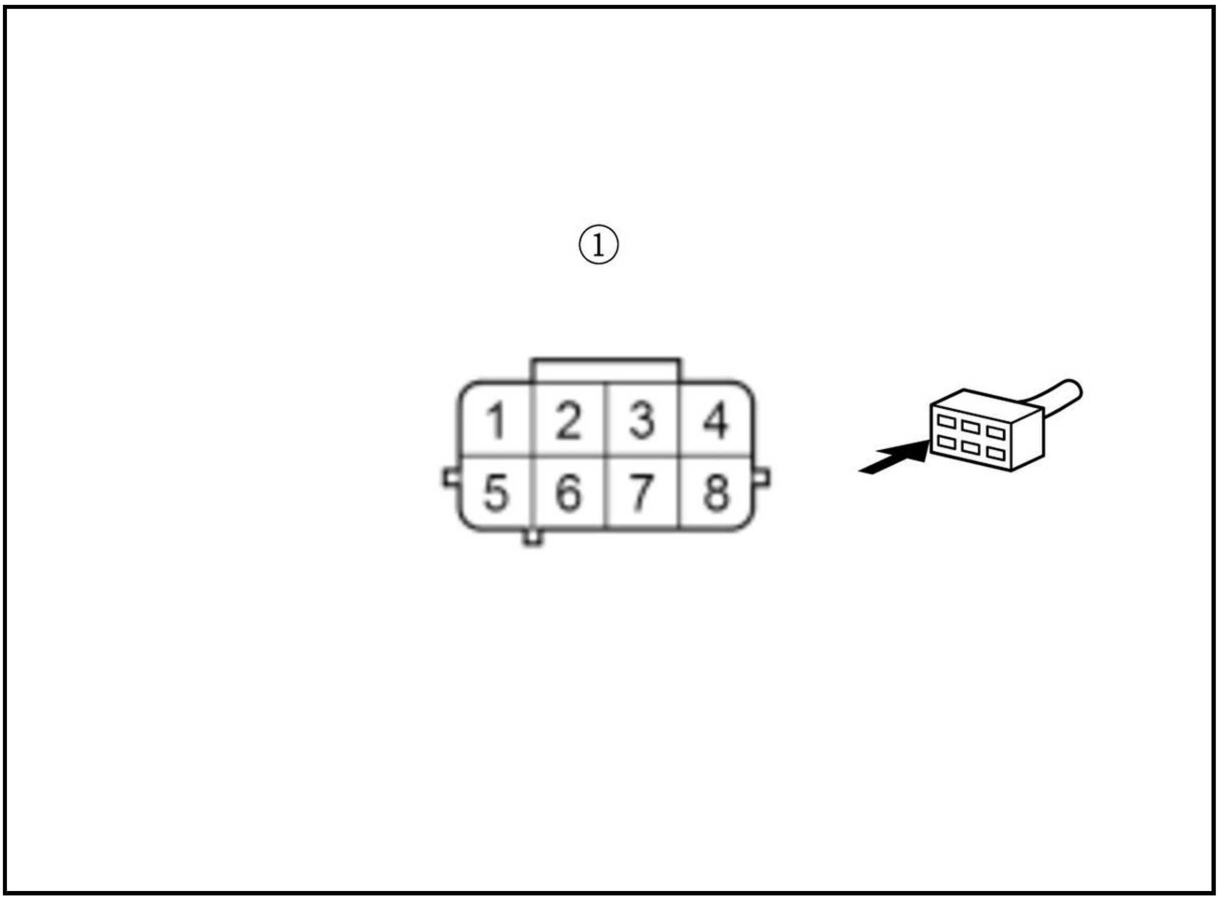
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 6: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	EVAP leak check module 8P connector No. 6: jumped to body ground
	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 63**

Test point 2	Body ground

Is there continuity?

YES

The VCC6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

DTC P24BB (1.5 L ENGINE) (2017)

DTC P24BB : EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is stored if there is a blockage in the drain hose of the EVAP leak check module, check the EVAP canister filter and the drain hoses before troubleshooting.

DTC Description	Confirmed DTC	Pending DTC
P24BB EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	More than 899	mmHg	B	B

   Do the current condition (s) match the malfunction threshold?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24BB EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage	B	B

   Is DTC P24BB indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Determine possible failure area (EVAP leak check module, others)

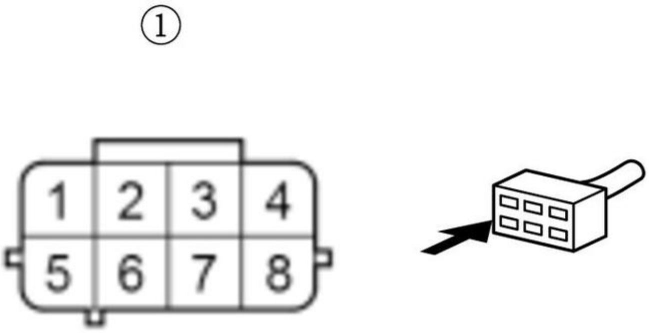
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	EVAP leak check module 8P connector (female terminals) No. 8: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Absolute Pressure of ELCM Pressure Sensor	More than 899	mmHg	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 4.

NO

Replace the EVAP leak check module .

4. Determine possible failure area (ELCMPA line, others)

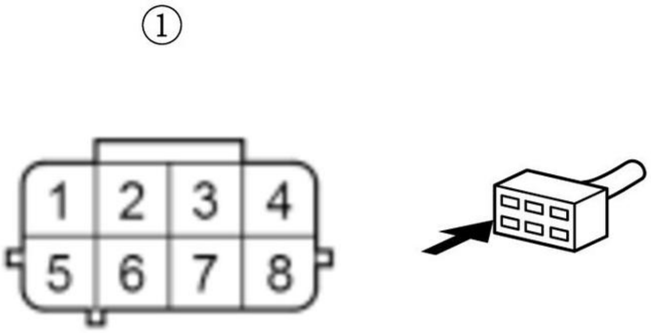
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	EVAP leak check module 8P connector (female terminals) No. 8: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 6.

5. Open wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

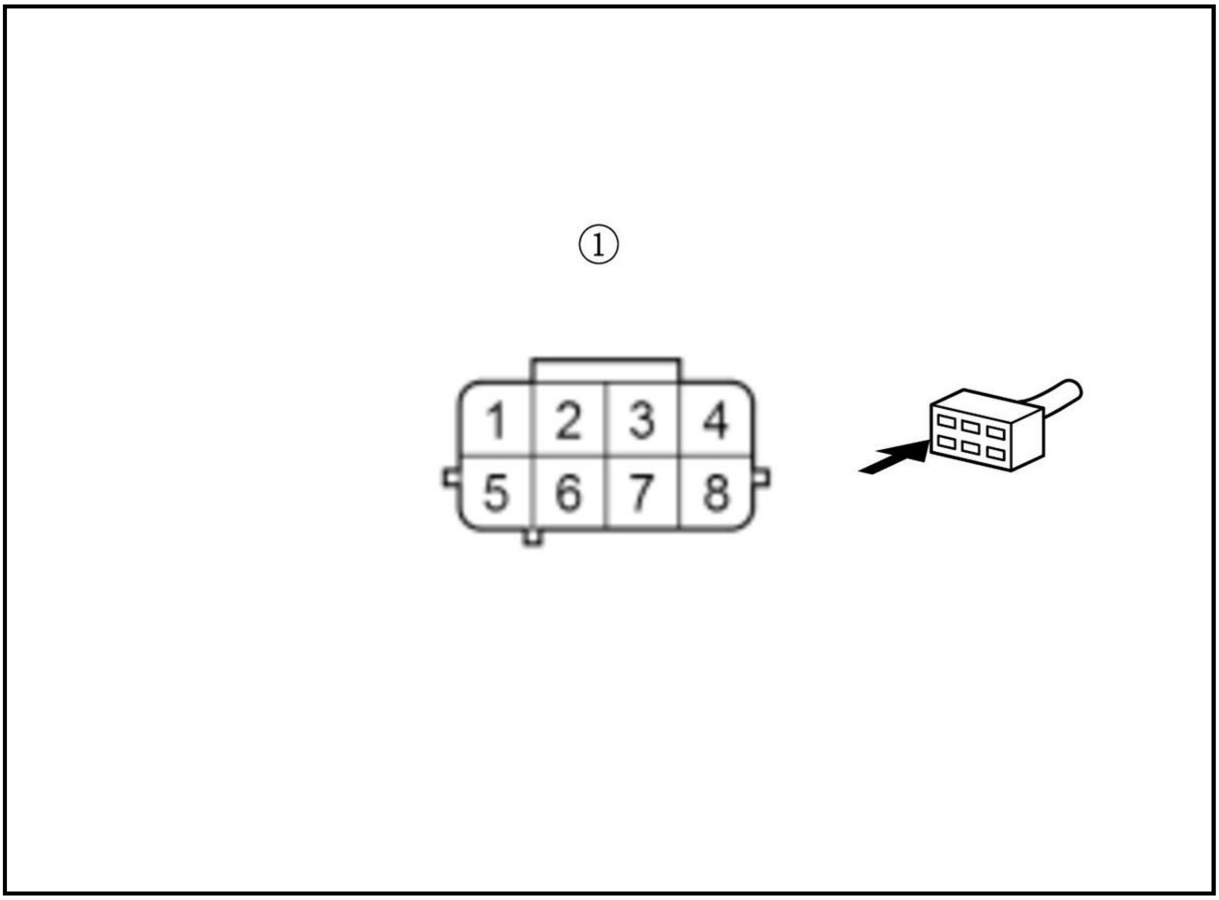
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode EVAP leak check module 8P connector: disconnected EVAP leak check module 8P connector No. 7: jumped to body ground PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 42**

Test point 2	Body ground

Is there continuity?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

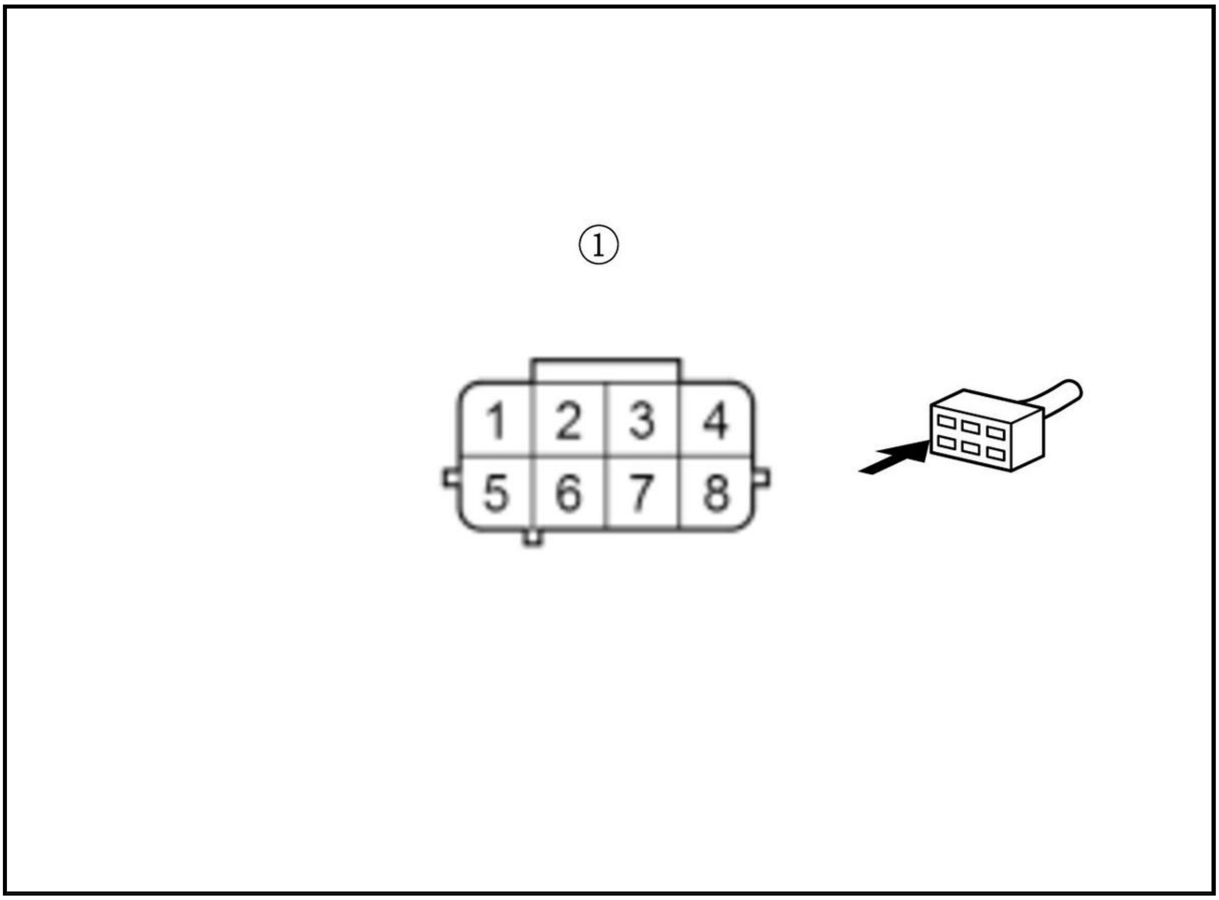
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

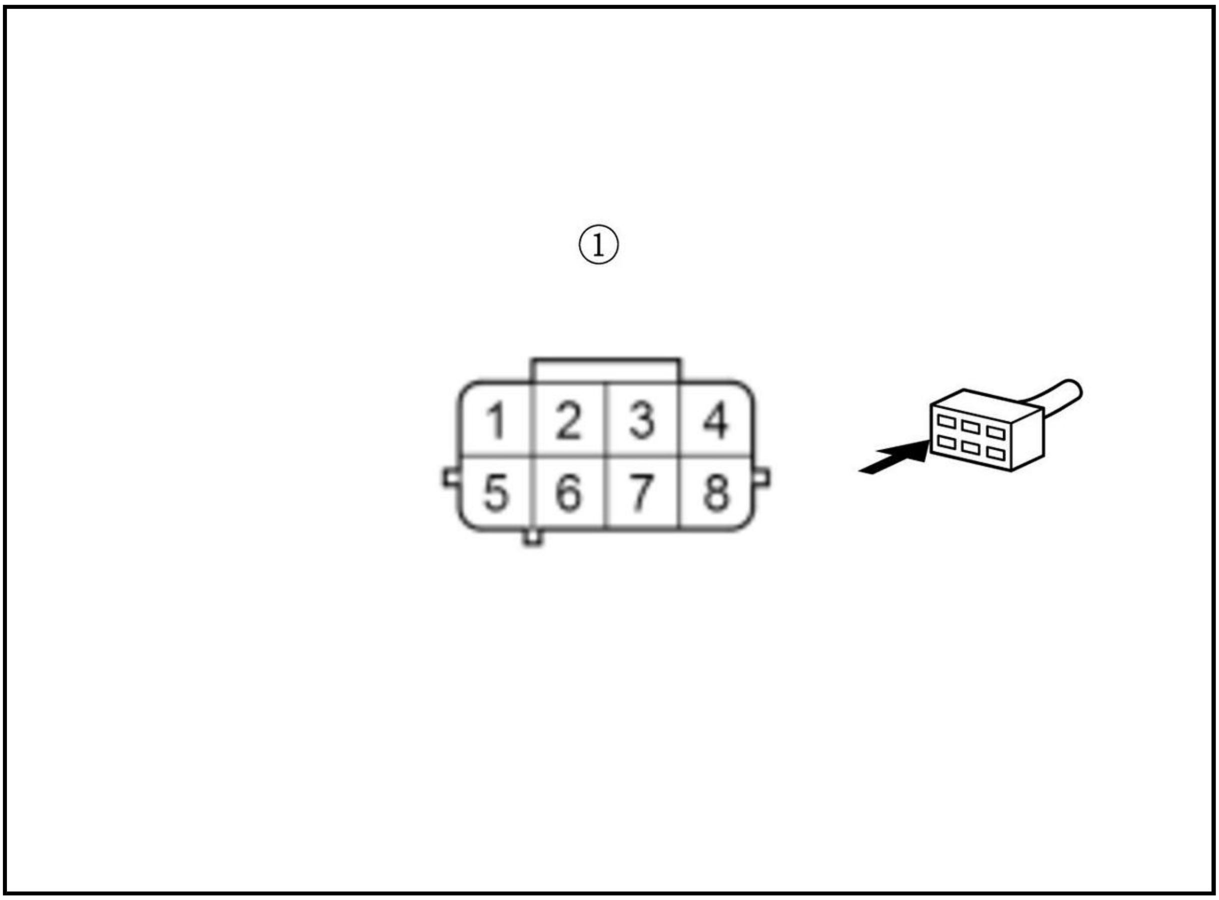
-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 6: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector: disconnected
	EVAP leak check module 8P connector No. 6: jumped to body ground
Test point 1	**PCM connector E (80P) No. 63**
Test point 2	body ground



Is there continuity?

YES

Go to step 7.

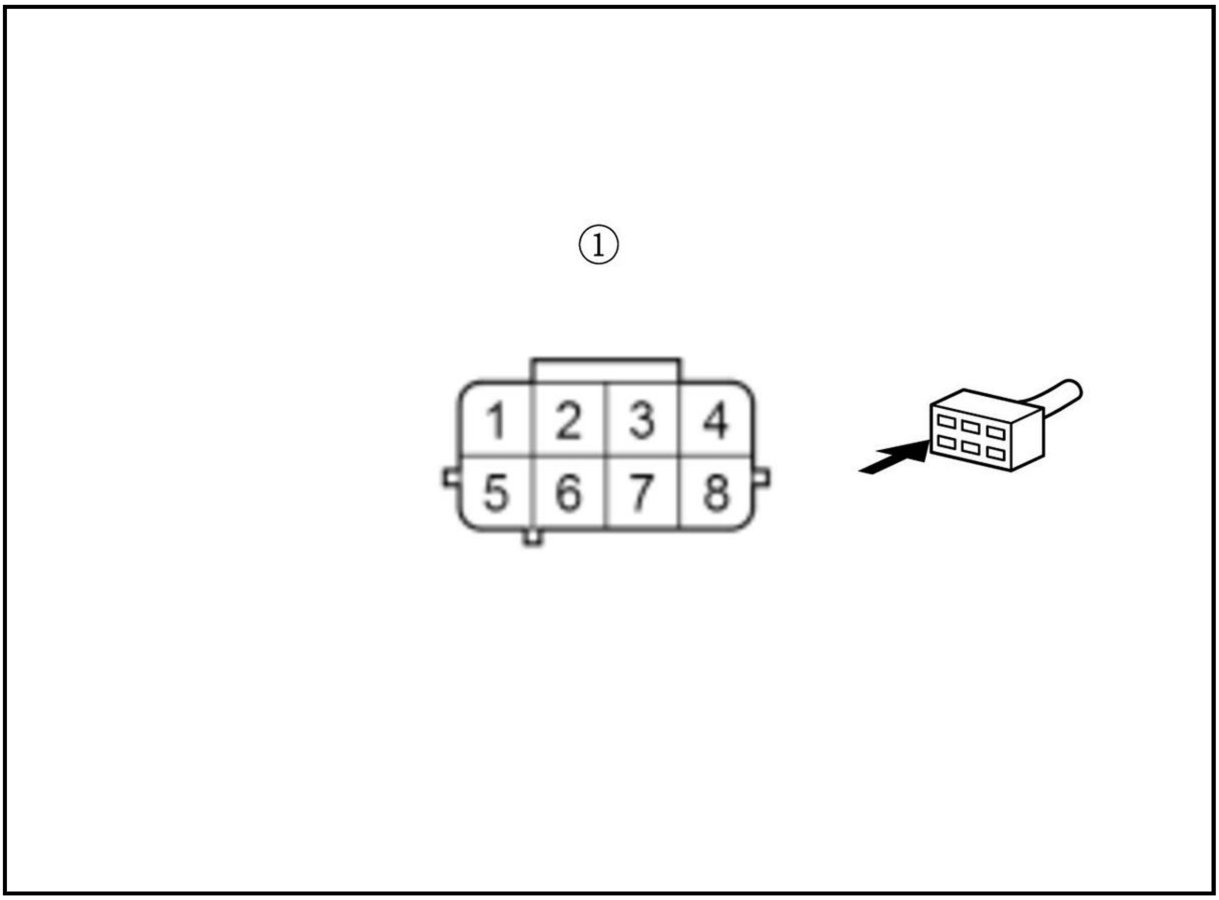
NO

Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

7. Open wire check (SG6 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 8: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector No. 8: jumped to body ground
Test point 1	**PCM connector E (80P) No. 45**
Test point 2	Body ground

Is there continuity?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and the EVAP leak check module.

DTC P24BB (1.5 L ENGINE) (2018 2019)

DTC P24BB : EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is stored if there is a blockage in the drain hose of the EVAP leak check module, check the EVAP canister filter and the drain hoses before troubleshooting.

DTC Description	Confirmed DTC	Pending DTC
P24BB EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	More than 856	mmHg	B	B

   Do the current condition (s) match the malfunction threshold?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24BB EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage	B	B

   Is DTC P24BB indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Determine possible failure area (EVAP leak check module, others)

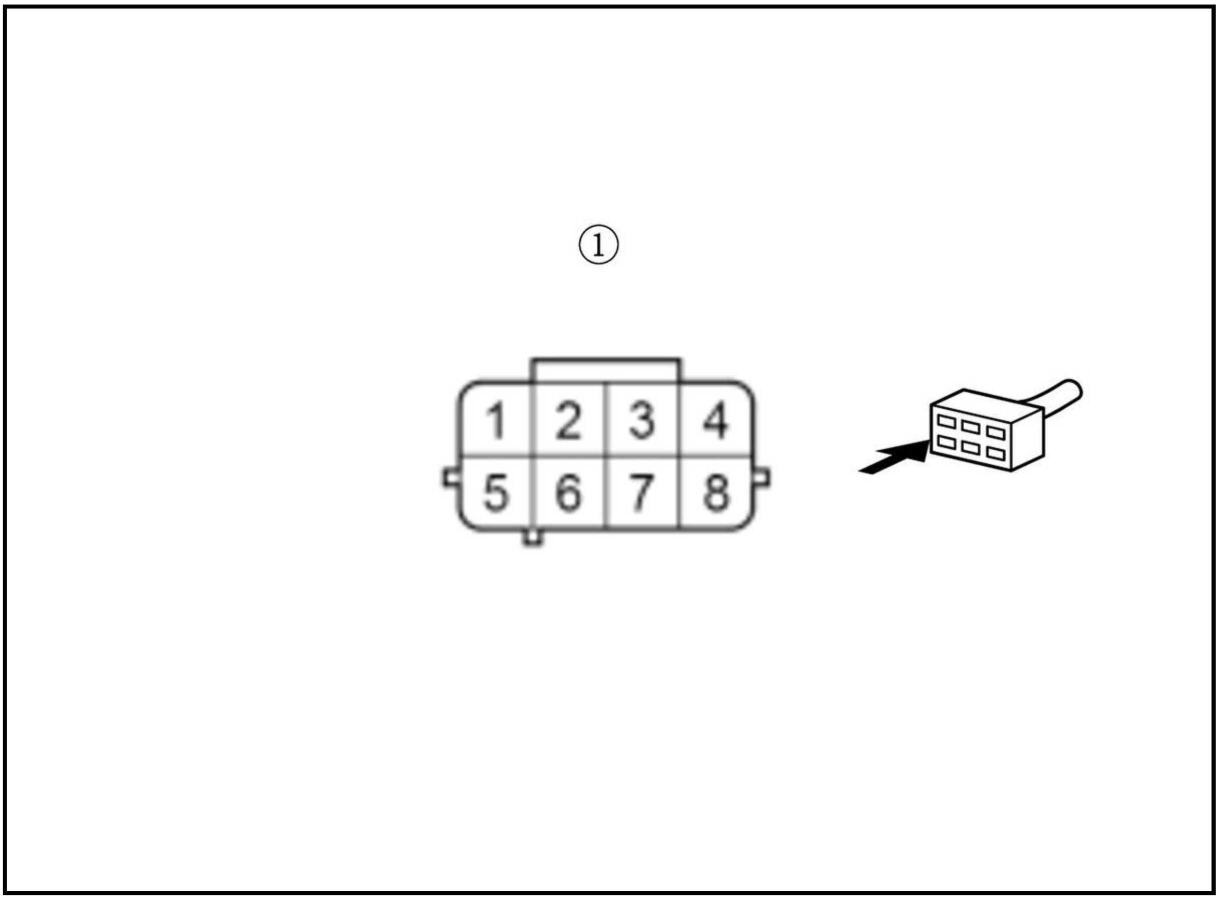
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	EVAP leak check module 8P connector (female terminals) No. 8: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
Absolute Pressure of ELCM Pressure Sensor	More than 856	mmHg	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 4.

NO

Replace the EVAP leak check module .

4. Determine possible failure area (ELCMPA line, others)

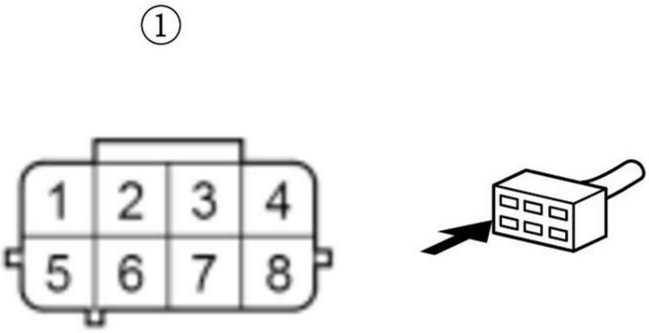
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	EVAP leak check module 8P connector (female terminals) No. 8: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 6.

5. Open wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

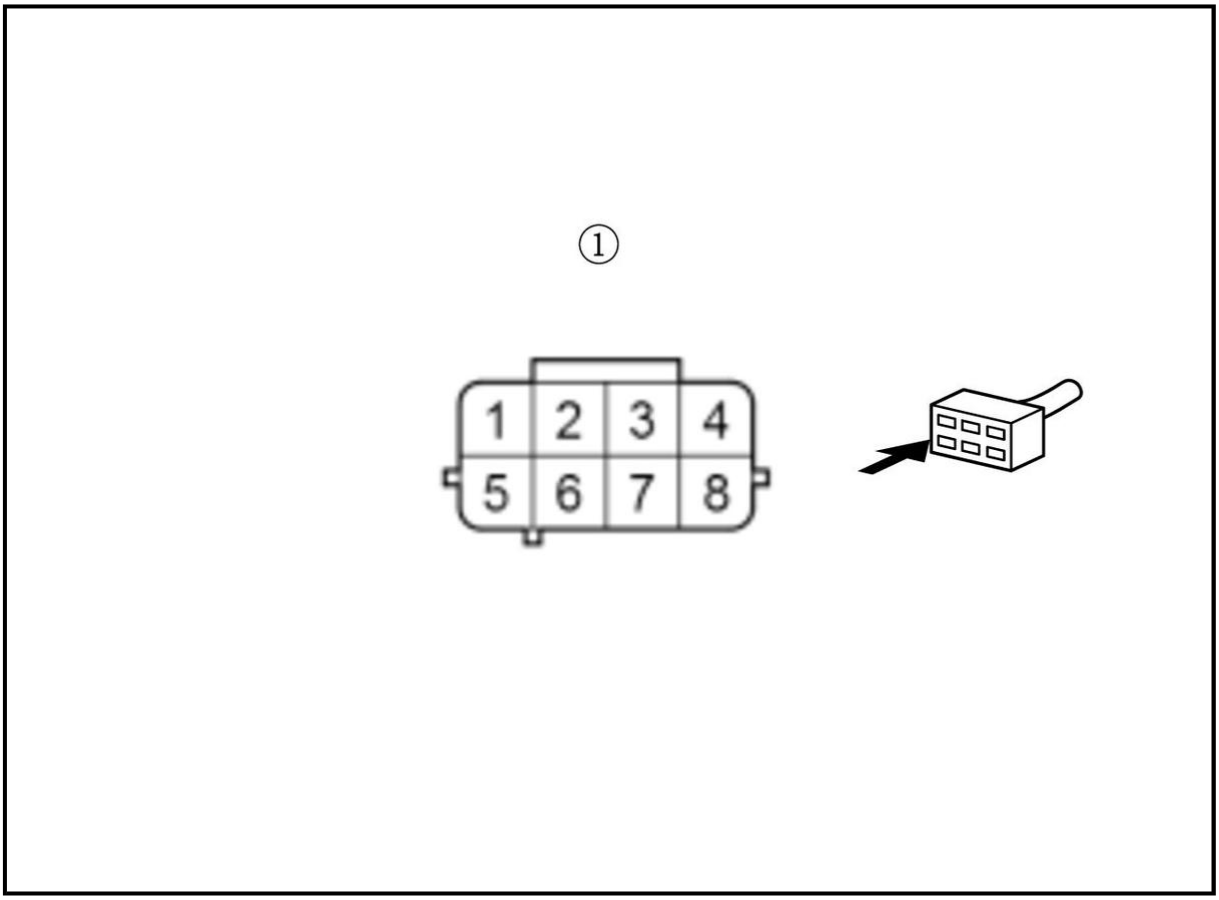
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	EVAP leak check module 8P connector No. 7: jumped to body ground
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 42**

Test point 2	Body ground

Is there continuity?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

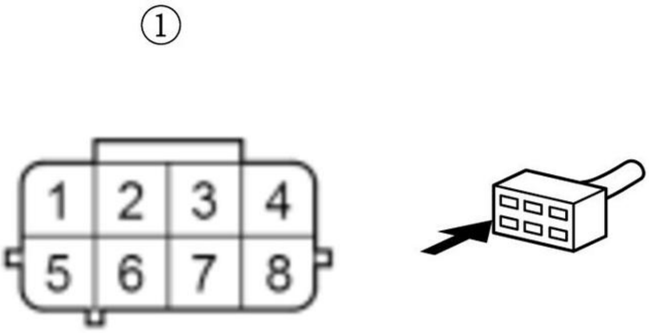
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

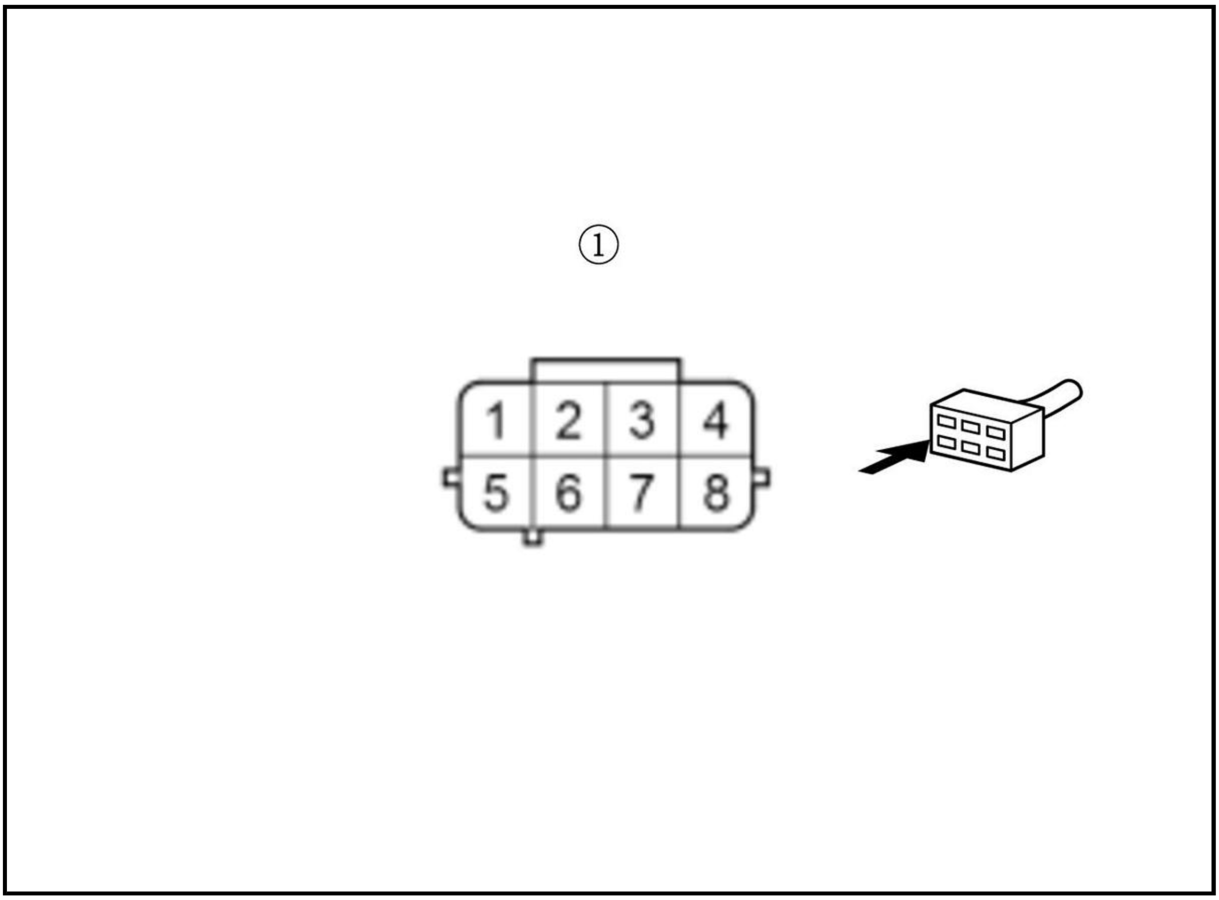
-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 6: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector: disconnected
	EVAP leak check module 8P connector No. 6: jumped to body ground
Test point 1	**PCM connector E (80P) No. 63**
Test point 2	body ground



Is there continuity?

YES

Go to step 7.

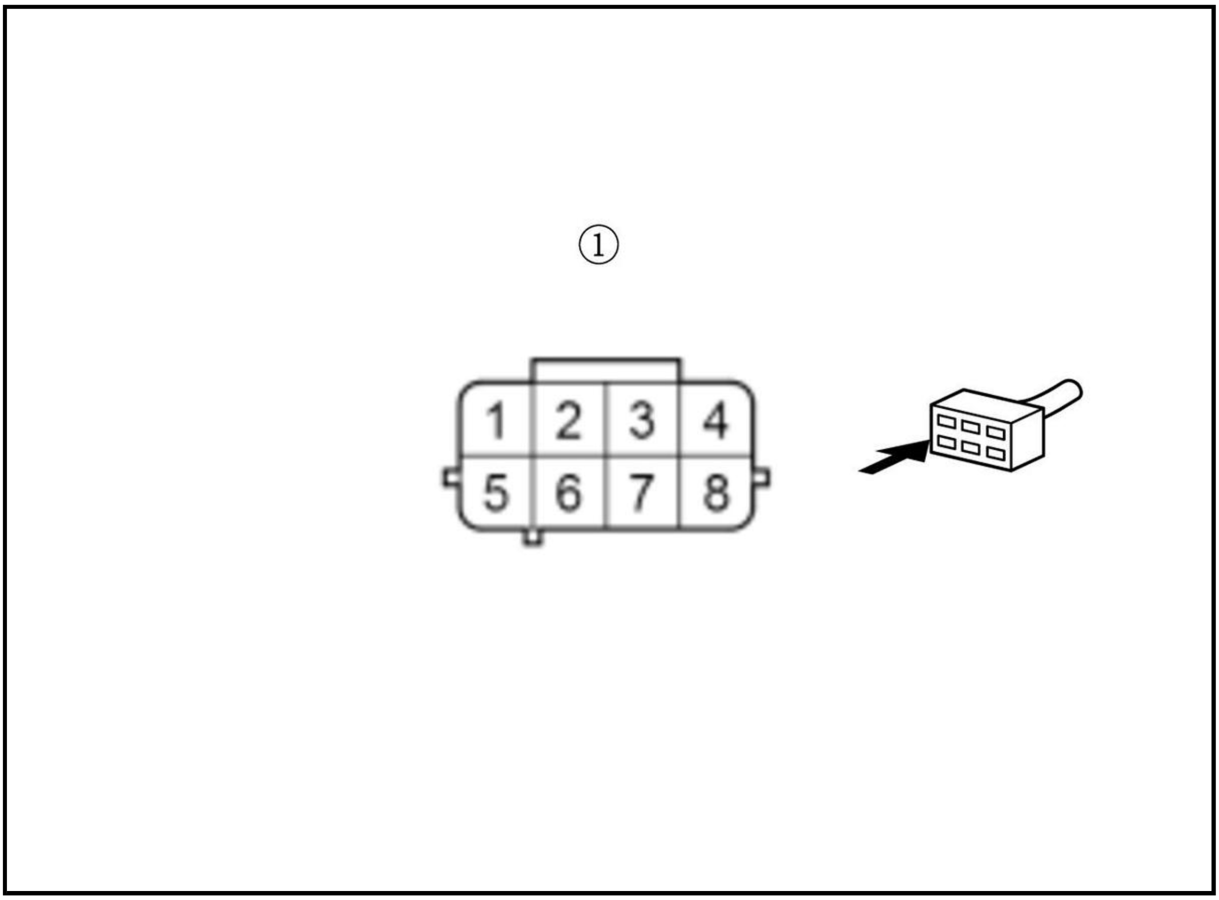
NO

Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

7. Open wire check (SG6 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 8: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector No. 8: jumped to body ground
Test point 1	**PCM connector E (80P) No. 45**
Test point 2	Body ground

Is there continuity?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and the EVAP leak check module.

DTC P24BB (1.5 L ENGINE) (2020 2021)

DTC P24BB : EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is stored if there is a blockage in the drain hose of the EVAP leak check module, check the EVAP canister filter and the drain hoses before troubleshooting.

DTC Description	Confirmed DTC	Pending DTC
P24BB EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	More than 899	mmHg	B	B

   Do the current condition (s) match the malfunction threshold?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24BB EVAP Leak Check Module Absolute Pressure Sensor Circuit High Voltage	B	B

   Is DTC P24BB indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Determine possible failure area (EVAP leak check module, others)

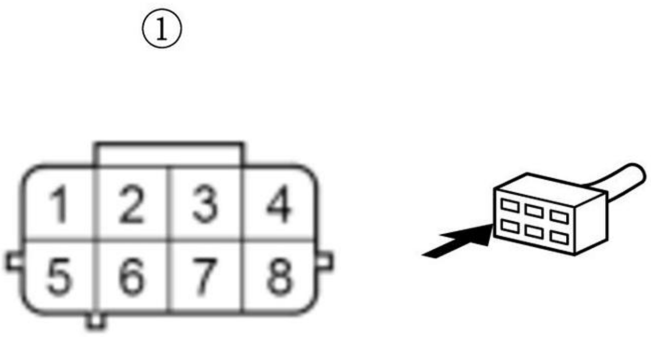
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	EVAP leak check module 8P connector (female terminals) No. 8: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	More than 899	mmHg	B	B

Do the current condition (s) match the malfunction threshold?

YES

Go to step 4.

NO

Replace the EVAP leak check module .

4. Determine possible failure area (ELCMPA line, others)

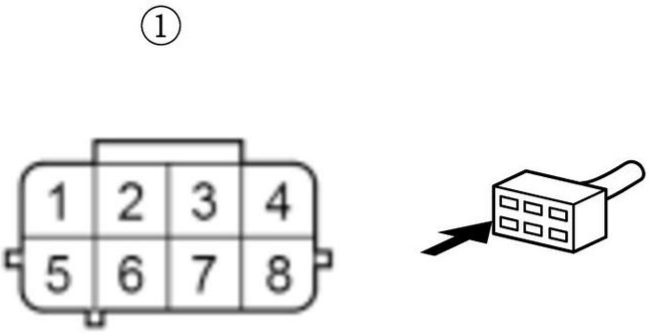
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	EVAP leak check module 8P connector (female terminals) No. 8: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 6.

5. Open wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

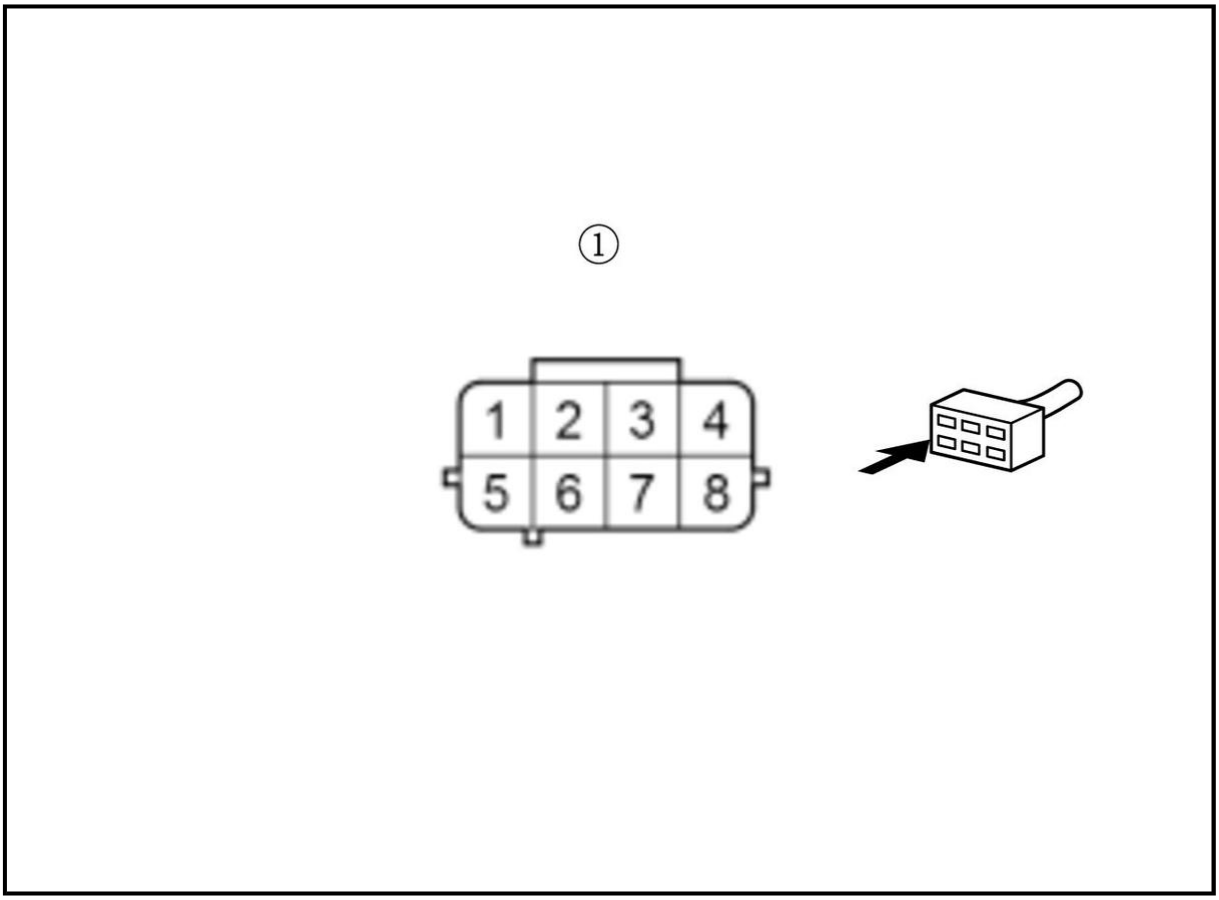
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	EVAP leak check module 8P connector No. 7: jumped to body ground
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 42**
Test point 2	Body ground

Is there continuity?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

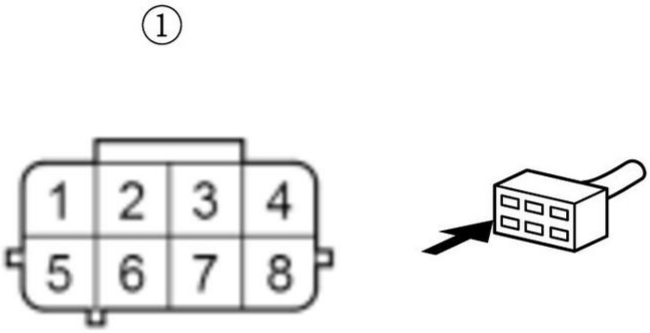
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

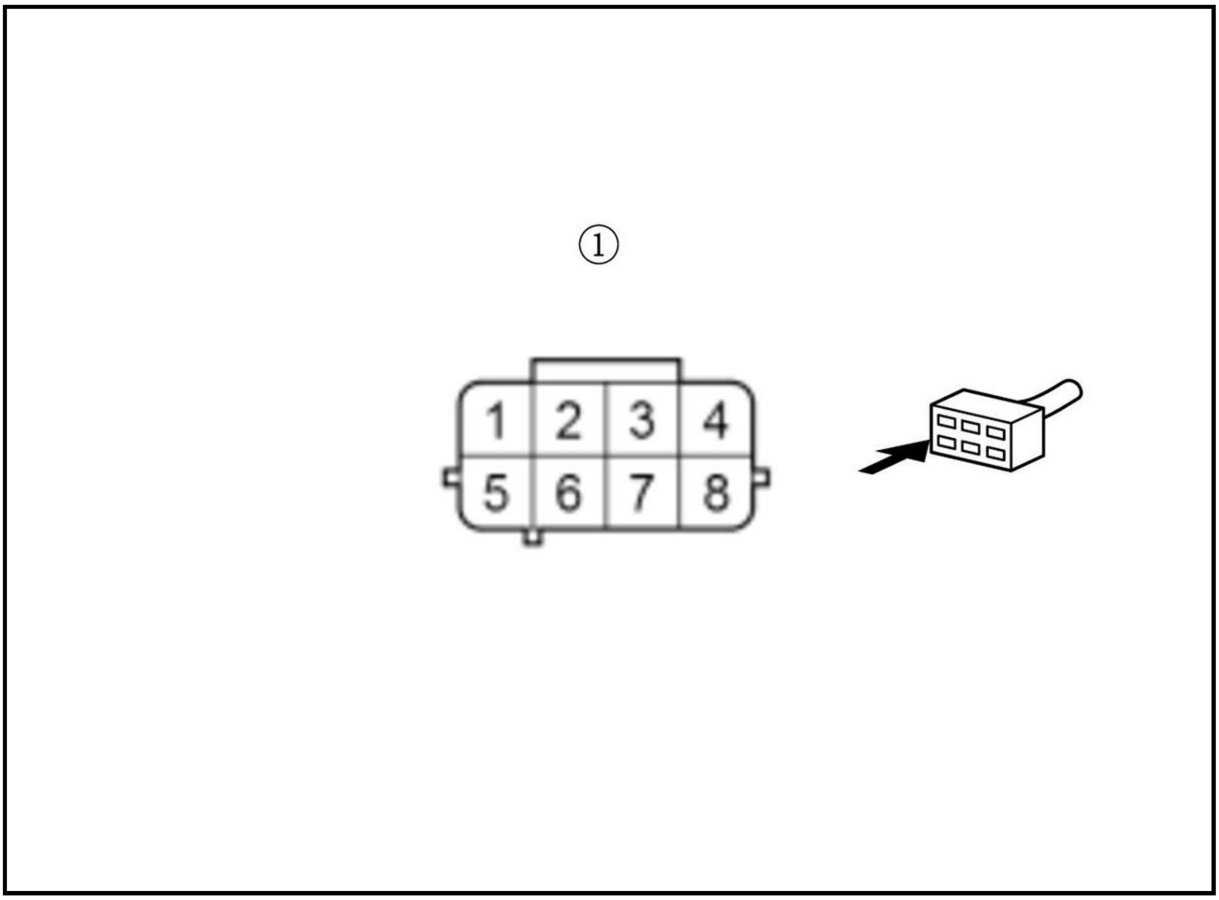
-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 6: ①
Terminal B	Body ground



-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector: disconnected
	EVAP leak check module 8P connector No. 6: jumped to body ground
Test point 1	**PCM connector E (80P) No. 63**
Test point 2	body ground



Is there continuity?

YES

Go to step 7.

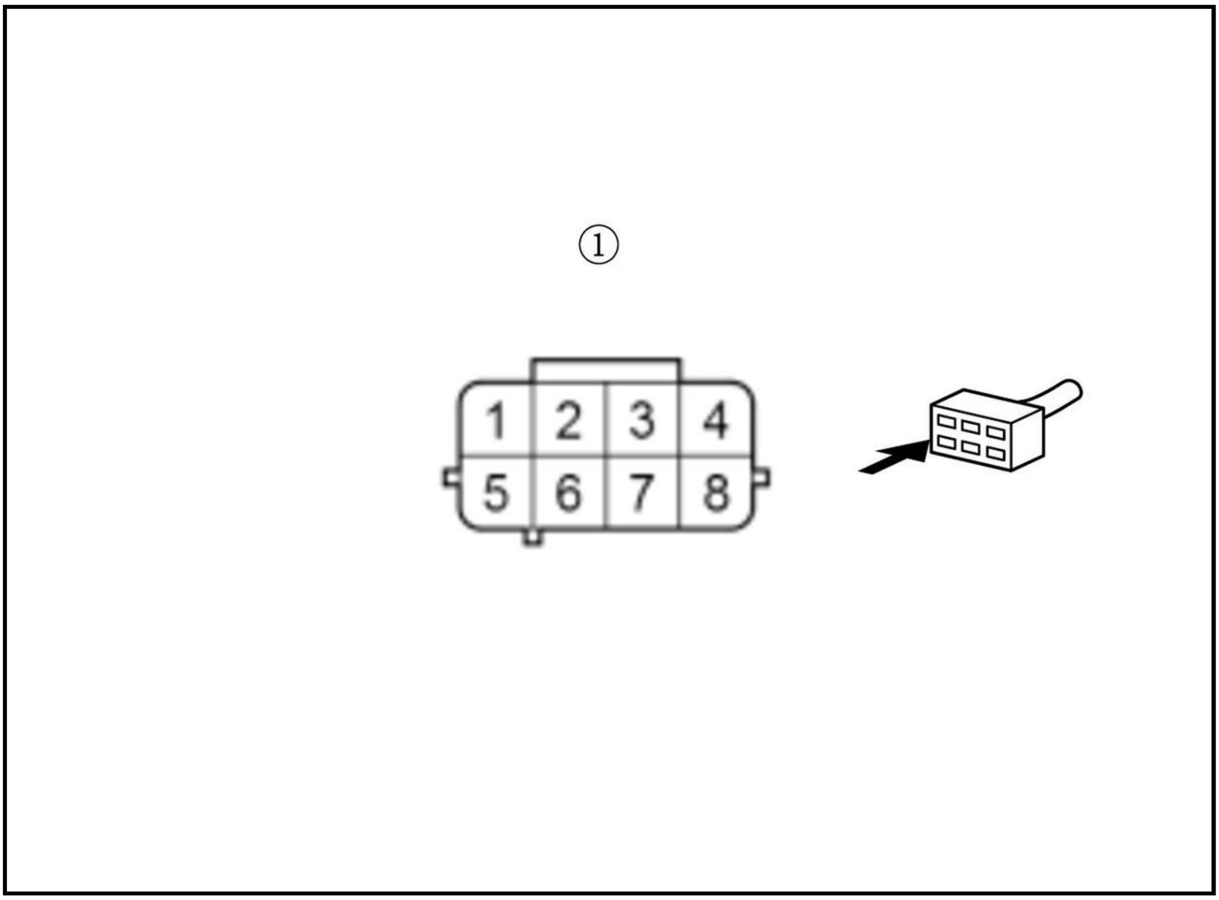
NO

Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

7. Open wire check (SG6 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 8: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode EVAP leak check module 8P connector: disconnected PCM connector E (80P): disconnected EVAP leak check module 8P connector No. 8: jumped to body ground
Test point 1	**PCM connector E (80P) No. 45**
Test point 2	Body ground

Is there continuity?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and the EVAP leak check module.

DTC P24BE (1.5 L ENGINE)

DTC P24BE : Canister Change Over Valve Control Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P24BE Canister Change Over Valve Control Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST (ELCM)

   Is the result OK?

   YES

   If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

   NO

   The failure is duplicated. Go to step 2.

2. Open wire check (IGPS (LAF) line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

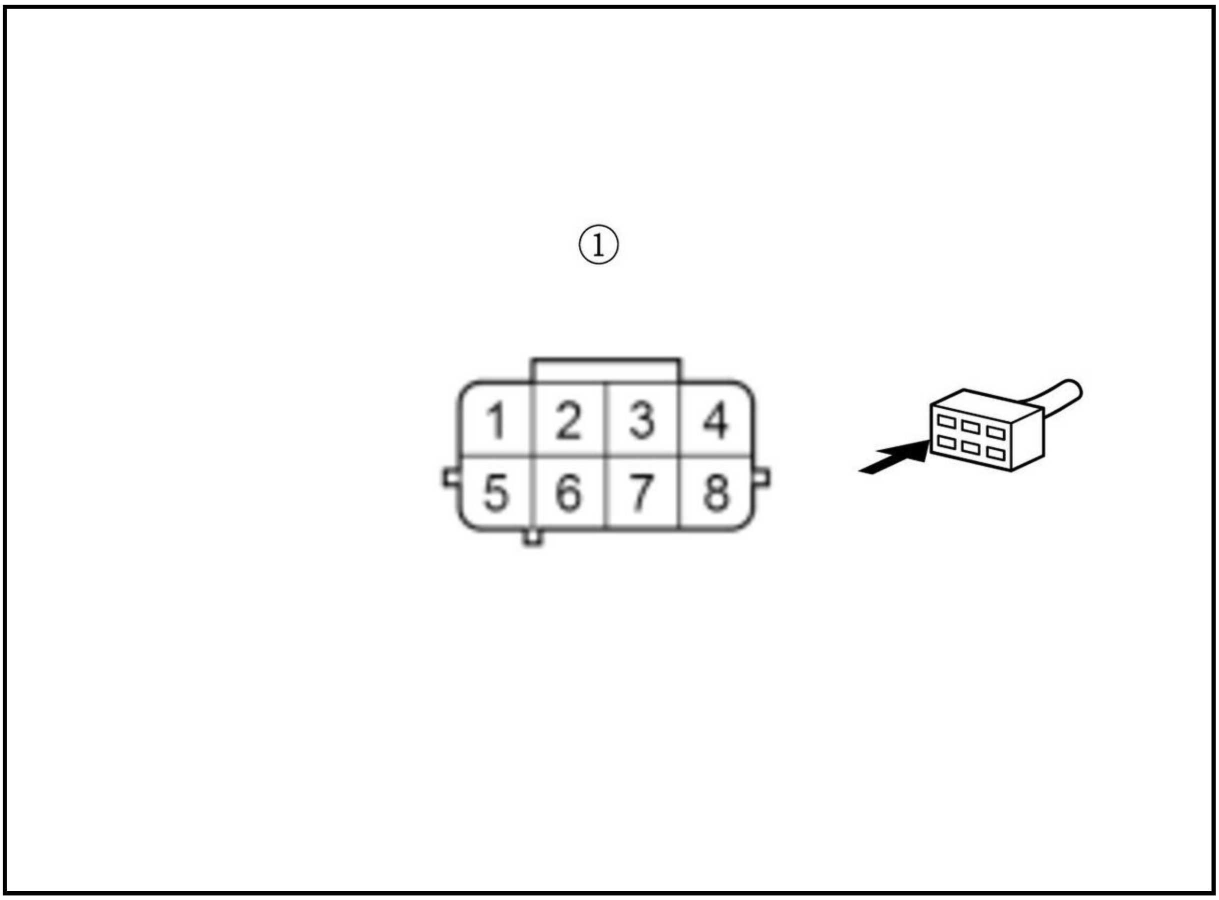
   -2. Disconnect the following connector.

EVAP leak check module 8P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGPS (LAF) wire is OK. Go to step 5.

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A11 (7.5 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 4.

NO

Check for a short in IGPS (LAF) wire between the No. A11 (7.5 A) fuse and the EVAP leak check module. If the wire is OK, replace the under-hood fuse/relay box . Also replace the No. A11 (7.5 A) fuse.

4. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Repair an open in the IGPS (LAF) wire between the EVAP leak check module and the A11 (7.5 A) fuse in the under-hood fuse/relay box, or the FI SUB RLY OUT wire between the relay circuit board (PGM-FI subrelay circuit) and the A11 (7.5 A) fuse in the under-hood fuse/relay box.

NO

Replace the relay circuit board .

5. Shorted wire check (CCV line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the CCV wire between the PCM (A6) and the EVAP leak check module.

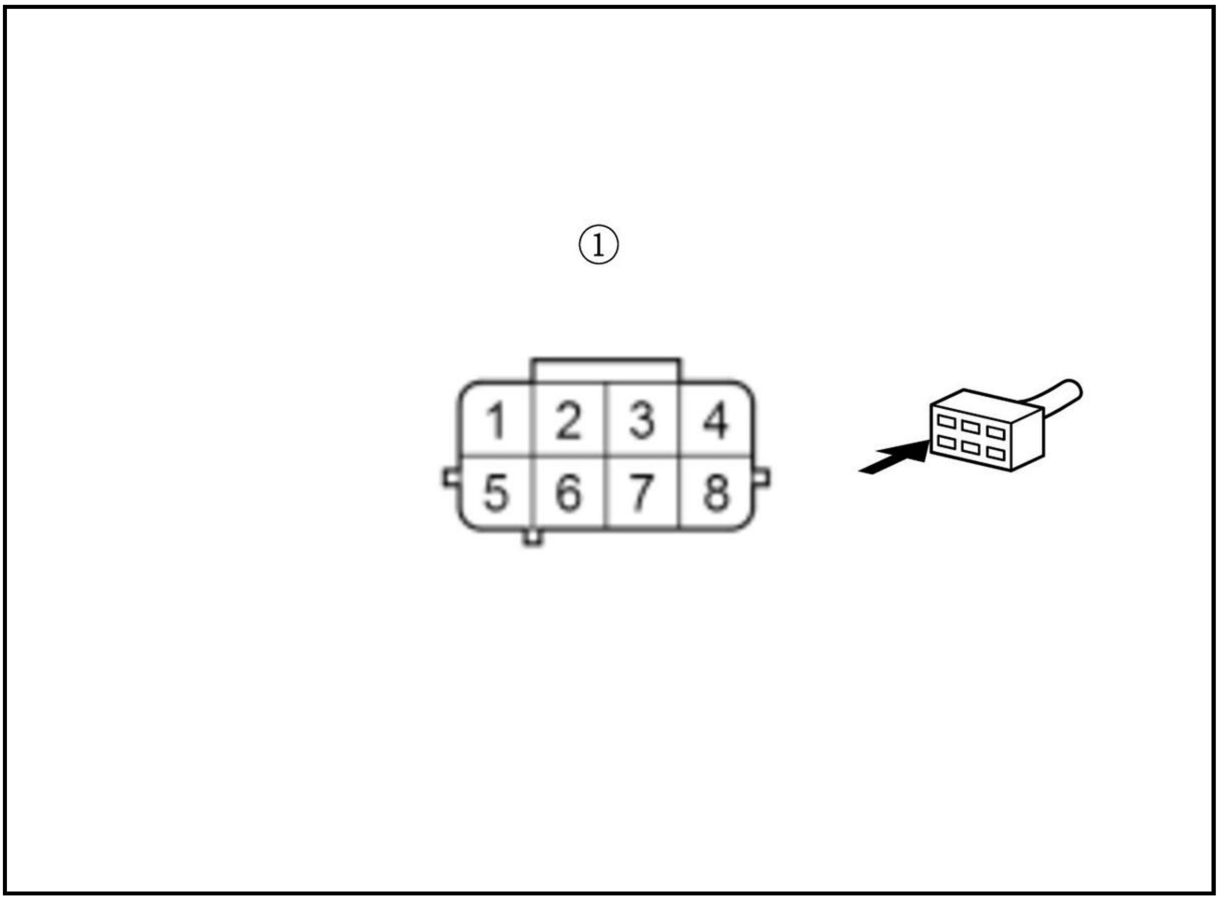
NO

The CCV wire is not shorted. Go to step 6.

6. Open wire check (CCV line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 1: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector A (50P): disconnected
	EVAP leak check module 8P connector No. 1: jumped to body ground
Test point 1	**PCM connector A (50P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

The CCV wire is OK. Go to step 7.

NO

Repair an open in the CCV wire between the PCM (A6) and the EVAP leak check module.

7. EVAP leak check module check

-1. **Substitute a known-good EVAP leak check module** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. **Reset the PCM with the HDS** .

Reset PCM

-6. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST (ELCM)

Is the test result of the DTC P24BE Failed?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

If the test result is PASSED, **replace the original EVAP leak check module** . If the test result is Not completed, do the test again. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

DTC P24BF (1.5 L ENGINE)

DTC P24BF : Canister Change Over Valve Control Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P24BF Canister Change Over Valve Control Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST (ELCM)

Is the result OK?

YES

If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

NO

The failure is duplicated. Go to step 2.

2. Shorted wire check (CCV line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)
EVAP leak check module 8P connector

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	EVAP leak check module 8P connector: disconnected
Test point 1	**PCM connector A (50P) No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the CCV wire between the PCM (A6) and the EVAP leak check module.

NO

Go to step 3.

3. EVAP leak check module check

-1. **Substitute a known-good EVAP leak check module** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. **Reset the PCM with the HDS** .

Reset PCM

-6. Select the EVAP TEST (ELCM) in the INSPECTION MENU, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST (ELCM)

Is the test result of the DTC P24BF Failed?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

If the test result is PASSED, **replace the original EVAP leak check module** . If the test result is Not completed, do the test again. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

DTC P24C0 (1.5 L ENGINE)

DTC P24C0 : Canister Change Over Valve Close Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P24C0 Canister Change Over Valve Close Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and let it idle without load (in P or N) until the radiator fan comes on.

   -4. Monitor the EVAP PC DUTY (purge control duty) in the DATA LIST with the HDS, while holding the engine speed at 3, 000 rpm with the EVAP PC DUTY at 20 % or more for at least 4 minutes, then let the engine idle.

Signal	Current conditions	
	Values	Unit
EVAP PC DUTY	B	B

   -5. Monitor the OBD STATUS for DTC P24C0 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P24C0 Canister Change Over Valve Close Malfunction	B

   Does the HDS indicate FAILED?

   YES

   Go to step 2.

   NO

   If the HDS indicates PASSED, there might be an intermittent failure, and the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. EVAP leak check module drain hose check

   -1. **Remove the EVAP leak check module** and the **EVAP canister filter** , then check the blockage in the hoses and the EVAP canister filter.

   Are the parts OK?

   YES

   Replace the EVAP leak check module .

   NO

   Remove the blockage from them, or replace the part (s) if needed.

DTC P2563 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P2563 : Turbocharger Wastegate Control Actuator Position Sensor Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2563 Turbocharger Wastegate Control Actuator Position Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EWG VOLTAGE FROM LIFT SENSOR	Less than 0.31	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification 2

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EWG VOLTAGE FROM LIFT SENSOR	More than 4.78	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 7.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Determine possible failure area (DCWGL line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Turbocharger 5P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
EWG VOLTAGE FROM LIFT SENSOR	Less than 0.31	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 6.

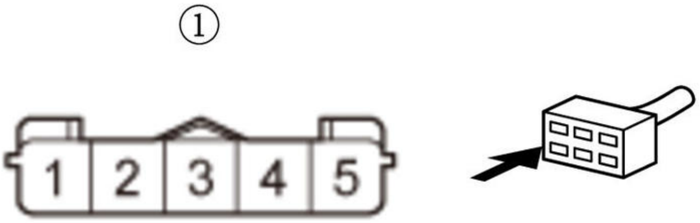
NO

Go to step 4.

4. Determine possible failure area (turbocharger wastegate control actuator position sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger 5P connector: disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 2: ①
Test point 2	Turbocharger 5P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the turbocharger .

NO

Go to step 5.

5. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

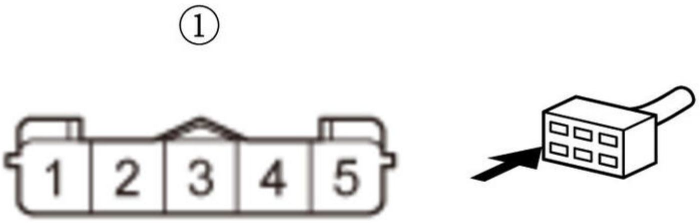
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there continuity?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC2 wire between the PCM (E77) and the turbocharger.

6. Shorted wire check (DCWGL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

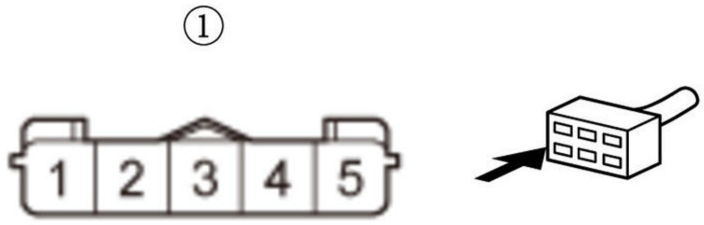
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the DCWGL wire between the PCM (E60) and the turbocharger.

NO

The DCWGL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

7. Determine possible failure area (turbocharger wastegate control actuator position sensor, others)

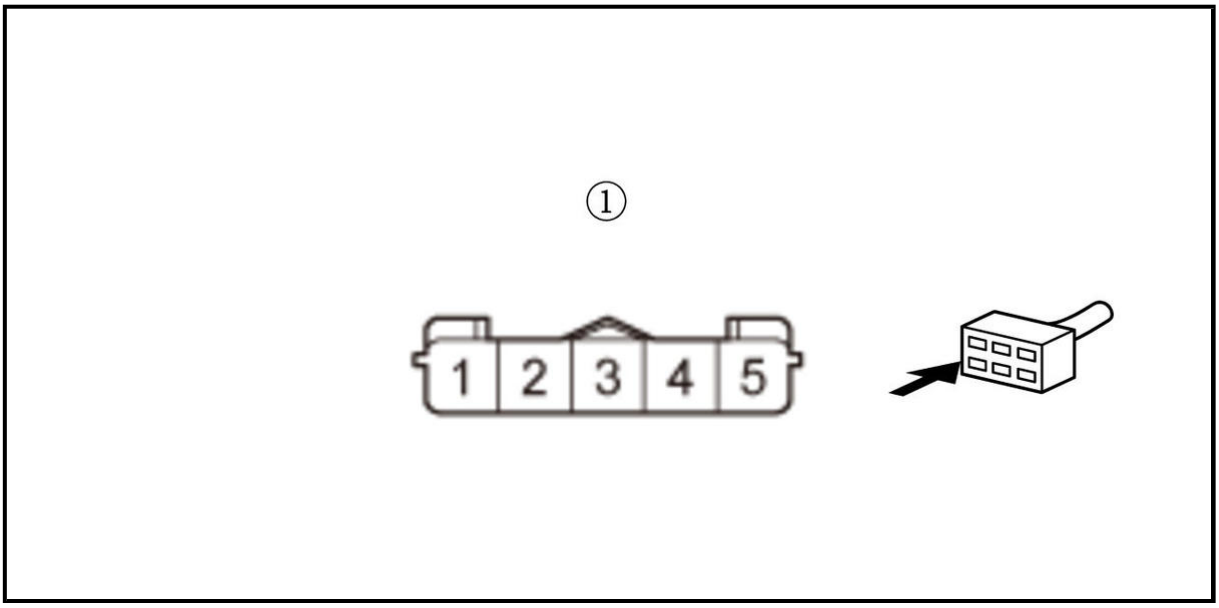
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Turbocharger 5P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Turbocharger 5P connector (female terminals) No. 3: ①
Terminal B	Turbocharger 5P connector (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
EWG VOLTAGE FROM LIFT SENSOR	More than 4.78	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 8.

NO

Replace the turbocharger .

8. Determine possible failure area (SG2 line, others)

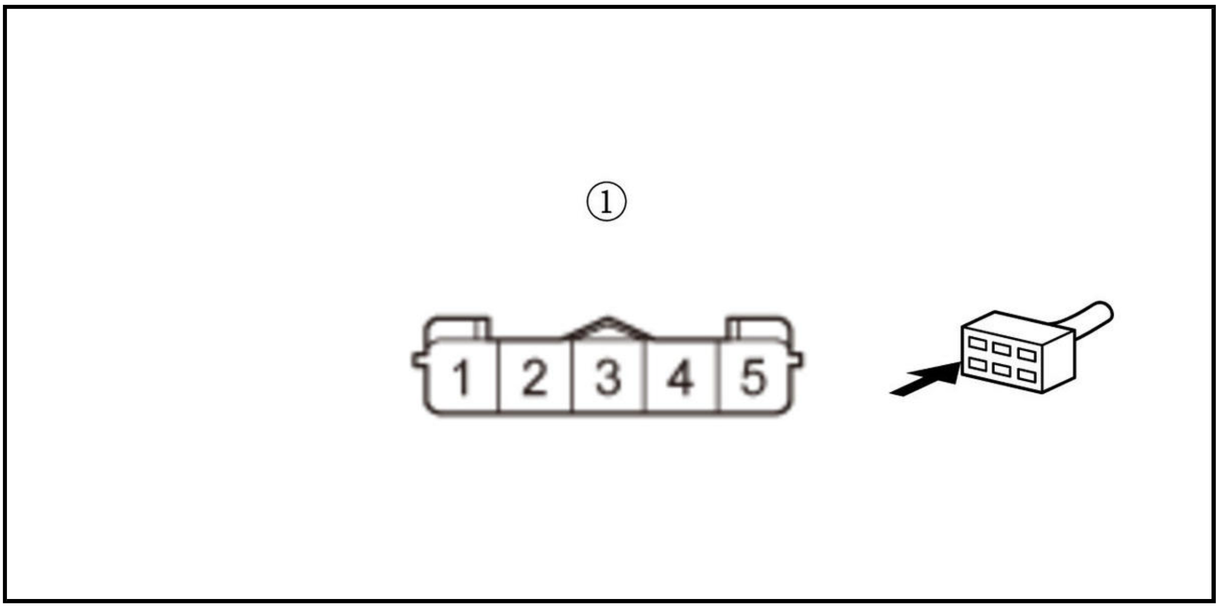
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the turbocharger 5P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger 5P connector: disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 2: ①
Test point 2	Turbocharger 5P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 10.

NO

Go to step 9.

9. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

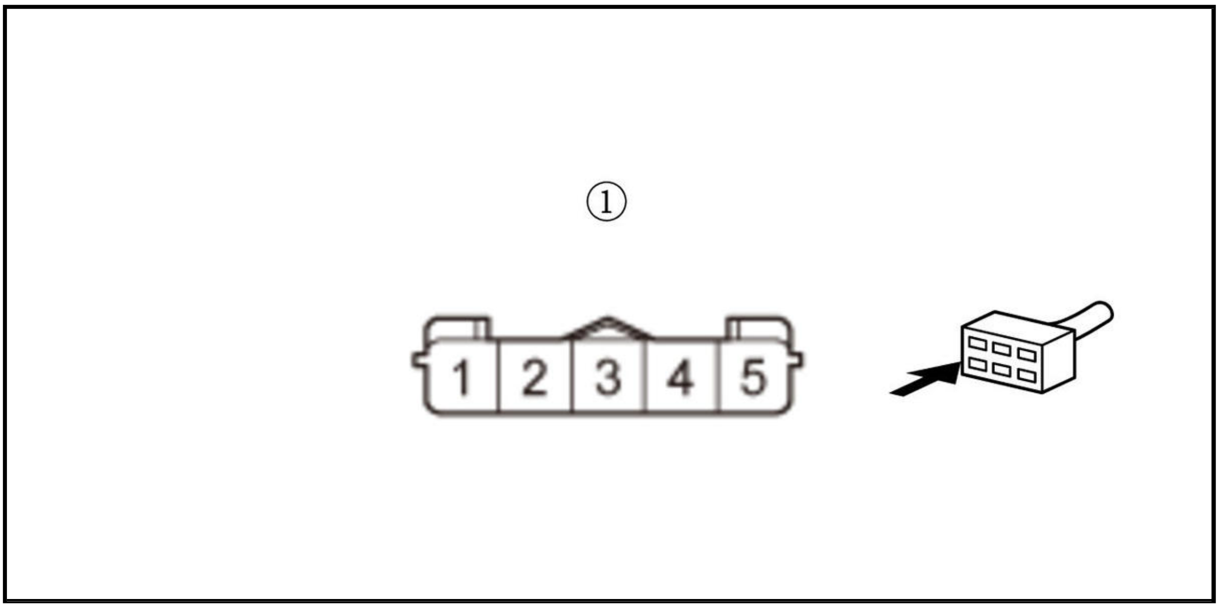
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and the turbocharger.

10. Open wire check (DCWGL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

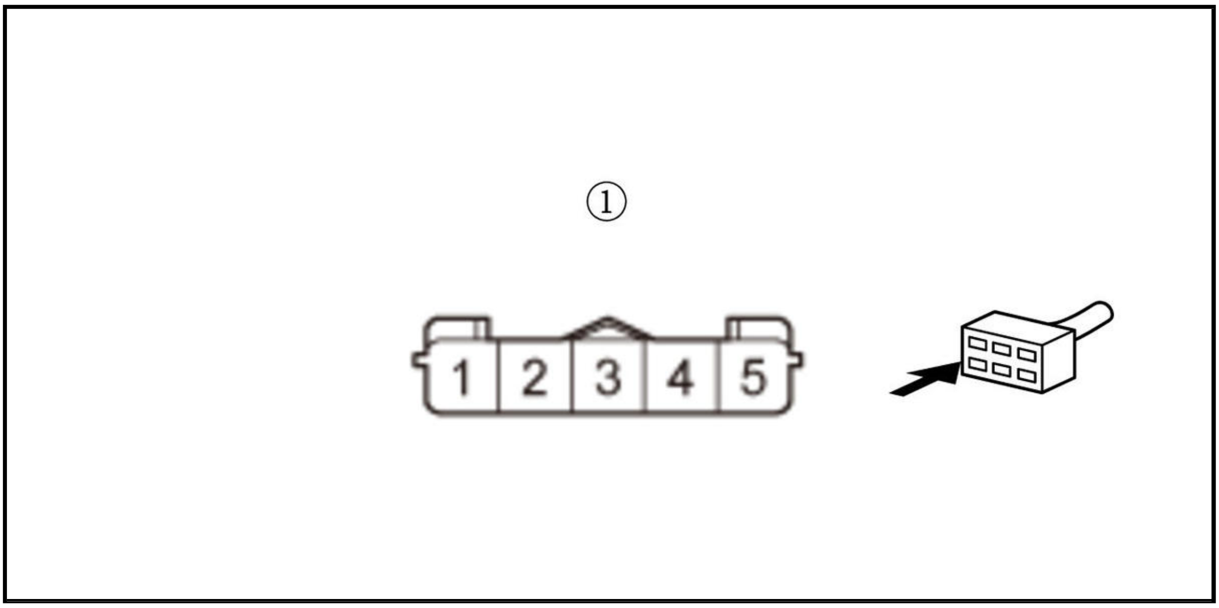
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 60**



Is there continuity?

YES

The DCWGL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the DCWGL wire between the PCM (E60) and the turbocharger.

DTC P2564 (1.5 L ENGINE)

DTC P2564 : Turbocharger Wastegate Control Actuator Position Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2564 Turbocharger Wastegate Control Actuator Position Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EWG VOLTAGE FROM LIFT SENSOR	Less than 0.16	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (DCWGL line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Turbocharger 5P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
EWG VOLTAGE FROM LIFT SENSOR	Less than 0.16	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

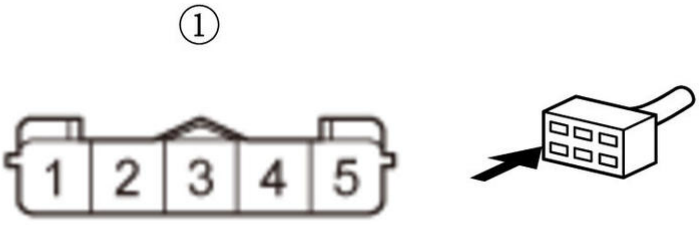
NO

Go to step 3.

3. Determine possible failure area (turbocharger wastegate control actuator position sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger 5P connector: disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 2: ①
Test point 2	Turbocharger 5P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the turbocharger .

NO

Go to step 4.

4. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

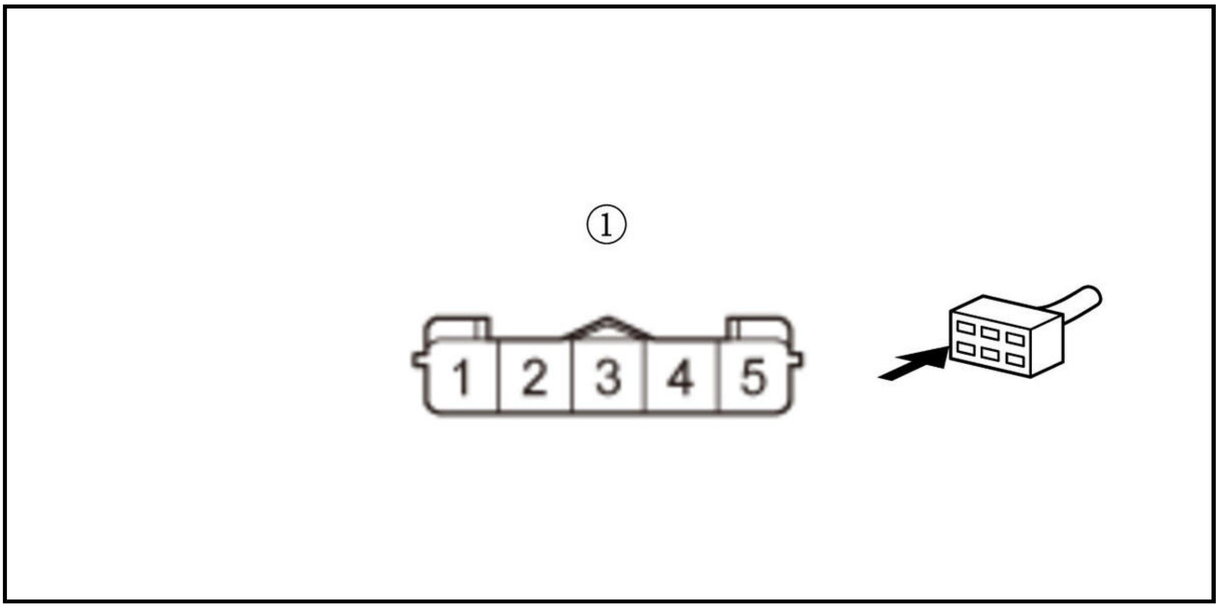
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there continuity?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC2 wire between the PCM (E77) and the turbocharger.

5. Shorted wire check (DCWGL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

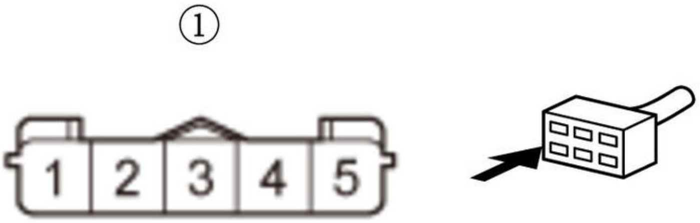
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the DCWGL wire between the PCM (E60) and the turbocharger.

NO

The DCWGL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P2565 (1.5 L ENGINE)

DTC P2565 : Turbocharger Wastegate Control Actuator Position Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2565 Turbocharger Wastegate Control Actuator Position Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EWG VOLTAGE FROM LIFT SENSOR	More than 4.87	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the turbocharger and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (turbocharger wastegate control actuator position sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Turbocharger 5P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Turbocharger 5P connector (female terminals) No. 3: ①
Terminal B	Turbocharger 5P connector (female terminals) No. 4: ①

   -4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
EWG VOLTAGE FROM LIFT SENSOR	More than 4.87	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the turbocharger .

3. Determine possible failure area (SG2 line, others)

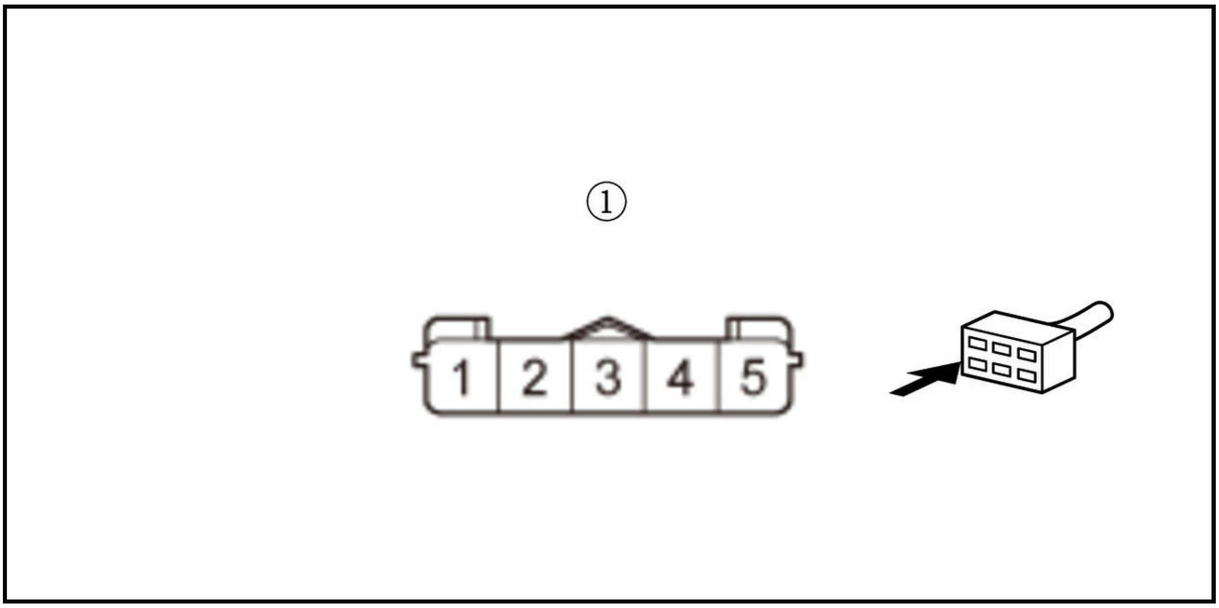
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the turbocharger 5P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Turbocharger 5P connector: disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 2: ①
Test point 2	Turbocharger 5P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

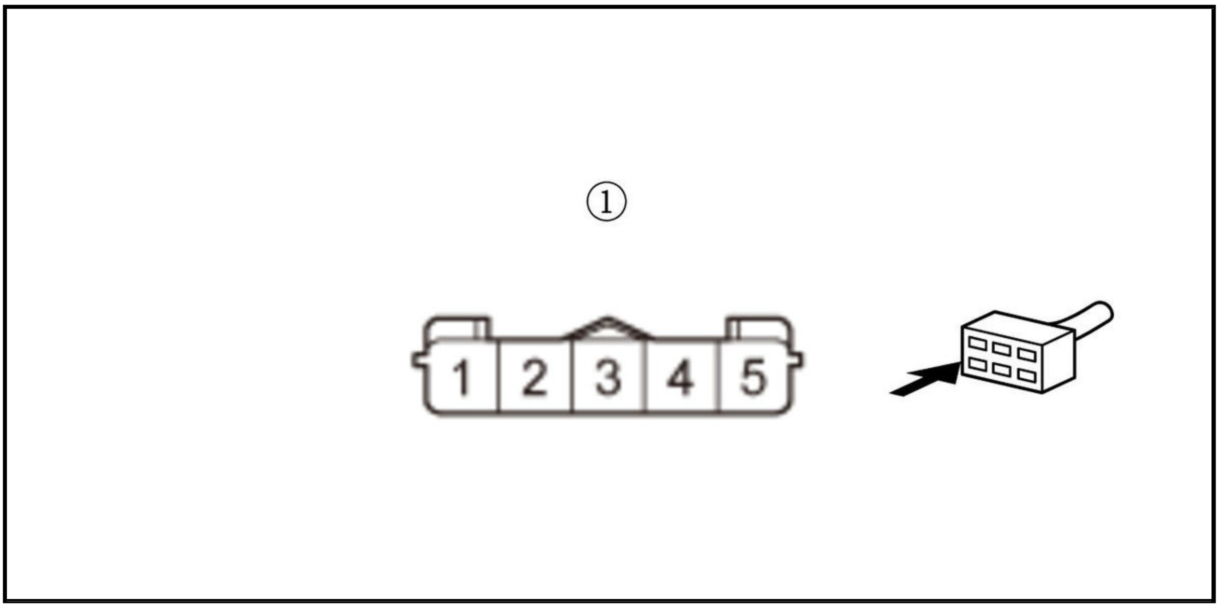
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there continuity?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and the turbocharger.

5. Open wire check (DCWGL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

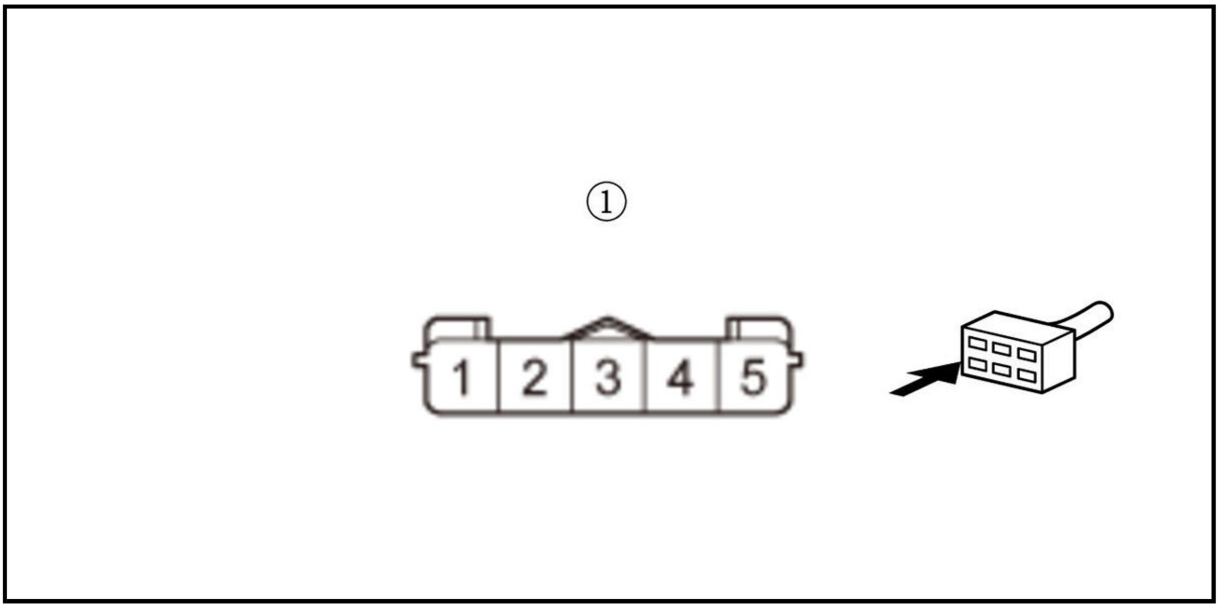
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Turbocharger 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Turbocharger 5P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 60**



Is there continuity?

YES

The DCWGL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the DCWGL wire between the PCM (E60) and the turbocharger.

DTC P2610 (1.5 L ENGINE)

DTC P2610 : PCM Ignition Off Internal Timer Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2610 PCM Ignition Off Internal Timer Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2610 PCM Ignition Off Internal Timer Malfunction	B	B

Is DTC P2610 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2610 (2.4 L ENGINE) (2017 2018 2019)

DTC P2610 : PCM Ignition Off Internal Timer Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2610 PCM Ignition Off Internal Timer Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2610 PCM Ignition Off Internal Timer Malfunction	B	B

Is DTC P2610 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2623 (1.5 L ENGINE)

DTC P2623 : High Pressure Fuel Pump Spill Valve Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2623 High Pressure Fuel Pump Spill Valve Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine (If the engine does not start, crank the engine for 20 seconds).

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0201 No. 1 Cylinder Injector Circuit Malfunction	B	B
P0202 No. 2 Cylinder Injector Circuit Malfunction	B	B
P0203 No. 3 Cylinder Injector Circuit Malfunction	B	B
P0204 No. 4 Cylinder Injector Circuit Malfunction	B	B
P2623 High Pressure Fuel Pump Spill Valve Malfunction	B	B

   Are DTC P2623 and P0201, P0202, P0203, or P0204 indicated at the same time?

   YES

   Go to step 2.

   NO

   Go to step 10.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the high pressure fuel pump and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Relay check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the injector relay** .

   -3. **Test the injector relay** .

   Is the relay OK?

   YES

   Go to step 3.

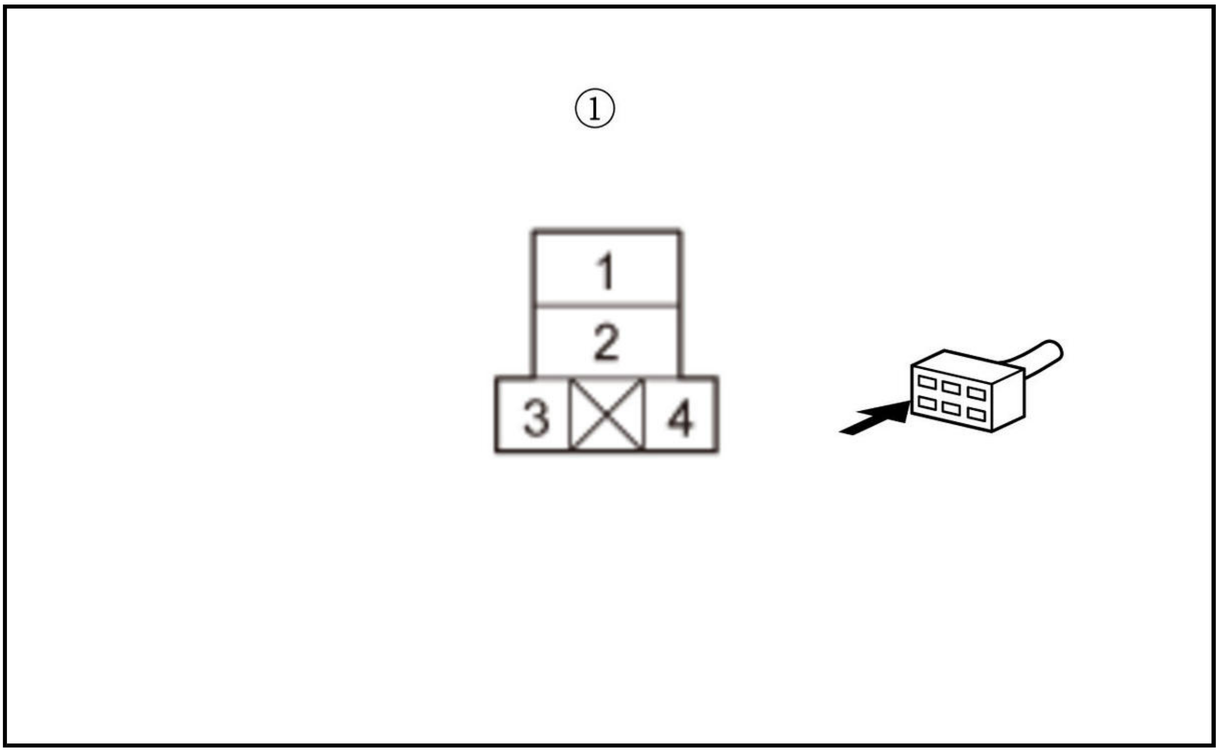
   NO

   Replace the injector relay.

3. Open wire check (+B IGP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B IGP wire is OK. Go to step 4.

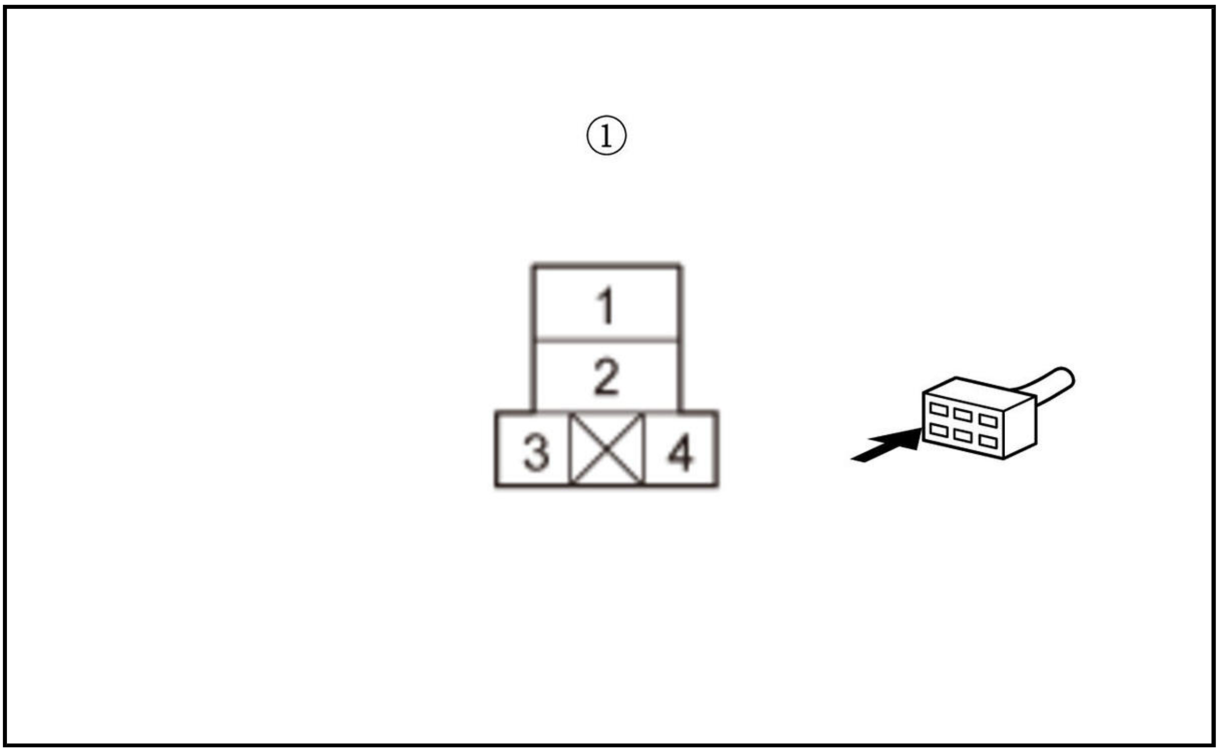
NO

Go to step 6.

4. Open wire check (+B INJ line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B INJ wire is OK. Go to step 7.

NO

Go to step 5.

5. Fuse check 1

   -1. Check the following fuse.

Fuse	No. A10 (20 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Repair an open in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. If needed, **replace the under-hood fuse/relay box** .

NO

Repair a short in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. Also replace the No. A10 (20 A) fuse. If needed, **replace the under-hood fuse/relay box** .

6. Fuse check 2

   -1. Check the following fuse.

Fuse	No. A7 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Repair an open in the +B IGP wire between the No. A7 (15 A) fuse and the injector relay. If needed, **replace the under-hood fuse/relay box** .

NO

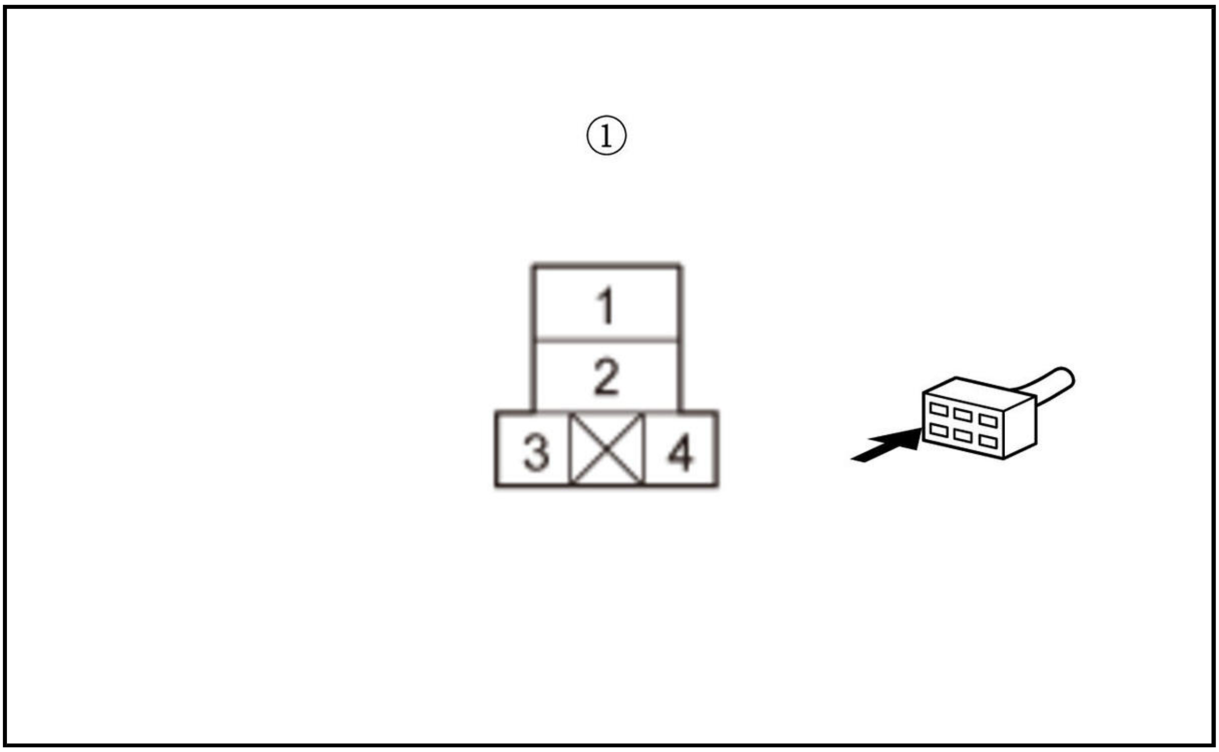
Repair a short in the +B IGP wire between the No. A7 (15 A) fuse and the injector relay. Also replace the No. A7 (15 A) fuse. If needed, **replace the under-hood fuse/relay box** .

7. Determine possible failure area (FI MAIN RLY CL- line, others)

   -1. Turn the vehicle to the ON mode.

   -2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle in ON mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Injector relay 4P socket (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 9.

NO

Go to step 8.

8. Open wire check (FI MAIN RLY CL- line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

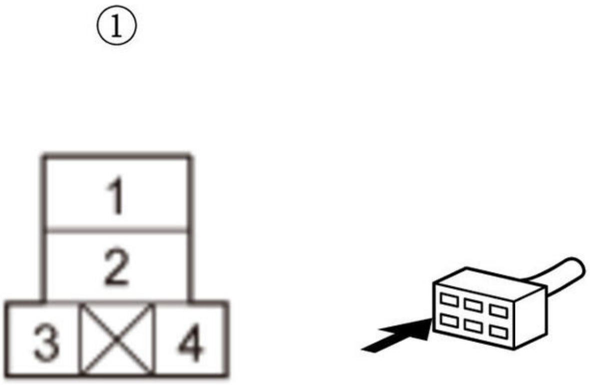
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Injector relay: disconnected PCM connector A (50P): disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (50P) No. 5**



Is there continuity?

YES

The FI MAIN RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

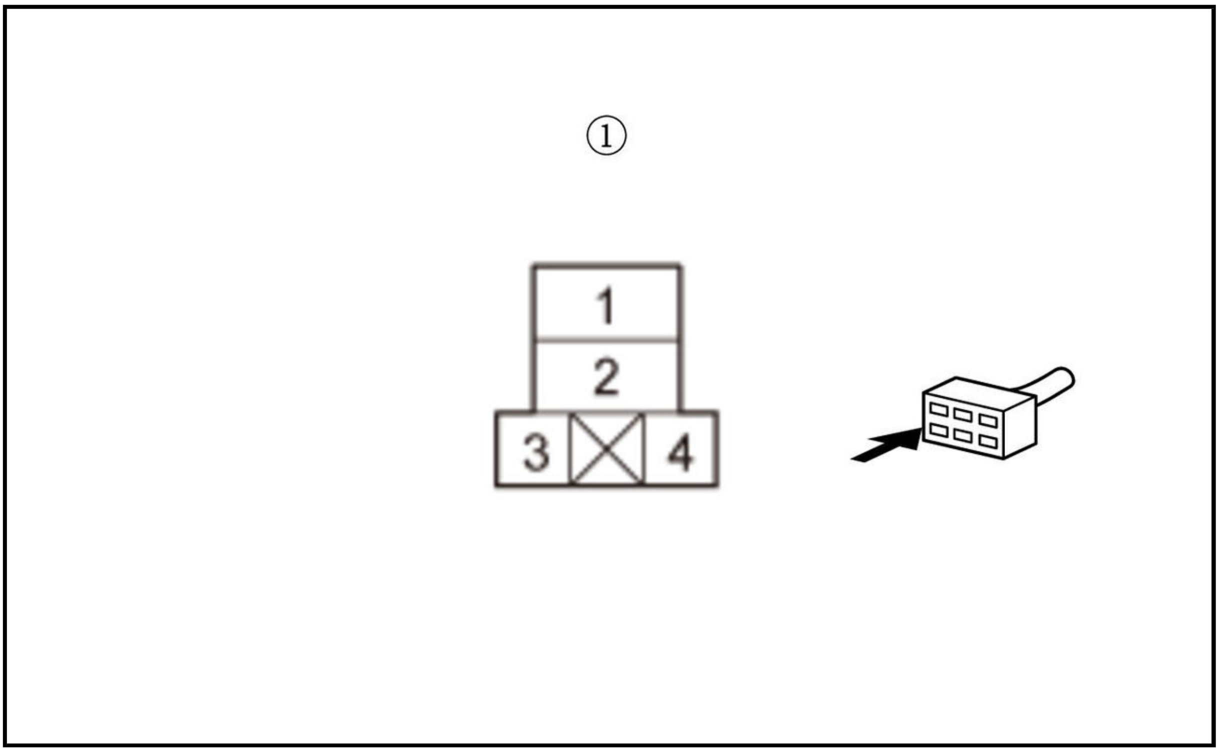
Repair an open in the FI MAIN RLY CL- wire between the PCM (A5) and the injector relay.

9. Open wire check (INJ RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Injector relay 4P socket (female terminals) No. 1: ①
Terminal B	Injector relay 4P socket (female terminals) No. 2: ①



-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (50P)

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
	Injector relay 4P socket No. 1 and No. 2: jumped
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 1**
Test point 2	Body ground

Test point 1	**PCM connector A (50P) No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 10.

NO

Repair an open in the INJ RLY OUT wire between the PCM (A1, A2) and the injector relay.

10. Open wire check (HPUMP H line, HPUMP L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the injector relay 4P socket as needed.

-3. Reinstall the injector relay.

-4. Jump the SCS line with the HDS, and wait more than 1 minute.

-5. Disconnect the following connector.

PCM connector E (80P)

-6. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 1**
Test point 2	**PCM connector E (80P) No. 14**

Is there continuity?

YES

Go to step 13.

NO

Go to step 11.

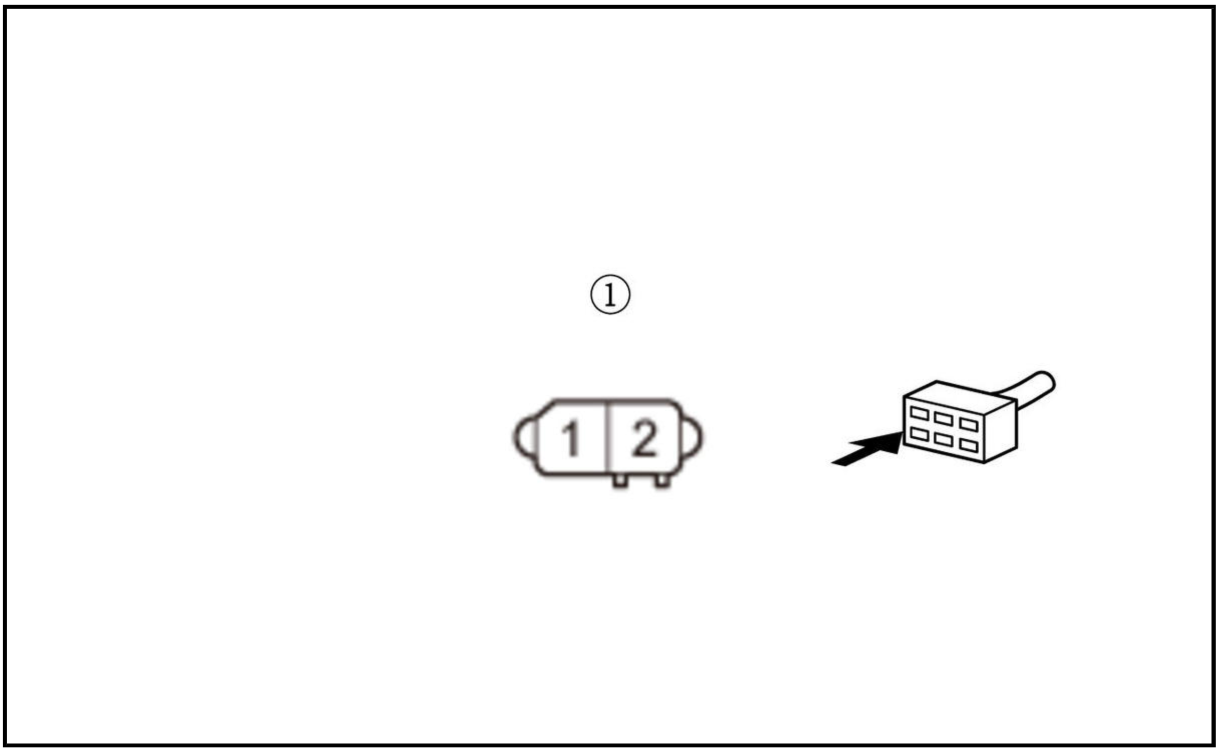
11. Open wire check (HPUMP H line)

-1. Disconnect the following connector.

High pressure fuel pump 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	High pressure fuel pump 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 1**



Is there continuity?

YES

Go to step 12.

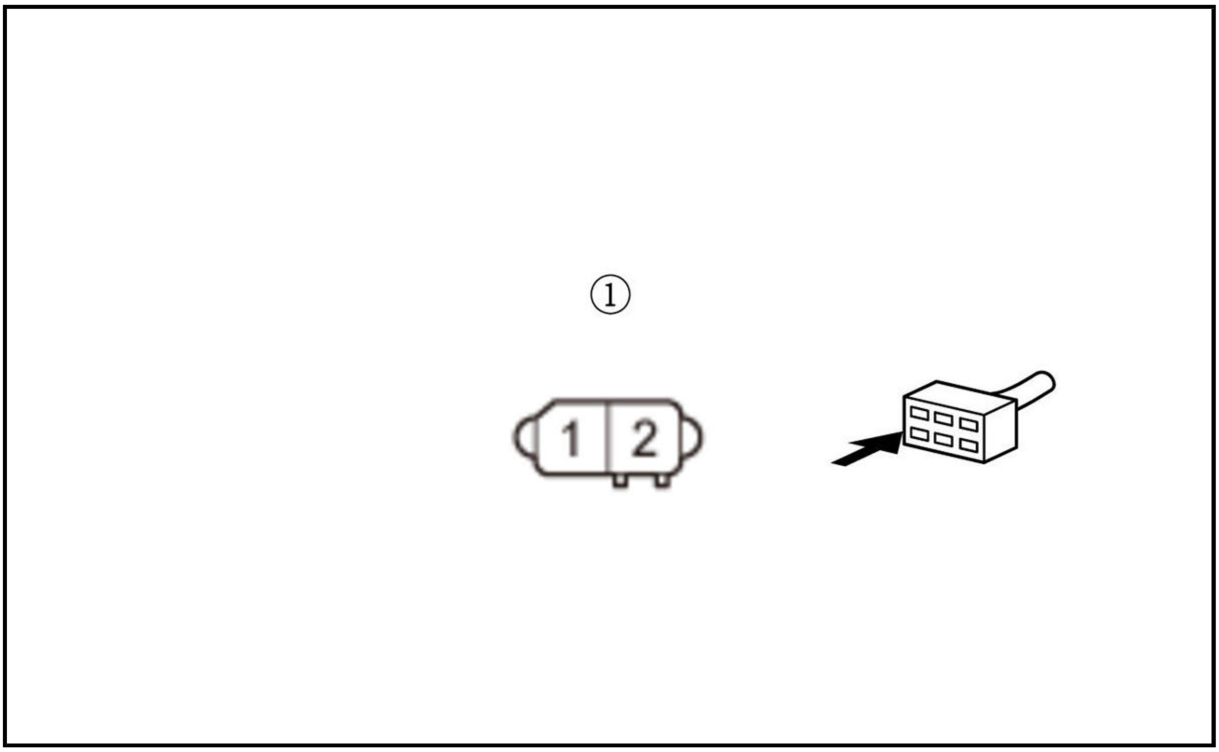
NO

Repair an open in the HPUMP H wire between the PCM (E1) and the high pressure fuel pump.

12. Open wire check (HPUMP L line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	High pressure fuel pump 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 14**



Is there continuity?

YES

The HPUMP L wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the HPUMP L wire between the PCM (E14) and the high pressure fuel pump.

13. Shorted wire check (HPUMP H line to power)

-1. Disconnect the following connector.

High pressure fuel pump 2P connector

-2. Exit the SCS mode with the HDS.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 1**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the HPUMP H wire between the PCM (E1) and the high pressure fuel pump.

NO

Go to step 14.

14. Shorted wire check (HPUMP L line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 14**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the HPUMP L wire between the PCM (E14) and the high pressure fuel pump.

NO

Go to step 15.

15. Shorted wire check (HPUMP H line to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the HPUMP H wire between the PCM (E1) and the high pressure fuel pump.

NO

Go to step 16.

16. Shorted wire check (HPUMP L line to ground)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	**PCM connector E (80P) No. 14**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the HPUMP L wire between the PCM (E14) and the high pressure fuel pump.

NO

The HPUMP L wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P2623 (2.4 L ENGINE) (2017 2018 2019)

DTC P2623 : High Pressure Fuel Pump Spill Valve Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2623 High Pressure Fuel Pump Spill Valve Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine. (If the engine does not start, crank the engine for 20 seconds).

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0201 No. 1 Cylinder Injector Circuit Malfunction	B	B
P0202 No. 2 Cylinder Injector Circuit Malfunction	B	B
P0203 No. 3 Cylinder Injector Circuit Malfunction	B	B
P0204 No. 4 Cylinder Injector Circuit Malfunction	B	B
P2623 High Pressure Fuel Pump Spill Valve Malfunction	B	B

Are DTC P2623 and P0201, P0202, P0203, or P0204 indicated at the same time?

YES

The failure is duplicated. Go to step 2.

NO

The failure is duplicated. Go to step 9.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the high pressure fuel pump and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the injector relay** .

-3. **Test the injector relay** .

Is the relay OK?

YES

The injector relay is OK. Go to step 3.

NO

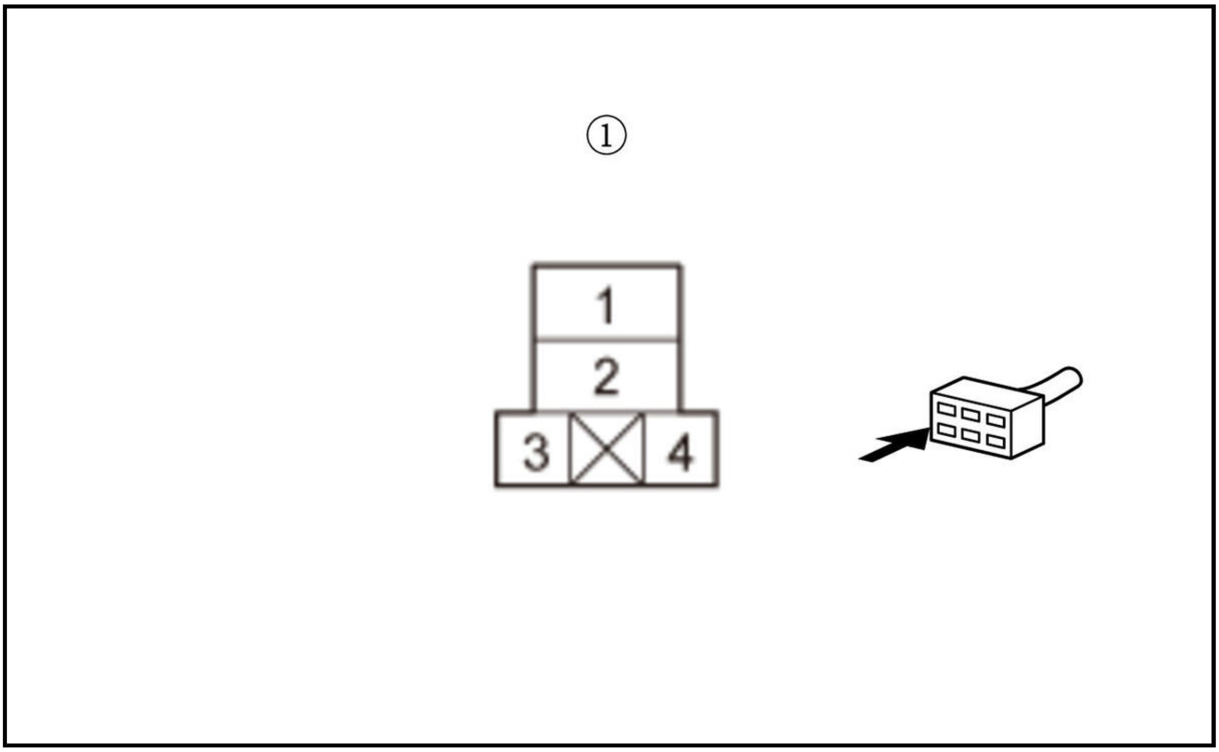
Replace the injector relay.

3. Open wire check (FI MAIN RLY OUT line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The FI MAIN RLY OUT wire is OK. Go to step 4.

NO

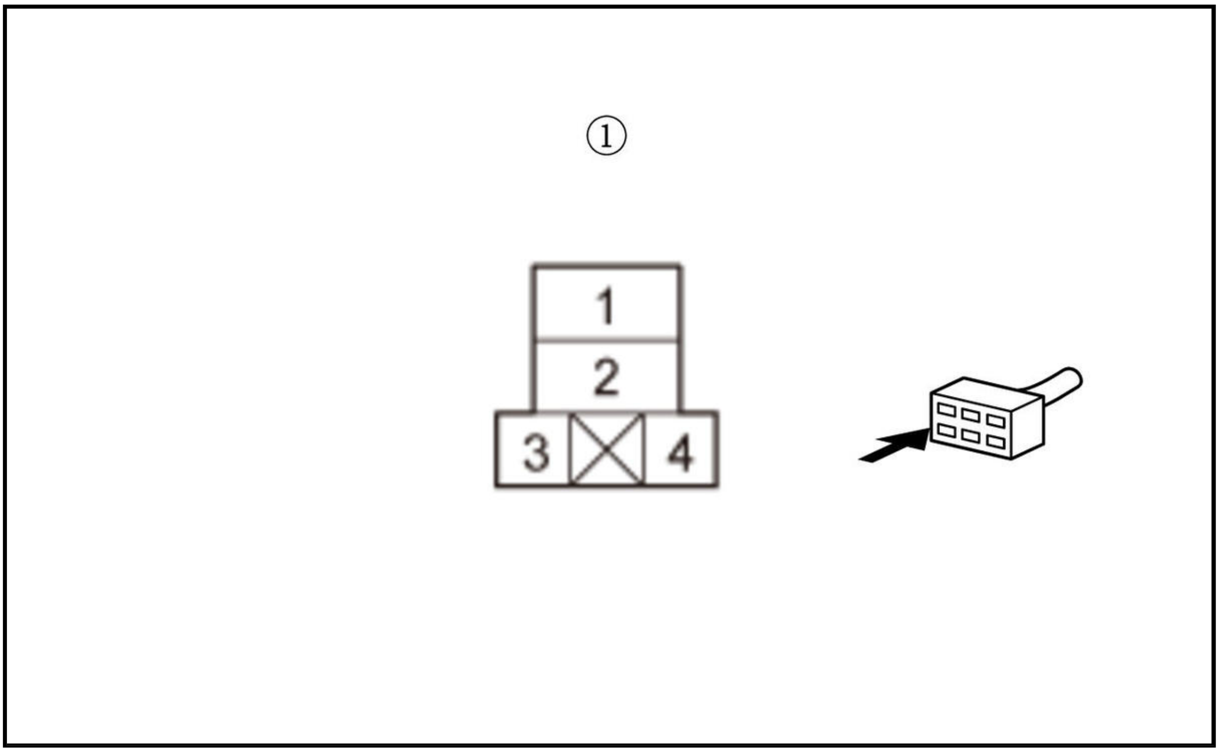
Repair an open in the FI MAIN RLY OUT wire between PGM-FI main relay 1 and the injector relay.

4. Open wire check (+B INJ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B INJ wire is OK. Go to step 6.

NO

Go to step 5.

5. Fuse check

-1. Check the following fuse.

Fuse	No. A10 (20 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Repair an open in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay.

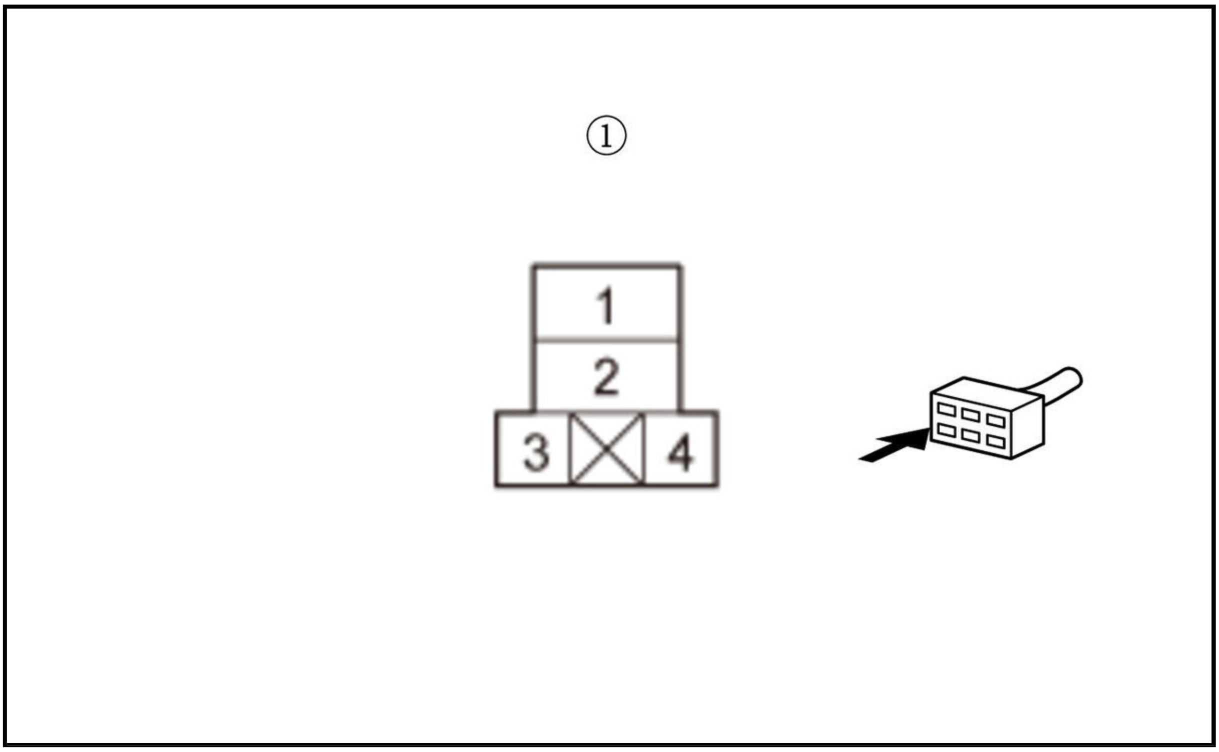
NO

Repair a short in the +B INJ wire between the No. A10 (20 A) fuse and the injector relay. Also replace the No. A10 (20 A) fuse. If needed, **replace the under-hood fuse/relay box** .

6. Determine possible failure area (INJ RLY CL- line, others)

-1. Turn the vehicle to the ON mode, and measure the voltage between test points 1 and 2 momentarily.

Test condition	Momentarily after vehicle in ON mode
	Injector relay: disconnected
Test point 1	Injector relay 4P socket (female terminals) No. 3: ①
Test point 2	Injector relay 4P socket (female terminals) No. 4: ①



Is there battery voltage momentarily?

YES

Go to step 8.

NO

Go to step 7.

7. Open wire check (INJ RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

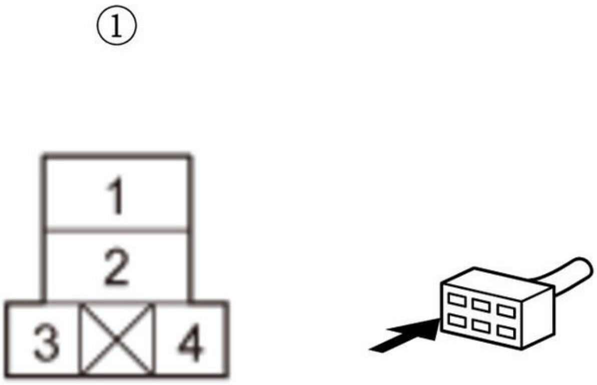
PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	PCM connector A (51P): disconnected

Test point 1	Injector relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (51P) No. 15**



Is there continuity?

YES

The INJ RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

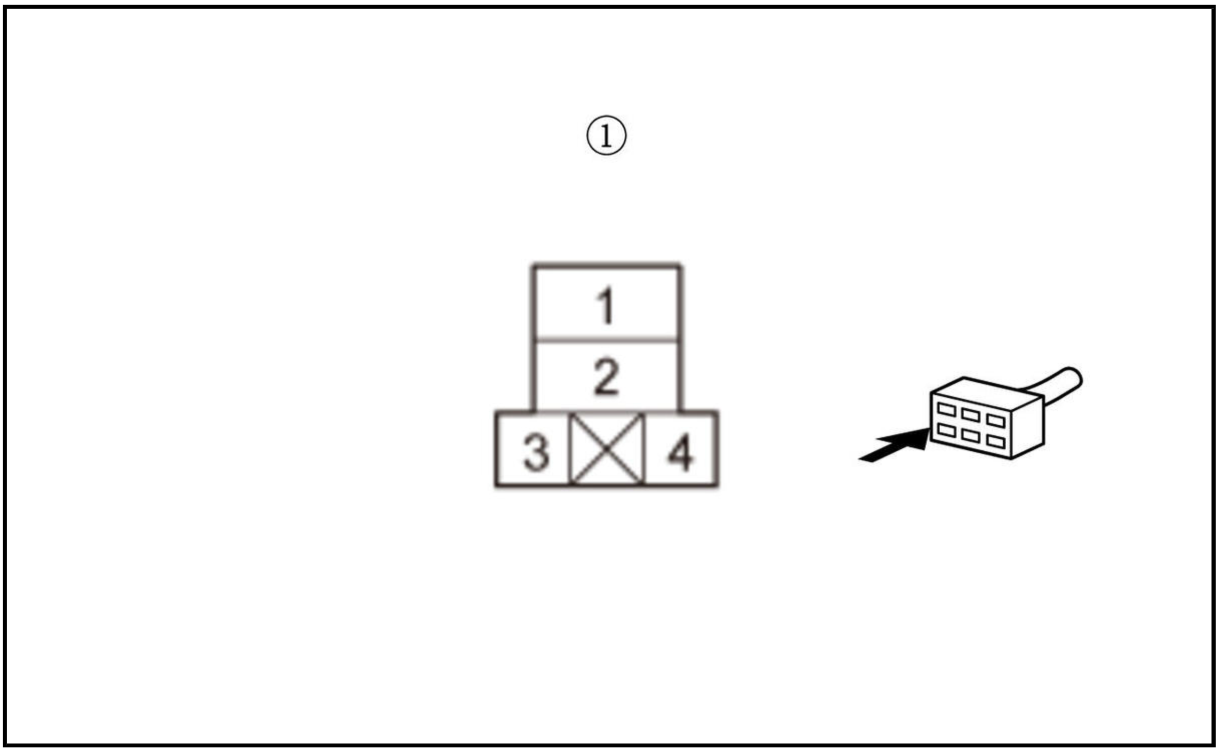
Repair an open in the INJ RLY CL- wire between the PCM (A15) and the injector relay.

8. Open wire check (INJ RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Injector relay 4P socket (female terminals) No. 1: ①
Terminal B	Injector relay 4P socket (female terminals) No. 2: ①



-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (51P)

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Injector relay: disconnected
	Injector relay 4P socket terminal No. 1 and No. 2: jumped
	PCM connector A (51P): disconnected
Test point 1	PCM connector A (51P) No. 6
Test point 2	Body ground

Test point 1	PCM connector A (51P) No. 7
Test point 2	Body ground

Is there battery voltage?

YES

The INJ RLY OUT wire is OK. Go to step 9.

NO

Repair an open in the INJ RLY OUT wire between the PCM (A6, A7) and the injector relay.

9. Open wire check (HPUMP H line, HPUMP L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the injector relay 4P socket as needed.

-3. Reinstall the injector relay.

-4. Jump the SCS line with the HDS, and wait more than 1 minute.

-5. Disconnect the following connector.

PCM connector C (51P)

-6. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 13**
Test point 2	**PCM connector C (51P) No. 14**

Is there continuity?

YES

The HPUMP H and HPUMP L wires are not open. Go to step 12.

NO

Go to step 10.

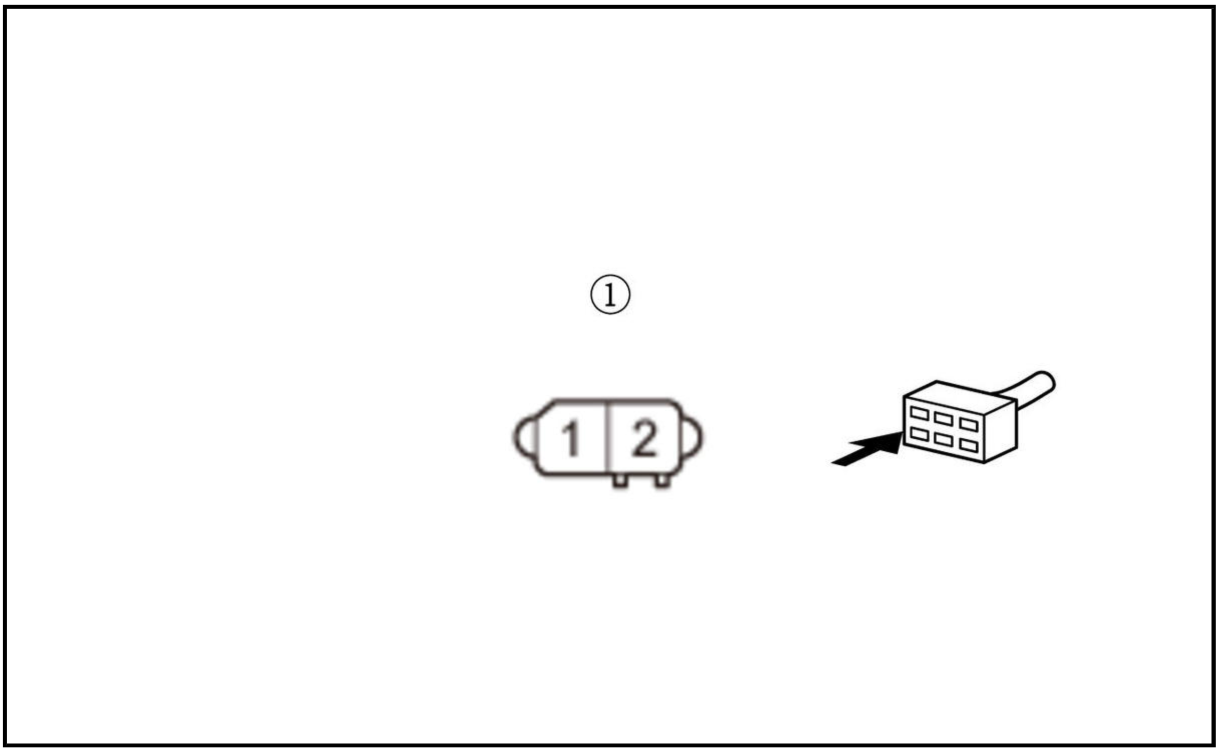
10. Open wire check (HPUMP H line)

-1. Disconnect the following connector.

High pressure fuel pump 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	High pressure fuel pump 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector C (51P) No. 13**



Is there continuity?

YES

The HPUMP H wire is not open. Go to step 11.

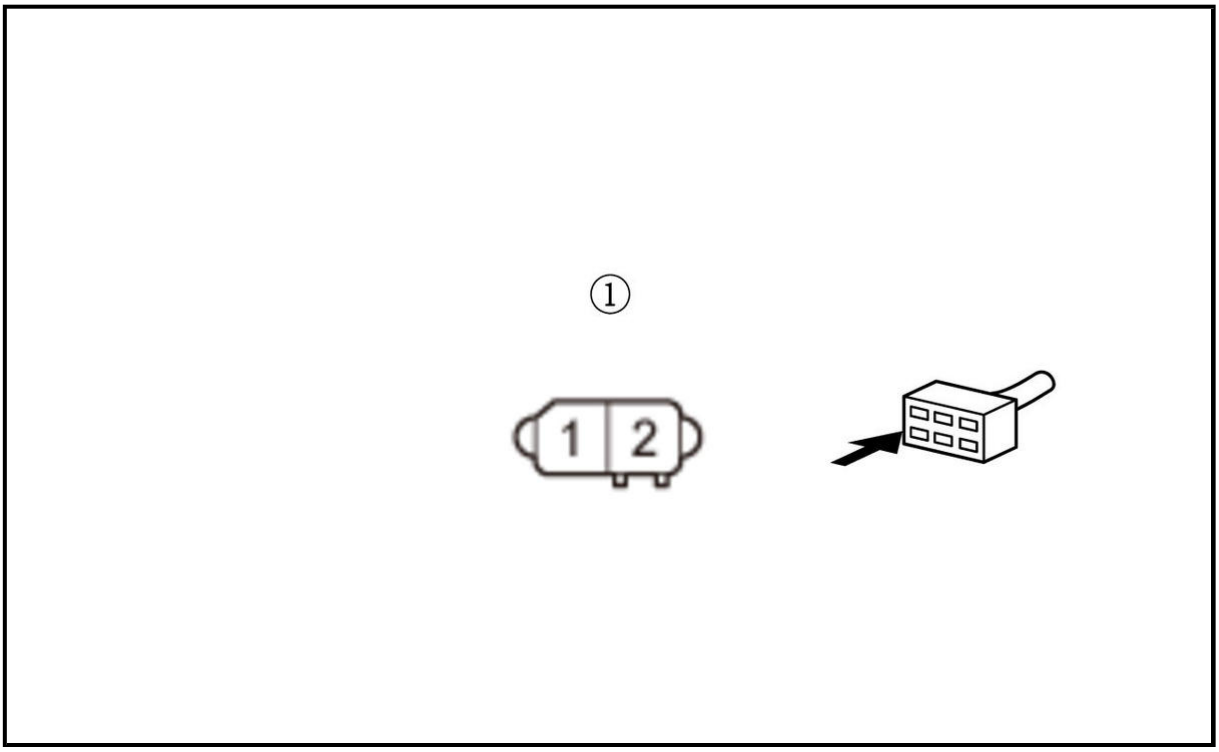
NO

Repair an open in the HPUMP H wire between the PCM (C13) and the high pressure fuel pump.

11. Open wire check (HPUMP L line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	High pressure fuel pump 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector C (51P) No. 14**



Is there continuity?

YES

The HPUMP L wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the HPUMP L wire between the PCM (C14) and the high pressure fuel pump.

12. Shorted wire check (HPUMP H line to power)

-1. Disconnect the following connector.

High pressure fuel pump 2P connector

-2. Exit the SCS mode with the HDS.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	**PCM connector C (51P) No. 13**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the HPUMP H wire between the PCM (C13) and the high pressure fuel pump.

NO

Go to step 13.

13. Shorted wire check (HPUMP L line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	**PCM connector C (51P) No. 14**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the HPUMP L wire between the PCM (C14) and the high pressure fuel pump.

NO

Go to step 14.

14. Shorted wire check (HPUMP H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	**PCM connector C (51P) No. 13**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the HPUMP H wire between the PCM (C13) and the high pressure fuel pump.

NO

Go to step 15.

15. Shorted wire check (HPUMP L line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	PCM connector C (51P): disconnected
	High pressure fuel pump 2P connector: disconnected
Test point 1	**PCM connector C (51P) No. 14**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the HPUMP L wire between the PCM (C14) and the high pressure fuel pump.

NO

The HPUMP L wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P2646 (2.4 L ENGINE) (2017 2018 2019)

DTC P2646 : Rocker Arm Oil Pressure Switch Circuit Low Voltage

Special Tools Required

Pressure Gauge Adapter 07NAJ-P07010A

A/T Low Pressure Gauge w/Panel 07406-0070301

A/T Pressure Test Hose 07AAJ-PY4A100

A/T Pressure Adapter 07MAJ-PY40120

Oil Pressure Hose 07ZAJ-S5AA200

NOTE:

- **How to read the torque specifications** .
- Before you troubleshoot, **review the general troubleshooting information**.
- If DTC P2648 and/or P2649 are stored at the same time as DTC P2646, troubleshoot those DTCs first, then recheck for DTC P2646.

DTC Description	Confirmed DTC	Pending DTC
P2646 Rocker Arm Oil Pressure Switch Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Oil level check

   -1. **Check the engine oil level** .

   Is the level OK?

   YES

   Go to step 2.

   NO

   Adjust the engine oil to the proper level .

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Do the VTEC TEST in the INSPECTION MENU with the HDS.

VTEC TEST

Is the result OK?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

NO

The failure is duplicated. Go to step 3.

3. Determine possible failure area (VTM line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rocker arm oil pressure switch 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
VTEC PRES SW	ON	B	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

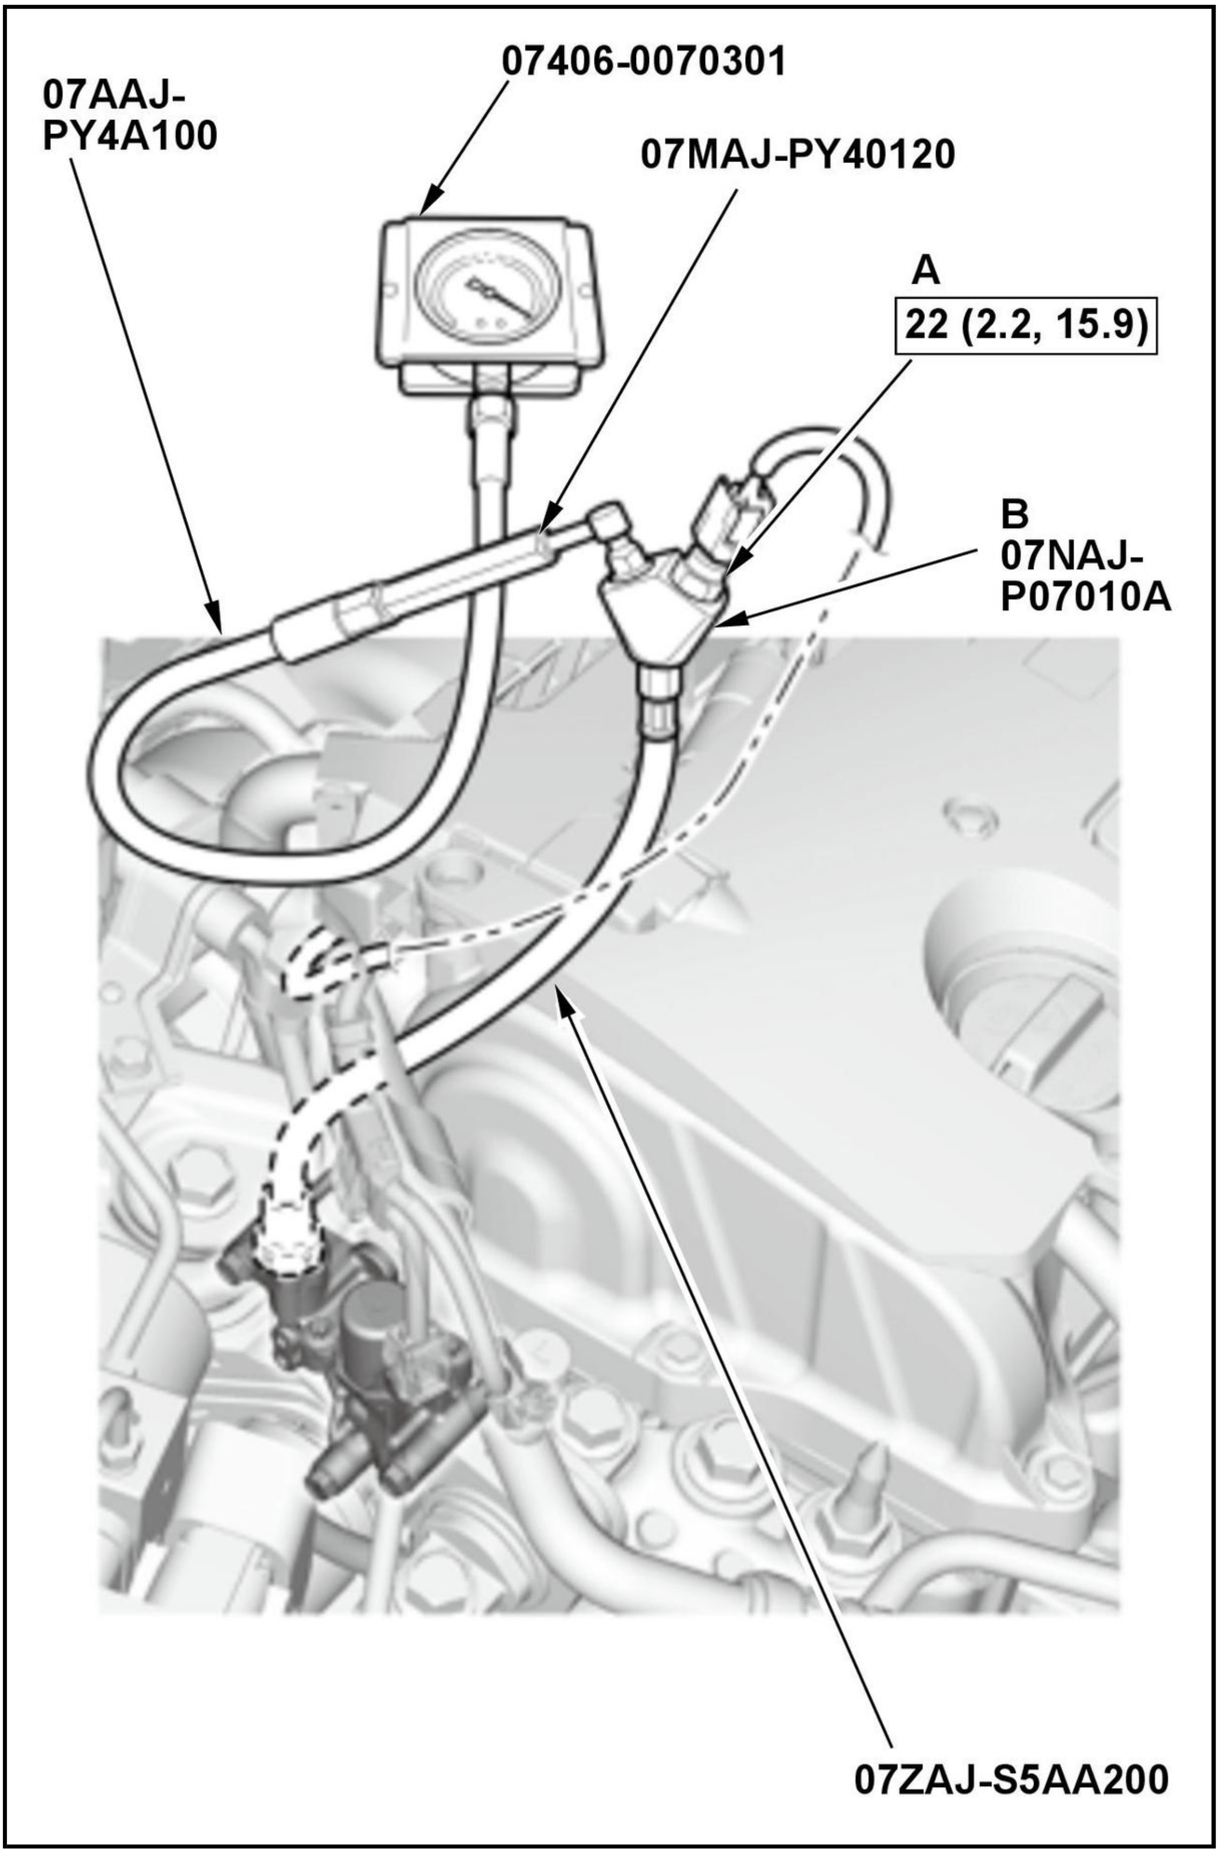
NO

Go to step 4.

4. VTEC system oil pressure check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the rocker arm oil pressure switch (A), and attach the special tools as shown, then attach the rocker arm oil pressure switch to the oil pressure gauge adapter (B).



07AAJ-
PY4A100
07406-0070301
07MAJ-PY40120
A
22 (2.2, 15.9)
B
07NAJ-
P07010A
07ZAJ-S5AA200

-3. Reconnect the following connector.

Rocker arm oil pressure switch 2P connector

-4. Start the engine.

-5. Do the VTEC TEST in the INSPECTION MENU with the HDS.

VTEC TEST

Check the oil pressure.

Does the oil pressure increase to 392 kPa (4.00 kgf/cm 2, 56.9 psi)?

YES

Replace the rocker arm oil pressure switch .

NO

Inspect the VTEC system. If it is OK, **replace the rocker arm oil control valve** .

5. Shorted wire check (VTM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector B (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil pressure switch 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 21**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the VTM wire between the PCM (B21) and the rocker arm oil pressure switch.

NO

The VTM wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P2647 (2.4 L ENGINE) (2017 2018 2019)

DTC P2647 : Rocker Arm Oil Pressure Switch Circuit High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If DTC P2648 and/or P2649 are stored at the same time as DTC P2647, troubleshoot those DTCs first, then recheck for DTC P2647.

DTC Description	Confirmed DTC	Pending DTC
P2647 Rocker Arm Oil Pressure Switch A (Bank 1) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Oil level check

   -1. **Check the engine oil level** .

   Is the level OK?

   YES

   Go to step 2.

   NO

   Adjust the engine oil to the proper level .

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   VTEC TEST

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

   NO

   The failure is duplicated. Go to step 3.

3. Rocker arm oil pressure switch internal circuit check

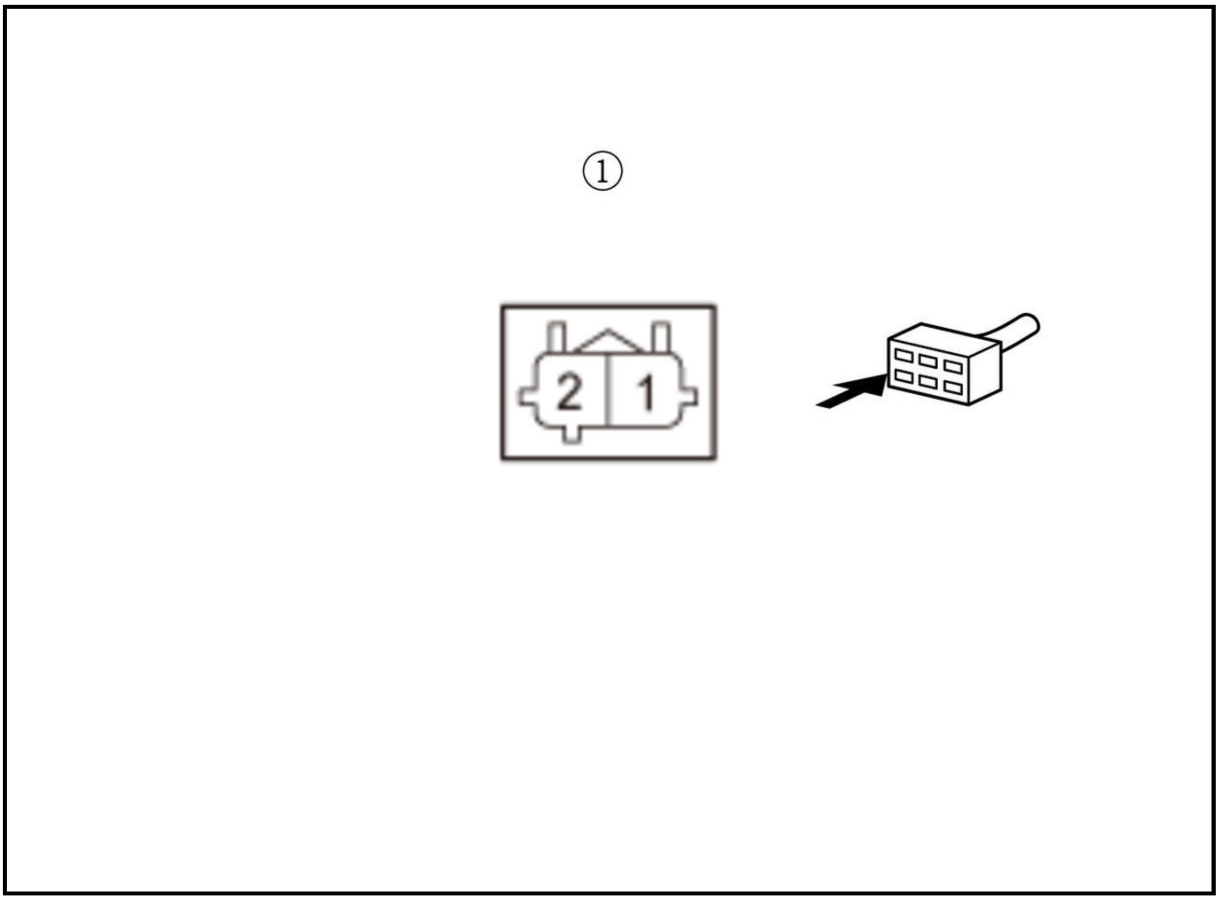
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Rocker arm oil pressure switch 2P connector

   -3. At the rocker arm oil pressure switch side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil pressure switch 2P connector: disconnected
Test point 1	Rocker arm oil pressure switch 2P connector (male terminals) No. 1 (rocker arm oil pressure switch side): ①
Test point 2	Rocker arm oil pressure switch 2P connector (male terminals) No. 2 (rocker arm oil pressure switch side): ①



Is there continuity?

YES

Go to step 4.

NO

Replace the rocker arm oil pressure switch .

4. Open wire check (VTM line)

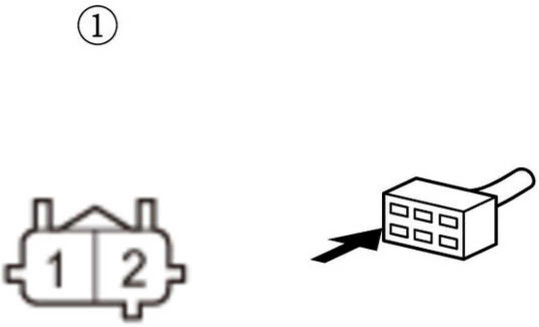
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil pressure switch 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	Rocker arm oil pressure switch 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector B (51P) No. 21**



Is there continuity?

YES

Go to step 5.

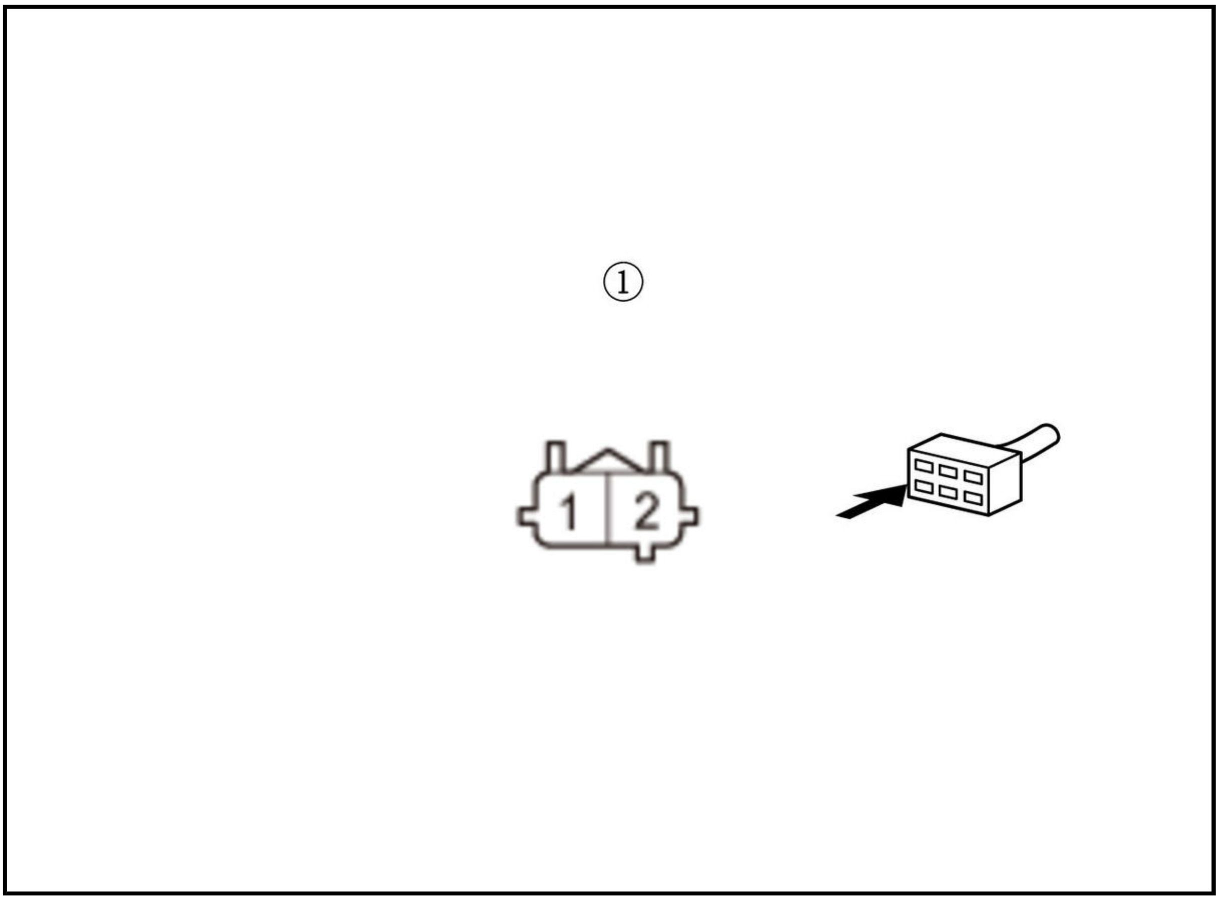
NO

Repair an open in the VTM wire between the PCM (B21) and the rocker arm oil pressure switch.

5. Open wire check (LG (VTM) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rocker arm oil pressure switch 2P connector: disconnected
	PCM connector B (51P): disconnected
Test point 1	Rocker arm oil pressure switch 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

The LG (VTM) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LG (VTM) wire between the rocker arm oil pressure switch and G101.

DTC P2648 (2.4 L ENGINE) (2017 2018 2019)

DTC P2648 : Rocker Arm Oil Control Solenoid Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2648 Rocker Arm Oil Control Solenoid Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Do the VTEC TEST in the INSPECTION MENU with the HDS.

VTEC TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2648 Rocker Arm Oil Control Solenoid Circuit Low Voltage	B	B

Is DTC P2648 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Rocker arm oil control solenoid internal resistance check

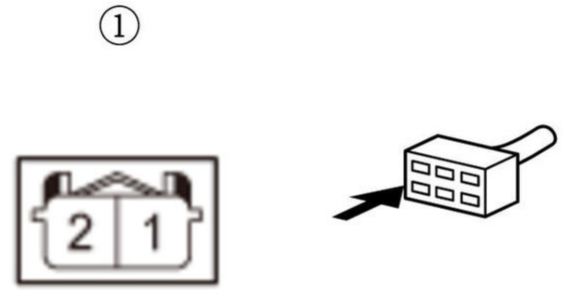
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rocker arm oil control solenoid 2P connector

-3. At the rocker arm oil control solenoid side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
Test point 1	Rocker arm oil control solenoid 2P connector (male terminals) No. 1 (rocker arm oil control solenoid side): ①
Test point 2	Rocker arm oil control solenoid 2P connector (male terminals) No. 2 (rocker arm oil control solenoid side): ①



Is there 14-30 Ω at room temperature?

YES

Go to step 3.

NO

Replace the rocker arm oil control valve (rocker arm oil control solenoid) .

3. Shorted wire check (VTS line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
B	PCM connector B (51P): disconnected
Test point 1	**PCM connector B (51P) No. 18**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the VTS wire between the PCM (B18) and the rocker arm oil control solenoid.

NO

The VTS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

DTC P2649 (2.4 L ENGINE) (2017 2018 2019)

DTC P2649 : Rocker Arm Oil Control Solenoid Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2649 Rocker Arm Oil Control Solenoid Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Do the VTEC TEST in the INSPECTION MENU with the HDS.

VTEC TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2649 Rocker Arm Oil Control Solenoid Circuit High Voltage	B	B

Is DTC P2649 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Rocker arm oil control solenoid internal resistance check

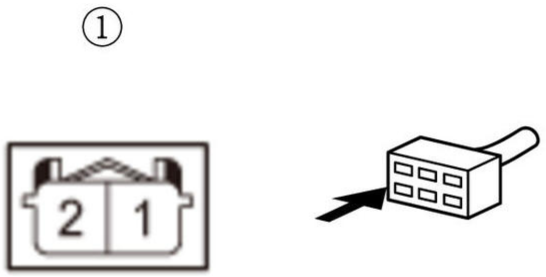
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rocker arm oil control solenoid 2P connector

-3. At the rocker arm oil control solenoid side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
Test point 1	Rocker arm oil control solenoid 2P connector (male terminals) No. 1 (rocker arm oil control solenoid side): ①
Test point 2	Rocker arm oil control solenoid 2P connector (male terminals) No. 2 (rocker arm oil control solenoid side): ①



Is there 14-30 Ω at room temperature?

YES

Go to step 3.

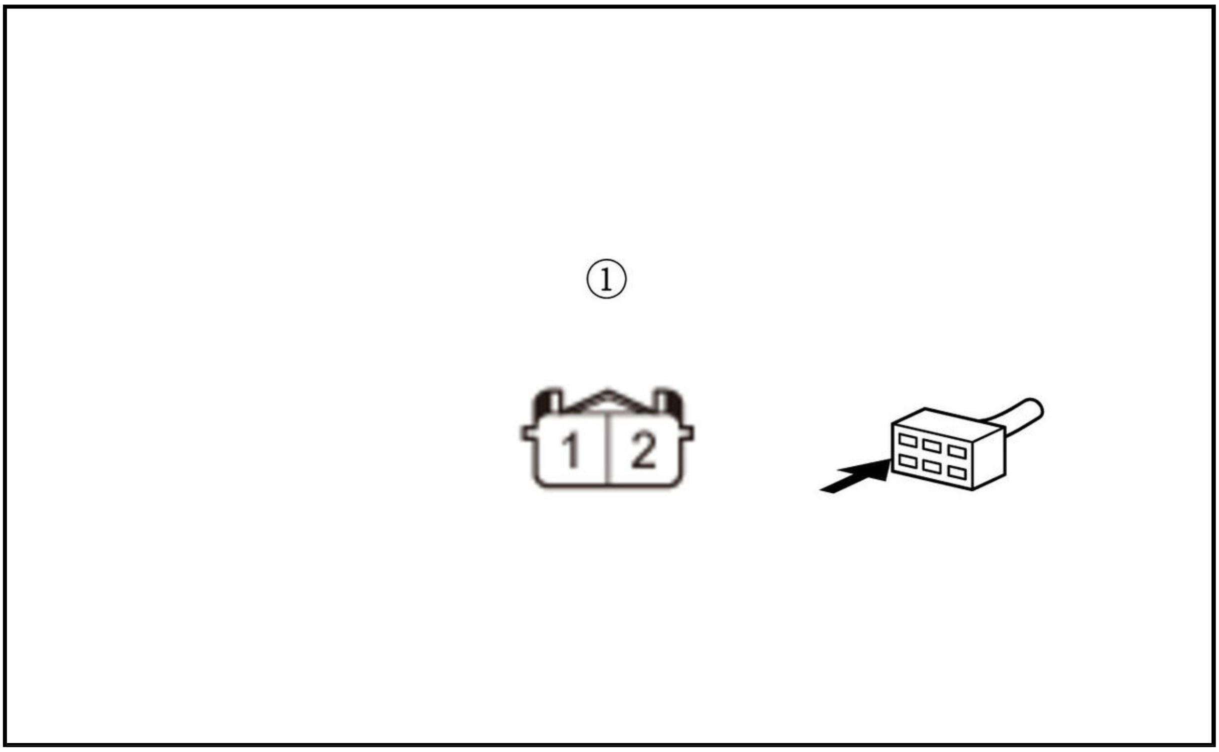
NO

Replace the rocker arm oil control valve (rocker arm oil control solenoid) .

3. Open wire check (PG line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
Test point 1	Rocker arm oil control solenoid 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The PG line is OK. Go to step 4.

NO

Repair an open in the PG wire between the rocker arm oil control solenoid and G101.

4. Open wire check (VTS line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

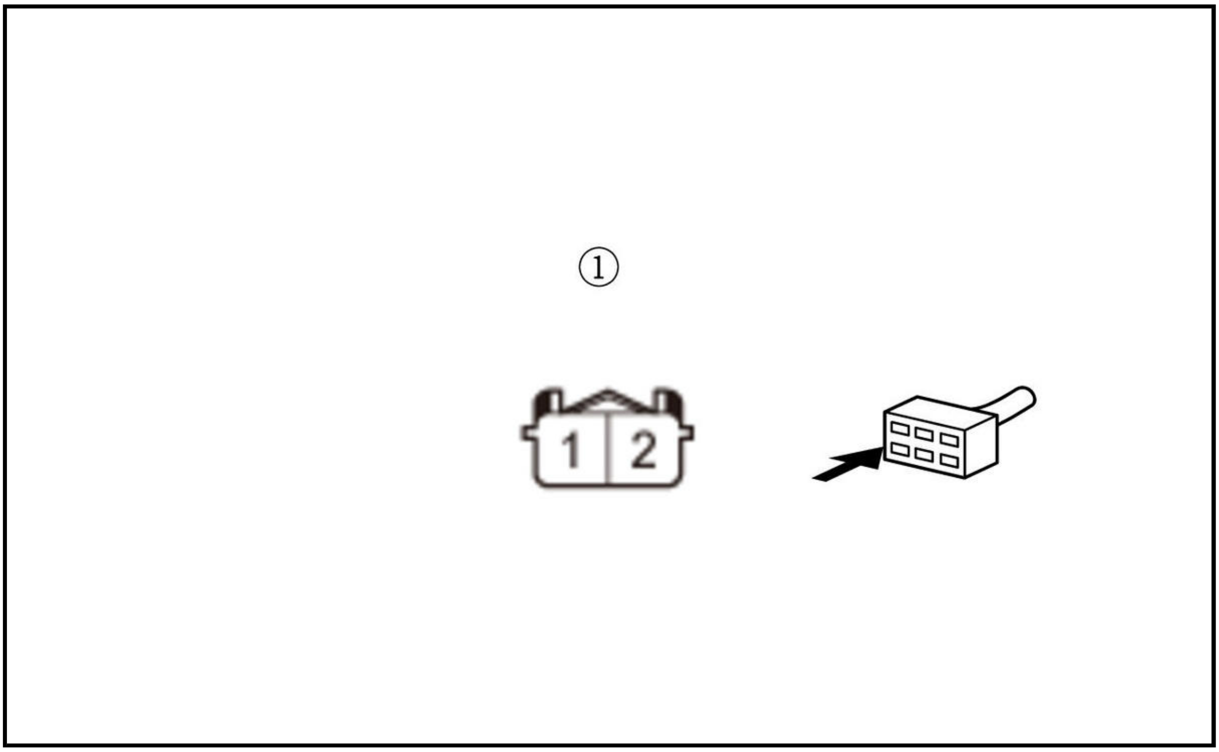
-2. Disconnect the following connector.

PCM connector B (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
B	PCM connector B (51P): disconnected

Test point 1	Rocker arm oil control solenoid 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector B (51P) No. 18**



Is there continuity?

YES

The VTS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Repair an open in the VTS wire between the PCM (B18) and the rocker arm oil control solenoid.

DTC P2715 (CVT (ECM/PCM))

DTC P2715 : Pressure Control Solenoid D Stuck On

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2715 Pressure Control Solenoid D Stuck On	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine. With the brake pedal pressed, Shift the transmission to N position/mode, then shift to D position/mode. Release the brake pedal, and test-drive the vehicle in D position/mode at speeds 12 mph (20 km/h) or below for at least 10 seconds.

-4. Turn the engine off. Repeat the test-drive in step 1-3 again.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2715 Pressure Control Solenoid D Stuck On	B	B	B

Is DTC P2715 indicated?

YES

The failure is duplicated. Faulty CVT lock-up clutch control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P2720 (CVT (ECM/PCM))

DTC P2720 : Pressure Control Solenoid D Control Circuit Low

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2720 Pressure Control Solenoid D Control Circuit Low	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine, and wait for at least 1 second.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2720 Pressure Control Solenoid D Control Circuit Low	B	B	B

Is DTC P2720 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT lock-up clutch control solenoid valve and the PCM. If the freeze data/on-board snapshot of this

DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. IG1 MISS SOL line check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 11**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 MISS SOL wire is OK. Go to step 3.

NO

Check for a blown No. D4 (10 A) fuse in the under-dash fuse/relay box. If the fuse is blown, replace it. If the fuse blows again, repair a short in the No. D4 (10 A) fuse circuit. If the fuse is OK, repair an open in the IG1 MISS SOL wire between the PCM and the under-dash fuse/relay box.

3. CVT lock-up clutch control solenoid valve check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 3**
Test point 2	Body ground

Is there 5.0-6.3 Ω?

YES

The CVT lock-up clutch control solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 4.

4. Shorted wire check (LCC LS line)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the LCC LS wire between the solenoid wire harness A 8P connector and the PCM.

NO

Go to step 5.

5. CVT lock-up clutch control solenoid valve internal resistance check

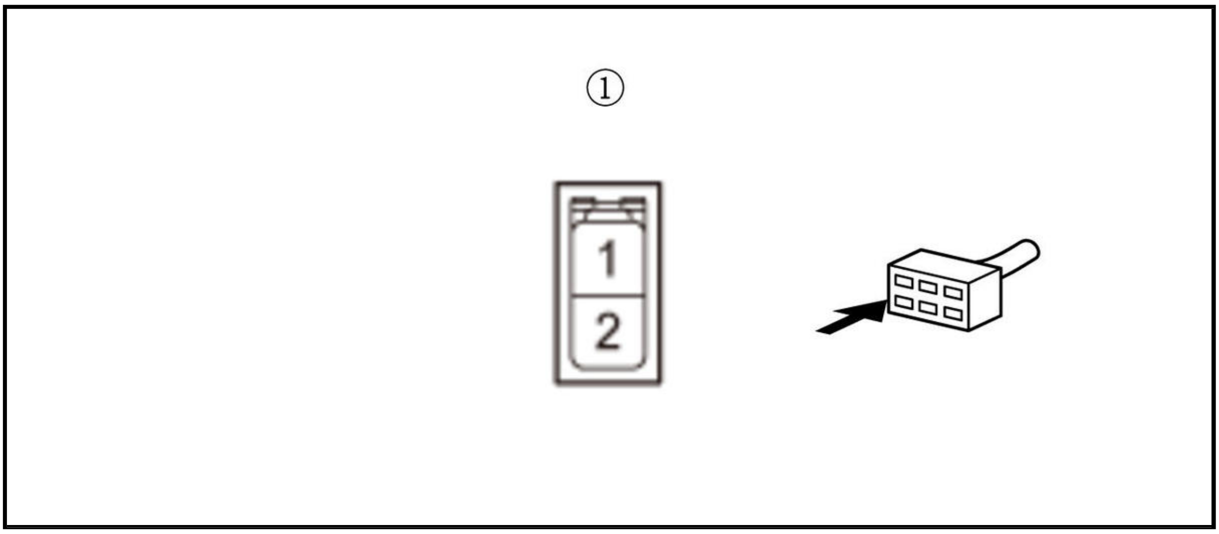
-1. **Remove the valve body assembly** .

-2. Disconnect the following connector.

CVT lock-up clutch control solenoid valve 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Valve body assembly: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT lock-up clutch control solenoid valve 2P connector: disconnected
Test point 1	CVT lock-up clutch control solenoid valve 2P connector (male terminals) No. 1 : ①
Test point 2	CVT lock-up clutch control solenoid valve 2P connector (male terminals) No. 2 : ①



Is there 5.0-6.3 Ω?

YES

Go to step 6.

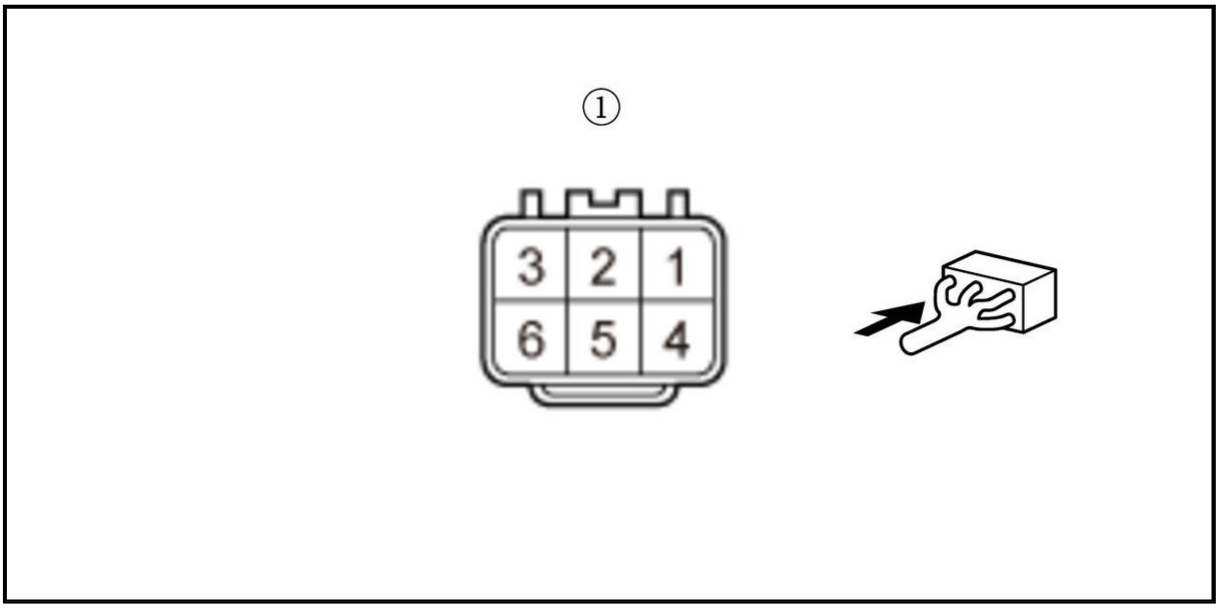
NO

Faulty CVT lock-up clutch control solenoid valve. **Replace the valve body assembly** .

6. Determine shorted wire in either solenoid wire harness A or B (LCC+ line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Valve body assembly: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT lock-up clutch control solenoid valve 2P connector: disconnected
Test point 1	Solenoid wire harness B 6P connector (male terminals) No. 4 : ①
Test point 2	Body ground (valve body assembly)



Is there continuity?

YES

Repair a short to body ground in the LCC+ wire between the CVT lock-up clutch control solenoid valve and the solenoid wire harness B 6P connector.

NO

Repair a short to body ground in the LCC+ wire between the solenoid wire harness A 6P connector and the solenoid wire harness A 8P connector.

DTC P2721 (CVT (ECM/PCM))

DTC P2721 : Pressure Control Solenoid D Control Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2721 Pressure Control Solenoid D Control Circuit High	B	B	B

DTC (CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2721 Pressure Control Solenoid D Control Circuit High	B	B	B

   Is DTC P2721 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the CVT lock-up clutch control solenoid valve and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT lock-up clutch control solenoid valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 3**
Test point 2	Body ground

Is there 5.0-6.3 Ω?

YES

The CVT lock-up clutch control solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 3.

3. Shorted wire check (LCC LS line to power)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Solenoid wire harness A 8P connector : disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 3**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the LCC LS wire between the solenoid wire harness A 8P connector and the PCM.

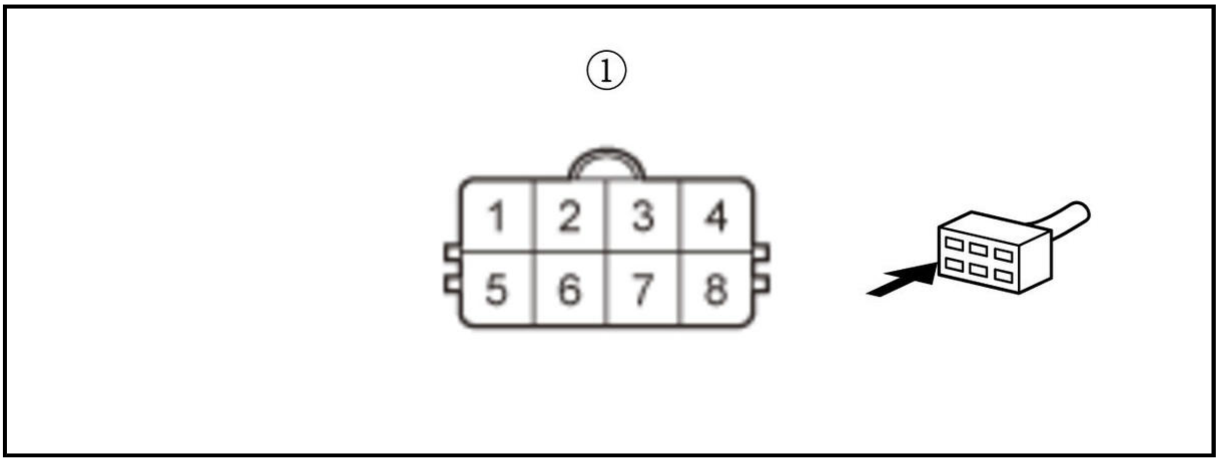
NO

The LCC LS wire is not shorted to power. Go to step 4.

4. Open wire check (LCC LS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 4 : ①
Test point 2	**PCM connector C (51P) No. 3**



Is there continuity?

YES

Go to step 5.

NO

Repair an open in the LCC LS wire between the solenoid wire harness A 8P connector and the PCM.

5. Open wire check (GND1 line, GND2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector B (51P): disconnected
Test Circuit 1	B
Test point 1	**PCM connector B (51P) No. 11**
Test point 2	Body ground
Test Circuit 2	B
Test point 1	**PCM connector B (51P) No. 12**
Test point 2	Body ground

Are there continuity?

YES

Go to step 6.

NO

Repair an open in GND1 wire and/or GND2 wire between the PCM and body ground (G101), or repair poor body ground (G101).

6. CVT lock-up clutch control solenoid valve internal resistance check

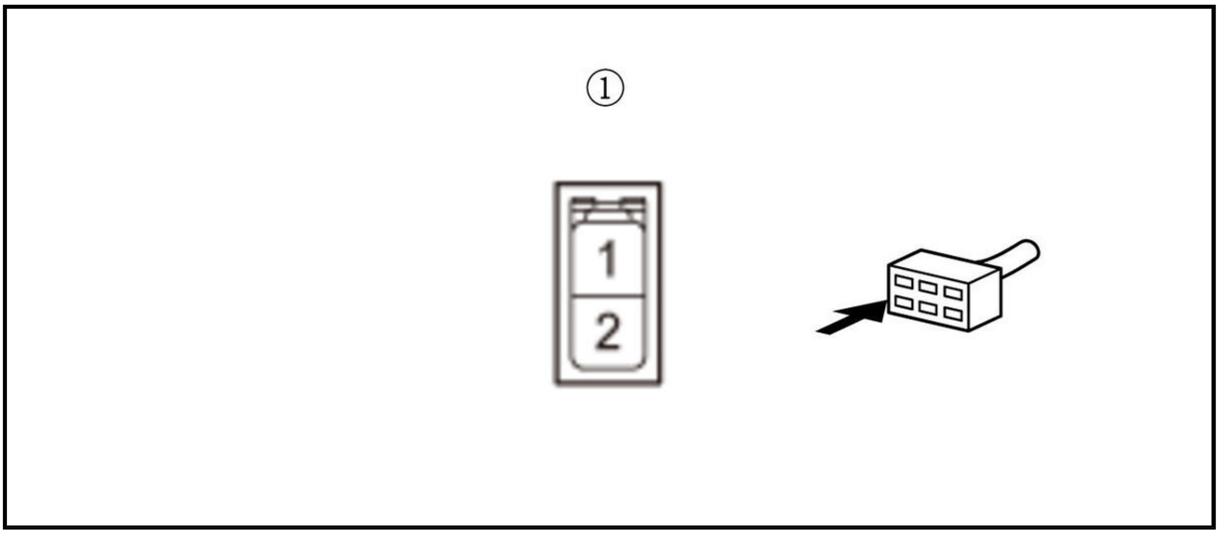
-1. **Remove the valve body assembly** .

-2. Disconnect the following connector.

CVT lock-up clutch control solenoid valve 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Valve body assembly: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT lock-up clutch control solenoid valve 2P connector: disconnected
Test point 1	CVT lock-up clutch control solenoid valve 2P connector (male terminals) No. 1 : ①
Test point 2	CVT lock-up clutch control solenoid valve 2P connector (male terminals) No. 2 : ①



Is there 5.0-6.3 Ω?

YES

Go to step 7.

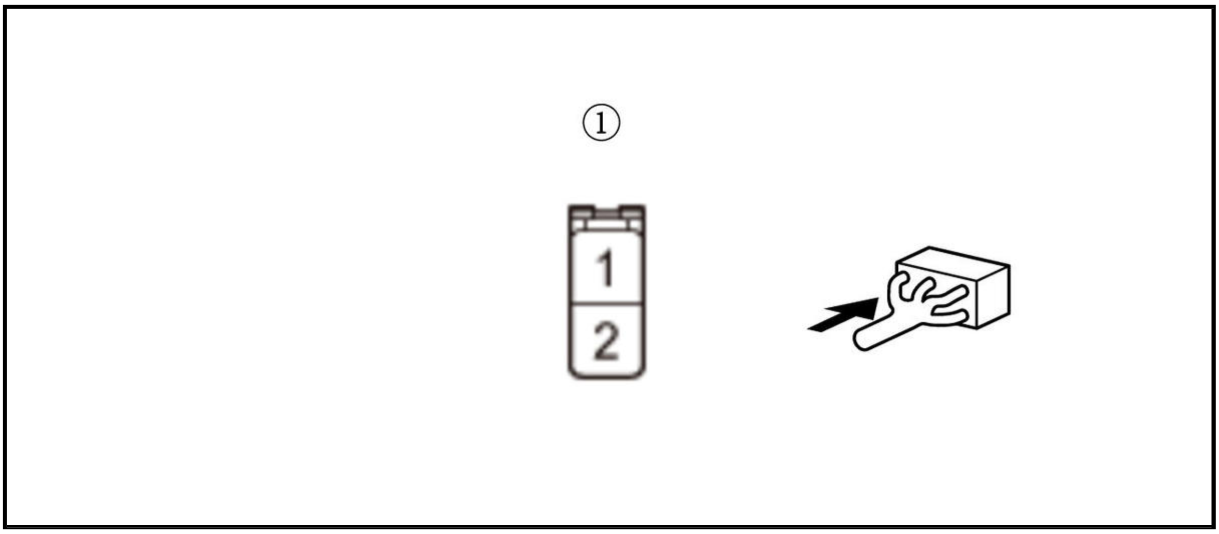
NO

Faulty CVT lock-up clutch control solenoid valve. Replace the valve body assembly .

7. Open wire check (LCC- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Valve body assembly: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT lock-up clutch control solenoid valve 2P connector: disconnected
Test point 1	CVT lock-up clutch control solenoid valve 2P connector (female terminals) No. 1 : ①
Test point 2	Body ground (valve body assembly)



Is there continuity?

YES

Go to step 8.

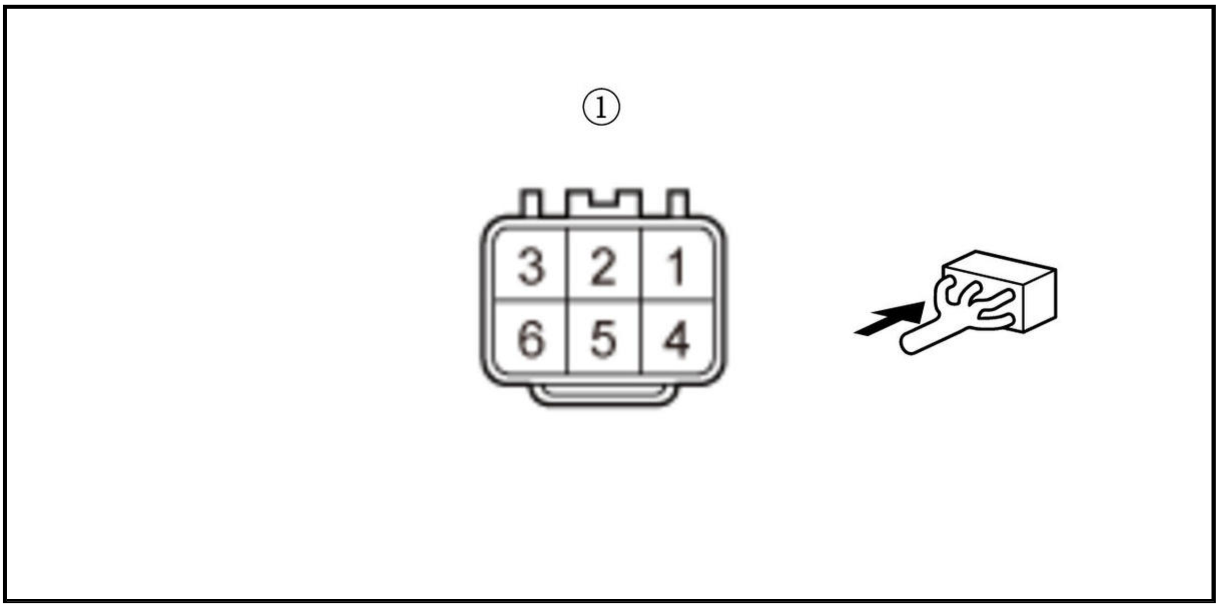
NO

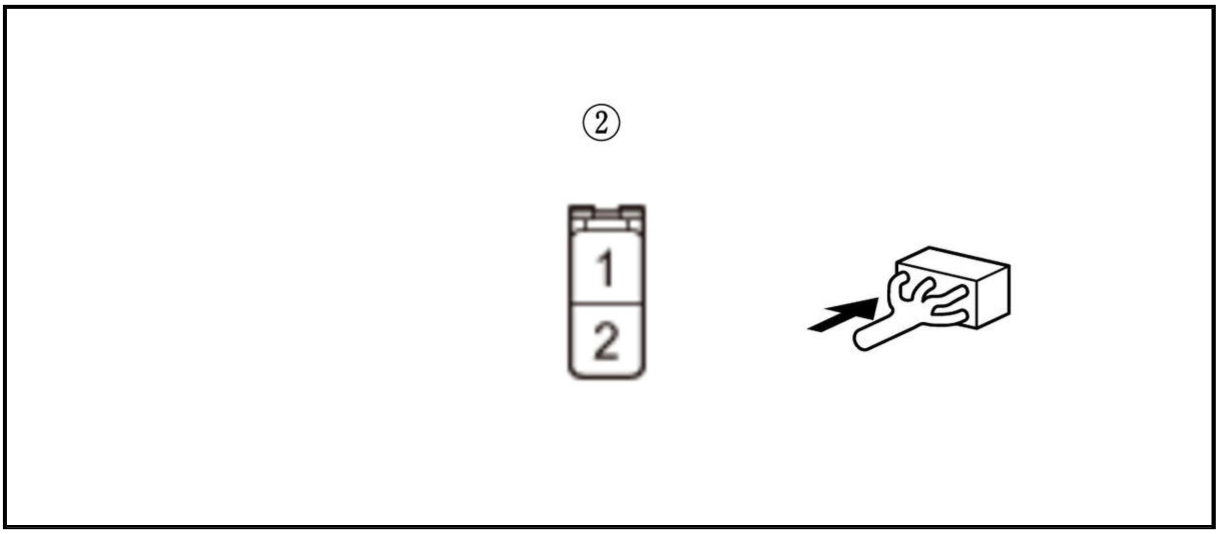
Repair an open in the LCC- wire between the CVT lock-up clutch control solenoid valve and body ground (G162), or repair poor body ground (G162).

8. Determine opened wire in either solenoid wire harness A or B (LCC+ line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Lower valve body: removed
B	Solenoid wire harness B 6P connector: disconnected
B	CVT lock-up clutch control solenoid valve 2P connector: disconnected
Test point 1	Solenoid wire harness B 6P connector (male terminals) No. 4 : ①
Test point 2	CVT lock-up clutch control solenoid valve 2P connector (female terminals) No. 2 : ②





Is there continuity?

YES

Repair an open in the LCC+ wire between the solenoid wire harness A 6P connector and the solenoid wire harness A 8P connector.

NO

Repair an open in the LCC+ wire between the CVT lock-up clutch control solenoid valve and the solenoid wire harness B 6P connector.

DTC P2817 (CVT (ECM/PCM))

DTC P2817 : Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck Off

NOTE: Before you troubleshoot, review the General Troubleshooting Information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2817 Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck Off	B	B	B

DTC (CVT)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine. With the brake pedal pressed, Shift the transmission to N position/mode, then shift to D position/mode. Release the brake pedal, and test-drive the vehicle in D position/mode at speeds 12 mph (20 km/h) or below for at least 10 seconds.

   -4. Turn the engine off. Repeat the test-drive in step 1-3 again.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2817 Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck Off	B	B	B

Is DTC P2817 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shift Solenoid Valve O/P operation check

   -1. Select the Shift Solenoid Valve O/P Test in the Miscellaneous Test Menu, and check that the shift solenoid valve O/P operates with the HDS.

   Does the shift solenoid valve O/P work properly?

   YES

   The shift solenoid valve O/P is OK. **Replace the transmission fluid pump** .

   NO

   Faulty the shift solenoid valve O/P. **Replace the shift solenoid valve O/P** .

DTC P2818 (CVT (ECM/PCM))

DTC P2818 : Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck On

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2818 Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck On	B	B	B

DTC (CVT)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine. With the brake pedal pressed, Shift the transmission to N position/mode, then shift to D position/mode. Release the brake pedal, and test-drive the vehicle in D position/mode at speeds 25 mph (40 km/h) or below for at least 10 seconds.

   -4. Turn the engine off. Repeat the test-drive in step 1-3 again.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2818 Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck On	B	B	B

   Is DTC P2818 indicated?

   YES

   The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shift Solenoid Valve O/P operation check

-1. Select the Shift Solenoid Valve O/P Test in the Miscellaneous Test Menu, and check that the shift solenoid valve O/P operates with the HDS.

Does the shift solenoid valve O/P work properly?

YES

The shift solenoid valve O/P is OK. **Replace the transmission fluid pump** .

NO

Faulty the shift solenoid valve O/P. **Replace the shift solenoid valve O/P** .

DTC P281D, P281E (CVT (ECM/PCM))

DTC P281D : Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit Low **DTC P281E** : Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P281D Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit Low	B	B	B
P281E Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit High	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Select the Shift Solenoid Valve O/P Test in the Miscellaneous Test Menu, and check that the shift solenoid valve O/P operates with the HDS.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P281D Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit Low	B	B	B
P281E Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit High	B	B	B

Is DTC P281D indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the shift solenoid valve O/P and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shift solenoid valve O/P check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector C (51P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 17**
Test point 2	Body ground

Is there 10.6-13.5 Ω?

YES

The shift solenoid valve O/P is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 3.

3. Shorted wire check (SOL C line)

-1. Disconnect the following connector.

Solenoid wire harness A 8P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	PCM connector C (51P): disconnected
Test point 1	**PCM connector C (51P) No. 17**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the SOL C wire between the solenoid wire harness A 8P connector and the PCM.

NO

Go to step 4.

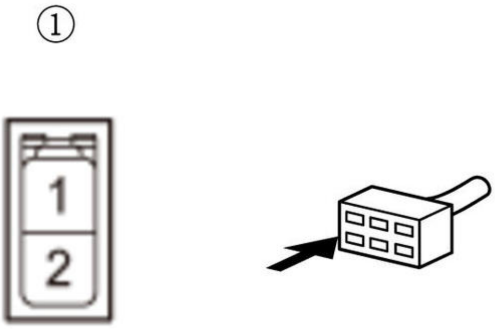
4. Shift solenoid valve O/P internal resistance check

-1. Disconnect the following connector.

Shift solenoid valve O/P 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve O/P 2P connector: disconnected
Test point 1	Shift solenoid valve O/P 2P connector (male terminals) No. 1 : ①
Test point 2	Body ground



Is there 10.6-13.5 Ω?

YES

The shift solenoid valve O/P is OK. Repair a short to body ground in the SHC+ wire between the solenoid wire harness A 8P connector and the shift solenoid valve O/P.

NO

Replace the shift solenoid valve O/P .

DTC P2A00 (1.5 L ENGINE)

DTC P2A00 : A/F Sensor (Sensor 1) Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2A00 A/F Sensor (Sensor 1) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Vehicle speed between 25 - 55 mph (40 - 90 km/h) for 5 minutes
- Drive at a steady speed between 55 - 75 mph (90 - 120 km/h) for 10 seconds, then decelerate (with throttle fully closed) for 4 seconds or more

Signal	**Current conditions**	
	Values	**Unit**
ECT SENSOR 1	B	B
ENGINE SPEED	B	B

-7. Monitor the OBD STATUS for DTC P2A00 in the DTCs MENU with the HDS.

DTC Description	**OBD Status**
P2A00 A/F Sensor (Sensor 1) Circuit Range/Performance Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the A/F sensor (Sensor 1)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**. If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-5 and recheck.

DTC P2A00 (2.4 L ENGINE) (2017 2018 2019)

DTC P2A00 : A/F Sensor (Sensor 1) Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	**Confirmed DTC**	**Pending DTC**
P2A00 A/F Sensor (Sensor 1) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Test-drive under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg. F (70 deg. C)
- Transmission in D
- Vehicle speed between 25 - 55 mph (40 - 90 km/h) for 5 minutes
- Drive at a steady speed between 55 - 75 mph (90 - 120 km/h) for 10 seconds, then decelerate (with throttle fully closed) for 5 seconds or more

Signal	Current conditions	
	Values	Unit
ECT SENSOR 1	B	B
ENGINE SPEED	B	B

-6. Monitor the OBD STATUS for DTC P2A00 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P2A00 A/F Sensor (Sensor 1) Circuit Range/Performance Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the A/F sensor (Sensor 1)** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**. If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

DTC P2A01 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P2A01 : Secondary HO2S (Sensor 2) Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P2A01 Secondary HO2S (Sensor 2) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine, and let it idle without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Monitor the OBD STATUS for DTC P0137 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2A01 Secondary HO2S (Sensor 2) Circuit Range/Performance Problem	B

Does the HDS indicate FAILED?

YES

Go to step 2.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	Less than 1.54	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the secondary HO2S (Sensor 2) .

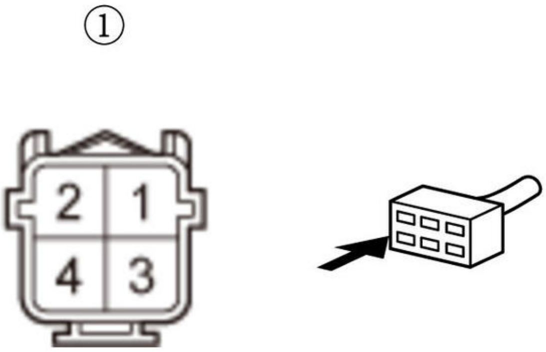
3. Determine possible failure area (short in SO2 line, short in SO2SG/SO2 SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected

Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (SO2 line)

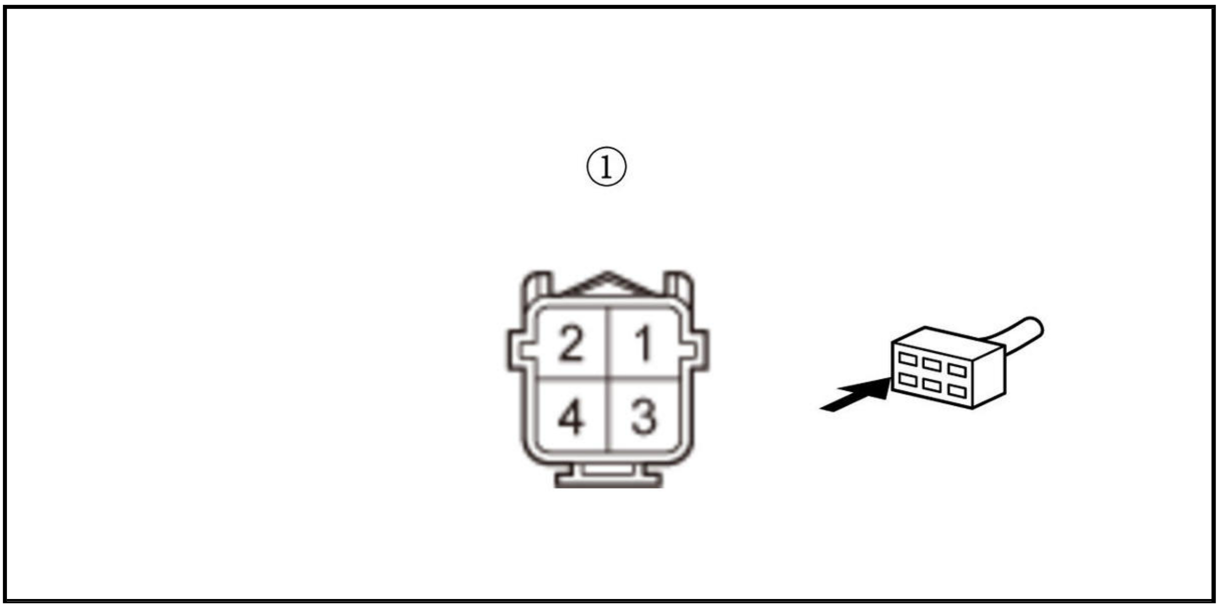
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the SO2 wire between the PCM (A47) and secondary HO2S (Sensor 2).

NO

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

5. Shorted wire check (SO2SG/SO2 SG line)

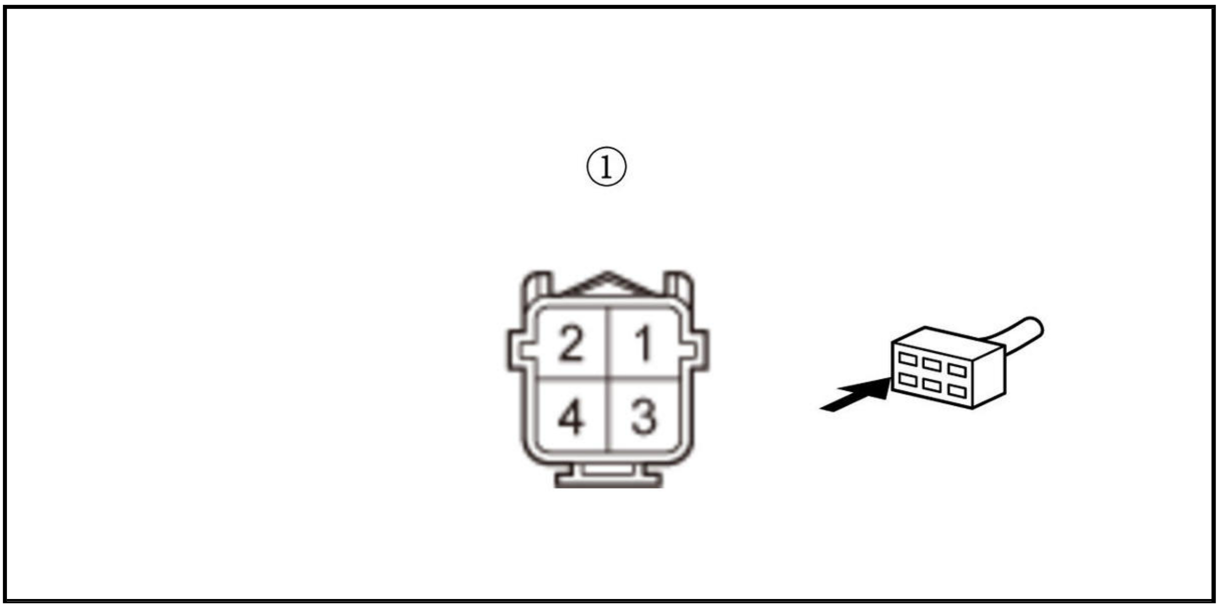
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the SO2SG/SO2 SG wire between the PCM (A48) and secondary HO2S (Sensor 2).

NO

The SO2SG/SO2 SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P2DE0 (1.5 L ENGINE) (2020 2021)

DTC P2DE0 : Cold Start Air Fuel Ratio Control System Lean

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If DTC P2DE0 is indicated alone, do the troubleshooting for DTC P0171 using the on-board snapshot for P2DE0.

DTC Description	Confirmed DTC	Pending DTC
P2DE0 Cold Start Air Fuel Ratio Control System Lean	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Start the engine, and let it idle for 10 seconds or more.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2DE0 Cold Start Air Fuel Ratio Control System Lean	B	B

Is DTC P2DE0 indicated?

YES

The failure is duplicated. Do the troubleshooting for **DTC P0171** using the on-board snapshot for P2DE0.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

DTC P2DE1 (1.5 L ENGINE) (2020 2021)

DTC P2DE1 : Cold Start Air Fuel Ratio Control System Rich

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If DTC P2DE1 is indicated alone, do the troubleshooting for DTC P0172 using the on-board snapshot for P2DE1.

DTC Description	Confirmed DTC	Pending DTC
P2DE1 Cold Start Air Fuel Ratio Control System Rich	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT SENSOR 1 is 122 deg. F (50 deg. C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Start the engine, and let it idle for 10 seconds or more.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2DE1 Cold Start Air Fuel Ratio Control System Rich	B	B

Is DTC P2DE1 indicated?

YES

The failure is duplicated. Do the troubleshooting for DTC P0172 using the on-board snapshot for P2DE1.

NO

Intermittent failure, the system is OK at this time. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot.

DTC U0029 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC U0029 : F-CAN Malfunction (BUS-OFF (PCM))

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC
U0029 F-CAN Malfunction (BUS-OFF (PCM))	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 6 seconds.

   -5. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (CAN gateway)

Are any DTCs indicated?

YES

Go to the troubleshooting for CAN gateway system DTC (s) .

NO

Intermittent failure, the system is OK at this time.

DTC U0029 (PGM-FI SYSTEM (2.4 L ENGINE)) (2017 2018 2019)

DTC U0029 : F-CAN Malfunction (BUS-OFF (PCM))

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC
U0029 F-CAN Malfunction (BUS-OFF (PCM))	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0029 F-CAN Malfunction (BUS-OFF (PCM))	B	B

Is DTC U0029 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

DTC U0038 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC U0038 : PT-CAN Malfunction (TCM ECU BUS-OFF)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- According to the detected DTC (s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the PCM.

DTC Description	Confirmed DTC	Pending DTC
U0038 PT-CAN Malfunction (TCM ECU BUS-OFF)	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0038 PT-CAN Malfunction (TCM ECU BUS-OFF)	B	B

Is DTC U0038 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the TCM and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. CVT system check

-1. Check for communication to the CVT system with the HDS.

Does the HDS communicate with the CVT system?

YES

Go to step 3.

NO

Go to the symptom troubleshooting for CVT system .

3. Open wire check (TM-CAN H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 4**
Test point 2	**PCM connector A (50P) No. 21**

Is there continuity?

YES

Go to step 4.

NO

Repair an open in the TM-CAN H wire between the PCM (A21) and the TCM.

4. Open wire check (TM-CAN L line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 12**
Test point 2	**PCM connector A (50P) No. 20**

Is there continuity?

YES

The TM-CAN L wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TM-CAN L wire between the PCM (A20) and the TCM.

DTC U0047 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC U0047 : F-CAN Malfunction For The Second Channel (BUS-OFF (PCM))

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
U0047 F-CAN Malfunction For The Second Channel (BUS-OFF (PCM))	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 6 seconds.

   -5. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (CAN gateway)

Are any DTCs indicated?

YES

Go to the troubleshooting for CAN gateway system DTC (s) .

NO

Intermittent failure, the system is OK at this time.

DTC U0101, U0104, U0114, U0122, U0128, U0129, U0131, U0151, U0155, U129E (PGM-FI SYSTEM (1.5 L ENGINE))

DTC U0101 : F-CAN Malfunction (PCM-TCM)**DTC U0104** : F-CAN Malfunction (PCM-Driving Support System Control Unit)**DTC U0114** : F-CAN Malfunction (PCM-AWD Control Unit)**DTC U0122** : F-CAN Malfunction (PCM-VSA Modulator-Control Unit)**DTC U0128** : F-CAN Malfunction (PCM-Electric Parking Brake Control Unit)**DTC U0129** : F-CAN Malfunction (PCM-Electric Brake Booster)**DTC U0131** : F-CAN Malfunction (PCM-EPS Control Unit)**DTC U0151** : F-CAN Malfunction (PCM-SRS Unit)**DTC U0155** : F-CAN Malfunction (PCM-Gauge Control Module)**DTC U129E** : F-CAN Malfunction (PCM-Power Control Unit (PCU))

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- According to the detected DTC (s), confirm the control unit that the PCM lost communication with has the proper power supply and ground connection. Refer to the input testing for that control unit if necessary.
- Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.
- Before disconnecting the TCM connector, jump the SCS line with the HDS, and wait more than 1 minute.
- Before disconnecting the electric brake booster connector, turn the vehicle to the OFF (LOCK) mode with driver's door open, then wait 3 minutes. Do not open and close the driver's door.
- Information marked with an asterisk (*) applies to the CAN gateway (16P connector type).

DTC Description	Confirmed DTC	Pending DTC
U0101 F-CAN Malfunction (PCM-TCM)	B	B
U0104 F-CAN Malfunction (PCM-Driving Support System Control Unit)	B	B
U0114 F-CAN Malfunction (PCM-AWD Control Unit)	B	B
U0122 F-CAN Malfunction (PCM-VSA Control Module Unit)	B	B
U0128 F-CAN Malfunction (PCM-Electric Parking Brake Control Unit)	B	B
U0129 F-CAN Malfunction (PCM-Electric Brake Booster)	B	B
U0131 F-CAN Malfunction (PCM-EPS Control Unit)	B	B
U0151 F-CAN Malfunction (PCM-SRS Unit)	B	B
U0155 F-CAN Malfunction (PCM-Gauge Control Module)	B	B
U129E F-CAN Malfunction (PCM-Power Control Unit (PCU))	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode, and wait 6 seconds.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

   DTC (CAN gateway)

   Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTCs .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Bus A is Not Available

Go to step 3.

Bus B is Not Available

Go to step 4.

Bus A and B are Available

Go to step 5.

3. Open wire check (F-CAN A H line, F-CAN A L line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

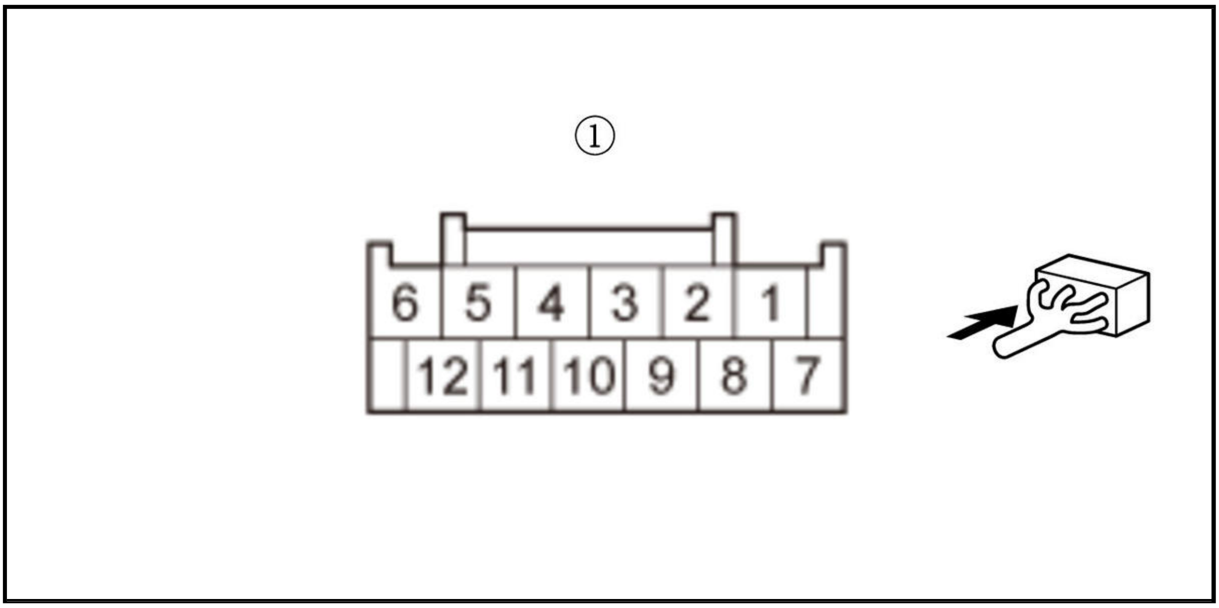
CAN gateway 12P (16P)* connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

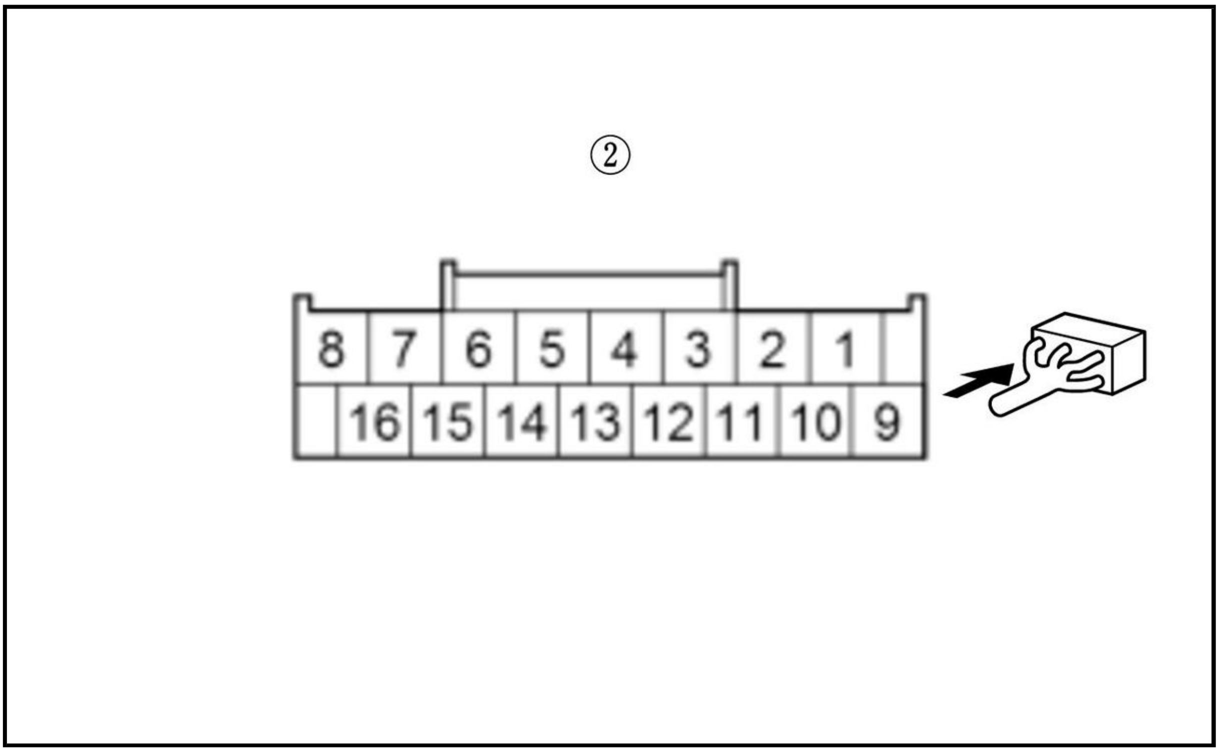
Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P (16P)* connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 3: ① CAN gateway 16P connector (female terminal) No. 3: ② *
Test point 2	**PCM connector A (50P) No. 37**

Test point 1	CAN gateway 12P connector (female terminal) No. 9: ① CAN gateway 16P connector (female terminals) No. 11: ② *
Test point 2	**PCM connector A (50P) No. 36**

12P Connector Type



16P Connector Type*



Is there 1.0 Ω or less?

YES

The F-CAN A H wire and the F-CAN A L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN A H wire or the F-CAN A L wire between the PCM (A36, A37) and the CAN gateway.

4. Open wire check (F-CAN B H line, F-CAN B L line) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

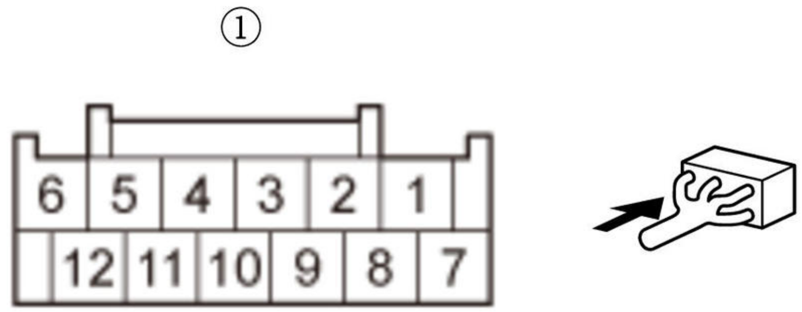
CAN gateway 12P (16P)* connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

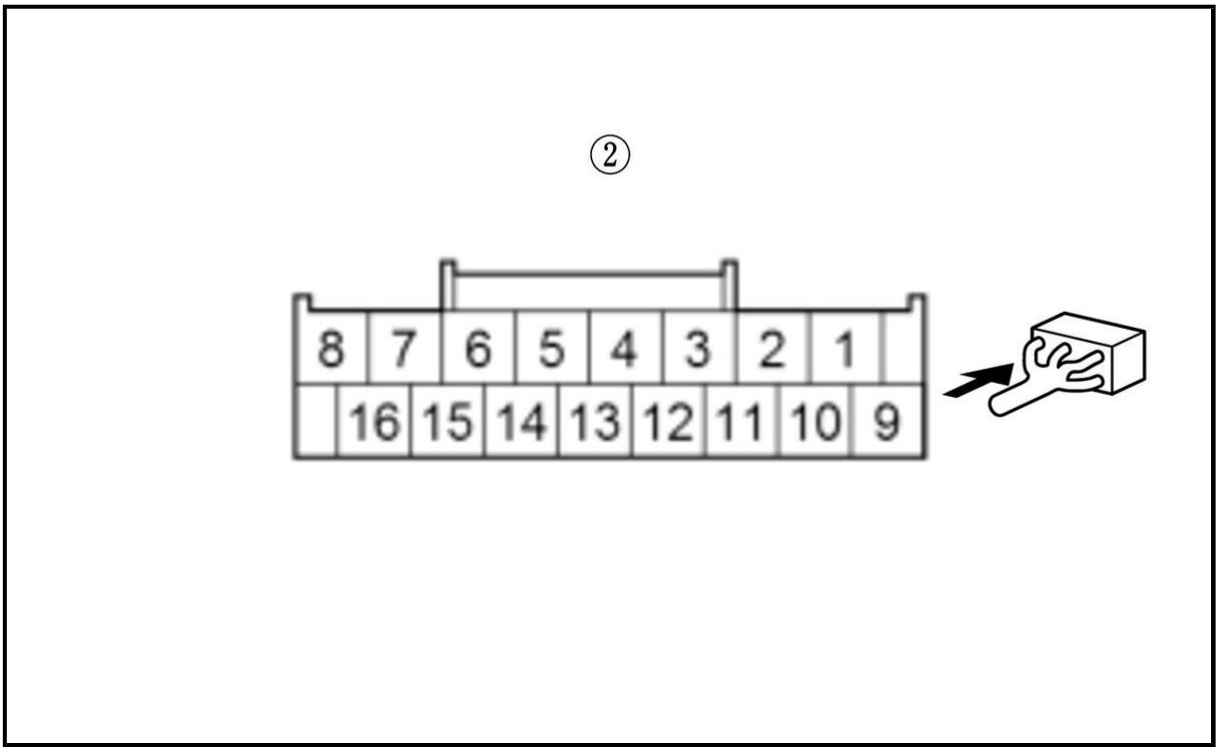
Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P (16P)* connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 12: ① CAN gateway 16P connector (female terminals) No. 6: ② *
Test point 2	**PCM connector A (50P) No. 39**

Test point 1	CAN gateway 12P connector (female terminal) No. 5: ① CAN gateway 16P connector (female terminals) No. 14: ② *
Test point 2	**PCM connector A (50P) No. 38**

12P Connector Type



16P Connector Type*



Is there 1.0 Ω or less?

YES

The F-CAN B H wire and the F-CAN B L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN B H wire or the F-CAN B L wire between the PCM (A38, A39) and the CAN gateway.

5. F-CAN circuit communication check (Transmitting control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel (s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel (s) at normal
U0101	TCM	A
U0104	Millimeter wave radar	B
U0114	Real time AWD control unit	B
U0122	VSA modulator-control unit	A, B
U0128	VSA modulator-control unit (electric parking brake control unit)	A, B
U0129	Electric brake booster	A, B
U0131	EPS control unit	B
U0151	SRS unit	B
U0155	Gauge control module	A
U129E	Body control module	A

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0101: TCM is Not Available for Bus A

Go to step 6.

U0104: Millimeter wave radar is Not Available for Bus B

Go to step 7.

U0114: Real time AWD control unit is Not Available for Bus B

Go to step 7.

U0122: VSA modulator-control unit is Not Available for Bus A

Go to step 6.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0128: VSA modulator-control unit (electric parking brake control unit) is Not Available for Bus A

Go to step 6.

U0128: VSA modulator-control unit (electric parking brake control unit) is Not Available for Bus B

Go to step 7.

U0129: Electric brake booster is Not Available for Bus A

Go to step 6.

U0129: Electric brake booster is Not Available for Bus B

Go to step 7.

U0131: EPS control unit connector is Not Available for Bus B

Go to step 7.

U0151: SRS unit connector is Not Available for Bus B

Go to step 7.

U0155: Gauge control module is Not Available for Bus A

Go to step 6.

U129E: Body control module is Not Available for Bus A

Go to step 6.

6. Open wire check (F-CAN A H line, F-CAN A L line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector (s).

DTC	Connector
-	CAN gateway 12P (16P)* connector
U0101	TCM 50P connector
U0122	VSA modulator-control unit 46P connector
U0128	VSA modulator-control unit 46P connector
U0129	Electric brake booster 26P connector
U0155	Gauge control module connector A (32P)
U129E	Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P (16P)* connector: disconnected
B	Transmitting control unit connector (s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)

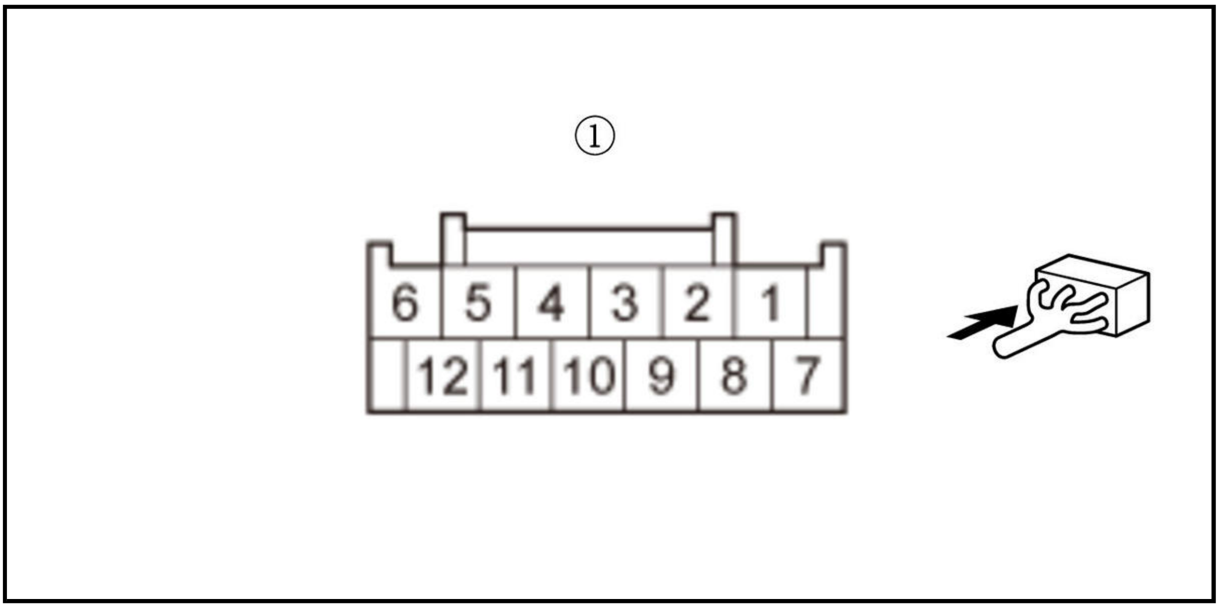
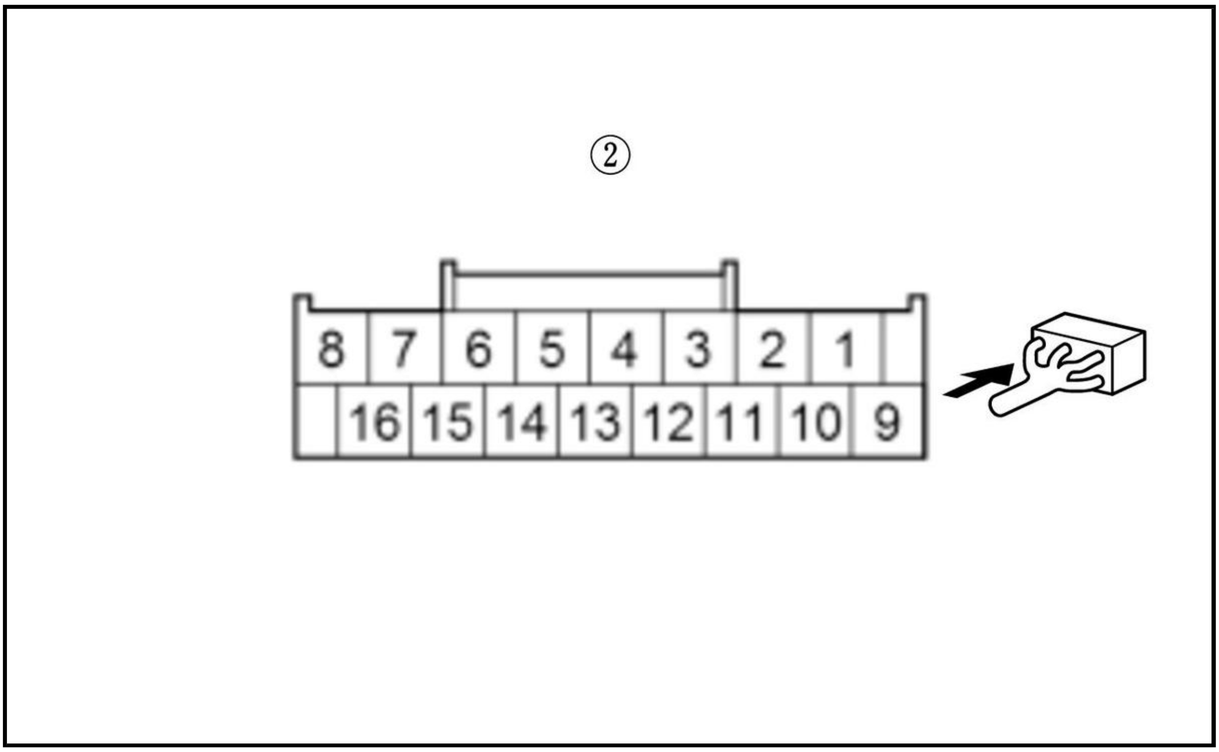
12P Connector Type



16P Connector Type*



Is there 1.0 Ω or less?

YES

The F-CAN A H wire and the F-CAN A L wire are OK. According to the detected DTC on the following table, update, substitute, or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0101	Check for poor connections or loose terminals at the CAN gateway and the TCM. **Substitute a known-good TCM** .
U0122	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0128	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0129	Check for poor connections or loose terminals at the CAN gateway and the electric brake booster. **Replace the electric brake booster** .
U0155	Check for poor connections or loose terminals at the CAN gateway and the gauge control module. **Substitute a known-good gauge control module** .
U129E	Check for poor connections or loose terminals at the CAN gateway and the body control module. **Substitute a known-good body control module** .

NO

Repair an open in the F-CAN A H wire or the F-CAN A L wire between the transmitting control unit and the CAN gateway.

7. Open wire check (F-CAN B H line, F-CAN B L line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector (s).

DTC	Connector
-	CAN gateway 12P (16P)* connector
U0104	Millimeter wave radar 8P connector

DTC	Connector
U0114	Real time AWD control unit 24P connector
U0122	VSA modulator-control unit 46P connector
U0128	VSA modulator-control unit 46P connector
U0129	Electric brake booster 26P connector
U0131	EPS control unit connector B (6P)
U0151	SRS unit connector A (39P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P (16P)* connector: disconnected
B	Transmitting control unit connector (s) for indicated DTCs: disconnected

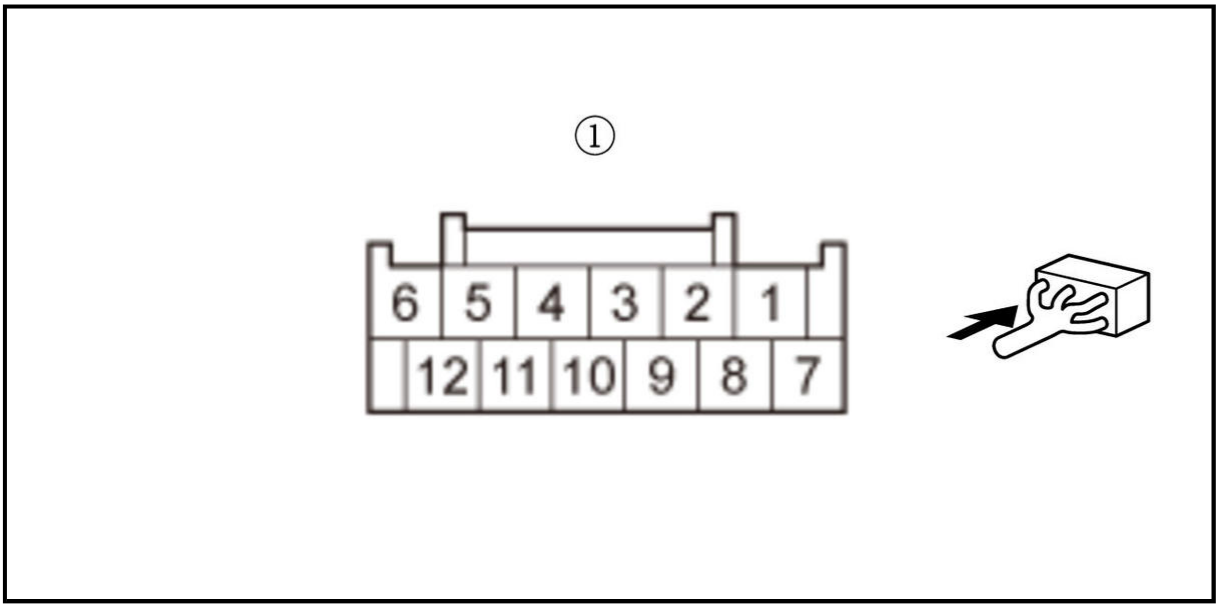
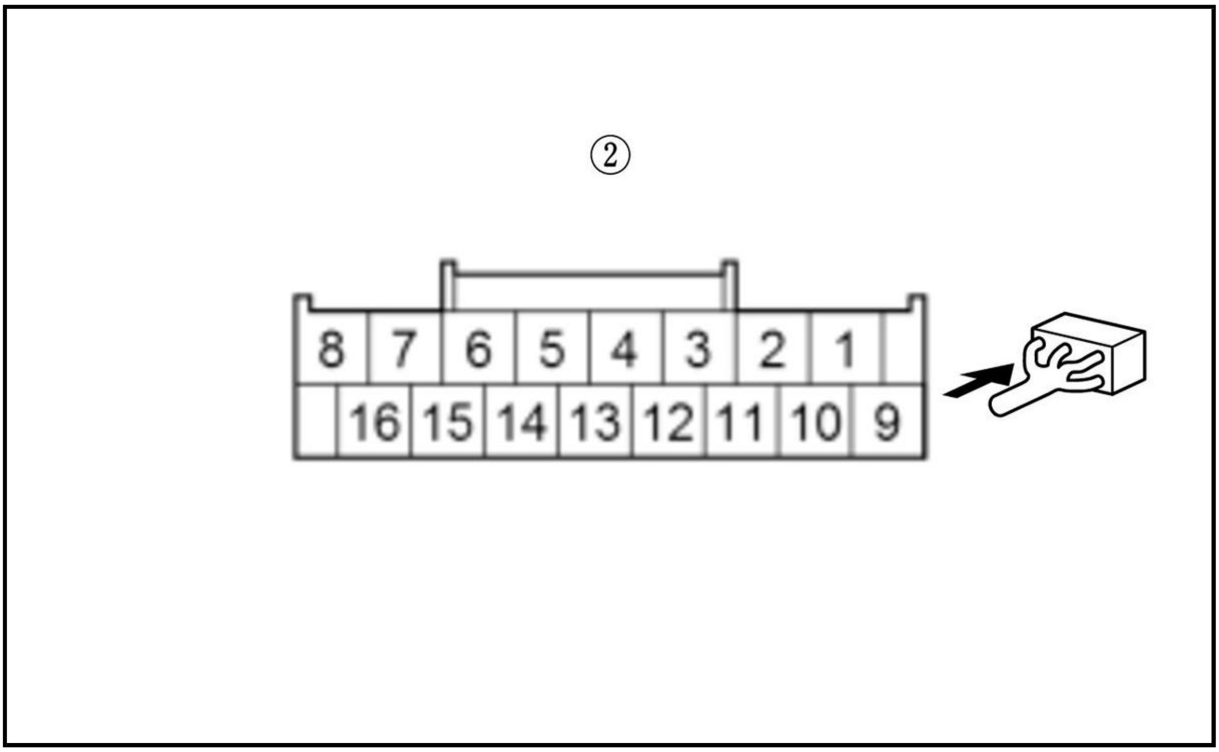
12P Connector Type



16P Connector Type*



Is there 1.0 Ω or less?

YES

The F-CAN B H wire and the F-CAN B L wire are OK. According to the detected DTC on the following table, update, substitute, or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0104	Check for poor connections or loose terminals at the CAN gateway and the millimeter wave radar. **Substitute a known-good millimeter wave radar** .
U0114	Check for poor connections or loose terminals at the CAN gateway and the AWD control unit. **Substitute a known-good AWD control unit** .
U0122	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0128	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .

DTC	Operation for transmitting control unit
U0129	Check for poor connections or loose terminals at the CAN gateway and the electric brake booster. **Replace the electric brake booster** .
U0131	Check for poor connections or loose terminals at the CAN gateway and the EPS control unit. **Substitute a known-good EPS control unit** .
U0151	Check for poor connections or loose terminals at the CAN gateway and the SRS unit. **Substitute a known-good SRS unit** .

NO

Repair an open in the F-CAN B H wire or the F-CAN B L wire between the transmitting control unit and the CAN gateway.

DTC U0114, U0122, U0128, U0129, U0131, U0155 (PGM-FI SYSTEM (2.4 L ENGINE)) (2017 2018 2019)

DTC U0114 : F-CAN Malfunction (PCM-AWD Control Unit)**DTC U0122** : F-CAN Malfunction (PCM-VSA Modulator-Control Unit)**DTC U0128** : F-CAN Malfunction (PCM-Electric Parking Brake Control Unit)**DTC**

U0129 : F-CAN Malfunction (PCM-Electric Brake Booster)**DTC U0131** : F-CAN Malfunction (PCM-EPS Control Unit)**DTC U0155** : F-CAN Malfunction (PCM-Gauge Control Module)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- According to the detected DTC (s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the PCM.
- Before disconnecting the electric brake booster connector, turn the vehicle to the OFF (LOCK) mode with driver's door open, then wait 3 minutes. Do not open and close the driver's door.

DTC Description	Confirmed DTC	Pending DTC
U0114 F-CAN Malfunction (PCM-AWD Control Unit)	B	B
U0122 F-CAN Malfunction (PCM-VSA Control Module Unit)	B	B
U0128 F-CAN Malfunction (PCM-Electric Parking Brake Control Unit)	B	B
U0129 F-CAN Malfunction (PCM-Electric Brake Booster)	B	B

U0155 F-CAN Malfunction (PCM-Gauge Control Module)	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0114 F-CAN Malfunction (PCM-AWD Control Unit)	B	B
U0122 F-CAN Malfunction (PCM-VSA Control Module Unit)	B	B
U0128 F-CAN Malfunction (PCM-Electric Parking Brake Control Unit)	B	B
U0129 F-CAN Malfunction (PCM-Electric Brake Booster)	B	B
U0131 F-CAN Malfunction (PCM-EPS Control Unit)	B	B
U0155 F-CAN Malfunction (PCM-Gauge Control Module)	B	B

   Are any DTCs indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control units and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Open wire check (F-CAN H line, F-CAN L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector (s).

NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when removing the PCM connector (s).

PCM connector A (51P)

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector (s).

DTC	Connector
U0114	Real time AWD control unit 24P connector
U0122	VSA modulator-control unit 46P connector
U0128	VSA modulator-control unit 46P connector
U0129	Electric brake booster 26P connector
U0131	EPS control unit connector B (6P)
U0155	Gauge control module connector A (32P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Receiving control unit connector (s): disconnected
B	Transmitting control unit connector (s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	**Terminal**	**Connector**	**Terminal**

Is there continuity?

YES

The F-CAN H wire and the F-CAN L wire are OK. Refer to the DTC shown on the display, then substitute or replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U0114	**Substitute a known-good AWD control unit** .
U0122	**Replace the VSA modulator-control unit** .
U0128	**Replace the VSA modulator-control unit** .
U0129	**Substitute a known-good electric brake booster** .
U0131	**Substitute a known-good EPS control unit** .
U0155	**Substitute a known-good gauge control module** .

NO

Repair an open in the F-CAN H wire or the F-CAN L wire between the transmitting control unit and the transmitting control unit.

DTC U0146 (CAN GATEWAY (KA/KC)) (2020 2021)

DTC U0146 : F-CAN Malfunction (PCM-CAN Gateway)

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
U0146 F-CAN Malfunction (PCM - CAN Gateway)	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0146 F-CAN Malfunction (PCM - CAN Gateway)	B	B

Is DTC U0146 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CAN gateway and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. CAN gateway system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the troubleshooting for CAN gateway system DTC (s) .

NO

Go to step 3.

3. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Connection Check.

F-CAN Connection Check

Which result is indicated?

PCM (Bus A) is Not Available

Go to step 4.

PCM (Bus B) is Not Available

Go to step 6.

4. Open wire check (F-CAN A H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

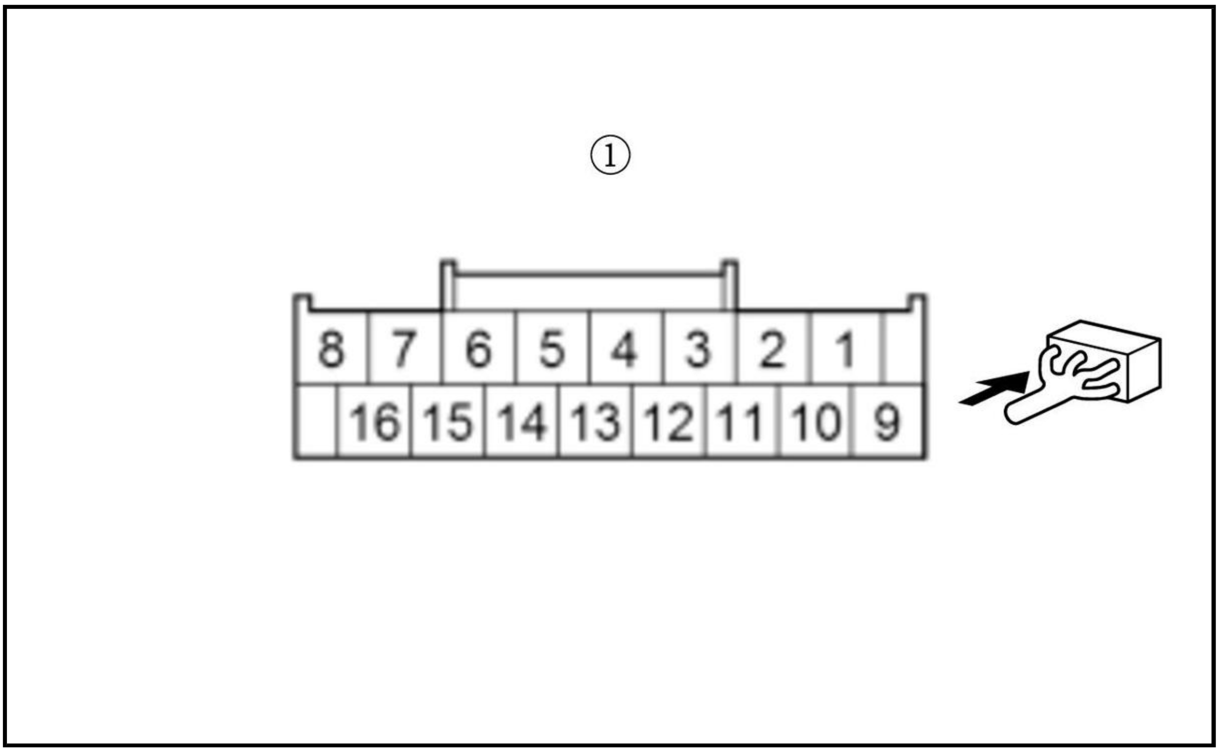
-3. Disconnect the following connectors.

CAN gateway 16P connector
PCM connector A (50P): disconnected

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	**PCM connector A (50P) No. 37**



Is there 1.0 Ω or less?

YES

The F-CAN A H wire is OK. Go to step 5.

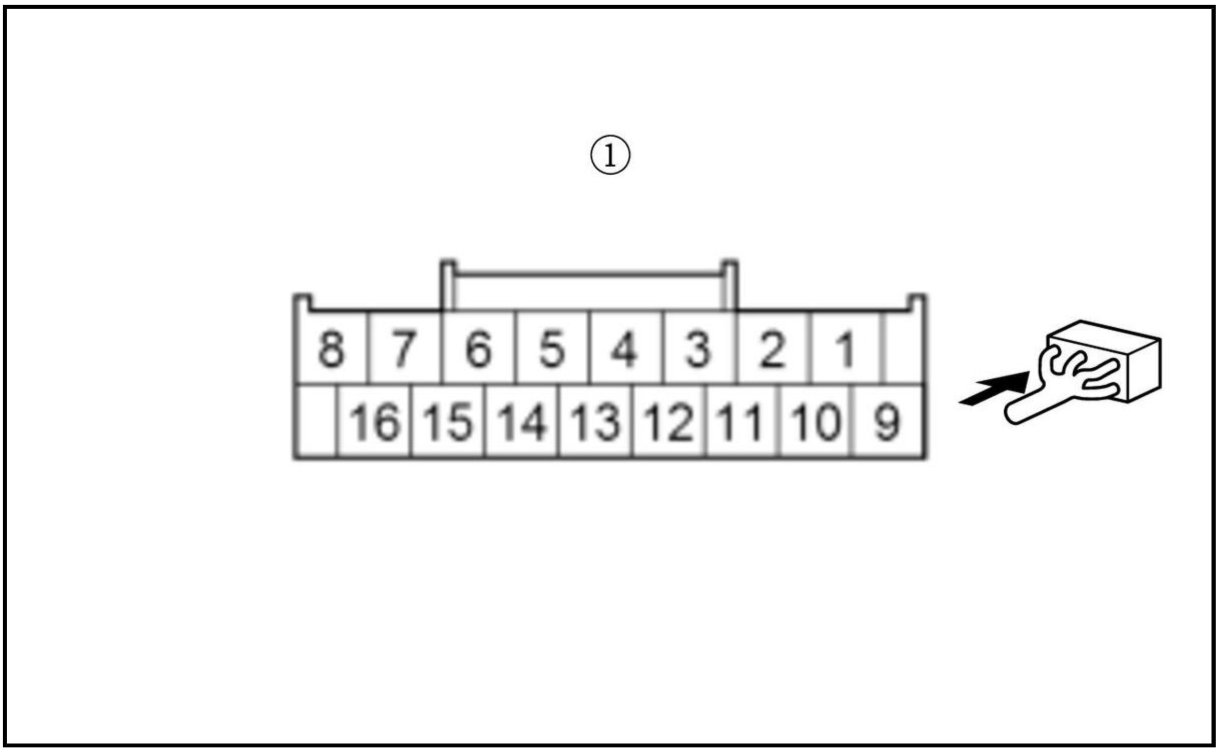
NO

Repair an open in the F-CAN A H wire between the PCM (A37) and the CAN gateway.

5. Open wire check (F-CAN A L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	**PCM connector A (50P) No. 36**



Is there 1.0 Ω or less?

YES

The F-CAN A L wire is OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN A L wire between the PCM (A36) and the CAN gateway.

6. Open wire check (F-CAN B H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

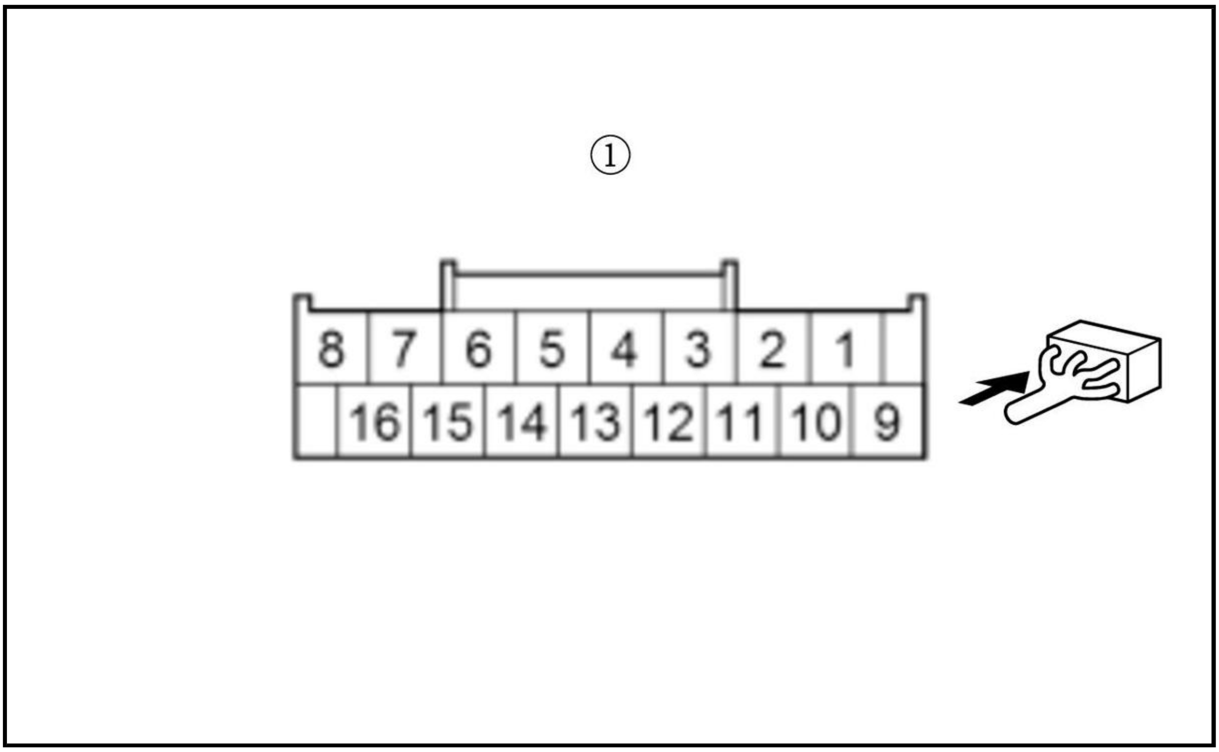
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

CAN gateway 16P connector
PCM connector A (50P): disconnected

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**PCM connector A (50P) No. 39**



Is there 1.0 Ω or less?

YES

The F-CAN B H wire is OK. Go to step 7.

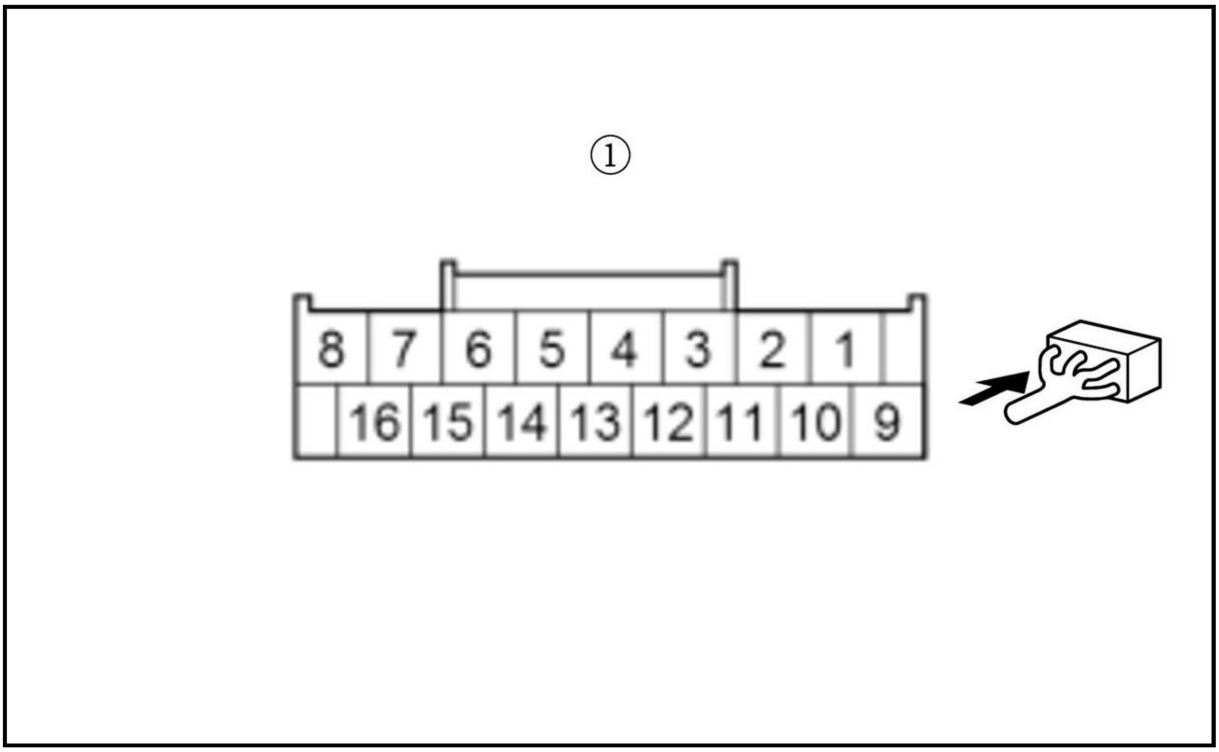
NO

Repair an open in the F-CAN B H wire between the PCM (A39) and the CAN gateway.

7. Open wire check (F-CAN B L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**PCM connector A (50P) No. 38**



Is there 1.0 Ω or less?

YES

The F-CAN B L wire is OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN B L wire between the PCM (A38) and the CAN gateway.

DTC U0301 (PGM-FI SYSTEM (1.5 L ENGINE))

DTC U0301 : PGM-FI System and Transmission System Program Version Mismatch

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
U0301 PGM-FI System and Transmission System Program Version Mismatch	B	B

DTC (PGM-FI)

1. Problem verification (update)

   -1. **Update the PCM** .

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0301 PGM-FI System and Transmission System Program Version Mismatch	B	B

Is DTC U0301 indicated?

YES

Replace the PCM .

NO

Update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC TROUBLESHOOTING INDEX

CVT SYSTEM DTC TROUBLESHOOTING INDEX (2.4 L ENGINE) (2017 2018 2019)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information .

KA models

DTC * (1)	Shift Position Indicator	MIL	Detection Item

FUEL AND EMISSIONS SYSTEMS DTC TROUBLESHOOTING INDEX (1.5 L ENGINE (KA/KC)) (2018 2019 2020 2021)

DTC Troubleshooting Index

DTC (MIL indication *1)	Two DriveCycle Detection	Detection Item	MIL
P0010 (56)	---	Variable Valve Timing Control (VTC) Oil Control Solenoid Valve A Malfunction	ON
P0011 (56)	o	Variable Valve Timing Control (VTC) A System Malfunction	ON
P0013 (141)	---	Variable Valve Timing Control (VTC) Oil Control Solenoid Valve B Malfunction	ON
P0014 (141)	o	Variable Valve Timing Control (VTC) B System Malfunction	ON
P0034 (194) *4	o	Turbocharger Bypass Control Solenoid Valve Circuit Low Voltage	ON
P0034 *5	o	Turbocharger Bypass Control Solenoid Valve Circuit Low Voltage	OFF
P0035 (194) *4	o	Turbocharger Bypass Control Solenoid Valve Circuit High Voltage	ON
P0035 *5	o	Turbocharger Bypass Control Solenoid Valve Circuit High Voltage	OFF

DTC (MIL indication *1)	Two DriveCycle Detection	Detection Item	MIL
P003A (190)	---	Turbocharger Wastegate Control Actuator Position Exceeded Learning Limit	ON
P0045 (190)	---	Turbocharger Wastegate Control Actuator Circuit Malfunction	ON
P0046 (190)	---	Turbocharger Wastegate Control Actuator Circuit Range/Performance Problem	ON
P0069 (13)	o	Barometric Pressure (BARO) Sensor Circuit Range/Performance Problem	ON
P006A (50)	o	Mass Air Flow (MAF) Sensor Circuit Range/Performance Problem	ON
P006E (190)	---	Turbocharger Power Supply Circuit Malfunction	ON
P0087 (197)	---	Fuel Rail Pressure Too Low	ON
P0088 (197)	---	Fuel Rail Pressure Too High	ON
P0096 (10)	o	Intake Air Temperature (IAT) Sensor 2 Circuit Range/Performance Problem	ON
P0097 (10)	o	Intake Air Temperature (IAT) Sensor 2 Circuit Low Voltage	ON
P0098 (10)	o	Intake Air Temperature (IAT) Sensor 2 Circuit High Voltage	ON
P00CF (171)	o	Turbocharger Boost Sensor/Barometric Pressure (BARO) Sensor Incorrect Correlation	ON
P00FE (90) *5	o	Evaporative Emission (EVAP) Vent Line Blockage	ON
P0100 (50)	---	Mass Air Flow (MAF) Sensor Circuit Malfunction	ON
P0101 (50)	o	Mass Air Flow (MAF) Sensor Circuit Range/Performance Problem (Out of Range)	ON
P0107 (3)	---	Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage	ON
P0108 (3)	---	Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage	ON
P0111 (10)	o	Intake Air Temperature (IAT) Sensor 1 Circuit Range/Performance Problem	ON
P0112 (10)	o	Intake Air Temperature (IAT) Sensor 1 Circuit Low Voltage	ON
P0113 (10)	o	Intake Air Temperature (IAT) Sensor 1 Circuit High Voltage	ON
P0115 (6)	o	Engine Coolant Temperature (ECT) Sensor 1 Out of Range	ON

NOTE: The above DTCs are indicated when the PGM-FI system is selected with the HDS. Some automatic transmission DTCs cause the MIL to come on. If the MIL is on and no DTCs are indicated in the PGM-FI system, select the A/T system, and check for automatic transmission DTCs.

*1: These DTCs are indicated by a blinking MIL when the SCS line is jumped with the HDS. Some DTCs do not cause the MIL to blink when the SCS line is jumped; these DTCs are shown in the gauge display.

*2: With multipurpose camera unit

*3: AWD

*4:'18-19

*5:'20-21

*6: With auto idle stop system

*7: With keyless access system

*8:'17-20

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE FUEL AND EMISSIONS SYSTEMS

Intermittent Failures

The term intermittent failure means a system may have had a failure, but it checks OK now. If the malfunction indicator lamp (MIL) on the dash does not come on, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting. If the MIL was on but then went off, the original problem may have been intermittent.

Service Information

Periodically, new PCM software or new service procedures may become available. Always check online for the latest software or service information related to the DTCs or symptoms you are troubleshooting.

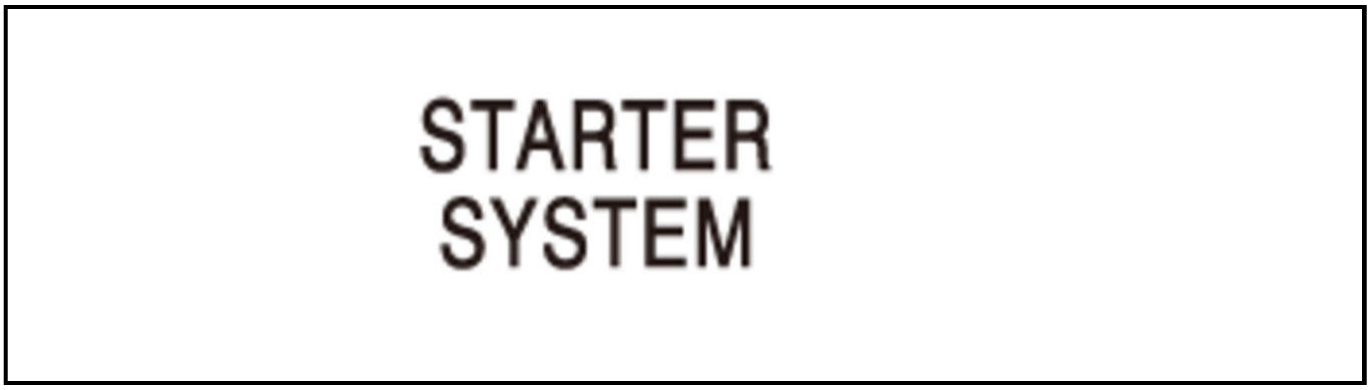
Opens and Shorts

Open and short are common electrical terms. An open is a break in a wire or at a connection. A short is an accidental connection of a wire to power, ground, or to another wire. In simple electronics, this usually means something won't work at all. With complex electronics (such as PCMs) this can sometimes mean something works, but not the way it's supposed to.

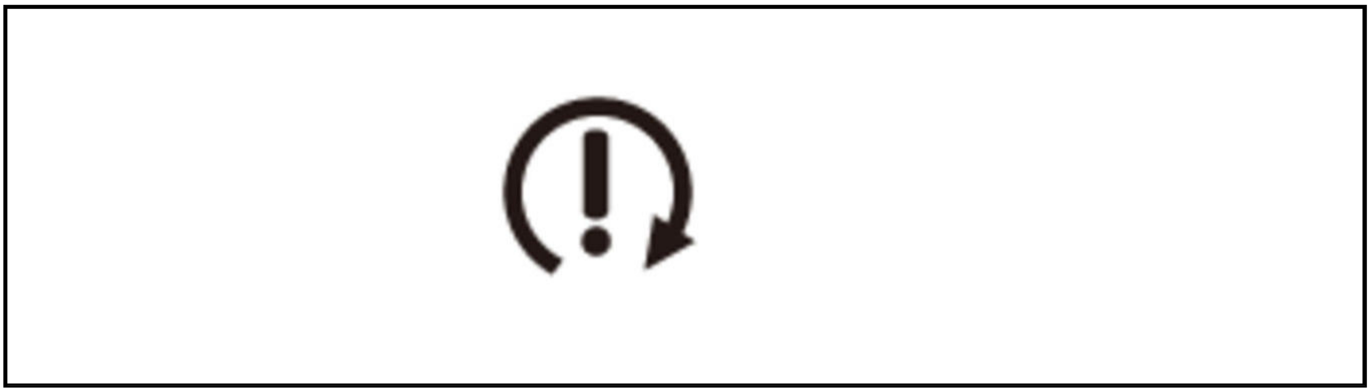
CHECK SYSTEM Display Indication (CHECK STARTING SYSTEM)

1. If this indicator comes on in the gauge control module, the starting system may have had a failure. Connect the HDS to the data link connector located under the driver's side of the dashboard. Check the diagnostic trouble code (DTC) and note it. Then refer to the indicated DTCs troubleshooting, and begin the appropriate troubleshooting procedure.

USA models

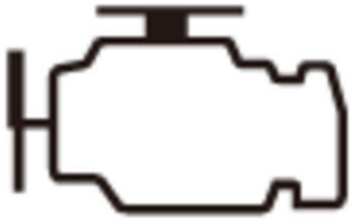


Except USA models



How to Use the HDS (Honda Diagnostic System)

1. Start the engine, and check the MIL in the gauge control module.



2. If the MIL stays on, **connect the HDS to the data link connector**

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the PCM and other vehicle systems. If it does not, **go to the DLC circuit troubleshooting**

5. Check the diagnostic trouble code (DTC) and note it. Also check the on-board snapshot data, and download any data found. Then refer to the indicated DTCs troubleshooting, and begin the appropriate troubleshooting procedure.

NOTE:

- On-board snapshot indicates the engine conditions when the first malfunction, misfire, or fuel trim malfunction was detected.
- The HDS can read the DTC, the on-board snapshot, the current data, and other PCM data.
- For specific operations, refer to the user's manual that came with the HDS.

6. If no DTCs are found, **go to the MIL circuit troubleshooting** .

If the MIL did not stay on

If the MIL did not stay on but there is a driveability problem, do the symptom troubleshooting.

If you cannot duplicate the DTC

Some of the troubleshooting requires you to reset the PCM and try to duplicate the DTC. If the problem is intermittent and you cannot duplicate the DTC, do not continue through the procedure. To do so will only result in confusion and possibly, a needlessly replaced PCM.

On-Board Snapshot

When a DTC troubleshooting results in intermittent failure, try to reproduce the failure under the same conditions with the on-board snapshot if the on-board snapshot has been recorded.

HDS Clear Command

The PCM stores various specific data to correct the system even if there is no electrical power such as when the 12 volt battery negative terminal is disconnected. Stored data based on failed parts should be cleared by using the CLEAR COMMAND of the HDS, if parts are replaced.

The HDS has three kinds of clear commands to meet this purpose. They are DTC clear, PCM reset, and CKP pattern clear. The DTC clear command erases all stored DTCs, freeze data, on-board snapshot, and readiness codes. This must be done with the HDS after reproducing the DTC during troubleshooting. The PCM reset command erases all stored DTCs, freeze data, on-board snapshot, readiness codes, and all specific data to correct the system except CKP pattern. If the CKP pattern data in the PCM was cleared, you must do the CKP pattern learn procedure. The CKP pattern clear command erases only CKP pattern data. This command is for repair of a misfire or the CKP sensor.

Scan Tool Clear Command

If you are using a generic scan tool to clear commands, be aware that there is only one setting for clearing the PCM, and it clears all commands at the same time (CKP pattern learn, idle learn, readiness codes, freeze data, on-board snapshot, and DTCs). After you clear all commands, you then need to do these procedures, in this order: **PCM idle learn procedure** ; **CKP pattern learn procedure** ; **test-drive to set readiness codes to complete** .

DTC Clear

1. Clear the DTC with the HDS while the engine is stopped.

2. Turn the vehicle to the OFF (LOCK) mode.

3. Turn the vehicle to the ON mode, and wait 30 seconds.

4. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the data link connector.

How to End a Troubleshooting Session (required after any troubleshooting)

1. **Reset the PCM with the HDS** .

2. **Do the PCM idle learn procedure**

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS from the data link connector.

NOTE: The PCM is part of the immobilizer system. If you replace the PCM, you must register the PCM to the keyless access system.

How to Troubleshoot Circuits at the PCM Connectors

Special Tools Required (for some models)

Pin Probe Male 07ZAJ-RDJA110

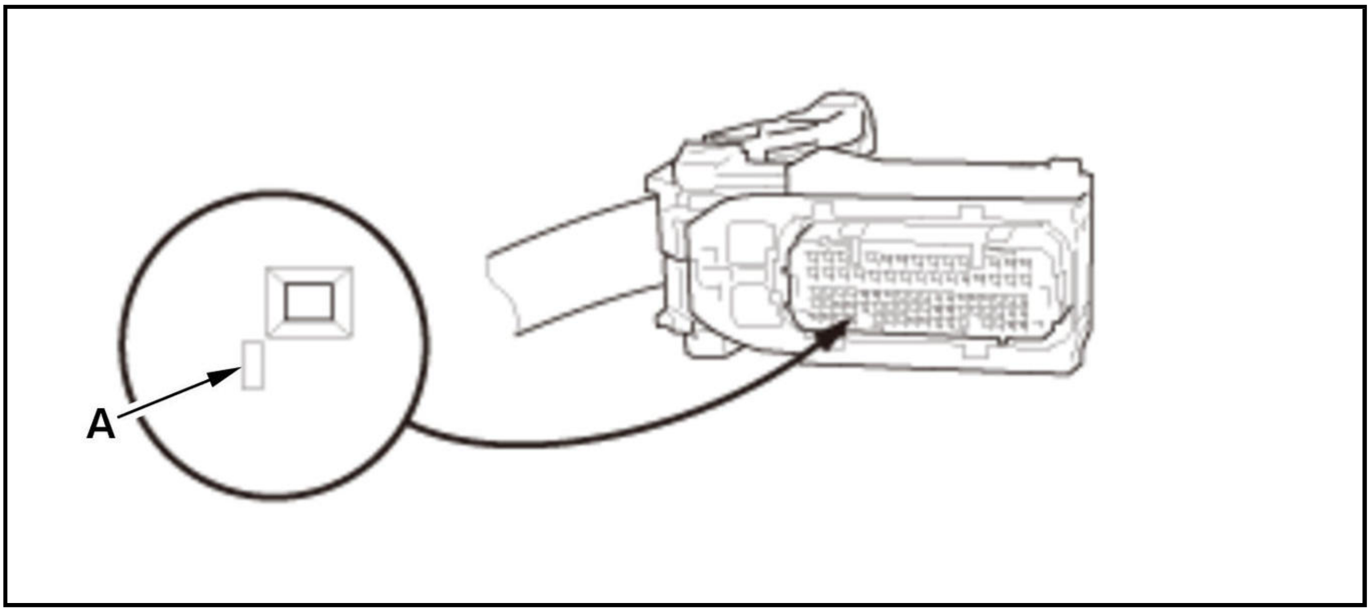
NOTE: The PCM stays on for up to an hour after the vehicle is turned to the OFF (LOCK) mode. Jumping the SCS line after turning the vehicle to the OFF (LOCK) mode cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.

1. Jump the SCS line with the HDS, and wait more than 1 minute.

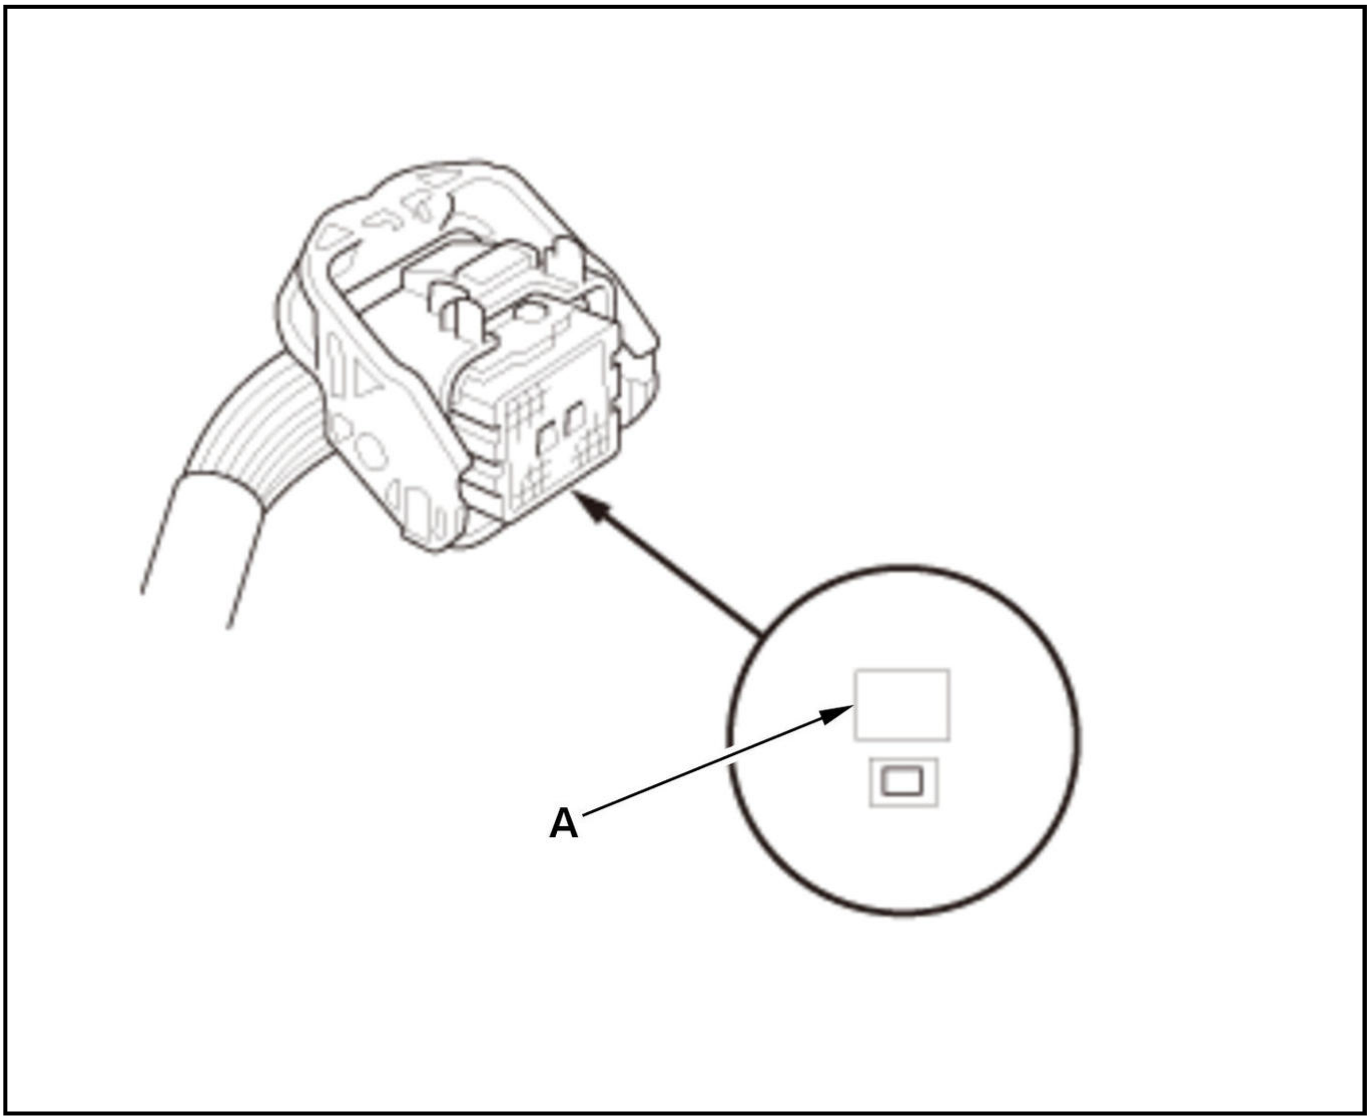
2. **Disconnect PCM connectors**

3. When diagnosis/troubleshooting is done at the PCM connectors, use the terminal test port (A) above the terminal you need to check.

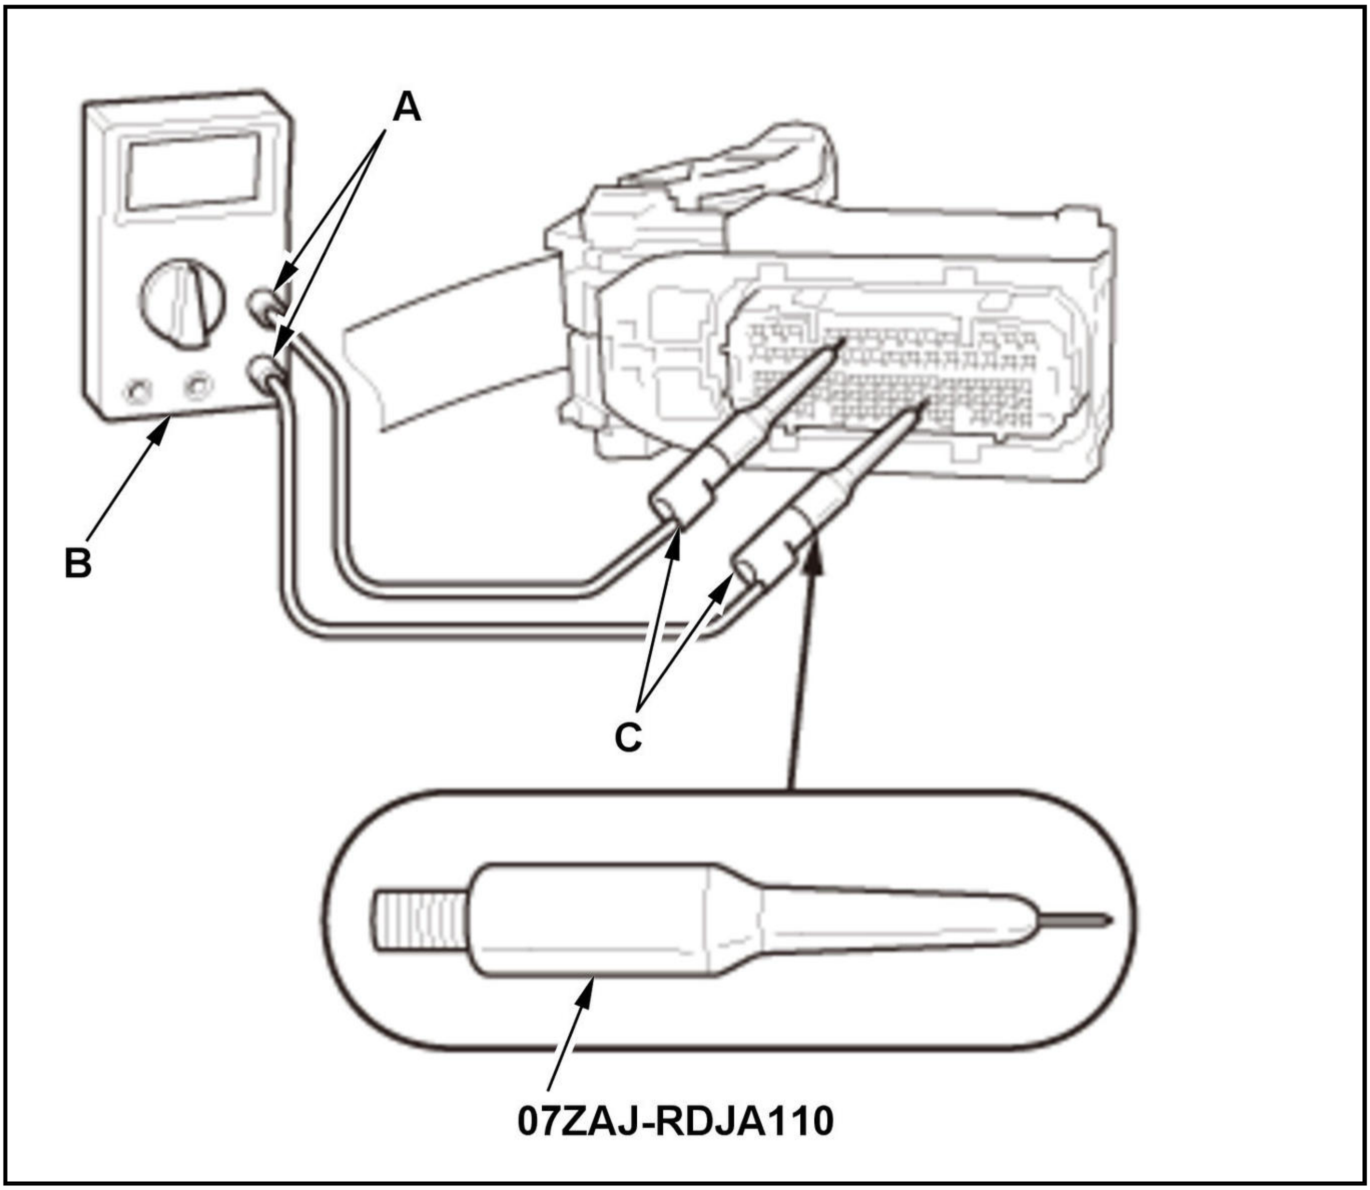
1.5 L engine



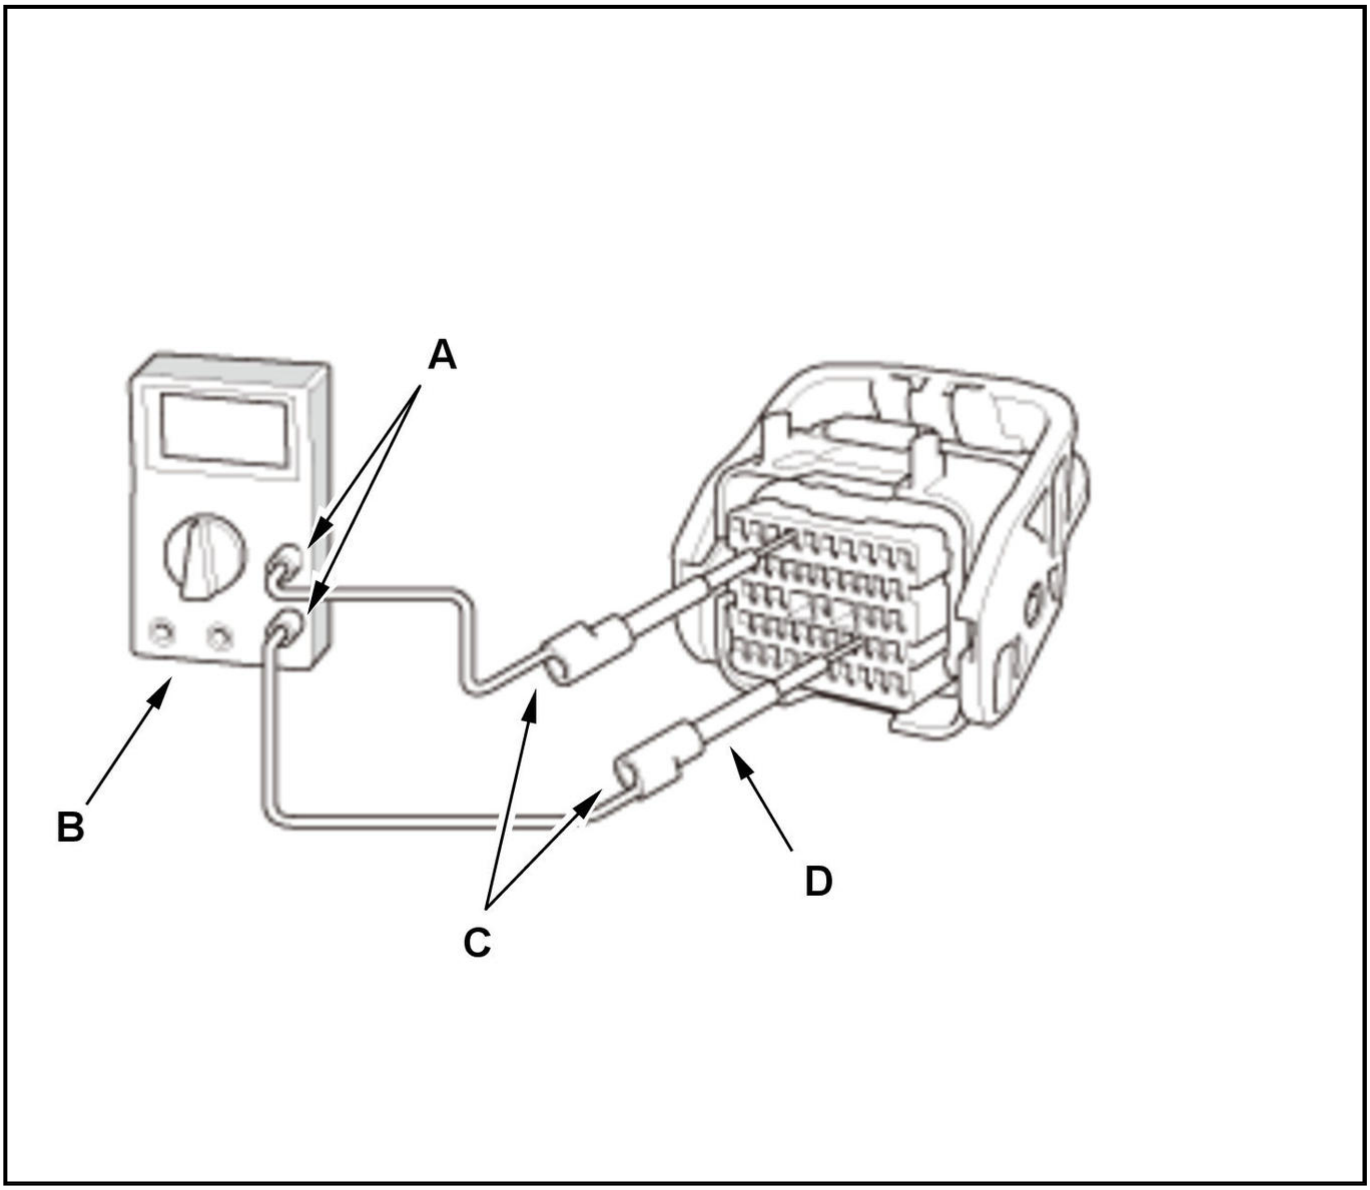
2.4 L engine



4. For some models: Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminal (C) to the pin probe male.



5. For some models: Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminal (C) to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (D).



Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- For accurate results, always use the pin probe (male).
- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause or eventually lead to poor or intermittent electrical connections.

OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on-board diagnosis is successfully finished.
- FAILED: The on-board diagnosis has finished but failed.
- EXECUTING: The vehicle is in enable criteria conditions of the DTC, and the on board diagnosis is running.
- NOT COMPLETED: The on-board diagnosis was running but is out of the enable conditions of the DTC.
- OUT OF CONDITION: The vehicle has stayed out of the enable conditions of the DTC.

*1: This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission (e-CVT).

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE FUEL AND EMISSIONS SYSTEMS

Intermittent Failures

The term intermittent failure means a system may have had a failure, but it checks OK now. If the malfunction indicator lamp (MIL) on the dash does not come on, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting. If the MIL was on but then went off, the original problem may have been intermittent.

Service Information

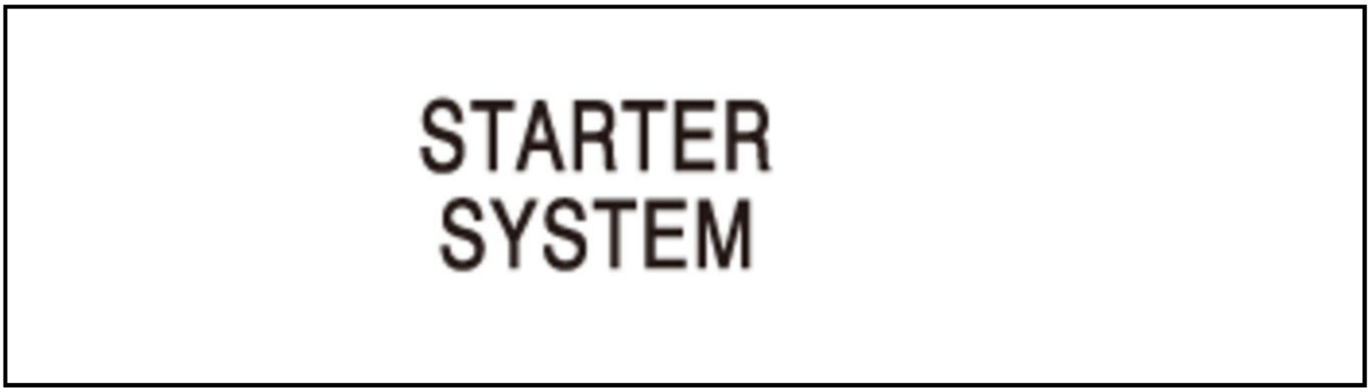
Periodically, new PCM software or new service procedures may become available. Always check online for the latest software or service information related to the DTCs or symptoms you are troubleshooting.

Opens and Shorts

Open and short are common electrical terms. An open is a break in a wire or at a connection. A short is an accidental connection of a wire to ground or to another wire. In simple electronics, this usually means something won't work at all. With complex electronics (such as PCMs) this can sometimes mean something works, but not the way it's supposed to.

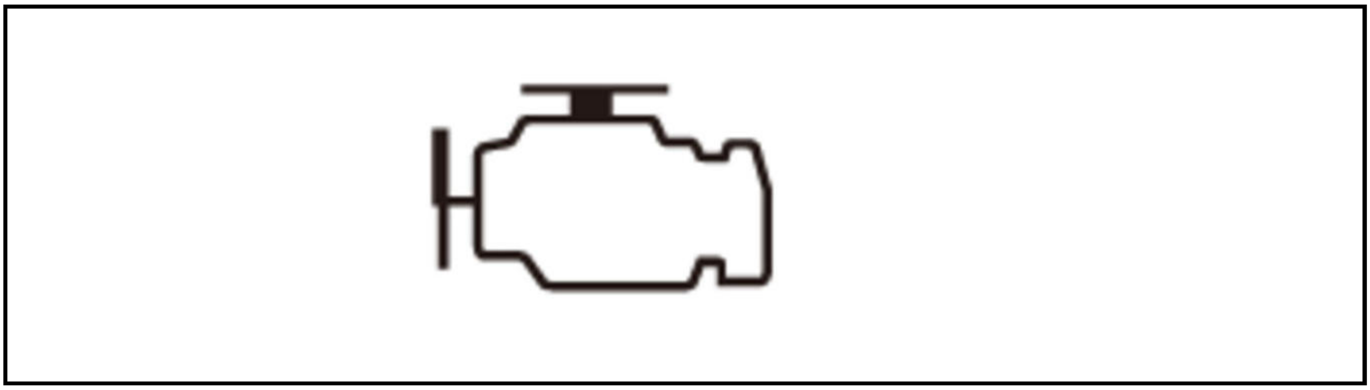
CHECK SYSTEM Display Indication (CHECK STARTING SYSTEM)

1. If this indicator comes on in the gauge control module, the starting system may have had a failure. Connect the HDS to the data link connector located under the driver's side of the dashboard. Check the diagnostic trouble code (DTC) and note it. Then refer to the indicated DTCs troubleshooting, and begin the appropriate troubleshooting procedure.



How to Use the HDS (Honda Diagnostic System)

1. **Enter the maintenance mode, then start the engine** , and check the MIL in the gauge control module.



2. If the MIL stays on, turn the vehicle to the OFF (LOCK) mode, and **connect the HDS to the data link connector (DLC)**

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the PCM and other vehicle systems. If it does not, **go to the DLC circuit troubleshooting**

Check the diagnostic trouble code (DTC) and note it. Also check the on-board snapshot data, and download any data found. Then refer to the indicated DTC's troubleshooting, and begin the appropriate troubleshooting procedure.

NOTE:

- On-board snapshot indicates the engine conditions when the first malfunction, misfire, or fuel trim malfunction was detected.
- The HDS can read the DTC, the on-board snapshot, the current data, and other PCM data.
- For specific operations, refer to the user's manual that came with the HDS.

6. If no DTCs are found, **go to the MIL circuit troubleshooting** .

If the MIL did not stay on

If the MIL did not stay on but there is a driveability problem, do the symptom troubleshooting.

If you cannot duplicate the DTC

Some of the troubleshooting requires you to reset the PCM and try to duplicate the DTC. If the problem is intermittent and you can't duplicate the DTC, do not continue through the procedure. To do so will only result in confusion and possibly, a needlessly replaced PCM.

On-Board Snapshot

When a DTC troubleshooting results in intermittent failure, try to reproduce the failure under the same conditions with the on-board snapshot if the on-board snapshot has been recorded.

HDS Clear Command

The PCM stores various specific data to correct the system even if there is no electrical power such as when the 12 volt battery negative terminal or **No. A12 fuse** is disconnected. Stored data based on failed parts should be cleared by using the CLEAR COMMAND of the HDS, if parts are replaced.

The HDS has three kinds of clear commands to meet this purpose. They are DTC clear, PCM reset, and CKP pattern clear. The DTC clear command erases all stored DTCs, freeze data, on-board snapshot, and readiness codes. This must be done with the HDS after reproducing the DTC during troubleshooting. The PCM reset command erases all stored DTCs, freeze data, on-board snapshot, readiness codes, and all specific data to correct the system except CKP pattern. If the CKP pattern data in the PCM was cleared, you must do the CKP pattern learn procedure. The CKP pattern clear command erases only CKP pattern data. This command is for repair of a misfire or the CKP sensor.

Scan Tool Clear Command

If you are using a generic scan tool to clear commands, be aware that there is only one setting for clearing the PCM, and it clears all commands at the same time (CKP pattern learn, freeze data, on-board snapshot, readiness codes, and DTCs). After you clear all commands, you then need to do the **CKP pattern learn procedure** ; **test-drive to set readiness codes to complete** .

DTC Clear

1. Clear the DTC with the HDS while the engine is stopped.

2. Turn the vehicle to the OFF (LOCK) mode.

3. Turn the vehicle to the ON mode, and wait 30 seconds.

4. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the DLC.

How to End a Troubleshooting Session (required after any troubleshooting)

1. Reset the PCM with the HDS.

2. Turn the vehicle to the OFF (LOCK) mode.

3. Disconnect the HDS from the DLC.

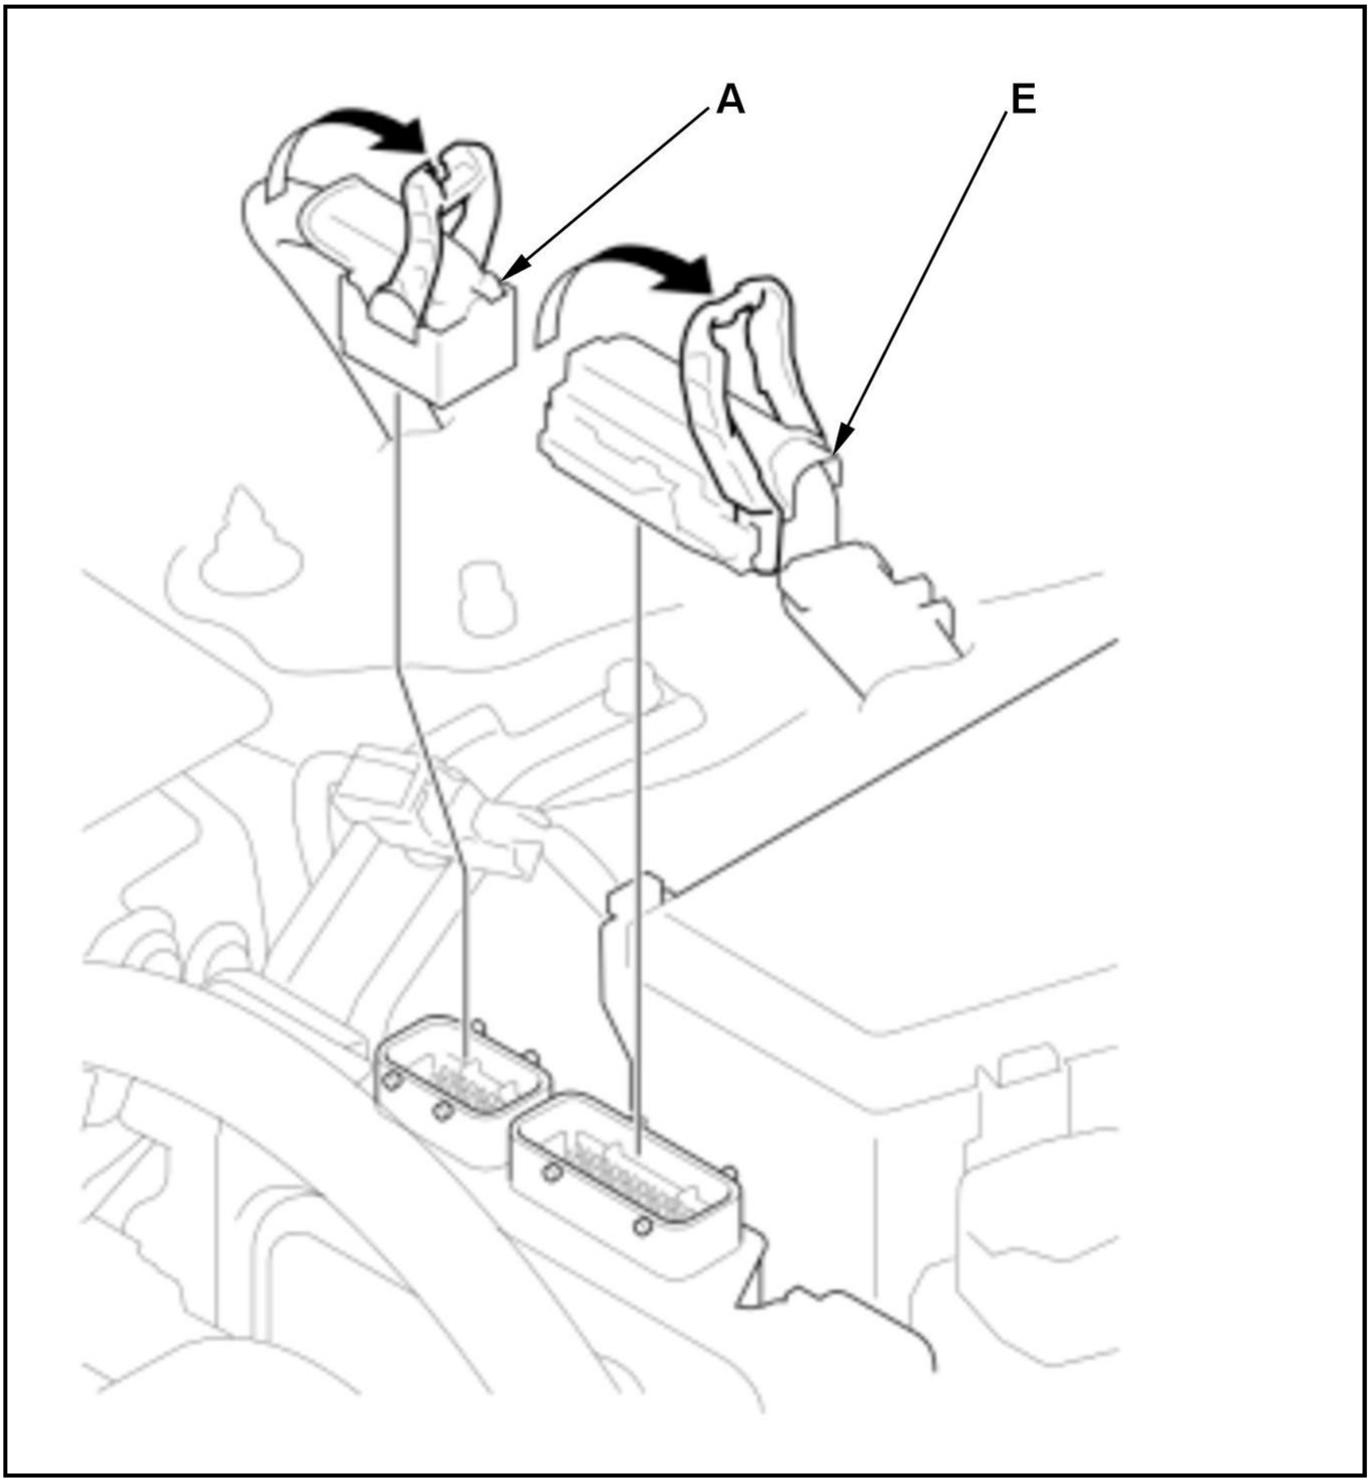
NOTE: The PCM is part of the immobilizer system. If you replace the PCM, you must register the keyless access system.

How to Troubleshoot Circuits at the PCM Connectors

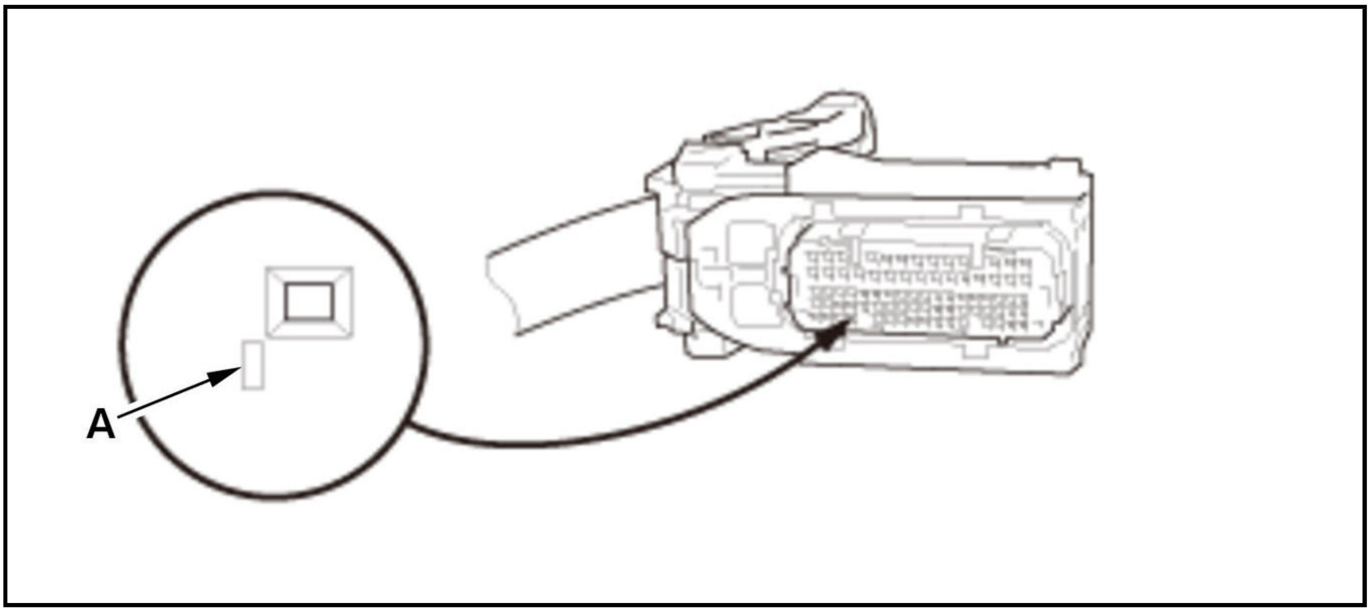
NOTE: The PCM stays on for up to an hour after the vehicle is turned to OFF (LOCK) mode. Jumping the SCS line after turning the vehicle to OFF (LOCK) mode cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.

1. Jump the SCS line with the HDS, and wait more than 1 minute.

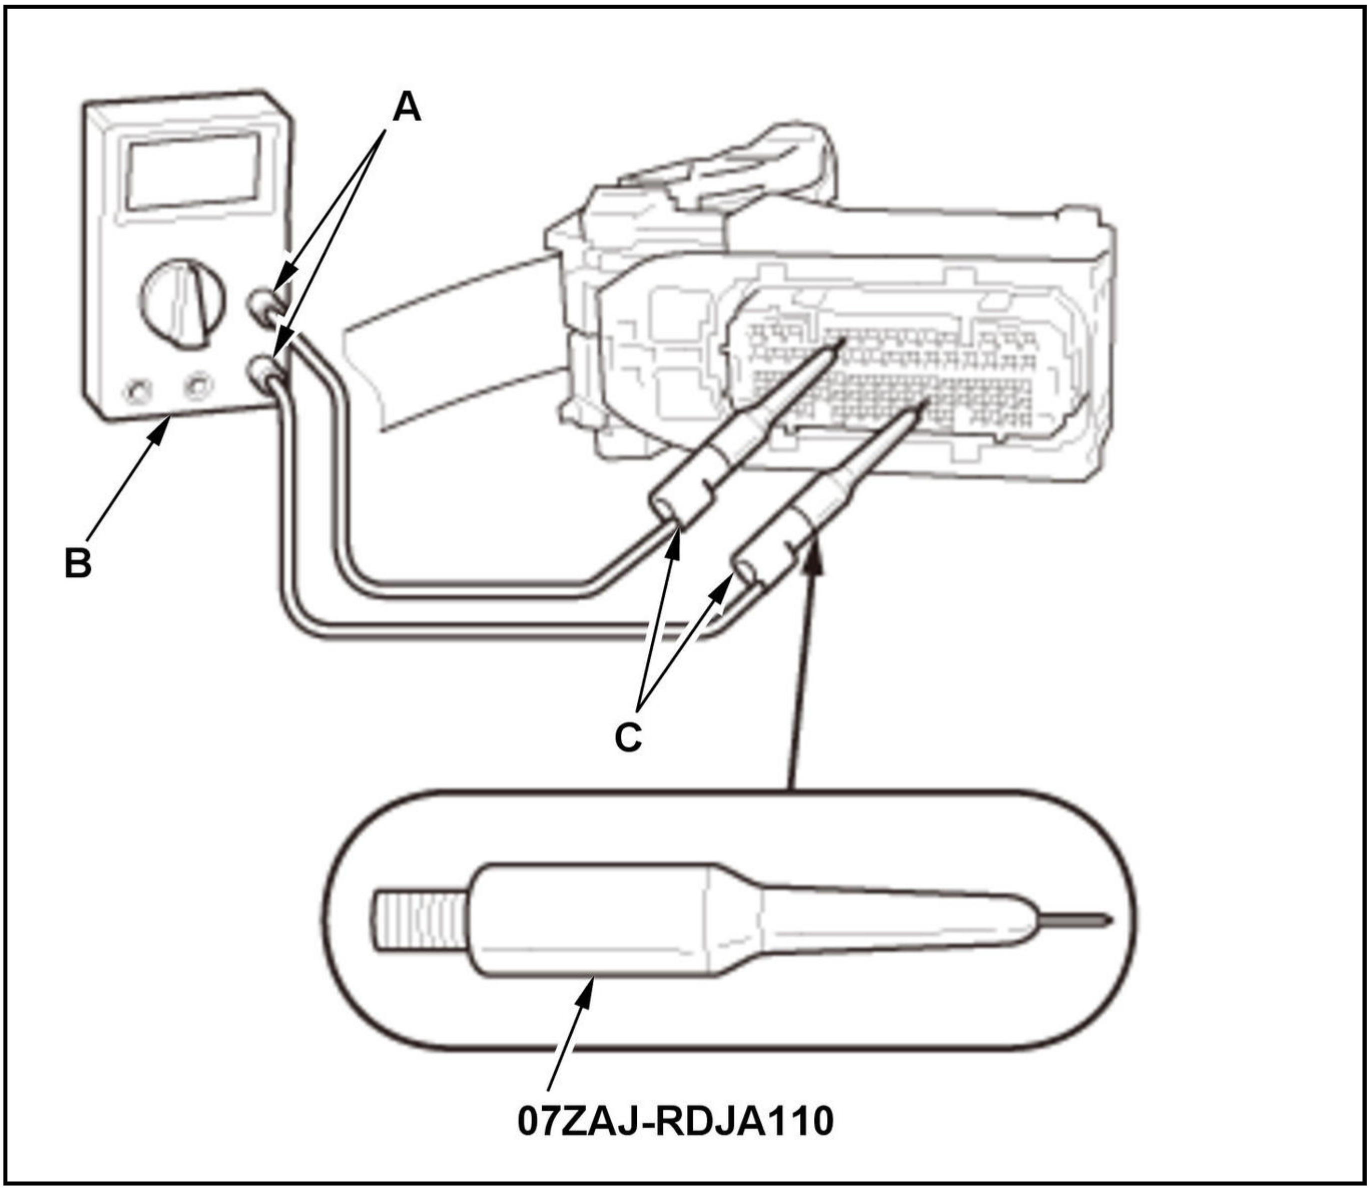
2. Disconnect PCM connectors A and E.



3. When diagnosis/troubleshooting is done at the PCM connectors, use the terminal test port (A) above the terminal you need to check.



4. Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminal (C) to the pin probe male.



Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

WARNING:

- **For accurate results, always use the pin probe (male).**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause or eventually lead to poor or intermittent electrical connections.**

OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

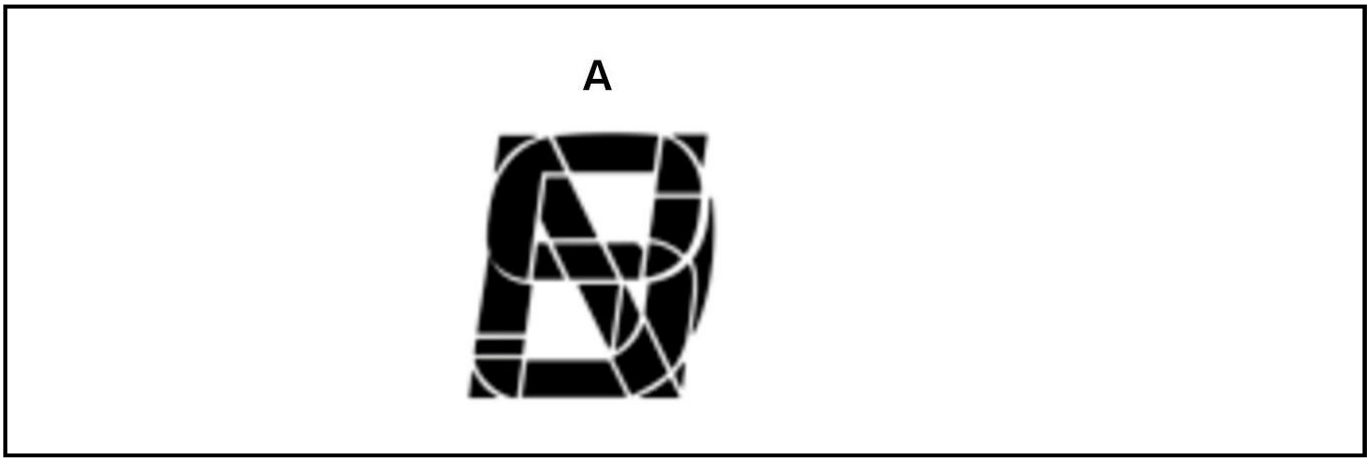
- PASSED: The on-board diagnosis is successfully finished.
- FAILED: The on-board diagnosis has finished but failed.
- EXECUTING: The vehicle is in enable criteria conditions of the DTC, and the on board diagnosis is running.
- NOT COMPLETED: The on-board diagnosis was running but is out of the enable conditions of the DTC.
- OUT OF CONDITION: The vehicle has stayed out of the enable conditions of the DTC.

HOW TO TROUBLESHOOT THE GEAR UNIT CONTROL SYSTEM

How to Check for DTCs with the Honda Diagnostic System (HDS)

When the powertrain control module (PCM) senses an abnormality in the input or output system, the shift position indicator (A) will usually blink as shown.

NOTE: When an abnormality occurs, the shift position indicator will blink.



When the Honda Diagnostic System (HDS) is connected to the data link connector (DLC) located under the driver's side of the dashboard, and then the vehicle is turned to the ON mode and the appropriate menu is selected, it will indicate the diagnostic trouble code (DTC).

If the shift position indicator or the malfunction indicator lamp (MIL) has been reported on, or if a driveability problem is suspected, follow this procedure:

1. Connect the HDS to the DLC

2. Check for Pending or Confirmed DTCs with the HDS.

3. Record the freeze data and the on-board snapshots for all PGM-FI DTCs and gear DTCs.

4. If there is a PGM-FI DTC, first check the PGM-FI system as indicated by the DTC.

5. Clear the DTC and the data.

6. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data or the on-board snapshot, and then recheck for the DTC. If the gear DTC returns, go to the indicated DTC's troubleshooting. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

Symptom Troubleshooting Versus DTC Troubleshooting

Some symptoms will not set DTCs or cause the shift position indicator to blink. If the MIL was reported ON or the shift position indicator has been blinking, check for DTCs. If the vehicle has an abnormal symptom, and there are no DTCs stored, do the symptom troubleshooting. Check the list of probable cause (s) for the symptom, in the sequence listed, until you find the problem.

How to Troubleshoot Circuits at the PCM Connectors

Special Tools Required

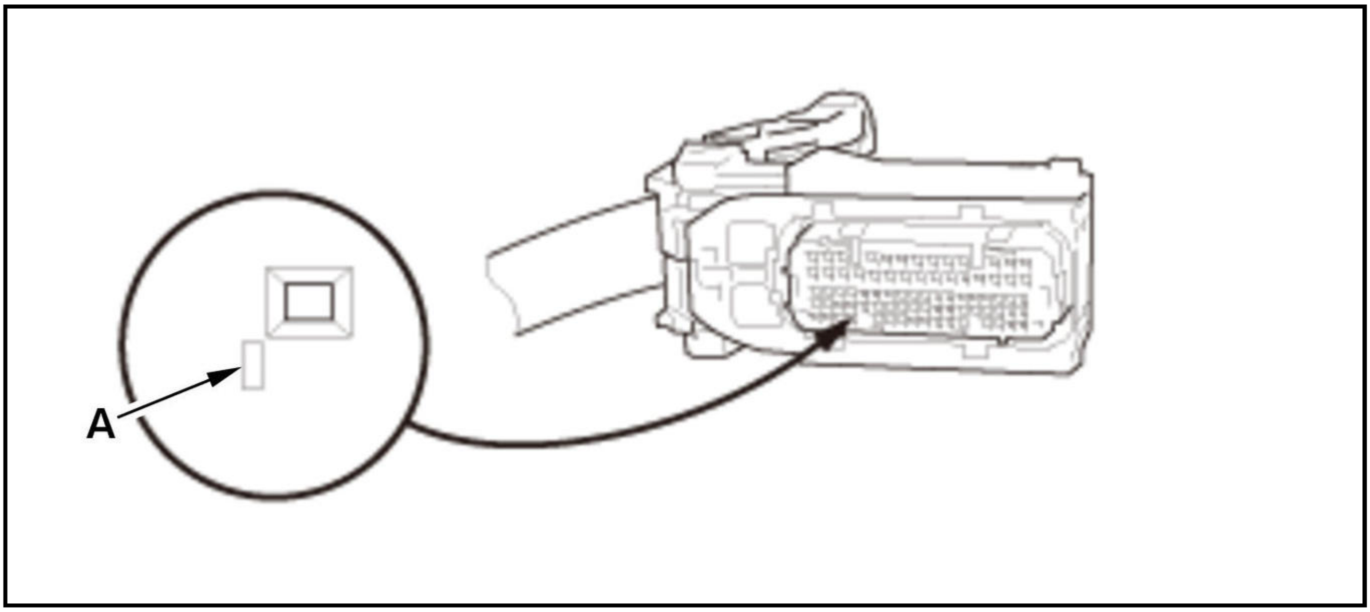
Male Pin Probe 07ZAJ-RDJA110

NOTE: The PCM stays on for up to an hour after the vehicle is turned to the OFF (LOCK) mode. Jumping the SCS line after turning the vehicle to the OFF (LOCK) mode cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.

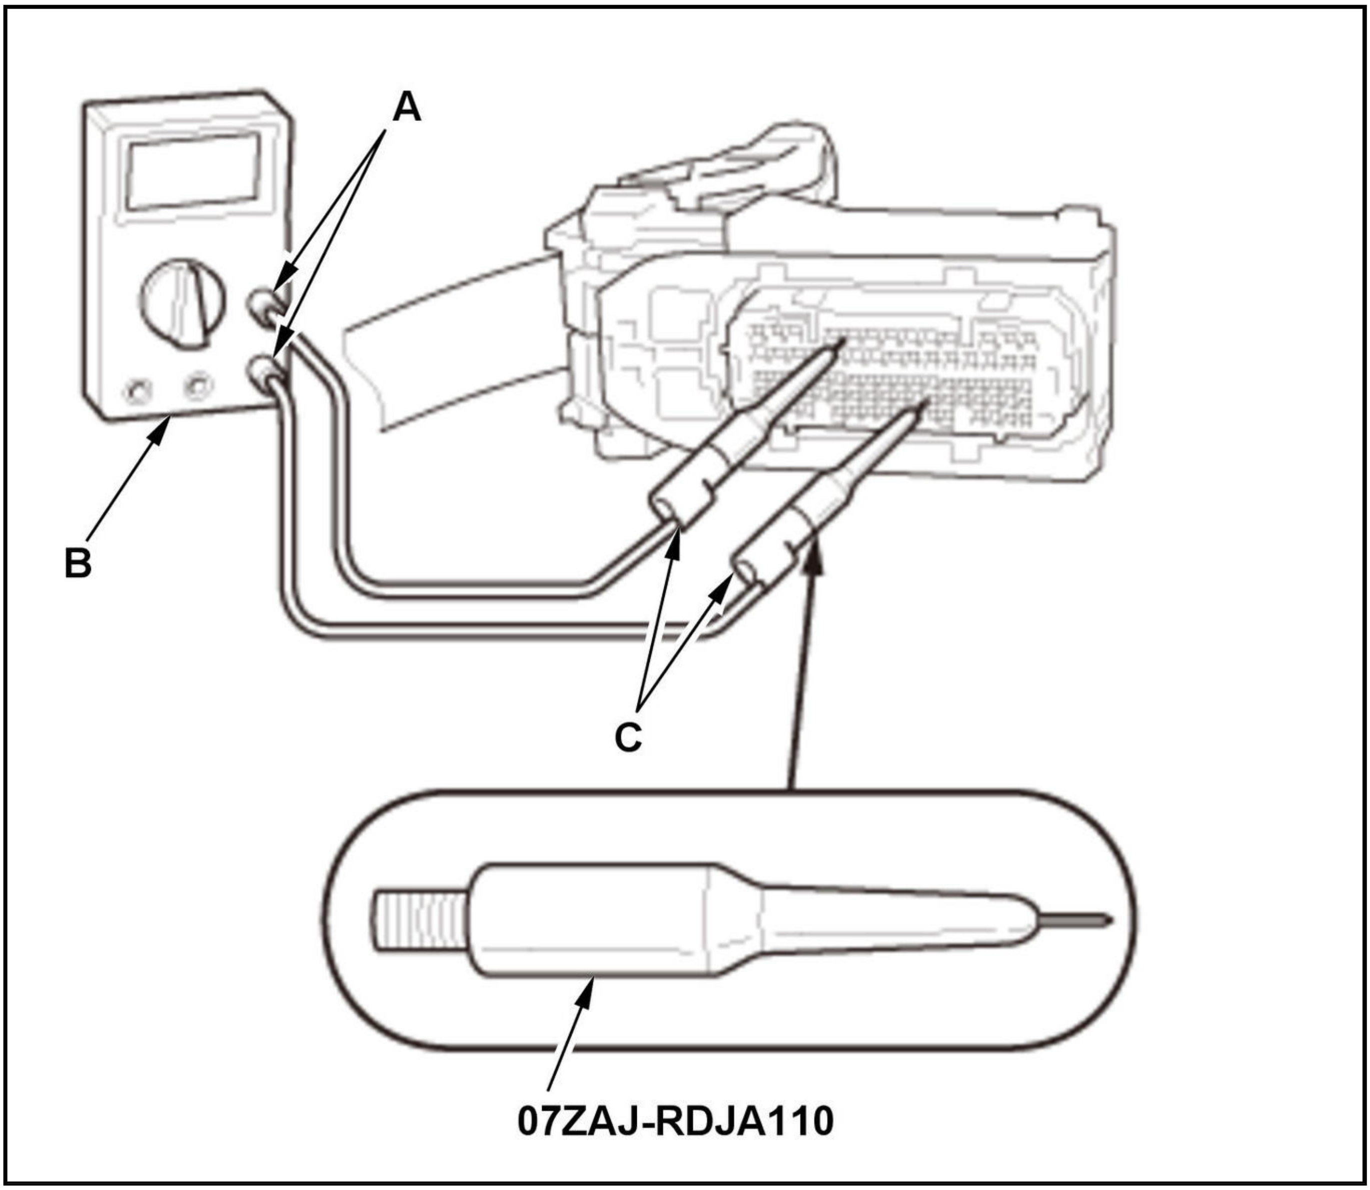
1. Jump the SCS line with the HDS, and wait more than 1 minute.

2. Disconnect PCM connectors A and E

3. When diagnosis/troubleshooting is done at the PCM connectors, use the terminal test port (A) above the terminal you need to check.



4. Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminals (C) to the male pin probe.



Gently contact the male pin probe at the terminal test port from the terminal side. Do not force the tips into the terminals.

WARNING:

- **For accurate results, always use the male pin probe.**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause or eventually lead to poor or intermittent electrical connections.**

Clear Gear Unit Control System DTCs Procedure

1. Connect the HDS to the DLC .

2. Clear the DTC (s) on the HDS screen.

OBD Status

The OBD STATUS shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on-board diagnosis is successfully completed.
- FAILED: The on-board diagnosis has completed but failed.
- NOT COMPLETED: The on-board diagnosis was running but is out of the enable conditions of the DTC.

How to End a Troubleshooting Session (required after any troubleshooting)

1. **Reset the PCM**

2. Turn the vehicle to the OFF (LOCK) mode.

3. Disconnect the HDS from the DLC.

4. **Enter the maintenance mode, then start the engine**

Hold the engine speed at 3, 000 rpm without load (in P or N position/mode) until the cooling fan comes on, then let it idle.

5. To verify that the problem is repaired, test-drive the vehicle for several minutes at speeds over 44 mph (70 km/h) or under the same conditions as those indicated by the freeze data.

Failure Reproduction Technique

NOTE: Follow these rules while the vehicle is raised on a lift for the test-drive.

- In case of the vehicle speed below 31 mph (50 km/h) : Disable the VSA by pressing the VSA OFF button.
- In case of the vehicle speed above 31 mph (50 km/h) : **Enter the VSA maintenance mode** .
- VSA DTC (s) may come on when test-driving on a lift. If the VSA system sets a DTC (s), clear the DTC (s) with the HDS.

Self-Diagnosis

If the PCM detects the failure of a signal from a sensor, a switch, a solenoid valve, or from another control unit, it stores a Pending or Confirmed DTC. Depending on the failure, a DTC is stored in either the first or second drive cycle. When a Confirmed DTC is stored, the PCM blinks the shift position indicator and/or turns on the MIL by a signal sent to the gauge control module via F-CAN.

- One Drive Cycle Detection Method:

  When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another control unit, the PCM stores a Pending or Confirmed DTC for the failure and blinks the shift position indicator and/or turns on the MIL immediately.

- Two Drive Cycle Detection Method:

  When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another control unit in the first drive cycle, the PCM stores a Pending DTC. The shift position indicator and the MIL do not turn on at this time. If the failure continues in the second drive cycle, the PCM stores a Confirmed DTC and blinks the shift position indicator and/or turns on the MIL.

Fail-Safe Function

When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another control unit, the PCM ignores that signal and substitutes a pre-programmed value for that signal to allow the powertrain to continue operating. This causes a DTC to be stored and the shift position indicator to blink and/or the MIL to come on. The powertrain may not operate normally during fail-safe operation. Do not run the test-driving diagnosis when the MIL is ON, or the shift position indicator is blinking.

DTC TROUBLESHOOTING

DTC P0010

DTC P0010 : VTC Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If DTC P0010 is indicated alone, do the troubleshooting for DTC P100A, P100B, and P100C using the on-board snapshot for P0010.
- If any of the DTCs listed below are indicated at the same time as DTC P0010, troubleshoot those DTCs first, then recheck for P0010.
-
    - -

      P100A, P100B, P100C: Electric VTC motor

DTC Description	Confirmed DTC	Pending DTC
P0010 VTC Malfunction	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P100A Electric VTC Motor Circuit Malfunction	B	B
P100B Electric VTC Motor Control Module Malfunction	B	B
P100C Electric VTC Motor Speed Signal Circuit Malfunction	B	B
P0010 VTC Malfunction	B	B

   Are DTC P100A, P100B, or P100C and P0010 indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC P100A** , **DTC P100B** , and **DTC P100C** using the on-board snapshot for DTC P0010.

DTC P0011

DTC P0011 : VTC System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If DTC P0010 and/or P0341 are stored at the same time as DTC P0011, troubleshoot those DTCs first, then recheck for DTC P0011.

- This DTC will be stored when the DC-DC converter output voltage is higher than the specified voltage (DC-DC converter failure).

DTC Description	Confirmed DTC	Pending DTC
P0011 VTC System Malfunction	B	B

DTC (PGM-FI)

1. Electric powertrain system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   Enter the maintenance mode, then start the engine , and wait for 2 minutes under these conditions:

   - Headlights on high beam
   - Blower fan at maximum speed
   - Rear window defogger on
   - A/C switch ON, heater on, max hot

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A94 DC-DC Converter Performance	B	B	B

   Is DTC P0A94 indicated?

   YES

   Go to the troubleshooting for **DTC P0A94** .

   NO

   Go to step 2.

2. Problem verification (DTC check)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode.

   -5. Turn the vehicle to the ON mode.

   -6. Select the VTC TEST in the Function Test Menu with the HDS.

   VTC TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0011 VTC System Malfunction	B	B

   Is DTC P0011 indicated?

YES

The failure is duplicated. Go to step 4.

NO

Go to step 3.

3. Problem verification (Test-drive)

-1. **Enter the maintenance mode, then start the engine** .

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. Test-drive the vehicle at a steady speed between 25-75 mph (40-120 km/h) for 15 seconds.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0011 VTC System Malfunction	B	B

Is DTC P0011 indicated?

YES

The failure is duplicated. Go to step 4.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the electric VTC motor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

4. VTC actuator installation check

-1. **Check the installation of the VTC actuator** .

Is the VTC actuator installed correctly?

YES

Replace the electric VTC motor .

NO

Reinstall the VTC actuator, or replace it if it is worn or damaged .

DTC P0069

DTC P0069 : BARO Sensor Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0069 BARO Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle under these conditions:

- Engine speed above 1, 200 rpm and REL TP SENSOR above 14.1 deg (or engine speed above 4, 000 rpm and REL TP SENSOR above 29.6 deg)
- Drive 2.5 seconds or more

Signal	**Current conditions**	
	Values	**Unit**
Engine Speed	B	B
ECT Sensor 1	B	B
REL TP Sensor	B	B

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	**Confirmed DTC**	**Pending DTC**
P0069 BARO Sensor Circuit Range/Performance Problem	B	B

Is DTC P0069 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

DTC P006A

DTC P006A : MAF Sensor Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If DTC P2228 and/or P2229 are stored at the same time as DTC P006A, troubleshoot those DTCs first, then recheck for DTC P006A.

DTC Description	**Confirmed DTC**	**Pending DTC**
P006A MAF Sensor Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Parts condition check:

Check for poor connections or damage to these parts:

- PCV valve

- PCV hose
- Intake air duct
- Air cleaner
- Purge (PCS) line

Are the parts OK?

YES

Go to step 2.

NO

Repair or replace the damaged part (s).

2. Intake air duct visual check

-1. Check for damage or looseness of the intake air duct from the throttle body to the air cleaner.

Is it OK?

YES

Go to step 3.

NO

Reconnect or replace the intake air duct from the throttle body to the air cleaner.

3. Air cleaner element visual check

-1. Check for a dirty air cleaner element.

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 4.

4. MAF sensor signal check (without engine running)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor	About 0.2	g/s	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

NO

Replace MAF sensor/IAT sensor 1 .

5. MAF sensor signal check (with engine running)

-1. Enter the maintenance mode, then start the engine .

-2. Vary the engine speed between 2, 000 rpm and 3, 000 rpm.

-3. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
MAF Sensor	B	B

Does the MAF Sensor reading change?

YES

Go to step 6.

NO

Replace MAF sensor/IAT sensor 1 .

6. MAF sensor check

-1. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

- Engine Speed
- Vehicle Speed
- MAP Sensor
- TP Sensor

On-board Snapshot

Signal	Current conditions	
	Values	Unit
Engine Speed	B	B
Vehicle Speed	B	B
MAP Sensor	B	B
TP Sensor	B	B

-3. Monitor the OBD STATUS for DTC P006A with the HDS.

DTC Description	OBD STATUS
P006A MAF Sensor Circuit Range/Performance Problem	B

Does the HDS indicate FAILED?

YES

Replace MAF sensor/IAT sensor 1 .

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**. If the HDS indicates NOT COMPLETED, go to step 6-2 and recheck.

DTC P0096

DTC P0096 : IAT Sensor 2 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0096 IAT Sensor 2 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2) Voltage	Less than 0.21	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at IAT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (IAT sensor 2, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

IAT sensor 2 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2) Voltage	Less than 0.21	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace IAT sensor 2 .

3. Shorted wire check (INTA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

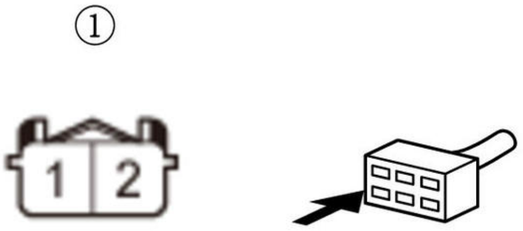
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IAT sensor 2 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The INTA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the INTA wire between the PCM (E55) and IAT sensor 2.

DTC P0097

DTC P0097 : IAT Sensor 2 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0097 IAT Sensor2 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2) Voltage	Less than 0.08	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at IAT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (IAT sensor 2, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

IAT sensor 2 2P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2) Voltage	Less than 0.08	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 3.

   NO

   Replace IAT sensor 2 .

3. Shorted wire check (INTA line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

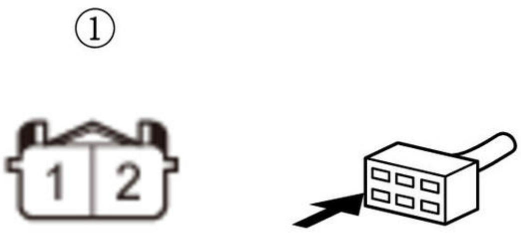
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IAT sensor 2 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The INTA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** ,

NO

Repair a short in the INTA wire between the PCM (E55) and IAT sensor 2.

DTC P0098

DTC P0098 : IAT Sensor 2 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0098 IAT Sensor2 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2) Voltage	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at IAT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (IAT sensor 2, others)

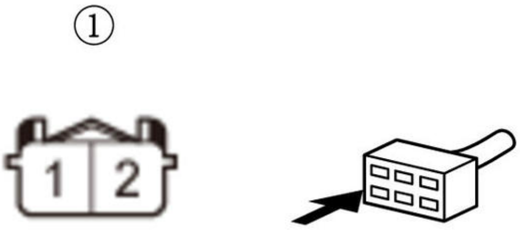
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

IAT sensor 2 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	IAT sensor 2 2P connector (female terminals) No. 1: ①
Terminal B	IAT sensor 2 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (2) Voltage	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace IAT sensor 2 .

3. Determine possible failure area (INTA line, others)

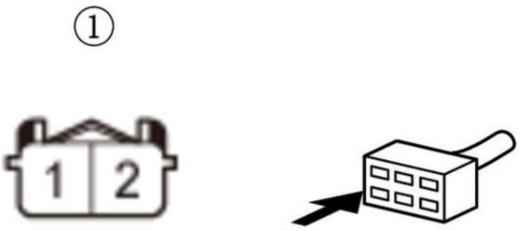
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from IAT sensor 2 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	IAT sensor 2 2P connector: disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

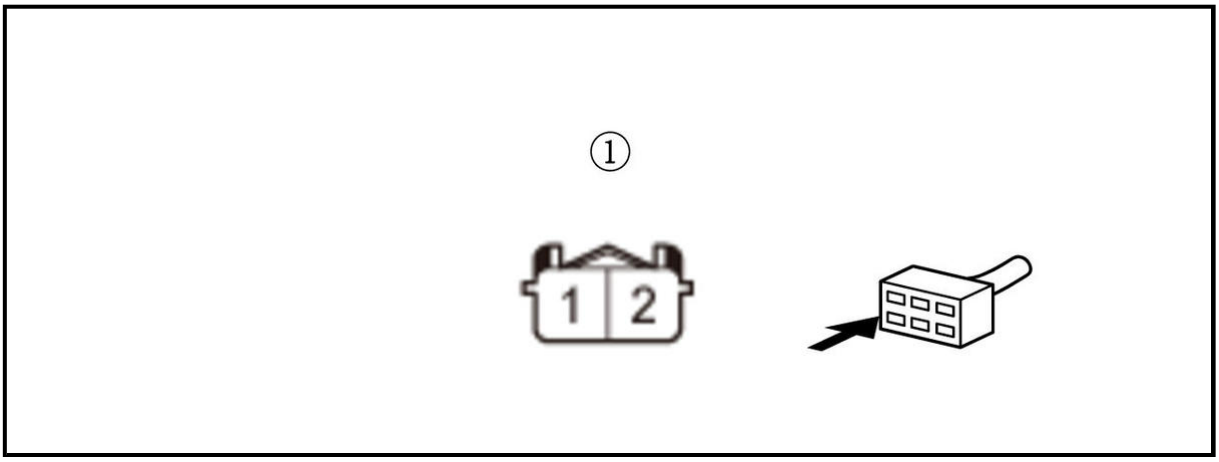
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IAT sensor 2 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and IAT sensor 2.

5. Open wire check (INTA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

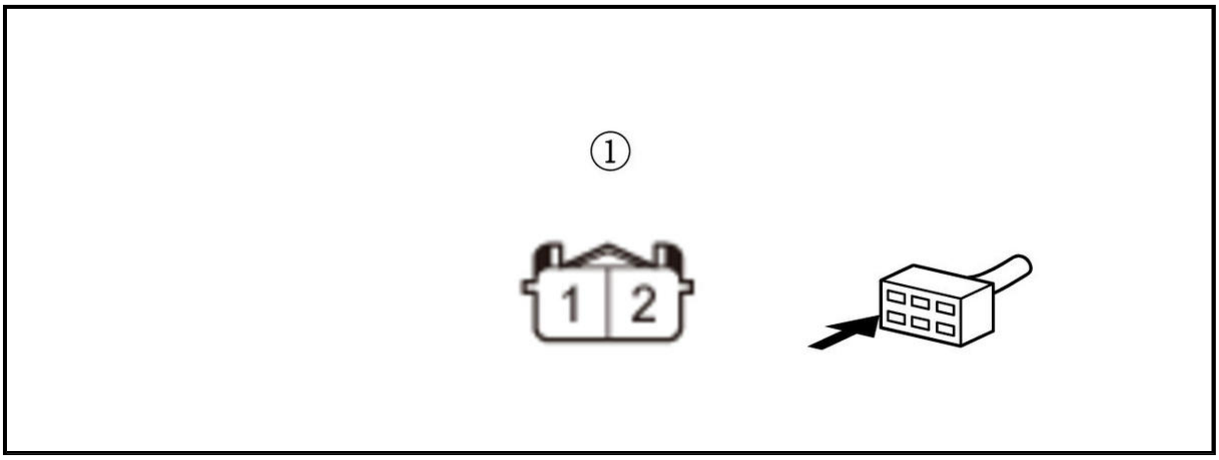
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IAT sensor 2 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	IAT sensor 2 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 55**



Is there 1.0 Ω or less?

YES

The INTA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the INTA wire between the PCM (E55) and IAT sensor 2.

DTC P00FE

DTC P00FE : EVAP Vent Line Blockage

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P00FE EVAP Vent Line Blockage	B	B

DTC (PGM-FI)

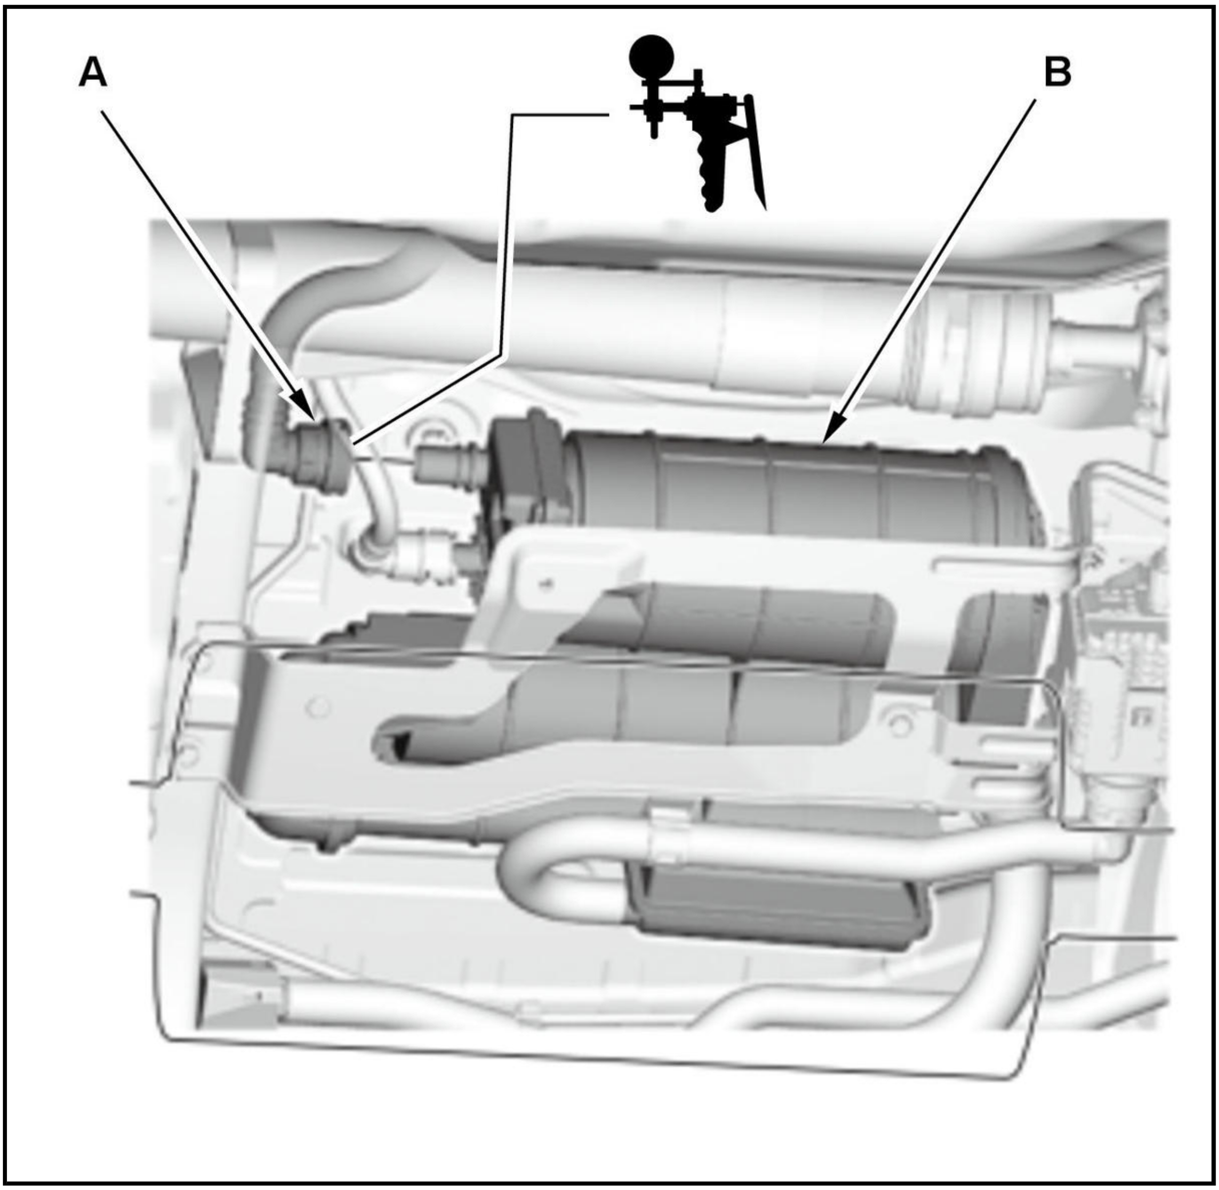
1. Fuel tank vapor control valve/fuel vent tube check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Insert the emergency fuel funnel into the fuel filler neck** .

   -3. **Remove the heat shield** .

   -4. Disconnect the fuel vent tube (A) from the EVAP canister (B), and connect a vacuum pump/gauge, 0-30 inHg, to the fuel vent tube as shown.



-5. Apply vacuum to the fuel vent tube.

Does it hold the vacuum?

YES

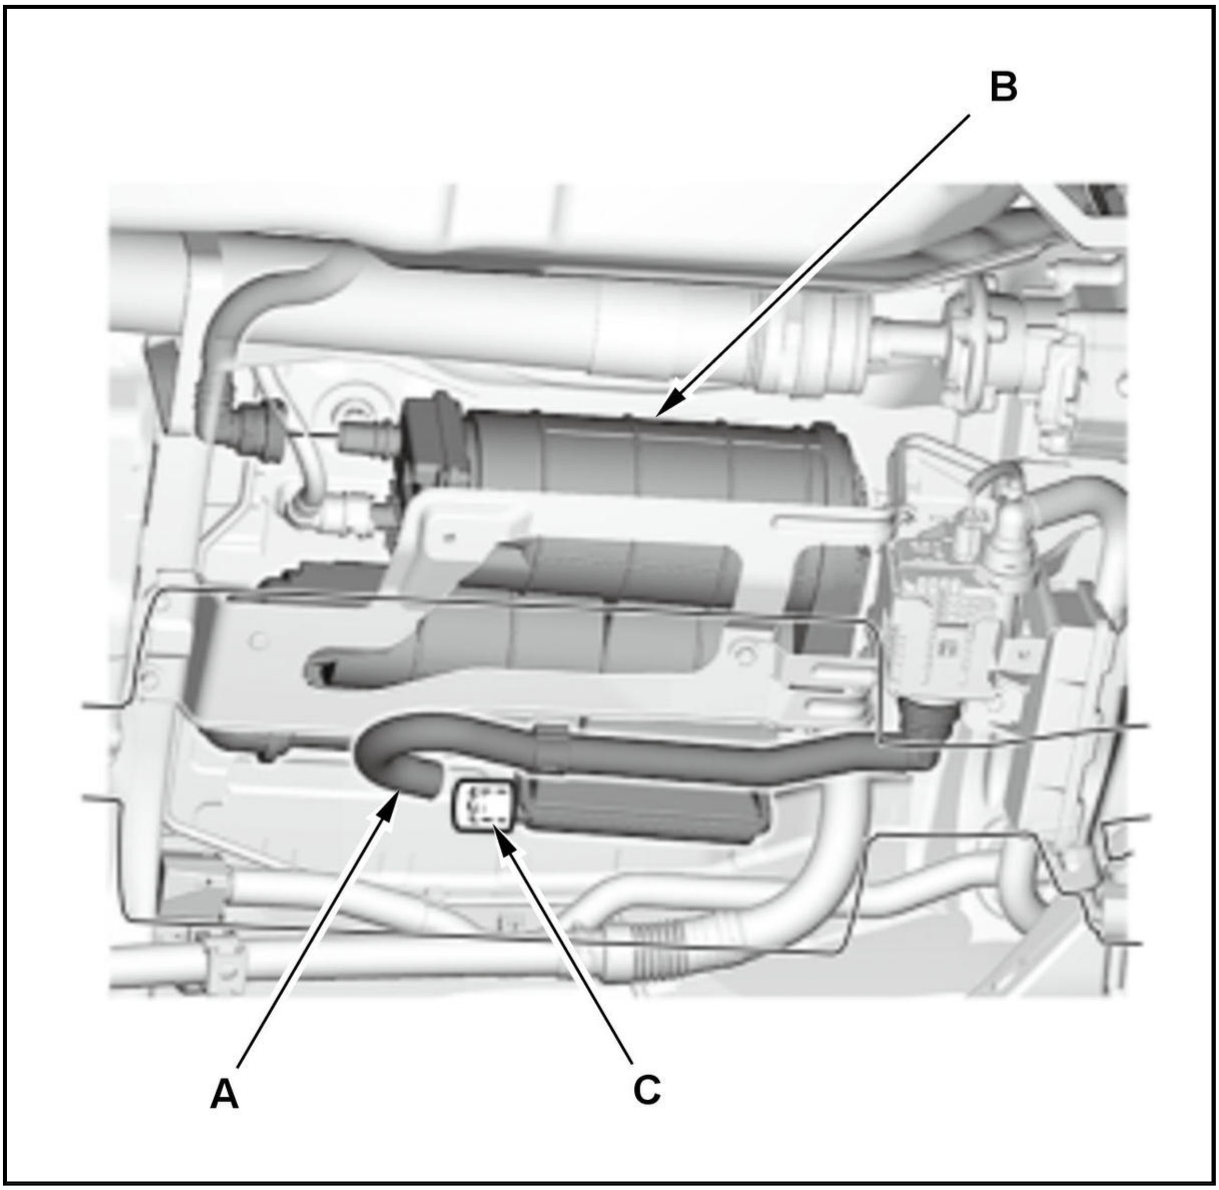
Replace the fuel tank .

NO

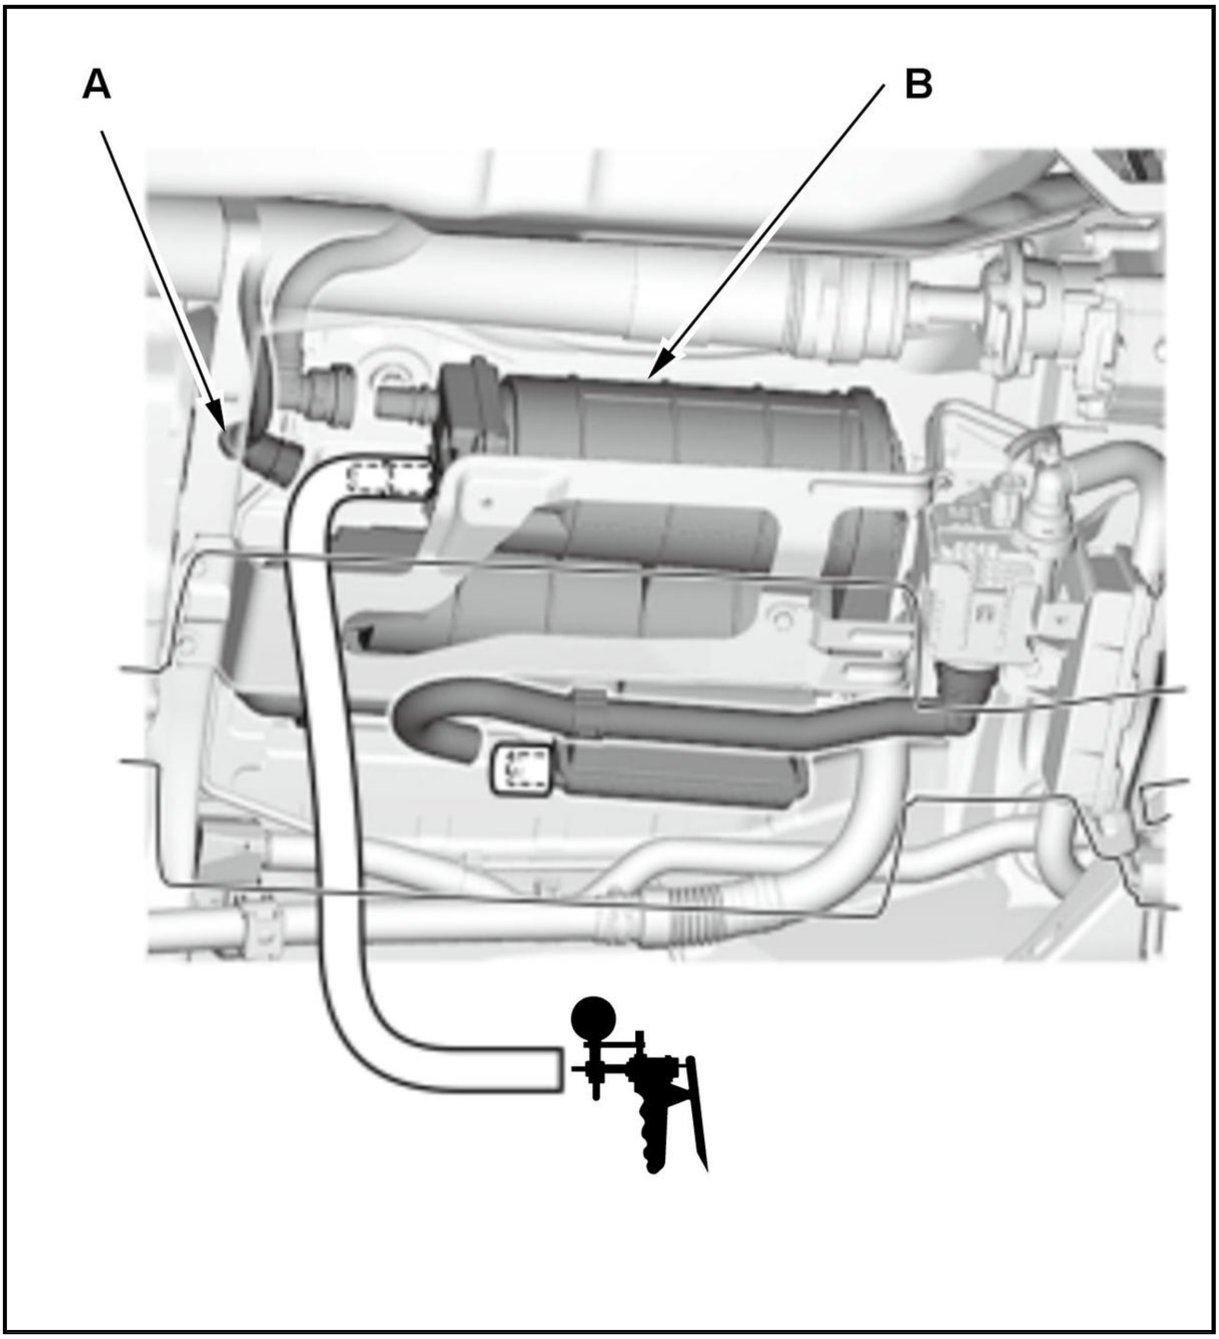
Go to step 2.

2. EVAP canister check 1

-1. Disconnect drain hose A from the EVAP canister (B), then plug the drain tube port (C).



-2. Disconnect the EVAP canister purge hose (A) from the EVAP canister (B), then connect the vacuum pump/gauge, 0-30 inHg, to the EVAP canister as shown.



-3. Apply vacuum to the EVAP canister.

Does it hold the vacuum?

YES

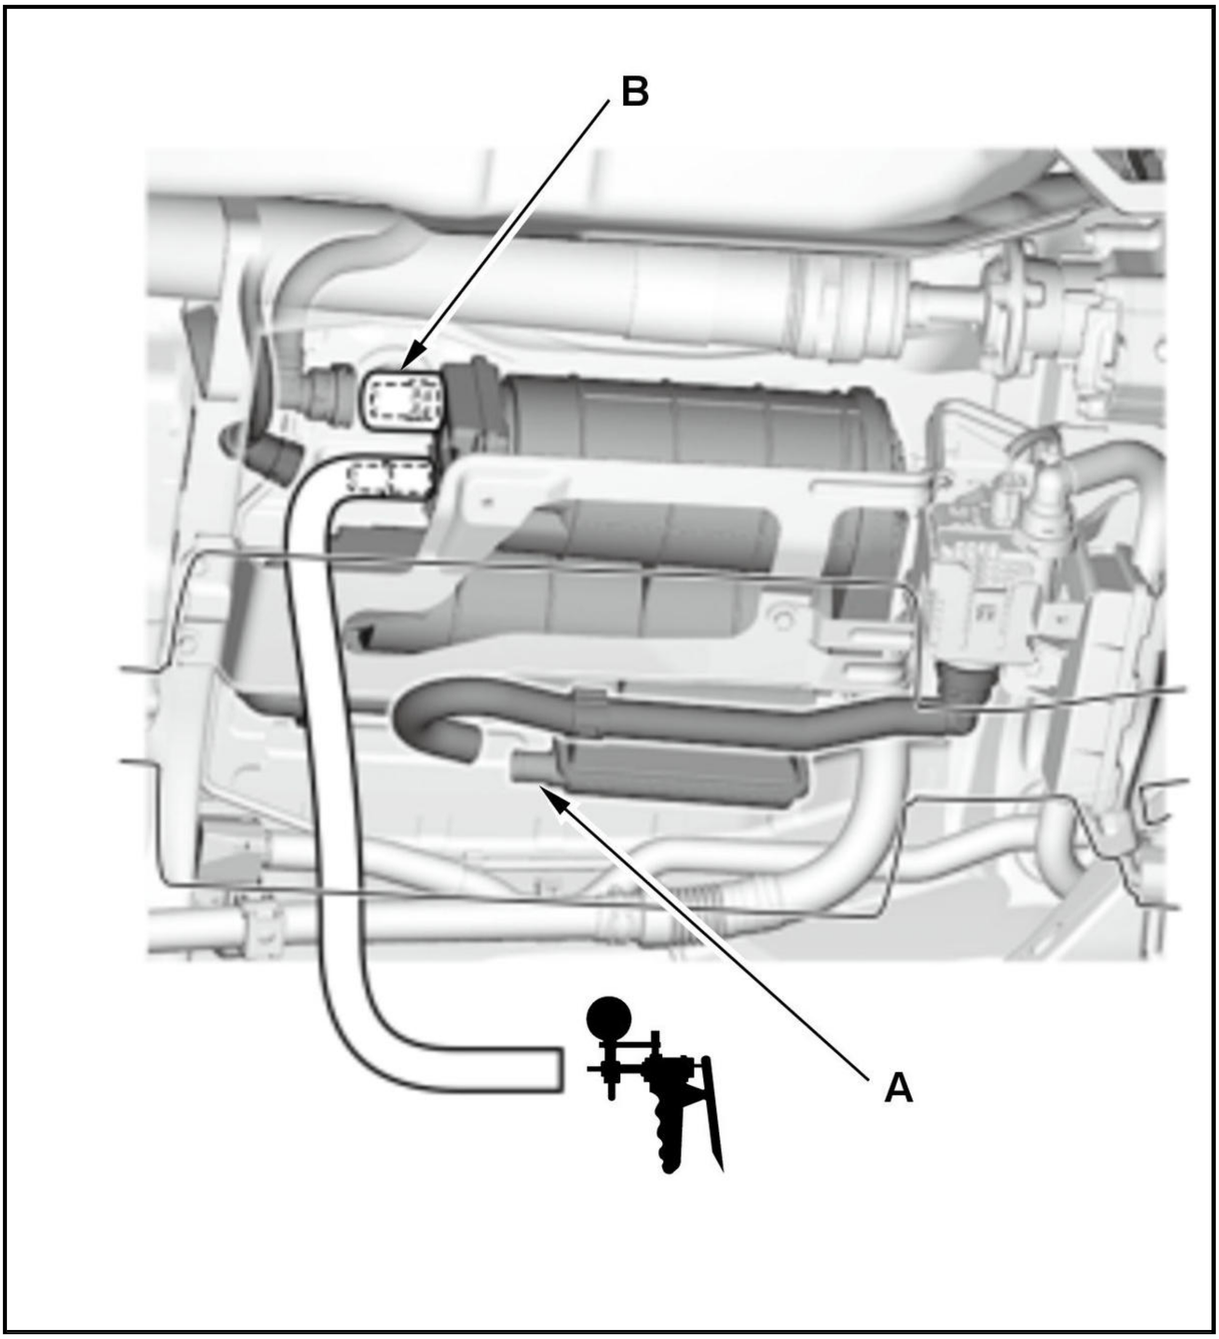
Replace the EVAP canister .

NO

Go to step 3.

3. EVAP canister check 2

-1. Remove the plug from the drain tube port (A) and plug the fuel vent tube port (B), then connect the vacuum pump/gauge, 0-30 inHg, to the EVAP canister as shown.



-2. Apply vacuum to the EVAP canister.

Does it hold the vacuum?

YES

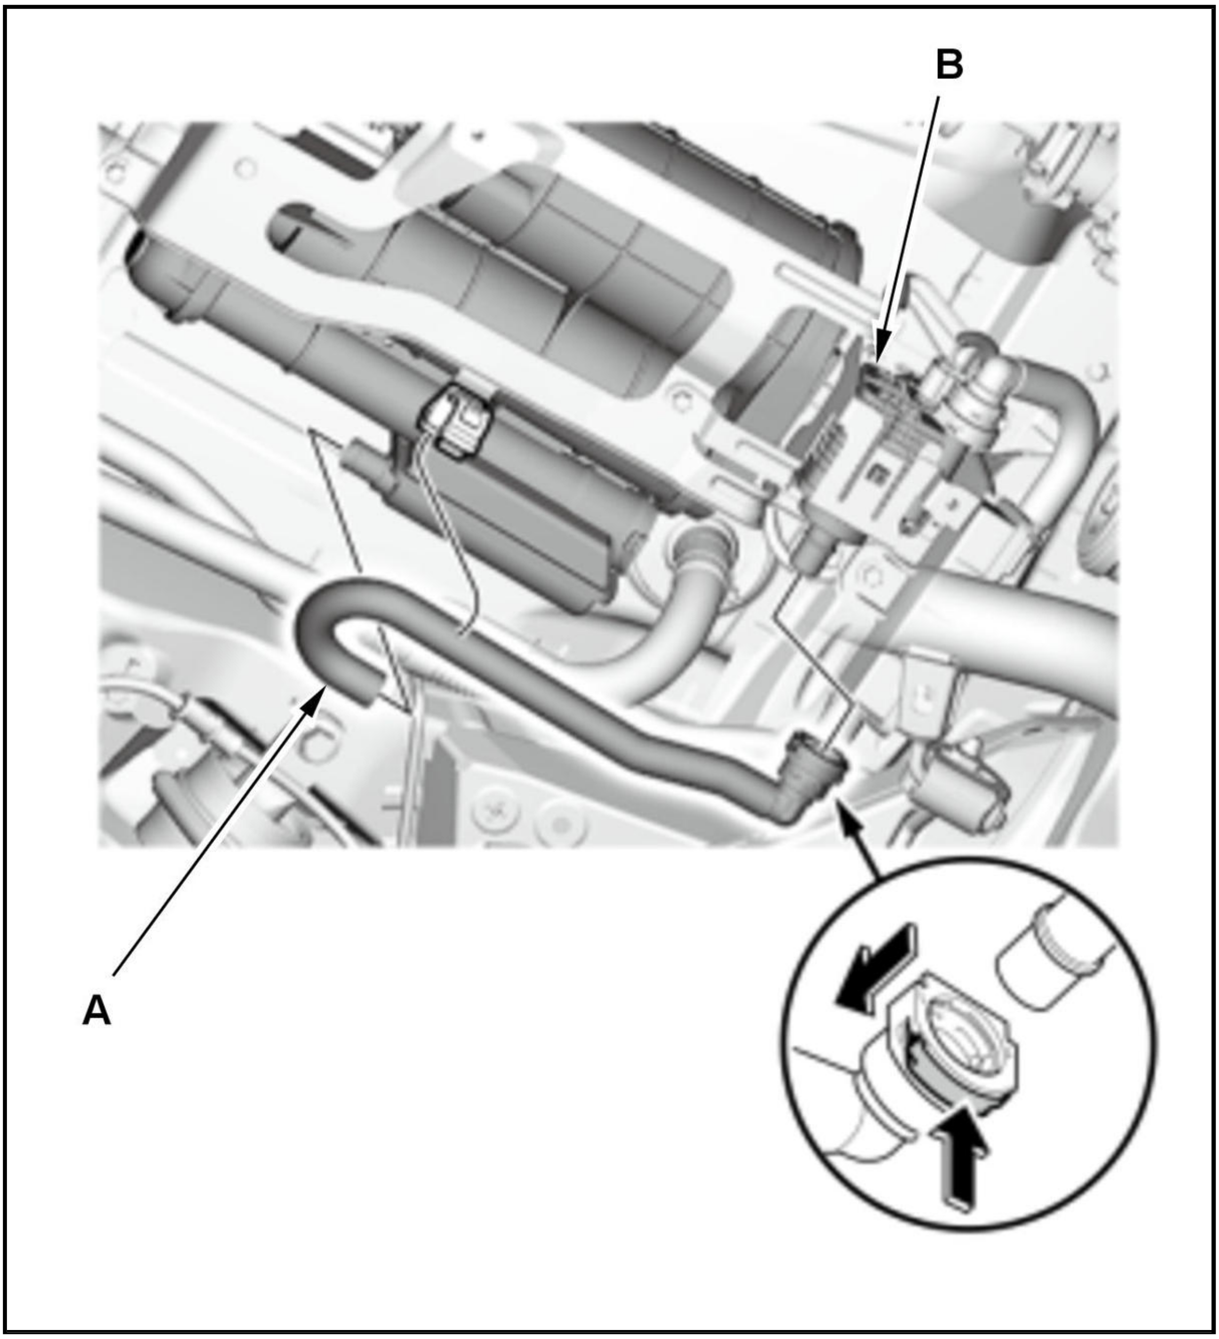
Replace the EVAP canister .

NO

Go to step 4.

4. Drain hose A visual check

-1. Disconnect drain hose A from the EVAP leak check module (B).



-2. Visually check drain hose A for deformation, foreign object clogged, or restrictions.

Is the hose OK?

YES

Replace the EVAP leak check module .

NO

Replace drain hose A .

DTC P0101

DTC P0101 : MAF Sensor Circuit Range/Performance Problem (Out of Range)

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0101 MAF Sensor Circuit Range/Performance Problem	B	B

DTC Description	Confirmed DTC	Pending DTC
(Out of Range)		

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor Voltage	Less than 0.14	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Open wire check (IG1 (AFM) /IG1 (MAIN) /IG1_ACG line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

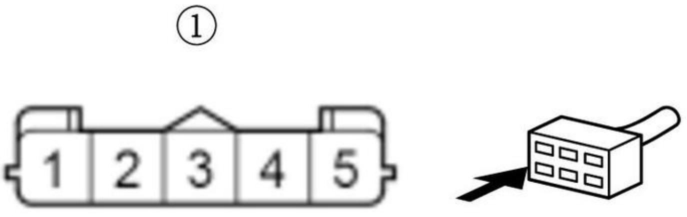
   -2. Disconnect the following connector.

MAF sensor/IAT sensor 1 5P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 3.

NO

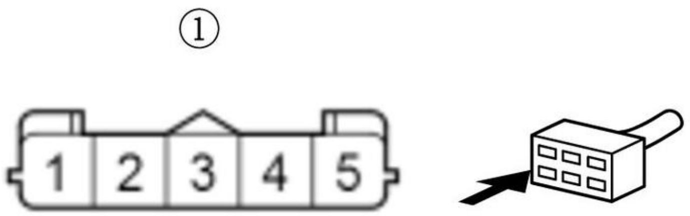
Repair an open in the IG1 (AFM) /IG1 (MAIN) /IG1_ACG wire between the No. D21 fuse and MAF sensor/IAT sensor 1.

3. Determine possible failure area (VGP line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 190-210 kΩ?

YES

Go to step 6.

NO

Go to step 4.

4. Shorted wire check (VGP line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

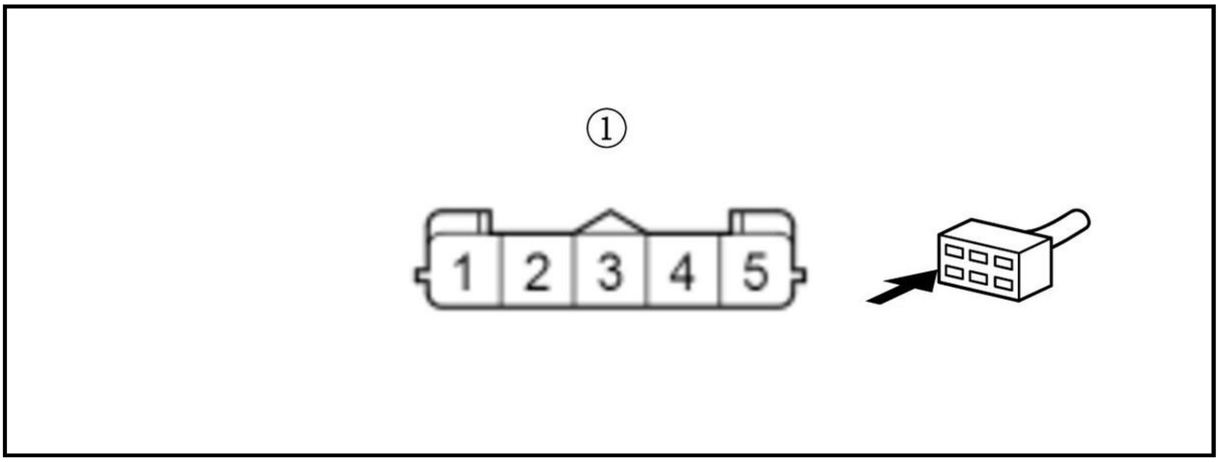
-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected

B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The VGP wire is not shorted. Go to step 5.

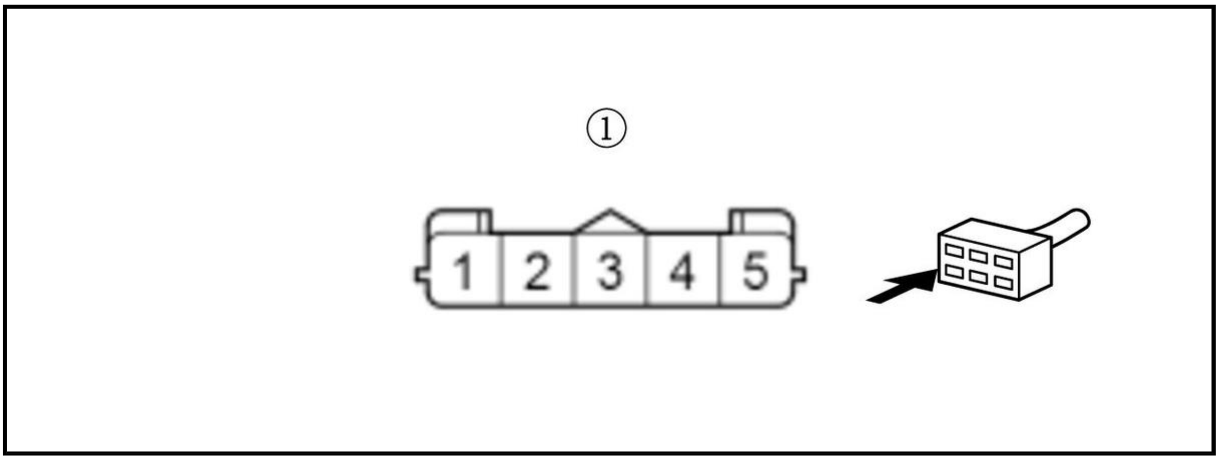
NO

Repair a short in the VGP wire between the PCM (E61) and MAF sensor/IAT sensor 1.

5. Open wire check (VGP line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 61**



Is there 1.0 Ω or less?

YES

The VGP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VGP wire between the PCM (E61) and MAF sensor/IAT sensor 1.

6. MAF sensor/IAT sensor 1 check

   -1. **Substitute known-good MAF sensor/IAT sensor 1** .

   -2. Reconnect all connectors.

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. **Enter the maintenance mode, then start the engine** .

   -6. Hold the engine speed at 2, 000 rpm without load (in P or N).

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0101 MAF Sensor Circuit Range/Performance Problem (Out of Range)	B	B

Is DTC P0101 indicated?

YES

MAF sensor/IAT sensor 1 is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace original MAF sensor/IAT sensor 1 .

DTC P0102

DTC P0102 : MAF Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0102 MAF Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor Voltage	Less than 0.10	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Open wire check (IG1 (AFM) /IG1 (MAIN) /IG1_ACG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

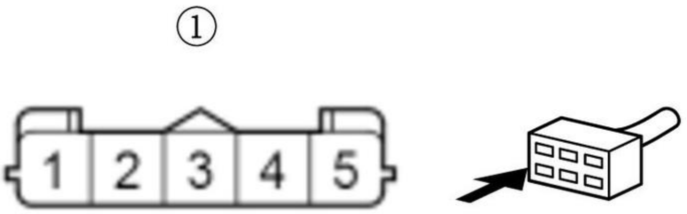
-2. Disconnect the following connector.

MAF sensor/IAT sensor 1 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 3.

NO

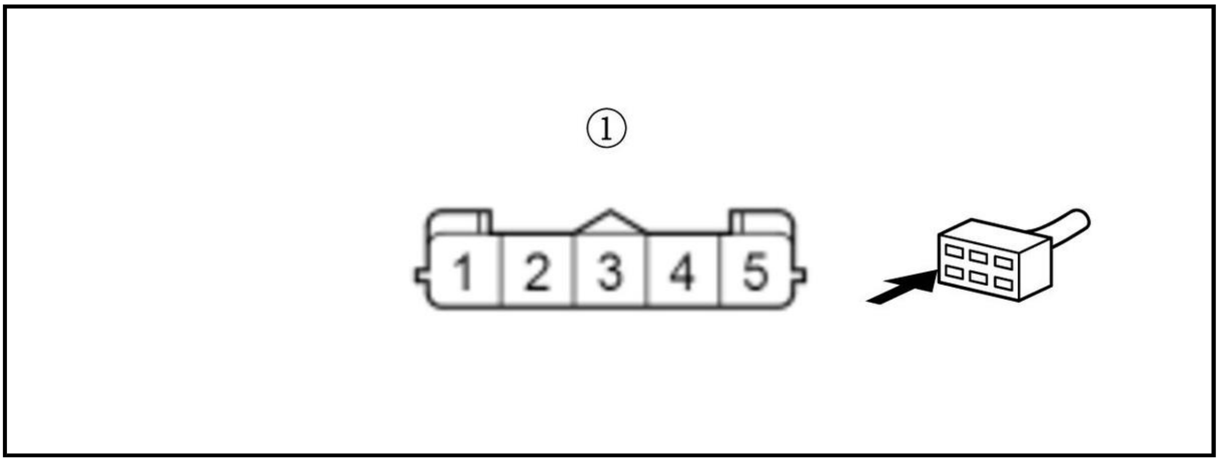
Repair an open in the IG1 (AFM) /IG1 (MAIN) /IG1_ACG wire between **No. D21 fuse** and MAF sensor/IAT sensor 1.

3. Determine possible failure area (VGP line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 190-210 kΩ?

YES

Go to step 6.

NO

Go to step 4.

4. Shorted wire check (VGP line)

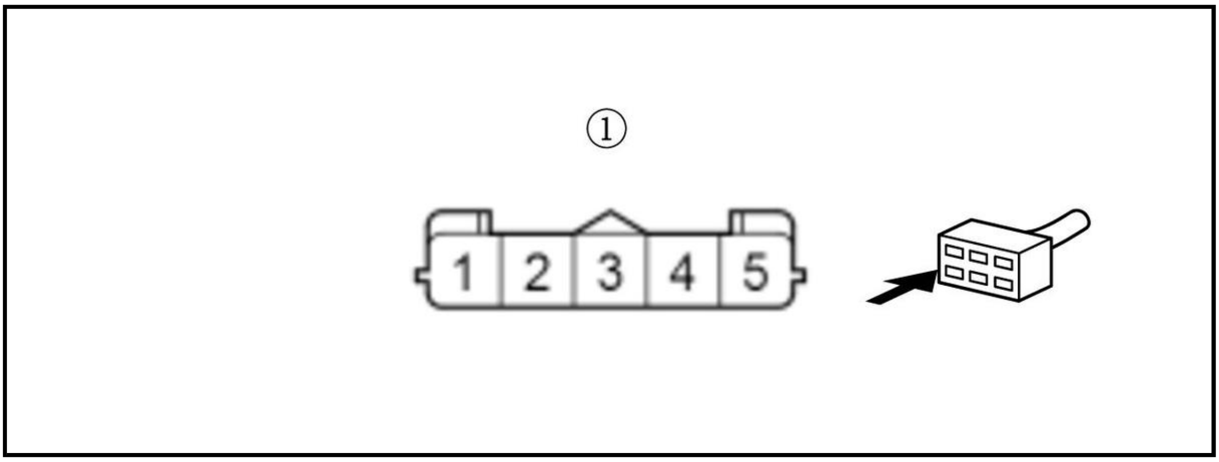
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The VGP wire is not shorted. Go to step 5.

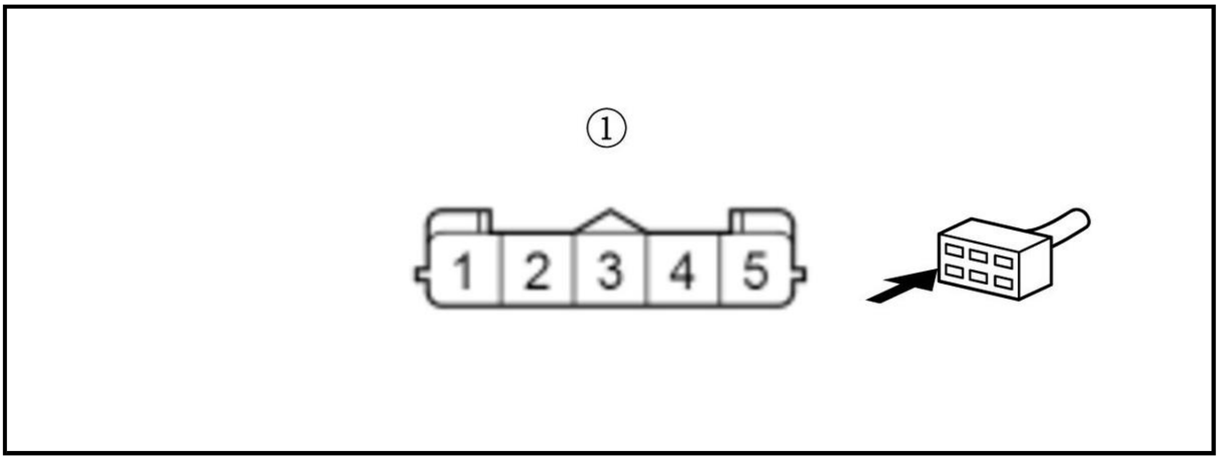
NO

Repair a short in the VGP wire between the PCM (E61) and MAF sensor/IAT sensor 1.

5. Open wire check (VGP line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 61**



Is there 1.0 Ω or less?

YES

The VGP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VGP wire between the PCM (E61) and MAF sensor/IAT sensor 1.

6. MAF sensor/IAT sensor 1 check

   -1. **Substitute a known-good MAF sensor/IAT sensor 1** .

   -2. Reconnect all connectors.

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. **Enter the maintenance mode, then start the engine** .

   -6. Hold the engine speed at 2, 000 rpm without load (in P or N).

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0102 MAF Sensor Circuit Low Voltage	B	B

   Is DTC P0102 indicated?

   YES

   MAF sensor/IAT sensor 1 is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

   NO

   Replace original MAF sensor/IAT sensor 1 .

DTC P0103

DTC P0103 : MAF Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0103 MAF Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor Voltage	More than 4.89	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Open wire check (VGM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

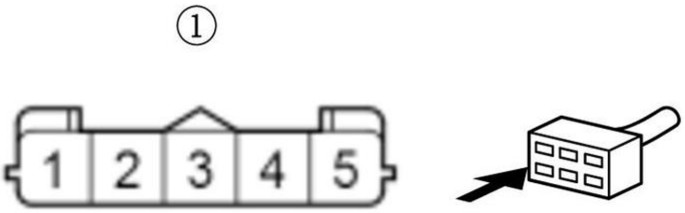
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

MAF sensor/IAT sensor 1 5P connector
PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 62**



Is there 1.0 Ω or less?

YES

Go to step 3.

NO

Repair an open in the VGM wire between the PCM (E62) and MAF sensor/IAT sensor 1.

3. PCM internal circuit check

-1. Reconnect the PCM connector E (80P).

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 2: ①

Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The PCM internal circuit is OK. Replace MAF sensor/IAT sensor 1 .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good PCM .

DTC P0105

DTC P0105 : MAP Sensor Out of Range

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC
P0105 MAP Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP Sensor Voltage	More than 3.29	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot.

2. Determine possible failure area (MAP sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

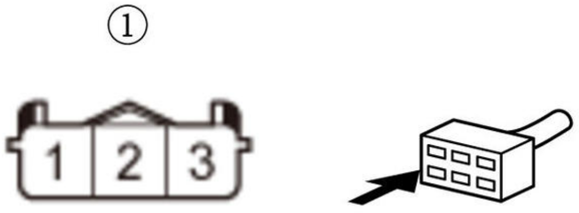
   -2. Disconnect the following connector.

MAP sensor 3P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	MAP sensor 3P connector (female terminals) No. 1: ①

Terminal B	MAP sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP Sensor Voltage	More than 3.29	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the MAP sensor .

3. Determine possible failure area (SG1 line, others)

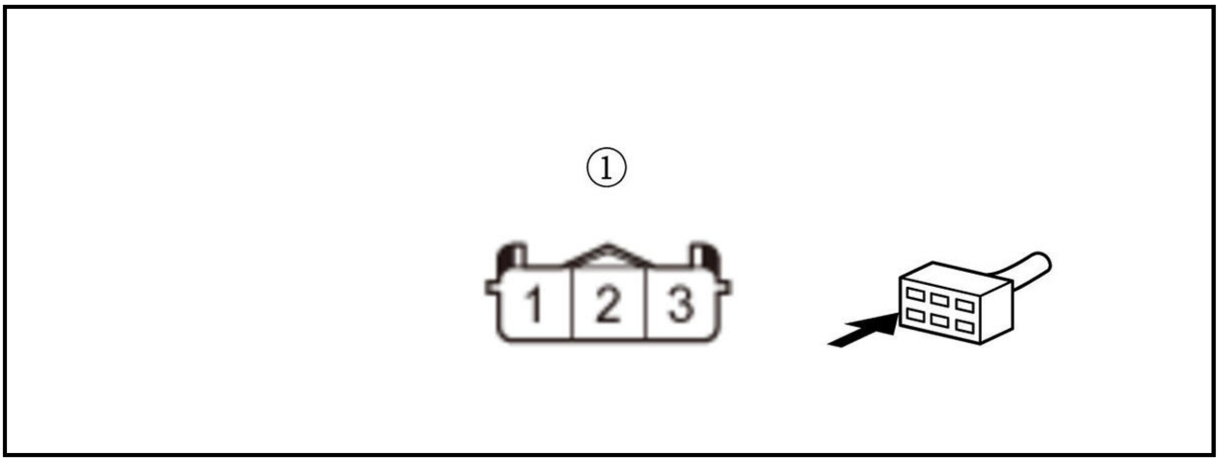
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the MAP sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

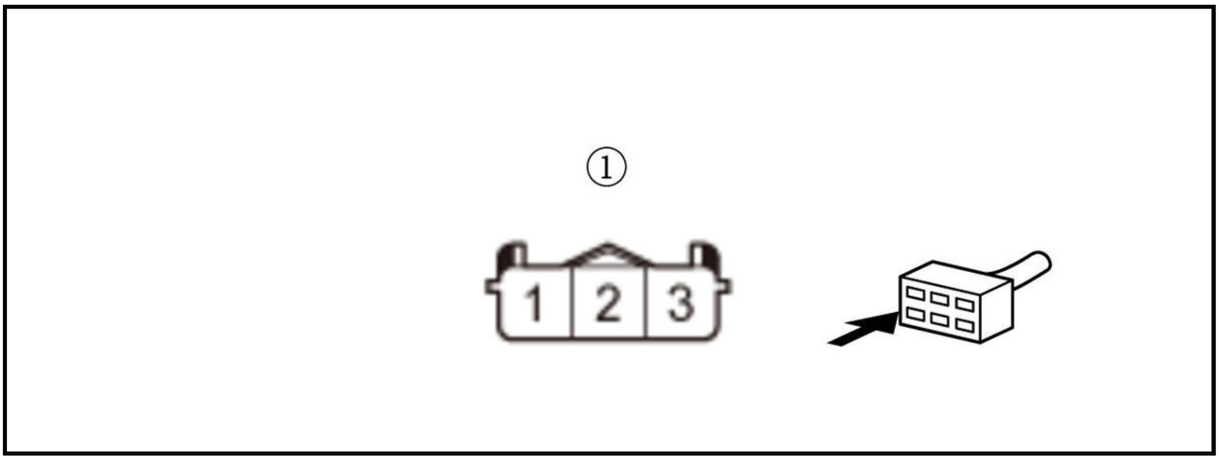
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 71**



Is there 1.0 Ω or less?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (E71) and the MAP sensor.

5. Open wire check (MAP (PB) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

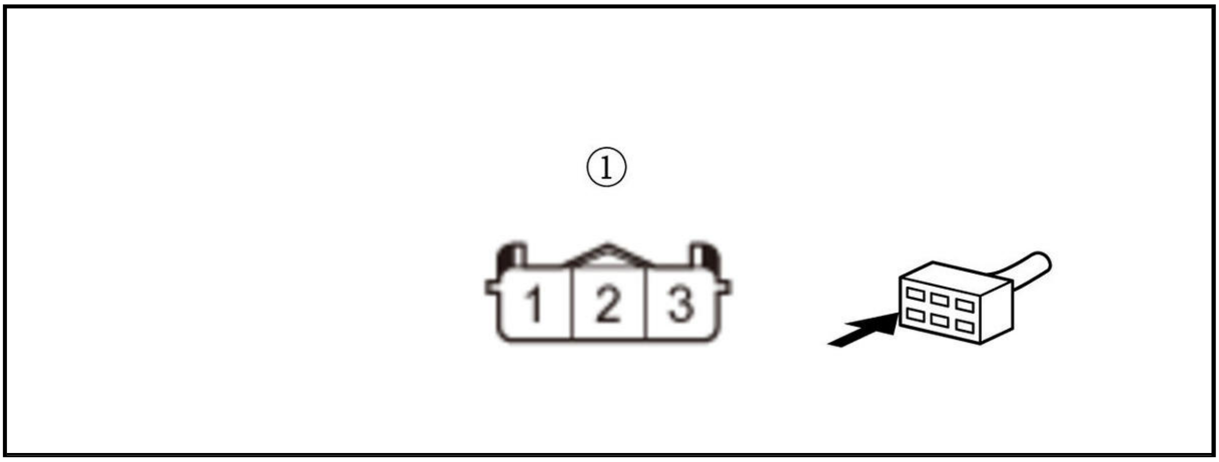
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 56**



Is there 1.0 Ω or less?

YES

The MAP (PB) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the MAP (PB) wire between the PCM (E56) and the MAP sensor.

DTC P0106

DTC P0106 : MAP Sensor Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0106 MAP Sensor Range/Performance Problem	B	B

DTC (PGM-FI)

1. Parts condition check:

   Check for poor connections or damage to these parts:

   - PCV hose
   - Purge (PCS) line
   - Air cleaner
   - Intake air duct
   - Intake manifold
   - Throttle body

   Are the parts OK?

   YES

   Go to step 2.

   NO

   Repair or replace the damaged part (s).

2. MAP sensor visual check

   -1. **Remove the MAP sensor** .

   -2. Check the MAP sensor port for clogging or restrictions (foreign material, carbon or sludge, etc.).

   Is the MAP sensor port clogged or restricted?

   YES

   Remove the clog or restriction from the MAP sensor port.

   NO

   Go to step 3.

3. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0106 MAP Sensor Range/Performance Problem	B	B

   Is DTC P0106 indicated?

   YES

   The failure is duplicated. **Replace the MAP sensor** .

NO

Go to step 4.

4. Problem verification 2

-1. **Enter the maintenance mode, then start the engine** .

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg.F (70 deg.C)
- Transmission in D
- Hold the engine speed at 1, 100 rpm or slightly higher without load (in P or N) for at least 5 seconds.
- Drive the vehicle at a steady speed of 40 mph (64 km/h) or more and engine speed between 1, 100 - 5, 500 rpm for at least 5 seconds.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
Engine Speed	B	B
Vehicle Speed	B	B

-4. Monitor the OBD STATUS for DTC P0106 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0106 MAP Sensor Range/Performance Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the MAP sensor** .

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**. If the HDS indicates NOT COMPLETED, go to step 4-3 and recheck.

DTC P0107

DTC P0107 : MAP Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0107 MAP Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
MAP Sensor Voltage	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (MAP (PB) line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAP sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
MAP Sensor Voltage	Less than 0.23	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

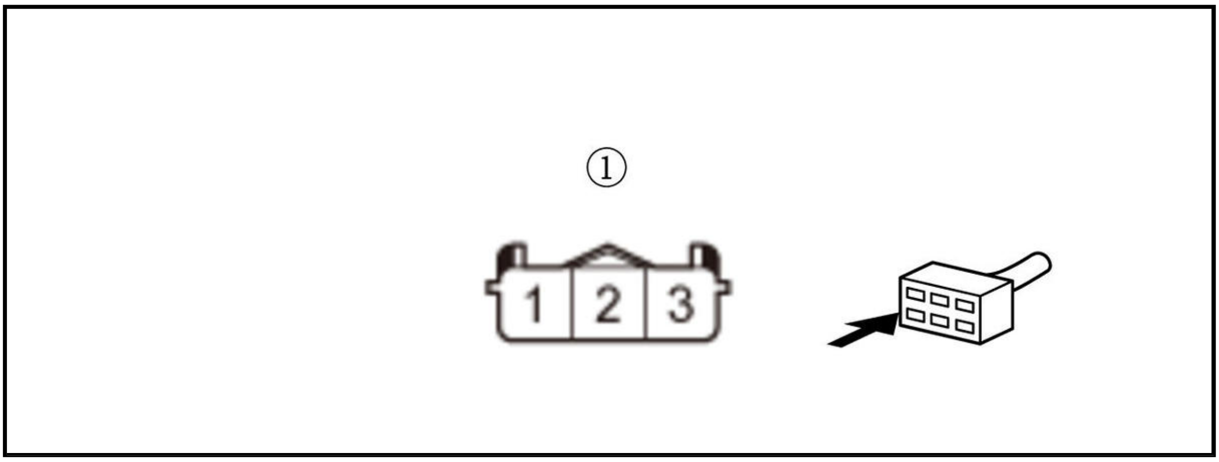
NO

Go to step 3.

3. Determine possible failure area (MAP sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the MAP sensor .

NO

Go to step 4.

4. Open wire check (VCC1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

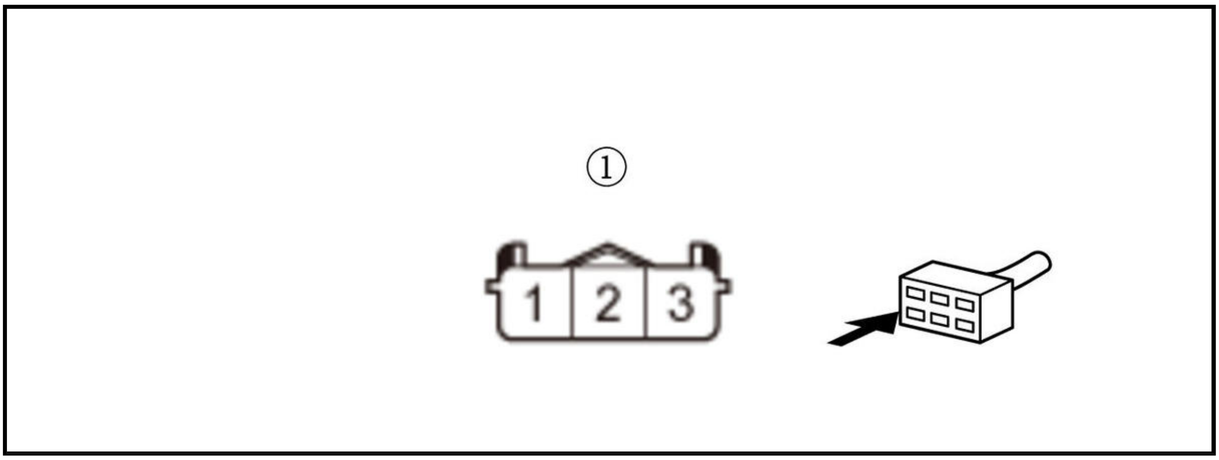
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 70**



Is there 1.0 Ω or less?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC1 wire between the PCM (E70) and the MAP sensor.

5. Shorted wire check (MAP (PB) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

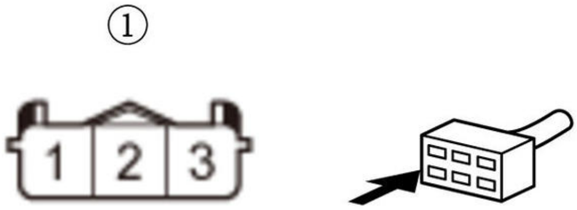
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the MAP (PB) wire between the PCM (E56) and the MAP sensor.

DTC P0108

DTC P0108 : MAP Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0108 MAP Sensor Circuit High Voltage	B	B

1. Problem verification

 -1. Turn the vehicle to the ON mode.

 -2. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
MAP Sensor Voltage	More than 4.49	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (MAP sensor, others)

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Disconnect the following connector.

MAP sensor 3P connector

 -3. Connect terminals A and B with a jumper wire.

Terminal A	MAP sensor 3P connector (female terminals) No. 1: ①
Terminal B	MAP sensor 3P connector (female terminals) No. 2: ①

 -4. Turn the vehicle to the ON mode.

 -5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP Sensor Voltage	More than 4.49	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the MAP sensor .

3. Determine possible failure area (SG1 line, others)

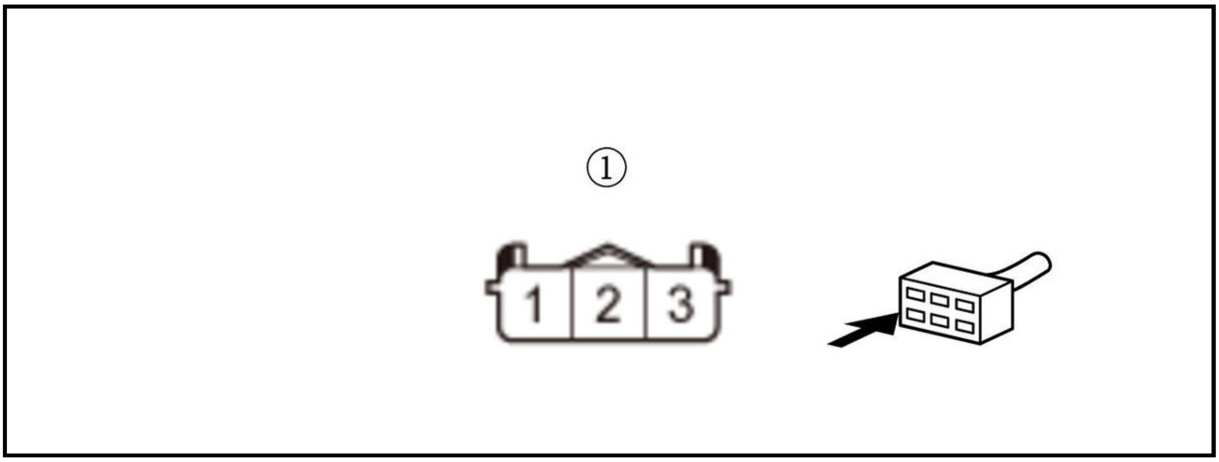
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the MAP sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAP sensor 3P connector: disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	MAP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

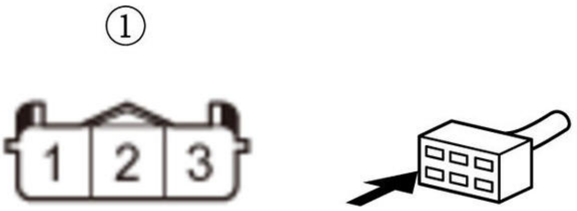
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 71**



Is there 1.0 Ω or less?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (E71) and the MAP sensor.

5. Open wire check (MAP (PB) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

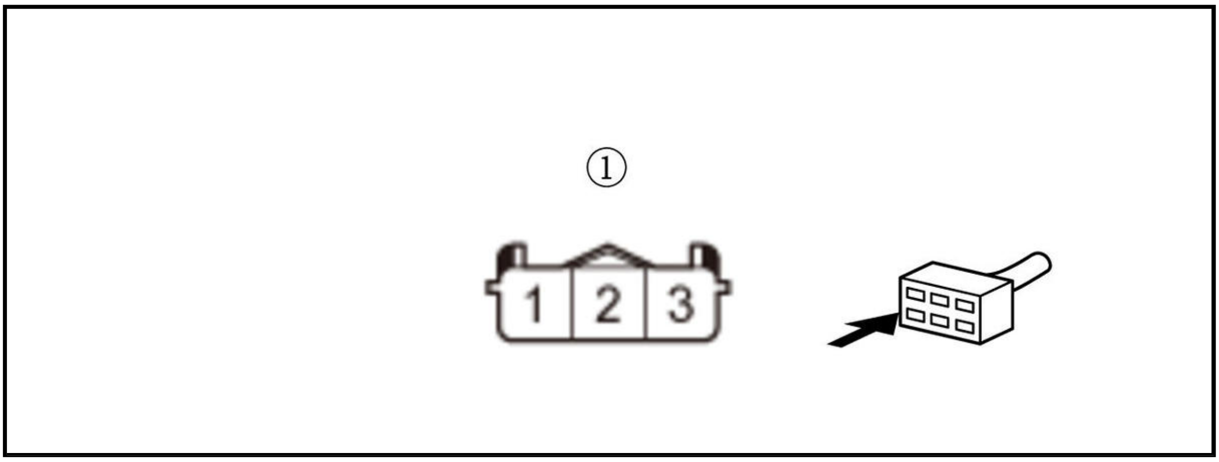
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAP sensor 3P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAP sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 56**



Is there 1.0 Ω or less?

YES

The MAP (PB) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the MAP (PB) wire between the PCM (E56) and the MAP sensor.

DTC P0111

DTC P0111 : IAT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0111 IAT Sensor 1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (1) Voltage	Less than 0.28	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (MAF sensor/IAT sensor 1, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAF sensor/IAT sensor 1 5P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
IAT Sensor (1) Voltage	Less than 0.28	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace MAF sensor/IAT sensor 1 .

3. Shorted wire check (TA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

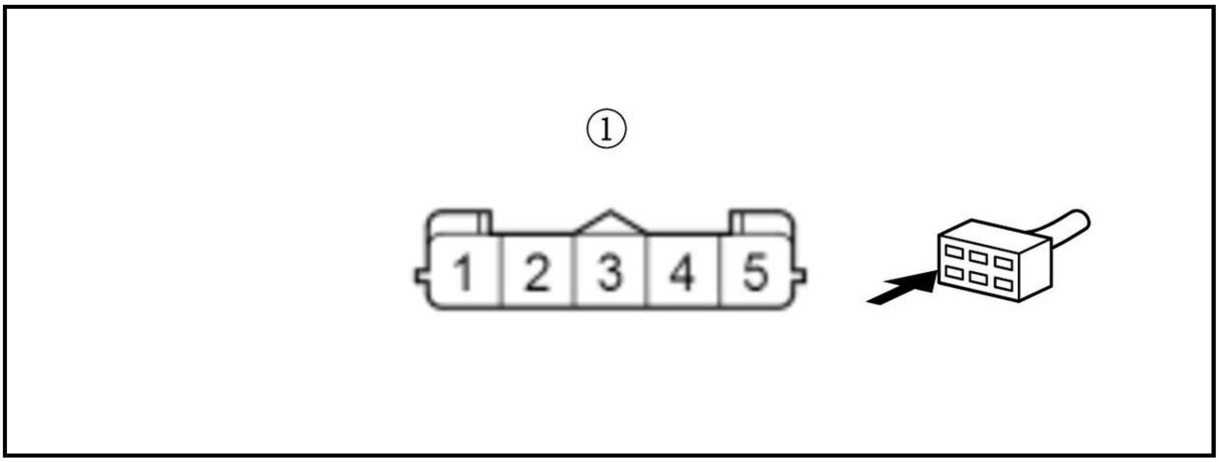
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The TA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the TA wire between the PCM (E53) and MAF sensor/IAT sensor 1.

DTC P0112

DTC P0112 : IAT Sensor 1 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0112 IAT Sensor 1 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (1) Voltage	Less than 0.08	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (MAF sensor/IAT sensor 1, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

MAF sensor/IAT sensor 1 5P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (1) Voltage	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace MAF sensor/IAT sensor 1 .

3. Shorted wire check (TA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

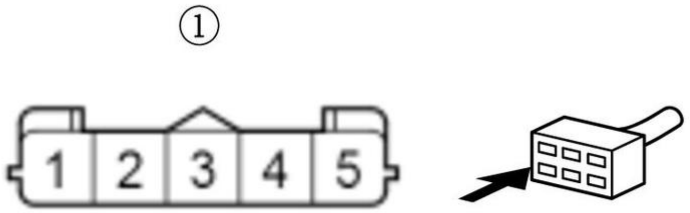
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The TA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the TA wire between the PCM (E53) and MAF sensor/IAT sensor 1.

DTC P0113

DTC P0113 : IAT Sensor 1 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0113 IAT Sensor 1 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (1) Voltage	More than 4.92	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (MAF sensor/IAT sensor 1, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

MAF sensor/IAT sensor 1 5P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 4: ①
Terminal B	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 5: ①

   -4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IAT Sensor (1) Voltage	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace MAF sensor/IAT sensor 1 .

3. Determine possible failure area (TA line, others)

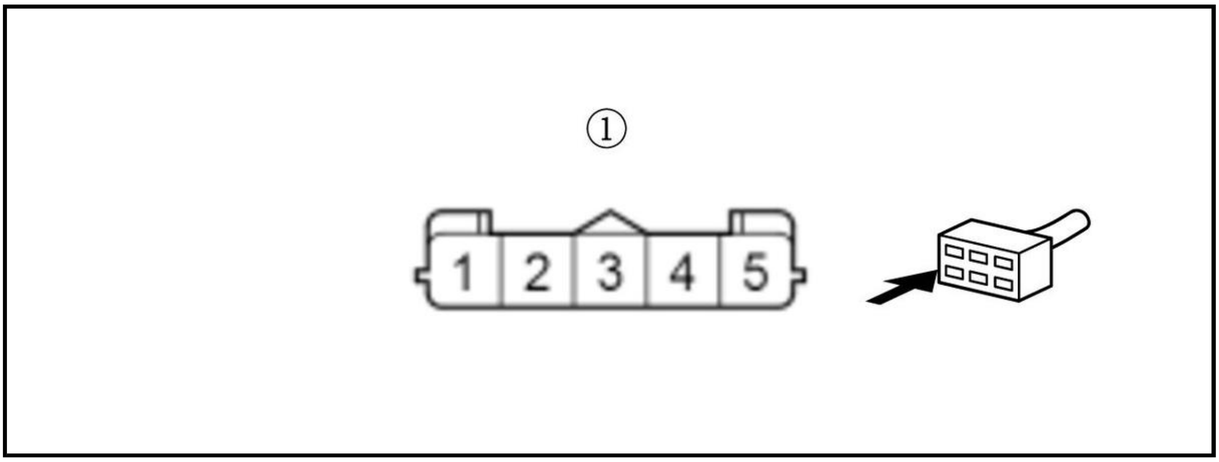
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the MAF sensor/IAT sensor 1 5P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

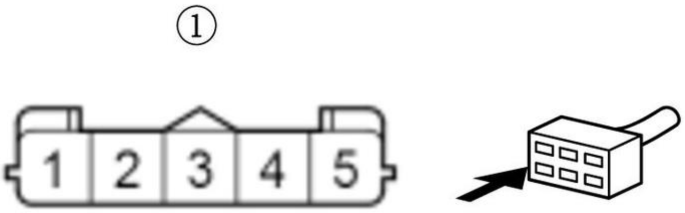
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and MAF sensor/IAT sensor 1.

5. Open wire check (TA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

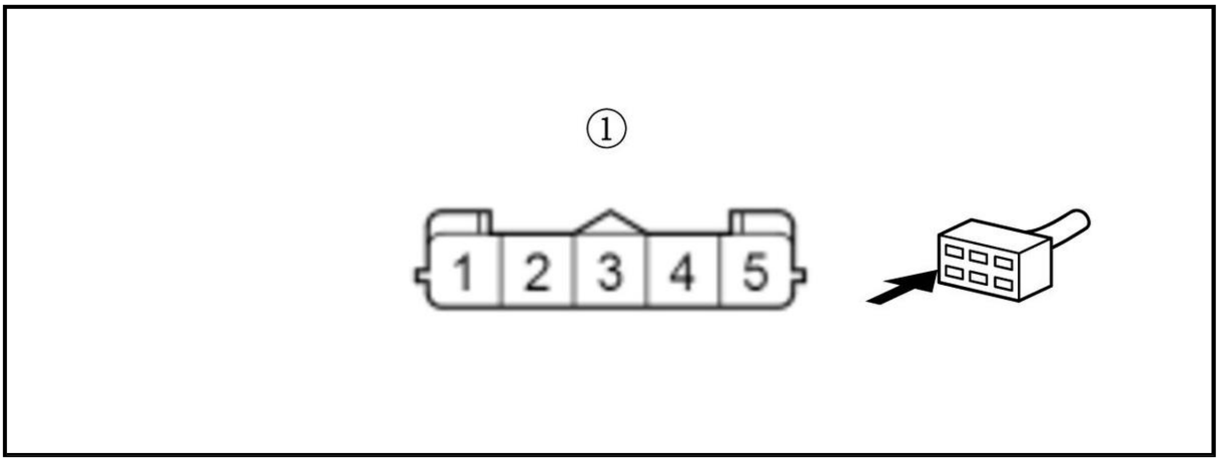
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	MAF sensor/IAT sensor 1 5P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	MAF sensor/IAT sensor 1 5P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 53**



Is there 1.0 Ω or less?

YES

The TA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TA wire between the PCM (E53) and MAF sensor/IAT sensor 1.

DTC P0115

DTC P0115 : ECT Sensor 1 Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0115 ECT Sensor 1 Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 1 Voltage	Less than 0.14	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (ECT sensor 1, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT Sensor 1 Voltage	Less than 0.14	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 1 .

3. Shorted wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

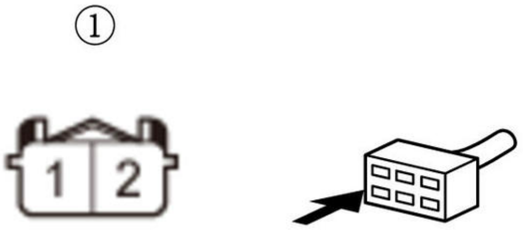
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the TW wire between the PCM (E52) and ECT sensor 1.

DTC P0116

DTC P0116 : ECT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0116 ECT Sensor 1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. ECT sensor 1 check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 1	More than 80	deg.C	B	B
	More than 176	deg.F		

Do the current condition (s) match the threshold?

YES

Note the value of ECT SENSOR 1, then go to step 3.

NO

Note the value of ECT SENSOR 1, then go to step 2.

2. Problem verification (low temperature)

-1. **Enter the maintenance mode, then start the engine** .

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

Does ECT Sensor 1 change 18 deg.F (10 deg.C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

NO

The failure is duplicated. **Replace ECT sensor 1** .

3. Problem verification (high temperature)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Open the hood, and let the engine cool for 3 hours.

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

Does ECT Sensor 1 change 18 deg.F (10 deg.C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

NO

The failure is duplicated. **Replace ECT sensor 1** .

DTC P0117

DTC P0117 : ECT Sensor 1 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0117 ECT Sensor 1 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 1 Voltage	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (ECT sensor 1, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT Sensor 1 Voltage	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 1 .

3. Shorted wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

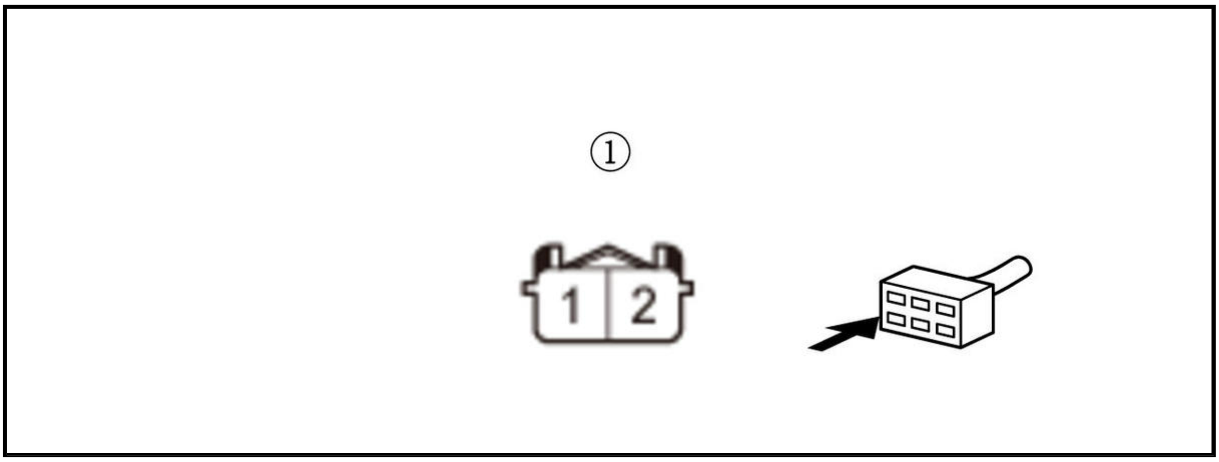
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the TW wire between the PCM (E52) and ECT sensor 1.

DTC P0118

DTC P0118 : ECT Sensor 1 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0118 ECT Sensor 1 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 1 Voltage	More than 4.92	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (ECT sensor 1, others)

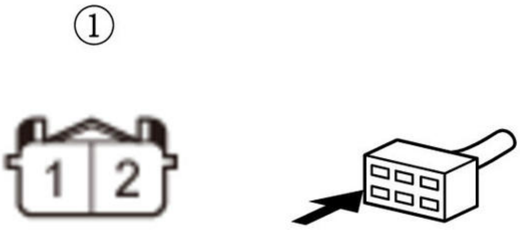
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 1 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 1 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 1 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
ECT Sensor 1 Voltage	More than 4.92	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 1 .

3. Determine possible failure area (TW line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

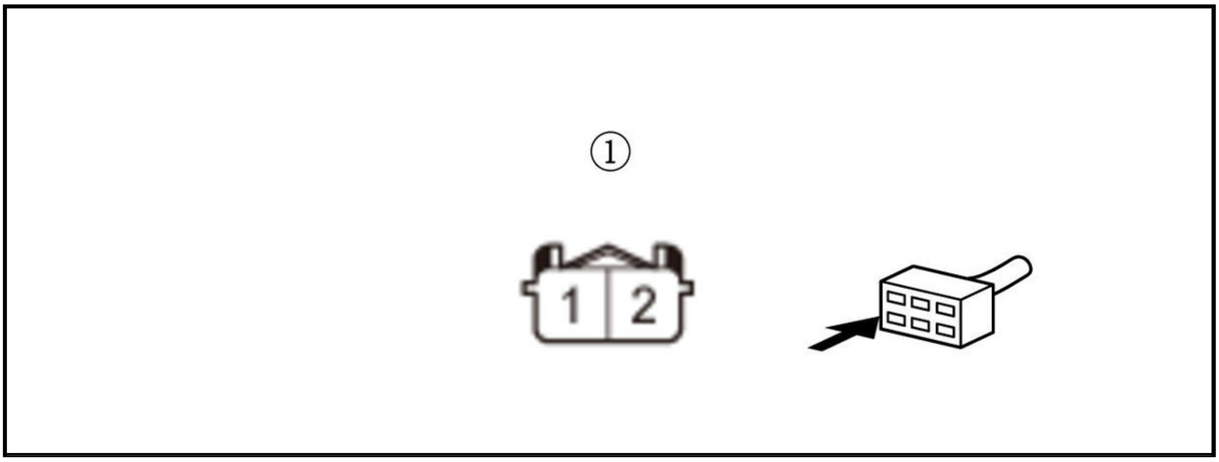
-2. Remove the jumper wire from ECT sensor 1 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 1 2P connector: disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①

Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

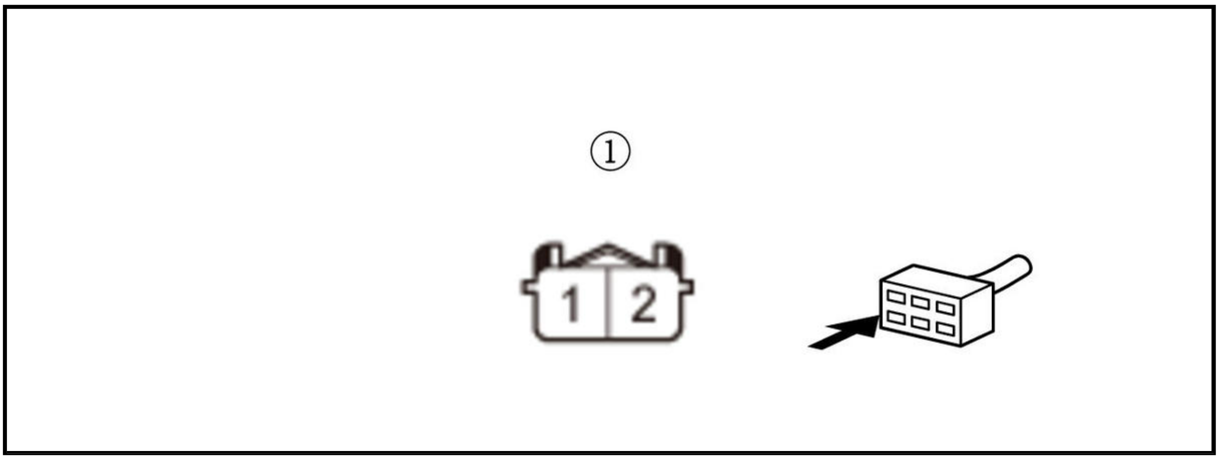
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and ECT sensor 1.

5. Open wire check (TW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

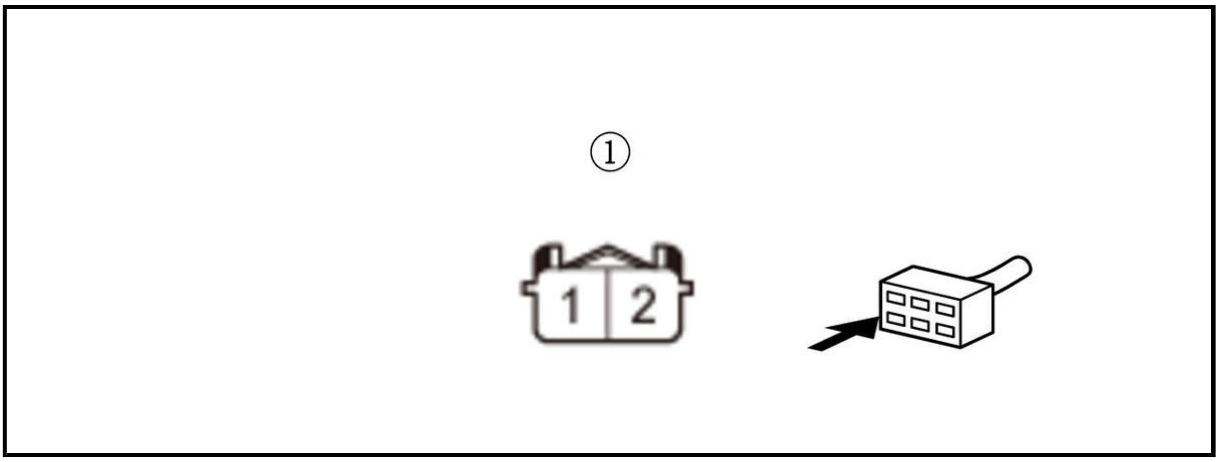
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 1 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	ECT sensor 1 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 52**



Is there 1.0 Ω or less?

YES

The TW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TW wire between the PCM (E52) and ECT sensor 1.

DTC P011A

DTC P011A : ECT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P011A ECT Sensor1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals of these connectors.

   - ECT sensor 1
   - ECT sensor 2
   - MAF sensor/IAT sensor 1

   Are the connections and terminals OK?

   YES

   Replace ECT sensor 1 .

   NO

   Repair the connections or terminals, then recheck.

DTC P011B

DTC P011B : IAT Sensor 1 Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P011B IAT Sensor 1 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals at these locations:

   - MAF sensor/IAT sensor 1
   - ECT sensor 1
   - ECT sensor 2

   Are the connections and terminals OK?

   YES

   Go to step 2.

   NO

   Repair the connections or terminals.

2. IAT sensor performance check (low temperature)

   -1. **Remove MAF sensor/IAT sensor 1** .

   -2. Allow MAF sensor/IAT sensor 1 to cool to the ambient temperature.

-3. Note the ambient temperature.

-4. Connect MAF sensor/IAT sensor 1 to its 5P connector, but do not install it.

-5. Turn the vehicle to the ON mode.

-6. Quickly note the value of IAT Sensor (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	**Unit**
IAT Sensor (1)	B	B

-7. Compare the value of IAT Sensor (1) to the ambient temperature.

Does the value of IAT Sensor (1) differ 5.4 deg.F (3 deg.C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

Go to step 3.

3. IAT sensor performance check (high temperature)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

MAF sensor/IAT sensor 1 5P connector

-3. Using a heat gun, blow hot air on MAF sensor/IAT sensor 1 for a few seconds. Do not apply the heat longer than a few seconds or you will damage the sensor.

-4. Connect MAF sensor/IAT sensor 1 to its 5P connector, but do not install it.

-5. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
IAT Sensor (1)	B	B

Does IAT Sensor (1) change 76 deg.F (42 deg.C) or more?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at MAF sensor/IAT sensor 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

NO

Replace MAF sensor/IAT sensor 1 .

DTC P0121

DTC P0121 : TP Sensor A Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP Sensor A	Less than 0.37	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Go to step 2.

2. Problem verification 2

   -1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP Sensor A	More than 4.50	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 7.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Determine possible failure area (THL1 line, others)

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

   Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

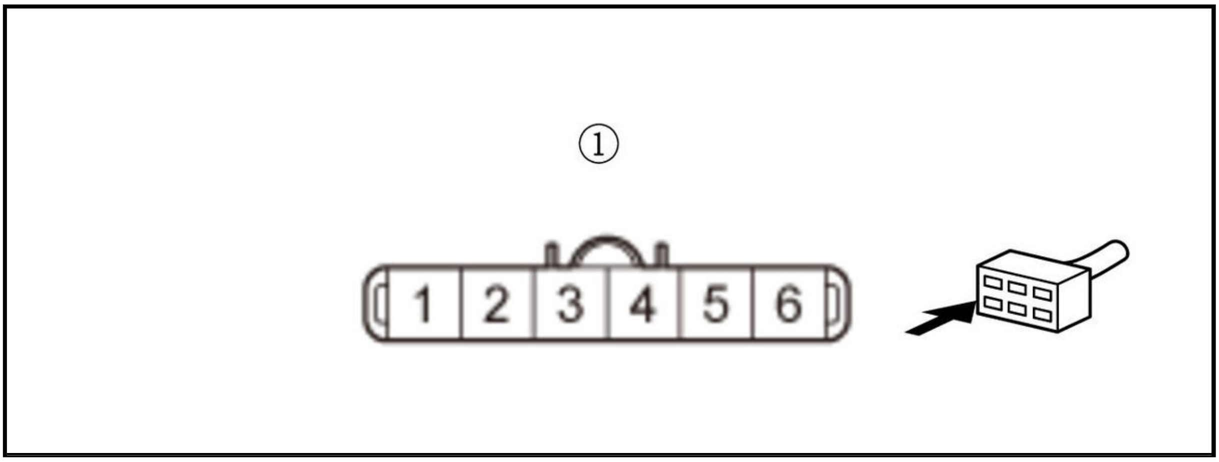
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P) : disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the THL1 wire between the PCM (E50) and the throttle body.

5. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

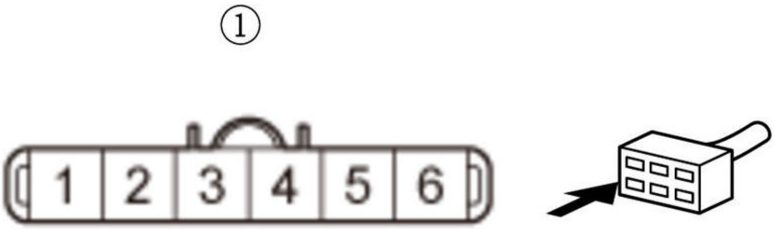
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 6.

6. Open wire check (VCC3 (DBW) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

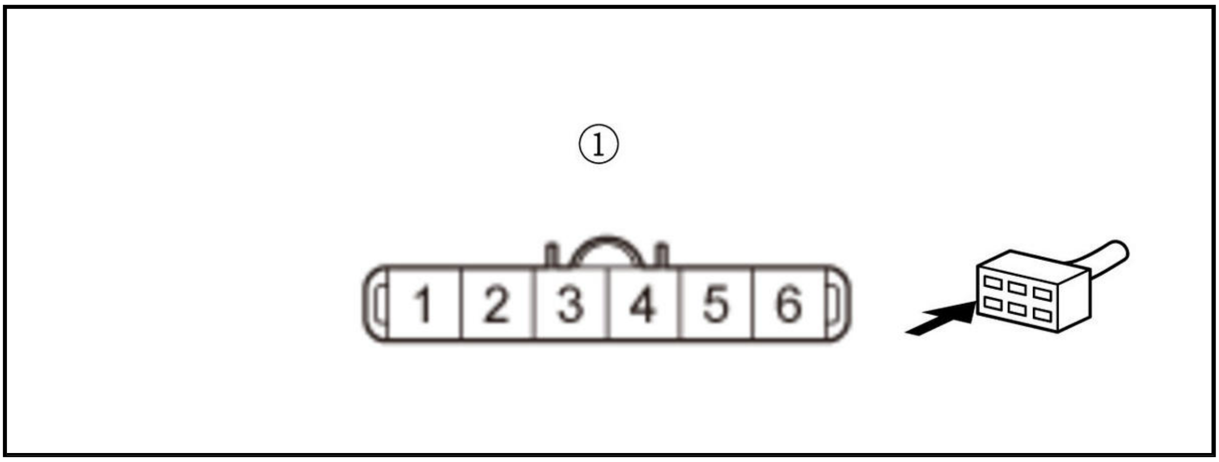
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 75**



Is there 1.0 Ω or less?

YES

The VCC3 (DBW) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 (DBW) wire between the PCM (E75) and the throttle body.

7. Determine possible failure area (SG3 (DBW) line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 10.

NO

Go to step 8.

8. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

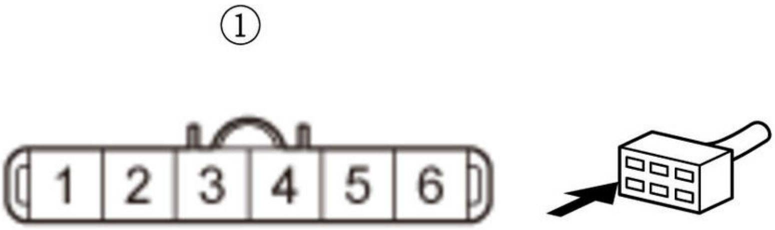
Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①

Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 9.

9. Open wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

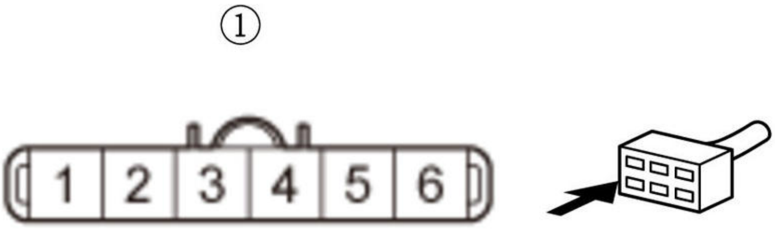
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	PCM connector E (80P) No. 50



Is there 1.0 Ω or less?

YES

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the THL1 wire between the PCM (E50) and the throttle body.

10. Open wire check (SG3 (DBW) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

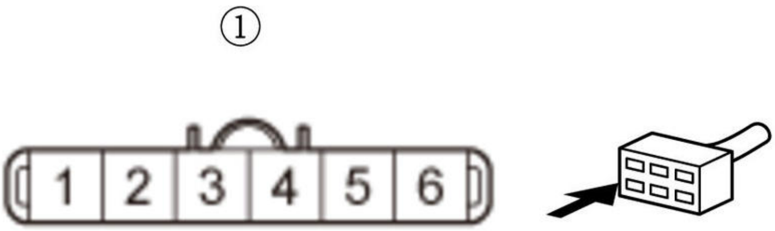
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P) : disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 76**



Is there 1.0 Ω or less?

YES

The SG3 (DBW) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG3 (DBW) wire between the PCM (E76) and the throttle body.

DTC P0122

DTC P0122 : TP Sensor A Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0122 TP Sensor A Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP Sensor A	Less than 0.3	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (THL1 line, others)

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0122 TP Sensor A Circuit Low Voltage	B	B
P0222 TP Sensor B Circuit Low Voltage	B	B

   Are DTC P0122 and P0222 indicated at the same time?

   YES

   Go to step 4.

   NO

   Go to step 3.

3. Shorted wire check (THL1 line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

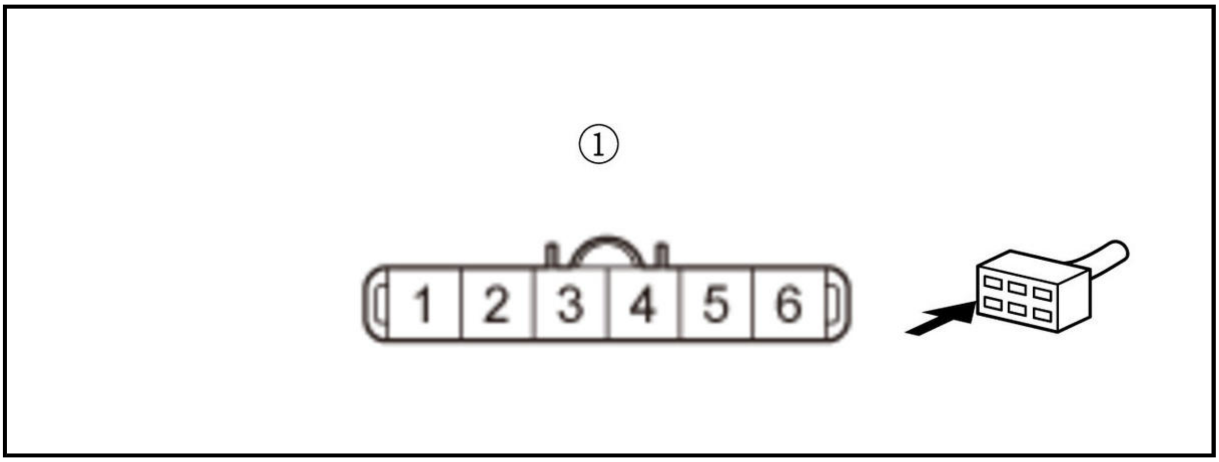
   -3. Disconnect the following connectors.

PCM connector E (80P)

Throttle body 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P) : disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the THL1 wire between the PCM (E50) and the throttle body.

4. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

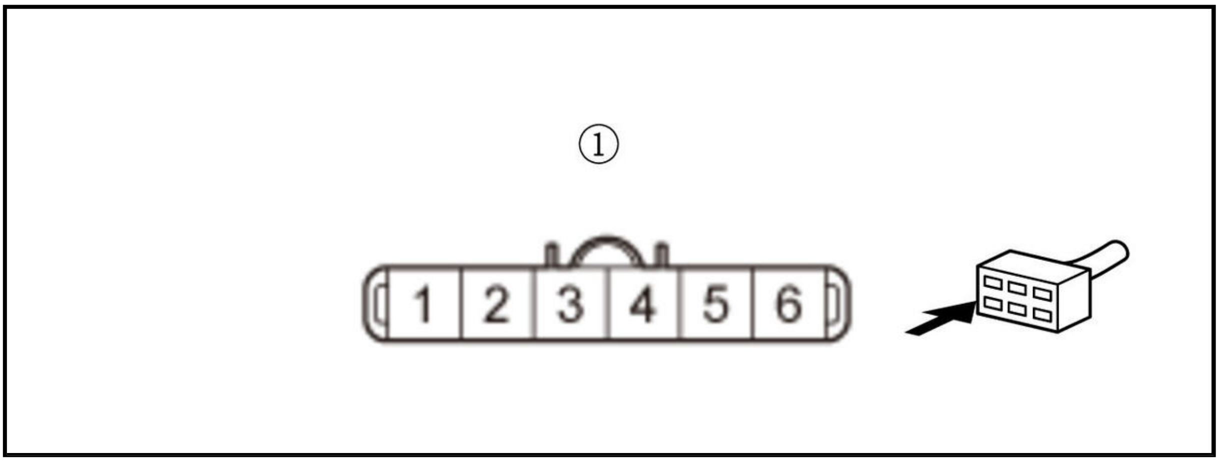
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 5.

5. Open wire check (VCC3 (DBW) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

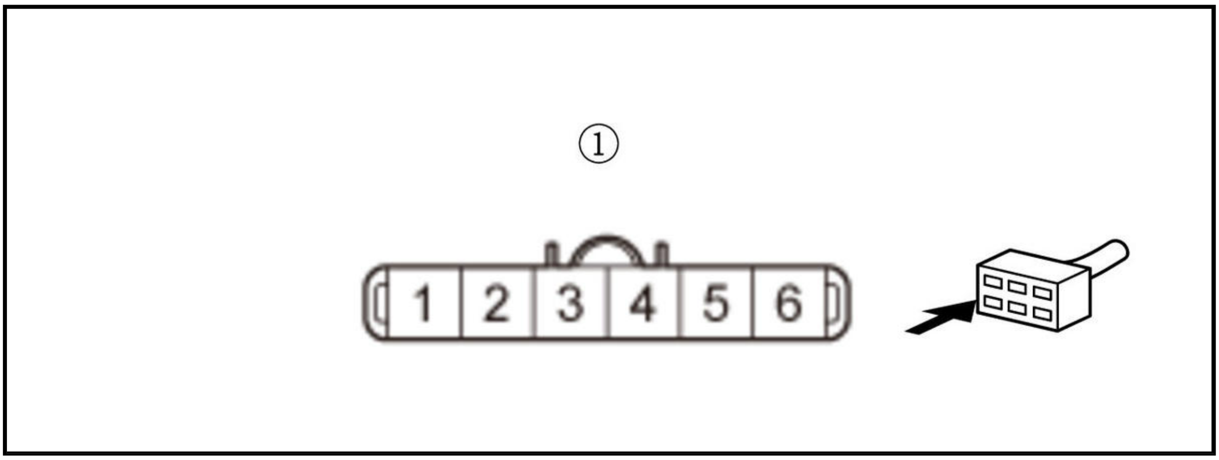
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	PCM connector E (80P) No. 75



Is there 1.0 Ω or less?

YES

The VCC3 (DBW) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the VCC3 (DBW) wire between the PCM (E75) and the throttle body.

DTC P0123

DTC P0123 : TP Sensor A Circuit High Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC
P0123 TP Sensor A Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP Sensor A	More than 4.8	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot.

2. Determine possible failure area (SG3 (DBW) line, others)

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0123 TP Sensor A Circuit High Voltage	B	B
P0223 TP Sensor B Circuit High Voltage	B	B

   Are DTC P0123 and P0223 indicated at the same time?

   YES

   Go to step 5.

   NO

   Go to step 3.

3. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

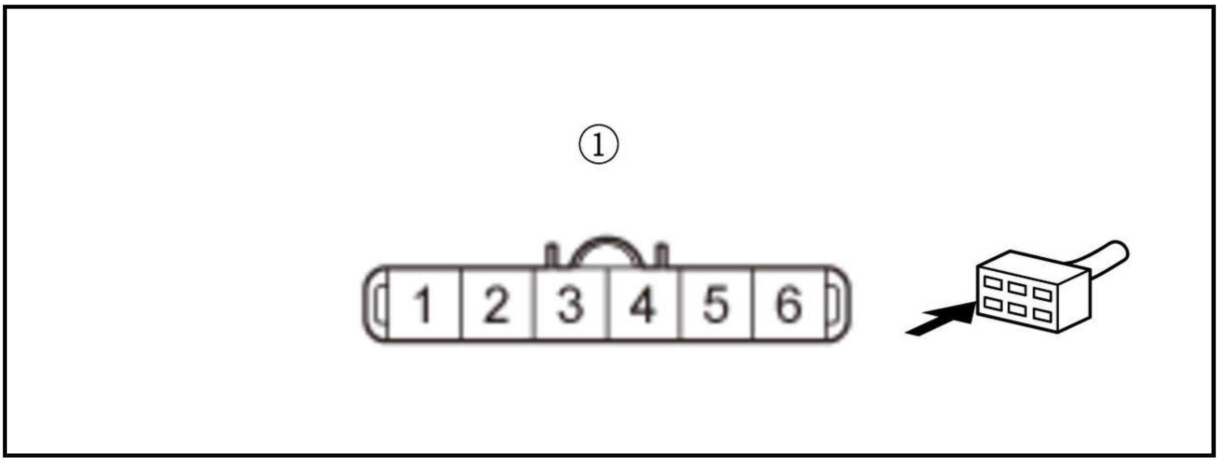
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 4.

4. Open wire check (THL1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

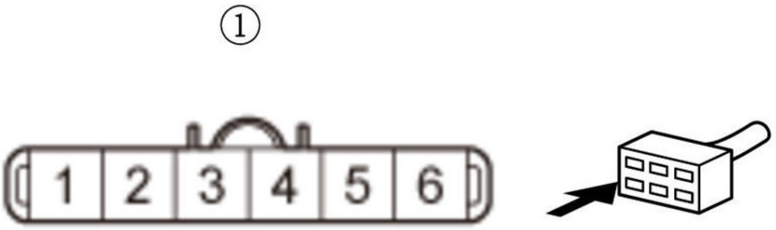
-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P) : disconnected

Test point 1	Throttle body 6P connector (female terminals) No. 6: ①
Test point 2	**PCM connector E (80P) No. 50**



Is there 1.0 Ω or less?

YES

The THL1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the THL1 wire between the PCM (E50) and the throttle body.

5. Open wire check (SG3 (DBW) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

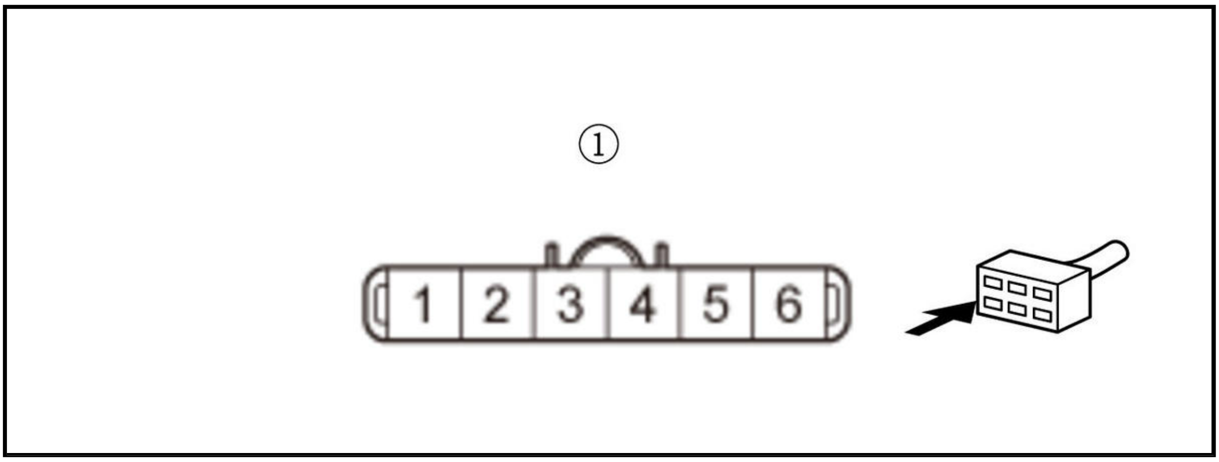
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P) : disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 76**



Is there 1.0 Ω or less?

YES

The SG3 (DBW) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG3 (DBW) wire between the PCM (E76) and the throttle body.

DTC P0125

DTC P0125 : ECT Sensor 1 Malfunction/Slow Response

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0125 ECT Sensor 1 Malfunction/Slow Response	B	B

DTC (PGM-FI)

1. ECT sensor 1 check

-1. **Enter the maintenance mode, then start the engine** .

-2. Let it idle for 10 minutes or more.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 1	Less than -18	deg.C	B	B
	Less than 0	deg.F		

Do the current condition (s) match the threshold?

YES

Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If they are OK, **replace ECT sensor 1** .

NO

Go to step 2.

2. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to 104 deg.F (40 deg.C) or less.

-3. Enter the maintenance mode, then start the engine .

-4. Let it idle until ECT SENSOR 1 goes up to about 158 deg.F (70 deg.C).

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 2	About 70	deg.C	B	B
	About 158	deg.F		

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot.

3. Thermostat check

-1. Check the thermostat .

Is the thermostat OK?

YES

Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. If the connections and terminals are OK, replace ECT sensor 1 .

NO

Replace the thermostat .

DTC P0128

DTC P0128 : Cooling System Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC
P0128 Cooling System Malfunction	B	B

DTC (PGM-FI)

1. Cooling fan control command check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the blower switch off.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Radiator Fan Control	About 0	%	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 2.

   NO

   Wait until the Radiator Fan Control is about 0 %, then go to step 2.

2. Cooling fan operation check

   -1. Check the cooling fan operation.

   Does the cooling fan keep running?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Cooling fan circuit and RFC relay check

   -1. Turn the vehicle to the ON mode.

   -2. Check the cooling fan circuit and the RFC relay.

   Is it OK?

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

   NO

   Check the cooling fan circuit and the RFC relay, if they are OK, **replace the cooling fan motor** .

4. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Let the engine cool until the coolant temperature is 104 deg.F (40 deg.C) or less.

-3. Note the value of ECT Sensor 1 and ECT Sensor 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
ECT Sensor 2	B	B

-4. **Enter the maintenance mode, then start the engine** .

-5. Let the engine idle until ECT Sensor 1 goes up 40 deg.F (22 deg.C) or more from the recorded start temperature.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-6. Check ECT Sensor 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT Sensor 2	B	B

-7. Compare the recorded start value of ECT Sensor 2 and the present value of ECT Sensor 2.

Did the temperature rise 14.4 deg.F (8.0 deg.C) or more?

YES

Test the thermostat and replace it if needed .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

DTC P0130

DTC P0130 : A/F Sensor (Sensor 1) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0130 A/F Sensor (Sensor 1) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Monitor the OBD STATUS for DTC P0130 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0130 A/F Sensor (Sensor 1) Out of Range	B

Does the HDS indicate FAILED?

YES

Replace the A/F sensor (Sensor 1) .

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-3 on this step and recheck.

DTC P0133

DTC P0133 : A/F Sensor (Sensor 1) Malfunction/Slow Response

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0133 A/F Sensor (Sensor 1) Malfunction/Slow Response	B	B

DTC (PGM-FI)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0133 A/F Sensor (Sensor 1) Malfunction/Slow Response	B	B

Is Confirmed DTC P0133 indicated?

YES (Confirmed DTC is indicated)

Replace the A/F sensor (Sensor 1) .

NO (Pending DTC is indicated)

Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM, and the installation of the A/F sensor (Sensor 1), then recheck.

DTC P0134

DTC P0134 : A/F Sensor (Sensor 1) Heater System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If DTC P0135 is stored at the same time as DTC P0134, troubleshoot DTC P0135 first, then recheck for P0134.

DTC Description	Confirmed DTC	Pending DTC
P0134 A/F Sensor (Sensor 1) Heater System Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** , and let it idle without load (in P or N) for at least 1 minute.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0134 A/F Sensor (Sensor 1) Heater System Malfunction	B	B

   Is DTC P0134 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Open wire check (VS line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

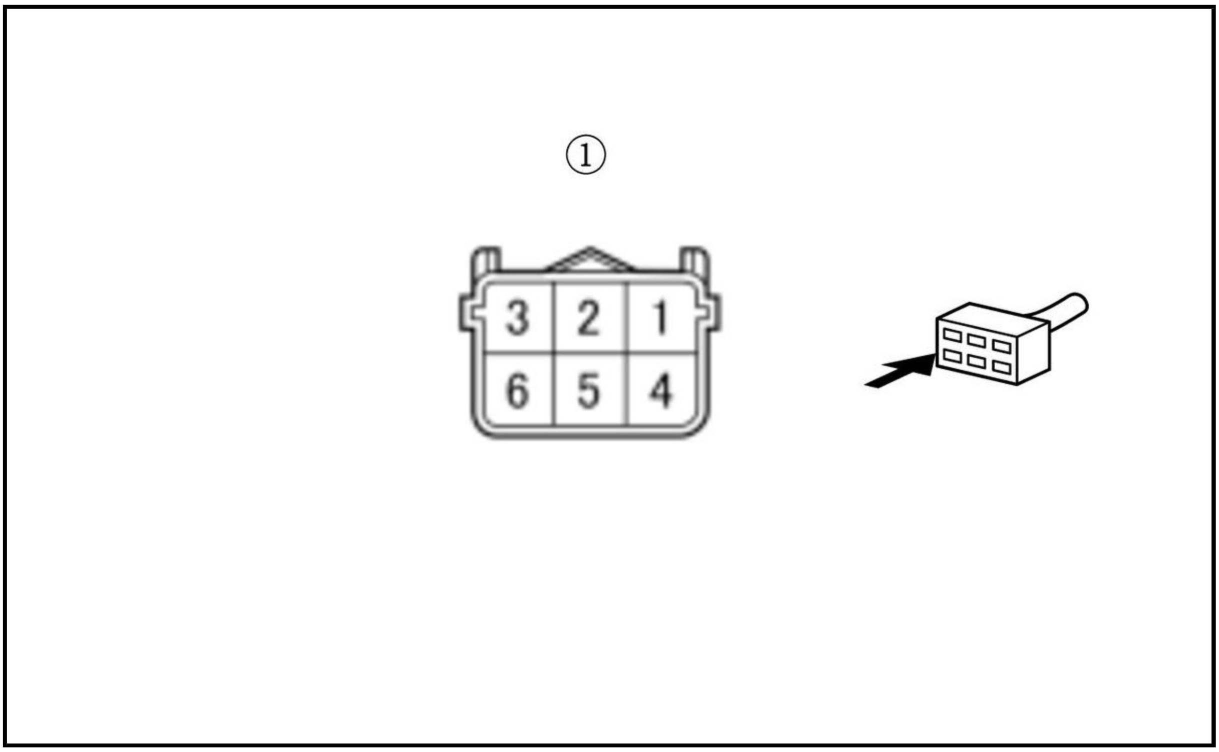
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

A/F sensor (Sensor 1) 6P connector
PCM connector E (80P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 73**



Is there 1.0 Ω or less?

YES

Go to step 3.

NO

Repair an open in the VS wire between the PCM (E73) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

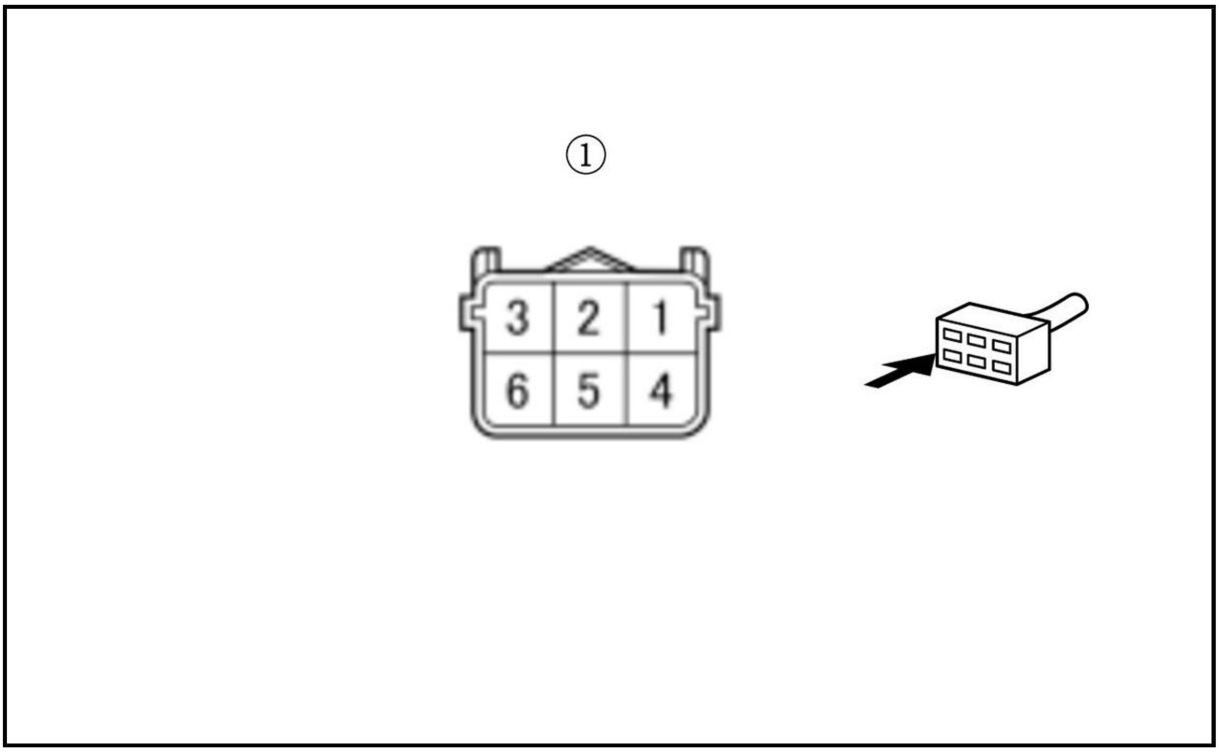
PCM connector E (80P)

-2. Exit the SCS mode with the HDS.

-3. **Enter the maintenance mode, then start the engine** , and let it idle without load (in P or N) for at least 1 minute.

-4. Measure the voltage between test point 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 4: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the A/F sensor (Sensor 1) .

DTC P0135

DTC P0135 : A/F Sensor (Sensor 1) Heater Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0135 A/F Sensor (Sensor 1) Heater Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0135 A/F Sensor (Sensor 1) Heater Circuit Malfunction	B	B

Is DTC P0135 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B
P1659 ETCS Control Relay OFF Malfunction	B	B

Is DTC P1658 and/or P1659 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A11**

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the IGPS (LAF) wire between the No. A11 fuse and the A/F sensor 1 (Sensor 1). Also replace the No. A11 fuse.

4. A/F sensor (Sensor 1) internal heater resistance check

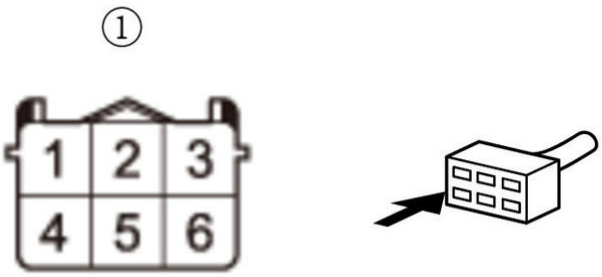
-1. Disconnect the following connector.

A/F sensor (Sensor 1) 6P connector

-2. At the A/F sensor (Sensor 1) side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected

Test point 1	A/F sensor (Sensor 1) 6P connector (female terminals) No. 1 (sensor side) : ①
Test point 2	A/F sensor (Sensor 1) 6P connector (female terminals) No. 2 (sensor side) : ①



Is there 2.8-4.5 Ω at room temperature?

YES

Go to step 5.

NO

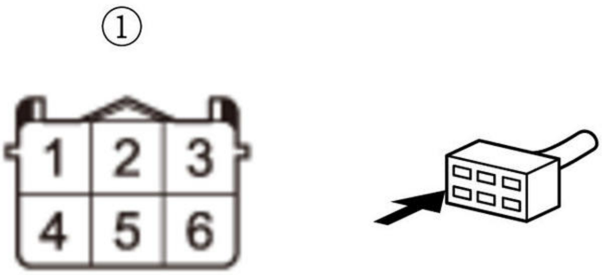
Replace the A/F sensor (Sensor 1) .

5. A/F sensor (Sensor 1) internal circuit check 1

-1. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected

Connector	Terminal
A/F sensor (Sensor 1) 6P connector (female terminals) (sensor side) : ①	No. 1
	No. 2
	No. 4
	No. 5
	No. 6



Is there 1 MΩ or more?

YES

Go to step 6.

NO

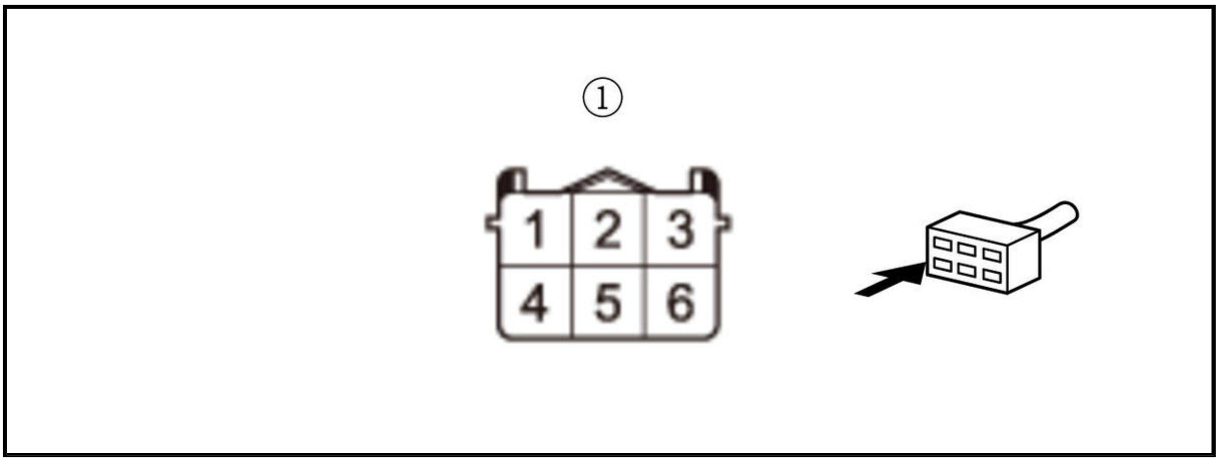
Replace the A/F sensor (Sensor 1) .

6. A/F sensor (Sensor 1) internal circuit check 2

-1. Measure the resistance between the following test points and the A/F sensor (Sensor 1) 6P connector No. 1 individually.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected

Connector	Terminal
A/F sensor (Sensor 1) 6P connector (female terminals) (sensor side) : ①	No. 2
	No. 4
	No. 5
	No. 6



Is there 1 MΩ or more?

YES

Go to step 7.

NO

Replace the A/F sensor (Sensor 1) .

7. Shorted wire check (AFHT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected

B	PCM connector E (80P) : disconnected
Test point 1	**PCM connector E (80P) No. 13**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The AFHT wire is not shorted. Go to step 8.

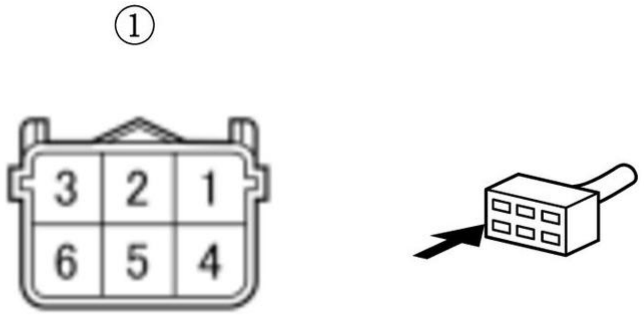
NO

Repair a short in the AFHT wire between the PCM (E13) and the A/F sensor (Sensor 1).

8. Open wire check (AFHT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 13**



Is there 1.0 Ω or less?

YES

The AFHT wire is OK. Go to step 9.

NO

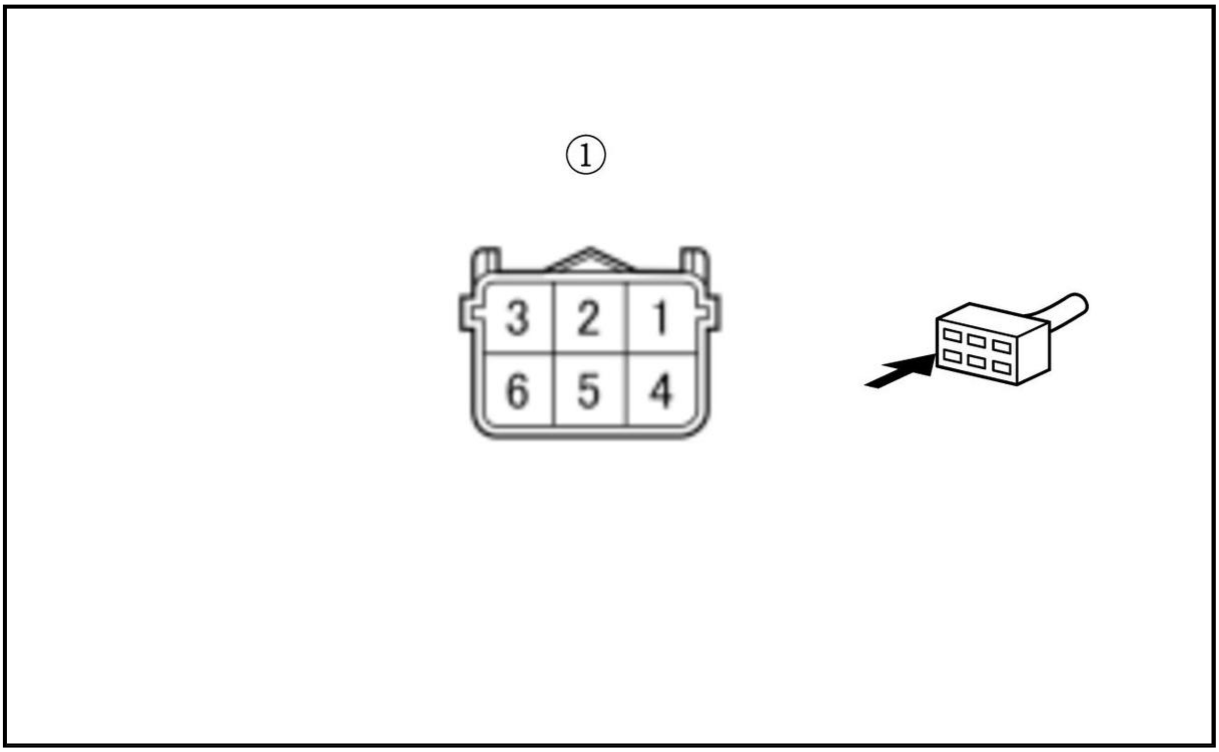
Repair an open in the AFHT wire between the PCM (E13) and the A/F sensor (Sensor 1).

9. Open wire check (IGPS (LAF) line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGPS (LAF) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the IGPS (LAF) wire between the A/F sensor (Sensor 1) and the **No. A11 fuse** .

DTC P0137

DTC P0137 : Secondary HO2S (Sensor 2) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0137 Secondary HO2S (Sensor 2) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Monitor the OBD STATUS for DTC P0137 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0137 Secondary HO2S (Sensor 2) Circuit Low Voltage	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**. If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-4 and recheck.

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	Less than 0.15	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Replace the secondary HO2S (Sensor 2) .

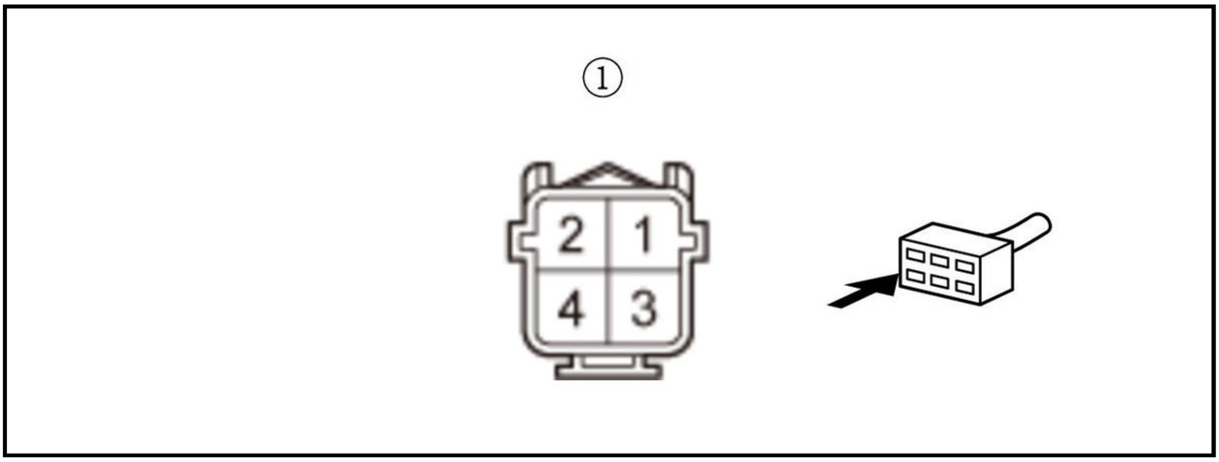
3. Determine possible failure area (short in SO2 line, short in SO2SG/SO2_SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (SO2 line)

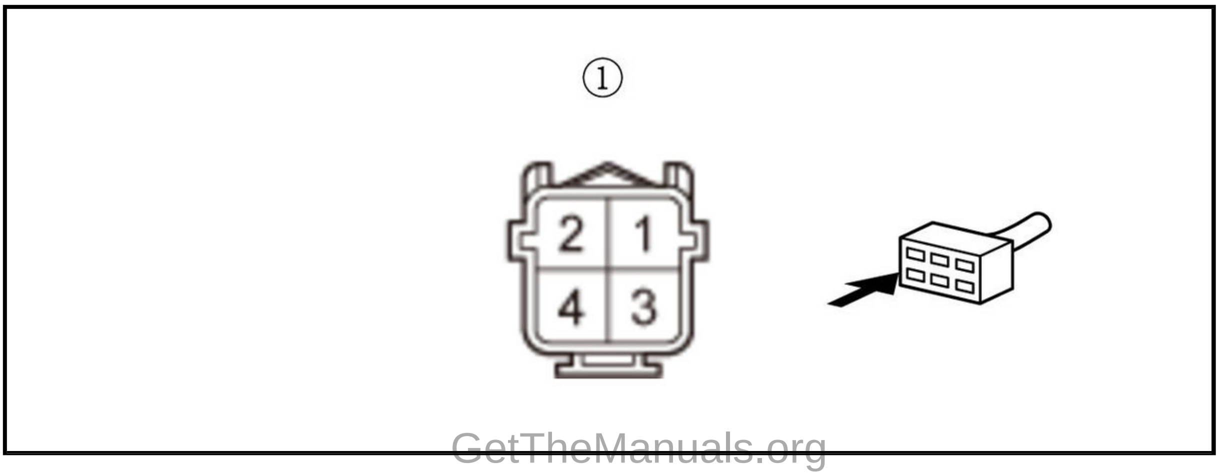
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P) : disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the SO2 wire between the PCM (A47) and the secondary HO2S (Sensor 2).

5. Shorted wire check (SO2SG/SO2_SG line)

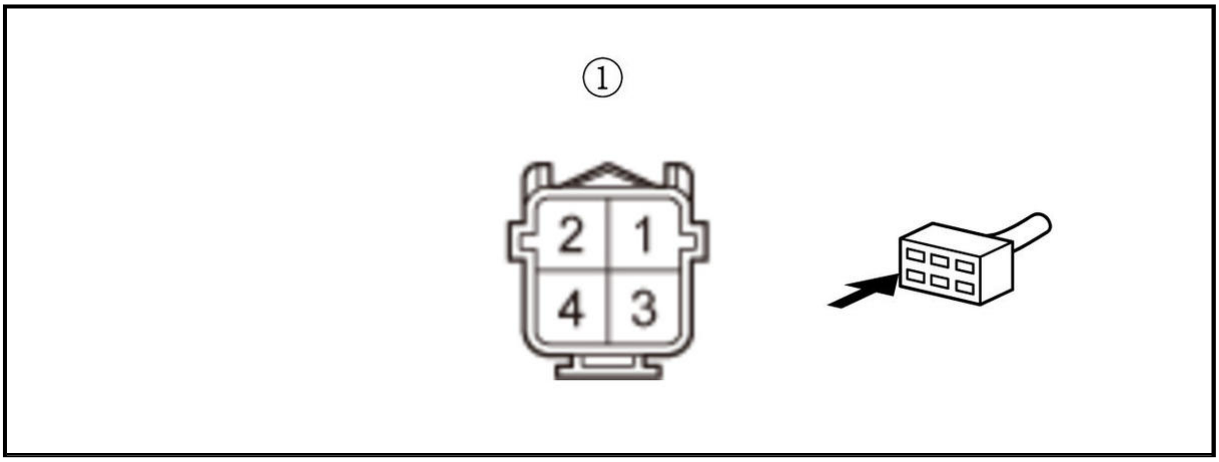
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P) : disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The SO2SG/SO2_SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the SO2SG/SO2_SG wire between the PCM (A48) and the secondary HO2S (Sensor 2).

DTC P0138

DTC P0138 : Secondary HO2S (Sensor 2) Circuit High Voltage

Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0138 Secondary HO2S (Sensor 2) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0138 Secondary HO2S (Sensor 2) Circuit High Voltage	B	B

   Is DTC P0138 is indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (short to power in SO2SG/SO2_SG line, others)

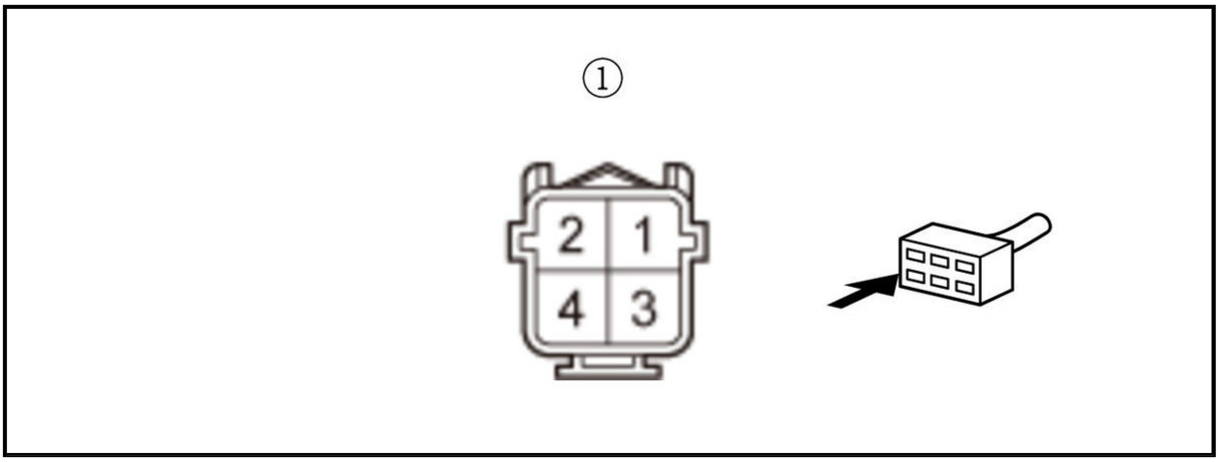
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 3.22	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Go to step 5.

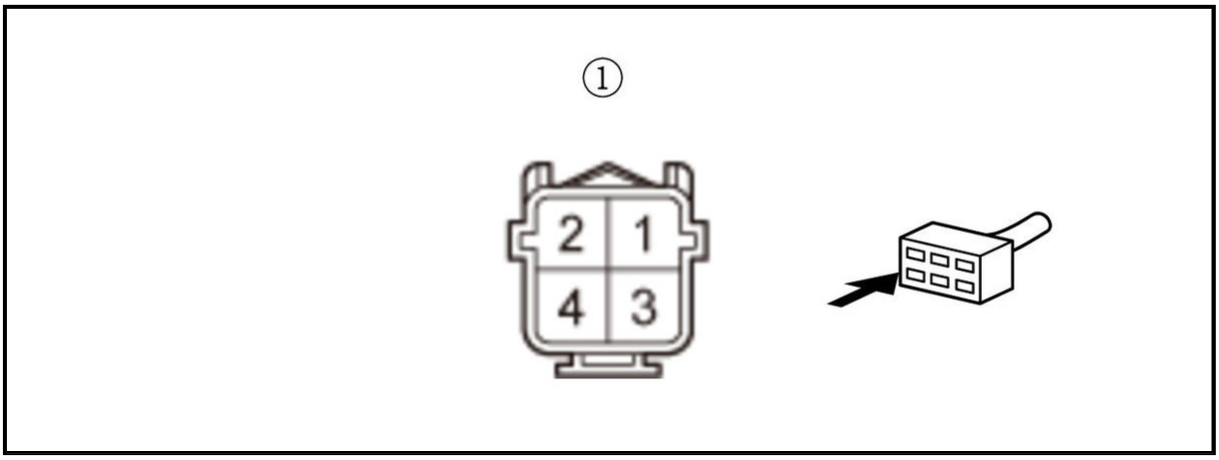
3. Open wire check (SO2SG/SO2_SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 3.22	V	B	B

Do the current condition (s) match the threshold?

YES

The SO2SG/SO2_SG wire is OK. Go to step 4.

NO

Repair an open in the SO2SG/SO2_SG wire between the PCM (A48) and the secondary HO2S (Sensor 2).

4. Open wire check (SO2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P) : disconnected
B	Secondary HO2S (Sensor 2) 4P connector No. 1: jumped to body ground
Test point 1	**PCM connector A (50P) No. 47**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SO2 wire between the PCM (A47) and the secondary HO2S (Sensor 2).

5. Shorted wire check (SO2SG/SO2_SG line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (50P)

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P) : disconnected
Test point 1	**PCM connector A (50P) No. 48**
Test point 2	Body ground

Is there about 5 V or more?

YES

Repair a short to power in the SO2SG/SO2_SG wire between the PCM (A48) and the secondary HO2S (Sensor 2).

NO

The SO2SG/SO2_SG wire is OK. **Replace the secondary HO2S (Sensor 2)** .

DTC P0139

DTC P0139 : Secondary HO2S (Sensor 2) Slow Response

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If there are leaks from the exhaust system, this DTC will be set. Check for damage in the exhaust pipe and repair it if needed.

DTC Description	Confirmed DTC	Pending DTC
P0139 Secondary HO2S (Sensor 2) Slow Response	B	B

DTC (PGM-FI)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0139 Secondary HO2S (Sensor 2) Slow Response	B	B

Is Confirmed DTC P0139 indicated?

YES (Confirmed DTC is indicated)

Replace the secondary HO2S (Sensor 2) .

NO (Pending DTC is indicated)

Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the PCM, and the installation of the secondary HO2S (Sensor 2), then recheck.

DTC P0141

DTC P0141 : Secondary HO2S (Sensor 2) Heater Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0141 Secondary HO2S (Sensor 2) Heater Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** , and let it idle.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0141 Secondary HO2S (Sensor 2) Heater Circuit Malfunction	B	B

   Is DTC P0141 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. D21**

   Is the fuse OK?

   YES

   Go to step 3.

   NO

   Repair a short in the IG1_ACG/IG1 (MAIN) /IG1 (SO2) wire between the No. D21 fuse and the secondary HO2S (Sensor 2). Also replace the No. D21 fuse.

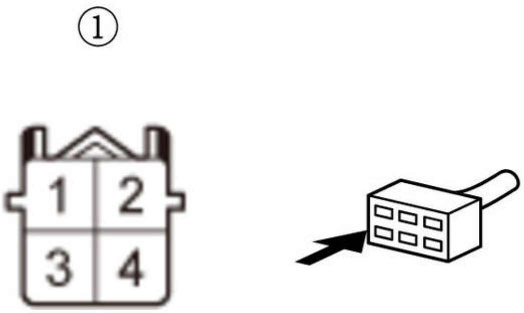
3. Secondary HO2S (Sensor 2) internal heater resistance check

   -1. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-2. At the secondary HO2S (Sensor 2) side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 3 (sensor side) : ①
Test point 2	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 4 (sensor side) : ①



Is there 4.2-6.6 Ω at room temperature?

YES

Go to step 4.

NO

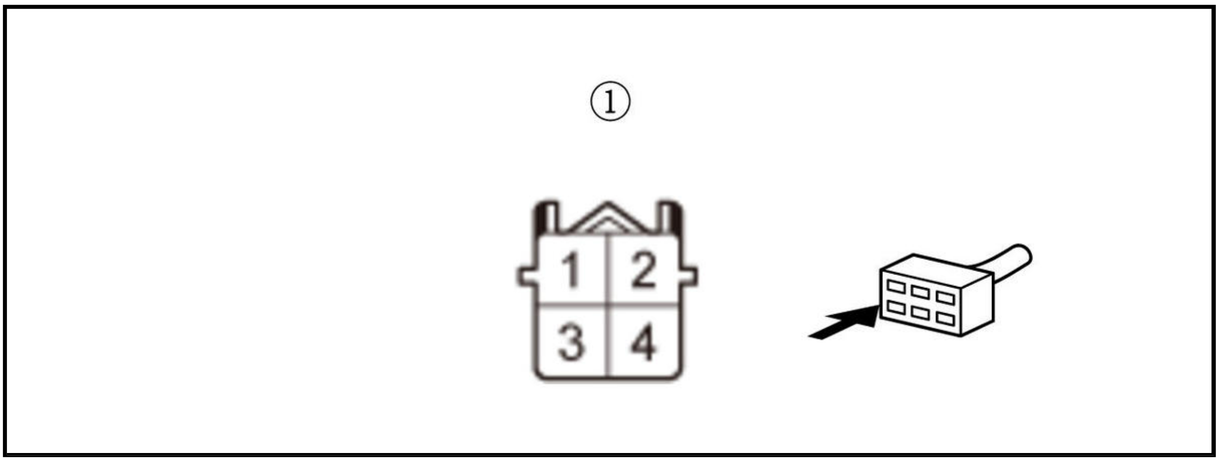
Replace the secondary HO2S (Sensor 2) .

4. Secondary HO2S (Sensor 2) internal circuit check

-1. At the sensor side, measure the resistance between test point 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Secondary HO2S (Sensor 2) 4P connector: disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (female terminals) No. 3 (sensor side) and No. 4 (sensor side) : ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 5.

NO

Replace the secondary HO2S (Sensor 2) .

5. Shorted wire check (SO2HT line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P) : disconnected
Test point 1	PCM connector A (50P) No. 4
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The SO2HT wire is not shorted. Go to step 6.

NO

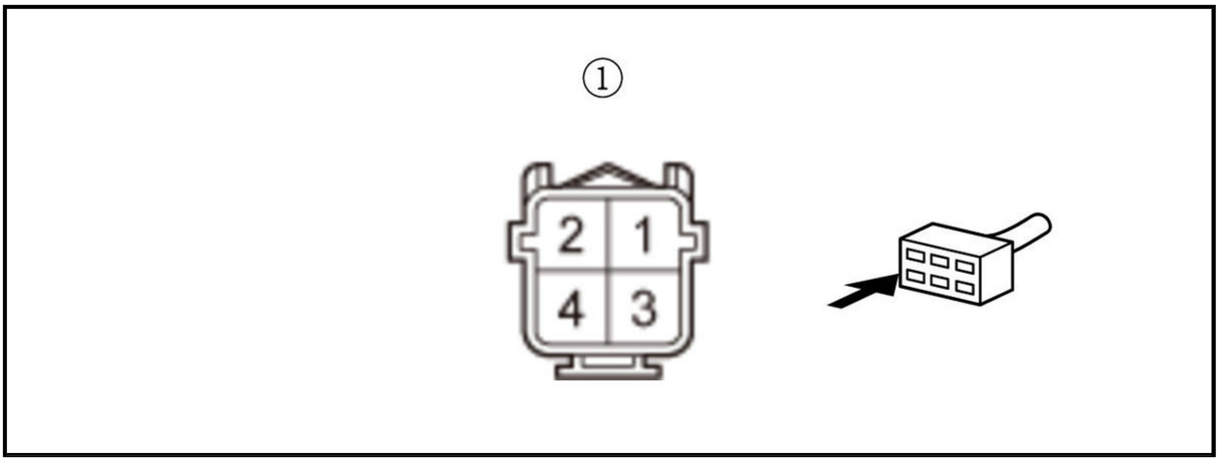
Repair a short in the SO2HT wire between the PCM (A4) and the secondary HO2S (Sensor 2).

6. Open wire check (SO2HT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P) : disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 3: ①

Test point 2	PCM connector A (50P) No. 4



Is there 1.0 Ω or less?

YES

The SO2HT wire is OK. Go to step 7.

NO

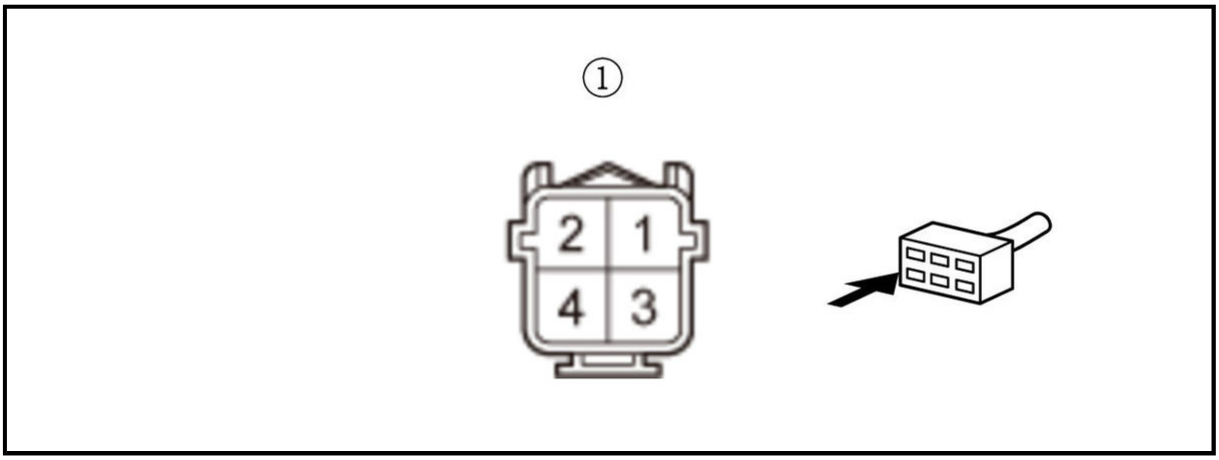
Repair an open in the SO2HT wire between the PCM (A4) and the secondary HO2S (Sensor 2).

7. Open wire check (IG1_ACG/IG1 (MAIN) /IG1 (SO2) line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P) : disconnected
Test point 1	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1_ACG/IG1 (MAIN) /IG1 (SO2) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the IG1_ACG/IG1 (MAIN) /IG1 (SO2) wire between the **No. D21 fuse** and the secondary HO2S (Sensor 2).

DTC P0171

DTC P0171 : Fuel System Too Lean

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- Do not clear the DTC or reset the PCM before beginning this troubleshooting procedure until instructed to clear it. Clearing the DTC or resetting the PCM can delete valuable diagnostic information, even if the on-board snapshot is saved.
- Inspect for aftermarket fuel system and engine components before beginning troubleshooting.
- If any of the DTCs listed below are stored at the same time as DTC P0171, troubleshoot those DTCs first, then recheck for P0171.

  P0010, P0011, P100A, P100B, P100C, P100D: VTC system

  P006A, P0101, P0102, P0103: MAF sensor

  P0105, P0106, P0107, P0108: MAP sensor

  P0130, P0133, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270, P2A01: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0201, P0202, P0203, P0204: No. 1 - No. 4 cylinder injector (s)

  P0400, P0401, P0404, P0405, P0406, P046C, P049D, P2413: EGR system

  P0443, P04AB: EVAP canister purge valve

  P2279: Intake air leakage

  P2646, P2647, P2648, P2649: VTEC system

DTC Description	Confirmed DTC	Pending DTC
P0171 Fuel System Too Lean	B	B

DTC (PGM-FI)

1. Problem verification - Idle

   -1. **Enter the maintenance mode, then start the engine** , and let it idle without load (in P or N).

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST Fuel Trim)	More than 1.30	B	B	B

Do the current condition (s) match the threshold?

YES

The AF FB (ST FUEL TRIM) is too high at idle. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK at idle. Go to step 2.

2. Problem verification - On-board Snapshot

-1. Review the on-board snapshot and record the value of the parameters below when AF FB (ST FUEL TRIM) was at its highest point.

Engine Speed	B
Vehicle Speed	B
REL TP Sensor	B
APP Sensor	B

On-board Snapshot

-2. Drive the vehicle according to the conditions determined above.

Signal	**Current conditions**	
	Values	**Unit**
Engine Speed	B	B
Vehicle Speed	B	B
REL TP Sensor	B	B
APP Sensor	B	B

-3. With the help of an assistant, check the parameter (s) below with the HDS while driving.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST Fuel Trim)	More than 1.30	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

AF FB (ST FUEL TRIM) is too high under the conditions above. Go to step 3.

NO

AF FB (ST FUEL TRIM) is OK under the same conditions as the on-board snapshot. The system is normal at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Check for debris in MAF sensor

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove MAF sensor/IAT sensor 1** .

-3. Check for lint, bugs, and other foreign objects in the sensor.

Is there debris in MAF sensor/IAT sensor 1?

YES

Remove the debris from MAF sensor/IAT sensor 1 and then use a vacuum cleaner to remove any debris from the air cleaner housing.

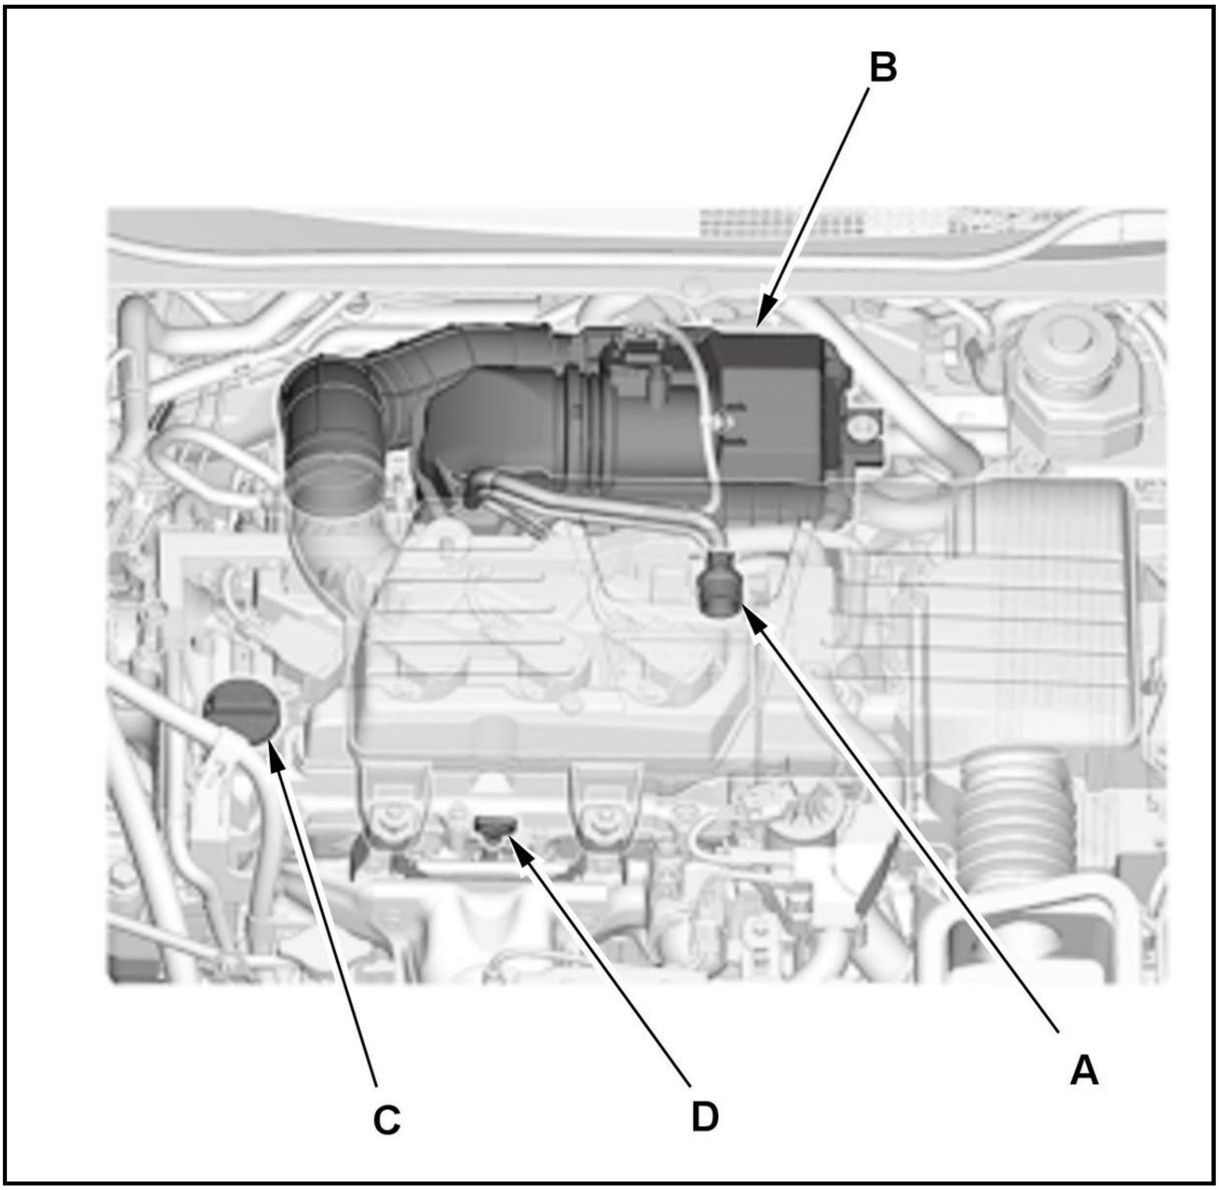
NO

Reinstall MAF sensor/IAT sensor 1 , then go to step 4.

4. Check for disconnected or damaged components:

   Visually inspect each of the components below for disconnected hoses, cracks, or damage:

   - Breather hose (A)
   - Air cleaner housing (B)
   - Oil cap (C) and dipstick (D)



Are any components disconnected or damaged?

YES

Repair the connection or replace damaged part (s).

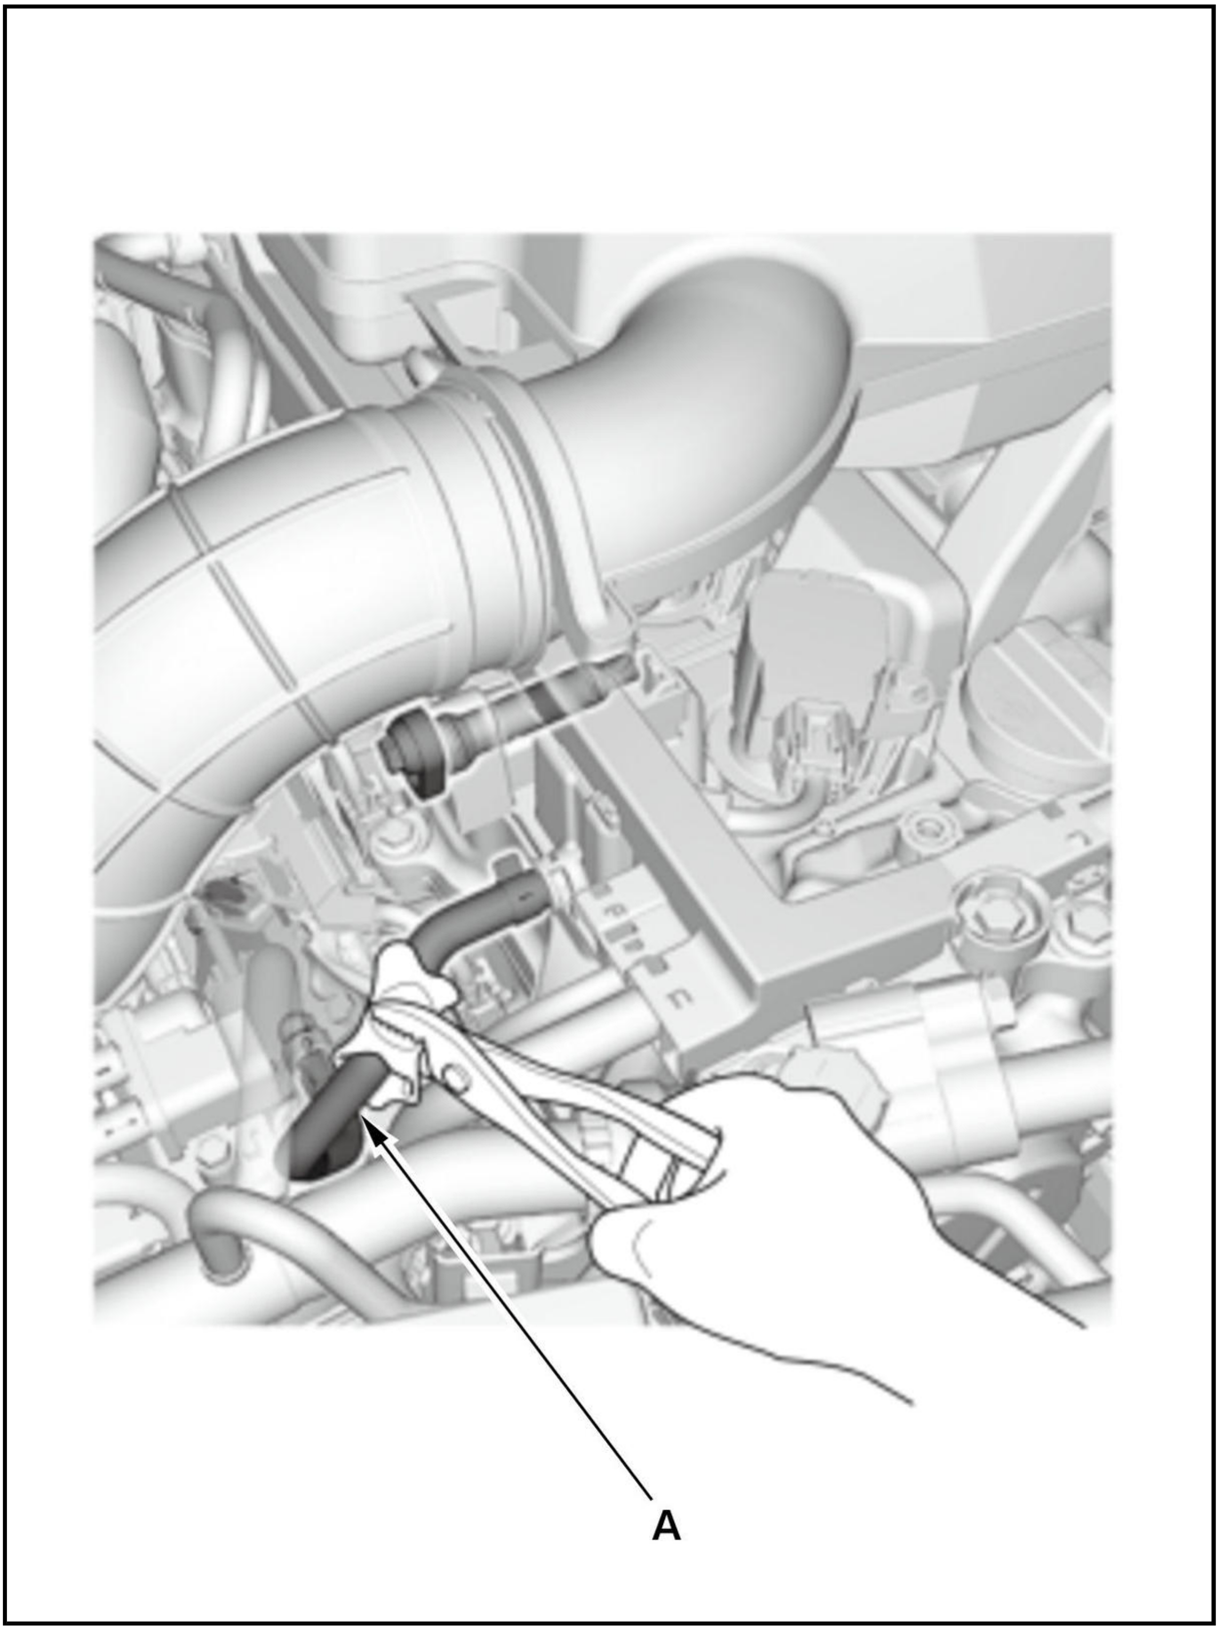
NO

Go to step 5.

5. Check PCV system

-1. **Enter the maintenance mode, then start the engine** .

-2. Gently pinch the PCV hose (A).



-3. Check the parameter (s) below with the HDS with the PCV hose pinched.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST Fuel Trim)	More than 1.30	B	B	B

Do the current condition (s) match the threshold?

YES

The PCV system is not leaking. Go to step 6.

NO

There is a leak in the PCV system. Check the PCV hose for leaks and repair as needed. If the hose is OK, **replace the PCV valve** .

6. Check MAF sensor reading

-1. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Make sure the following conditions are met:

- ECT Sensor 1 above 158 deg.F (70 deg.C)
- Transmission in P or N
- All engine and electrical loads turned off

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Monitor the Engine Speed in the DATA LIST with the HDS, then hold the engine speed at 2, 500 rpm with the accelerator pedal held steady.

Signal	Current conditions	
	Values	Unit
Engine Speed	B	B

-4. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor	7.5 - 10.5	g/s	B	B

Do the current condition (s) match the threshold?

YES

The MAF sensor read value is OK. Go to step 7.

NO

The MAF sensor read value is incorrect. Inspect for a cracked, damaged, or incorrectly installed air cleaner assembly. If OK, **replace MAF sensor/IAT sensor 1** .

7. Check for intake manifold vacuum leaks

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the intake air duct from the air cleaner housing.

-3. Connect a large intake manifold adapter cone into the intake air duct from the OTC LeakMaster evaporative emissions system tester kit.

-4. Use the OTC LeakMaster evaporative emissions system tester to direct smoke into the intake manifold.

Inspect each of the areas below for signs of leaks:

- Intake manifold and gaskets
- Throttle body and gasket
- Air intake ducting
- All vacuum and air hoses

Are there any leaks?

YES

Repair the vacuum leak.

NO

Reconnect any disconnected components, then go to step 8.

8. Check fuel pressure

-1. **Check the fuel pressure** under the conditions when AF FB (ST FUEL TRIM) is 1.30 or more.

Signal	Current conditions	
	Values	Unit
AF FB (ST Fuel Trim)	B	B

Is the fuel pressure within a specified range of **fuel pressure test** ?

YES

The fuel pressure is OK. Go to step 9.

NO

Check the correct power supply and ground for the fuel pump and if both are OK, **replace the fuel tank unit** .

9. Replace fuel:

NOTE: There is an increased likelihood of a fuel related issue if the lean condition appeared shortly after refueling. The MIL DIST (MIL Distance) value in the DATA LIST in combination with the fuel level may help you make this determination.

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Drain the fuel from the fuel tank unit, and refill the fuel tank with known-good fuel.

-3. **Enter the maintenance mode, then start the engine** .

-4. Operate the vehicle under the same conditions where AF FB (ST FUEL TRIM) was 1.30 or more.

Engine Speed	B
Vehicle Speed	B
REL TP Sensor	B
APP Sensor	B

On-board Snapshot

Signal	Current conditions	
	Values	**Unit**
Engine Speed	B	B
Vehicle Speed	B	B
REL TP Sensor	B	B
APP Sensor	B	B

-5. With the help of an assistant, check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST Fuel Trim)	More than 1.30	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The fuel is not the cause of the high AF FB (ST FUEL TRIM) value. Go to step 10.

NO

The fuel was causing the high AF FB (ST FUEL TRIM) value.

10. Replace A/F sensor (Sensor 1)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Replace the A/F sensor (Sensor 1) with a known-good sensor** .

-3. **Enter the maintenance mode, then start the engine** .

-4. Operate the vehicle under the same conditions where AF FB (ST FUEL TRIM) was 1.30 or more.

Engine Speed	B
Vehicle Speed	B
REL TP Sensor	B
APP Sensor	B

On-board Snapshot

Signal	Current conditions	
	Values	**Unit**
Engine Speed	B	B
Vehicle Speed	B	B
REL TP Sensor	B	B
APP Sensor	B	B

-5. With the help of an assistant, check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST Fuel Trim)	More than 1.30	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The A/F sensor (Sensor 1) is not the cause of the high AF FB (ST FUEL TRIM) value. Reinstall the original A/F sensor (Sensor 1), then go to step 11.

NO

The A/F sensor (Sensor 1) was causing the high AF FB (ST FUEL TRIM) value. **Replace the original A/F sensor (Sensor 1)** .

11. Replace injectors

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Replace the injectors with known-good injectors** .

-3. **Enter the maintenance mode, then start the engine** .

-4. Operate the vehicle under the same conditions where AF FB (ST FUEL TRIM) was 1.30 or more.

Engine Speed	B
Vehicle Speed	B
REL TP Sensor	B
APP Sensor	B

On-board Snapshot

Signal	Current conditions	
	Values	**Unit**
Engine Speed	B	B
Vehicle Speed	B	B
REL TP Sensor	B	B
APP Sensor	B	B

-5. With the help of an assistant, check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST Fuel Trim)	More than 1.30	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The injectors are not the cause of the high AF FB (ST FUEL TRIM) value. **Substitute a known-good PCM** , then recheck.

NO

The injectors were causing the high AF FB (ST FUEL TRIM) value. **Replace the original injectors** .

DTC P0172

DTC P0172 : Fuel System Too Rich

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- Do not clear the DTC or reset the PCM before beginning this troubleshooting procedure until instructed to clear it. Clearing the DTC or resetting the PCM can delete valuable diagnostic information, even if the on-board snapshot is saved.
- Inspect for aftermarket fuel system and engine components before beginning troubleshooting.
- If any of the DTCs listed below are stored at the same time as P0172, troubleshoot those DTCs first, then recheck for P0172.

  P0010, P0011, P100A, P100B, P100C, P100D: VTC system

  P006A, P0101, P0102, P0103: MAF sensor

  P0105, P0106, P0107, P0108: MAP sensor

  P0130, P0133, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270, P2A01: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0201, P0202, P0203, P0204: No. 1 - No. 4 cylinder injector (s)

  P0400, P0401, P0404, P0405, P0406, P046C, P049D, P2413: EGR system

  P0443, P04AB: EVAP canister purge valve

  P2279: Intake air leakage

  P2646, P2647, P2648, P2649: VTEC system

DTC Description	Confirmed DTC	Pending DTC
P0172 Fuel System Too Rich	B	B

DTC (PGM-FI)

1. Problem verification - Idle

   -1. **Enter the maintenance mode, then start the engine** .

   -2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST Fuel Trim)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold?

YES

The AF FB (ST FUEL TRIM) is too low at idle. Go to step 3.

NO

The AF FB (ST FUEL TRIM) is OK at idle. Go to step 2.

2. Problem verification - On-board Snapshot

   -1. Review the on-board snapshot and record the value of the parameters below when AF FB (ST FUEL TRIM) was at its lowest point.

Engine Speed	B
Vehicle Speed	B
REL TP Sensor	B
APP Sensor	B

   On-board Snapshot

   -2. Drive the vehicle according to the conditions determined above.

Signal	Current conditions	
	Values	**Unit**
Engine Speed	B	B
Vehicle Speed	B	B
REL TP Sensor	B	B

Signal	Current conditions	
	Values	**Unit**
APP Sensor	B	B

   -3. With the help of an assistant, check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST Fuel Trim)	Less than 0.79	B	B	B

   Do the current condition (s) match the threshold under the on-board snapshot conditions?

   YES

   AF FB (ST FUEL TRIM) is too low under the conditions above. Go to step 3.

   NO

   AF FB (ST FUEL TRIM) is OK under the same conditions as the on-board snapshot. The system is normal at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Check fuel pressure

-1. **Enter the maintenance mode, then start the engine** , and let it idle.

-2. **Check the fuel pressure** under the conditions when AF FB (ST FUEL TRIM) is 0.79 or less.

Signal	**Current conditions**	
	Values	**Unit**
AF FB (ST Fuel Trim)	B	B

Is the fuel pressure within a specified range of **fuel pressure test** ?

YES

The fuel pressure is OK. Go to step 4.

NO

Replace the fuel pressure regulator and the fuel tank unit .

4. Replace fuel:

NOTE: There is an increased likelihood of a fuel related issue if the rich condition appeared shortly after refueling. The MIL DIST (MIL Distance) value in the DATA LIST in combination with the fuel level may help you make this determination.

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Drain the fuel from the fuel tank unit, and refill the fuel tank with known-good fuel.

-3. **Enter the maintenance mode, then start the engine** , and let it idle.

-4. Operate the vehicle under the same conditions where AF FB (ST FUEL TRIM) was 0.79 or less.

Engine Speed	B
Vehicle Speed	B
REL TP Sensor	B
APP Sensor	B

On-board Snapshot

Signal	**Current conditions**	
	Values	**Unit**
Engine Speed	B	B
Vehicle Speed	B	B
REL TP Sensor	B	B
APP Sensor	B	B

-5. With the help of an assistant, check the parameter (s) below with the HDS while driving.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
AF FB (ST Fuel Trim)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The fuel is not the cause of the low AF FB (ST FUEL TRIM) value. Go to step 5.

NO

The fuel was causing the low AF FB (ST FUEL TRIM) value.

5. Check MAF sensor reading

-1. Continue to let the engine idle.

Make sure the following conditions are met:

- ECT Sensor 1 above 158 deg.F (70 deg.C)
- Transmission in P or N
- All engine and electrical loads turned off

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Monitor the Engine Speed in the DATA LIST with the HDS, then hold the engine speed at 2, 500 rpm with the accelerator pedal held steady.

Signal	Current conditions	
	Values	Unit
Engine Speed	B	B

-4. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor	7.5-10.5	g/s	B	B

Do the current condition (s) match the threshold?

YES

The MAF sensor read value is OK. Go to step 6.

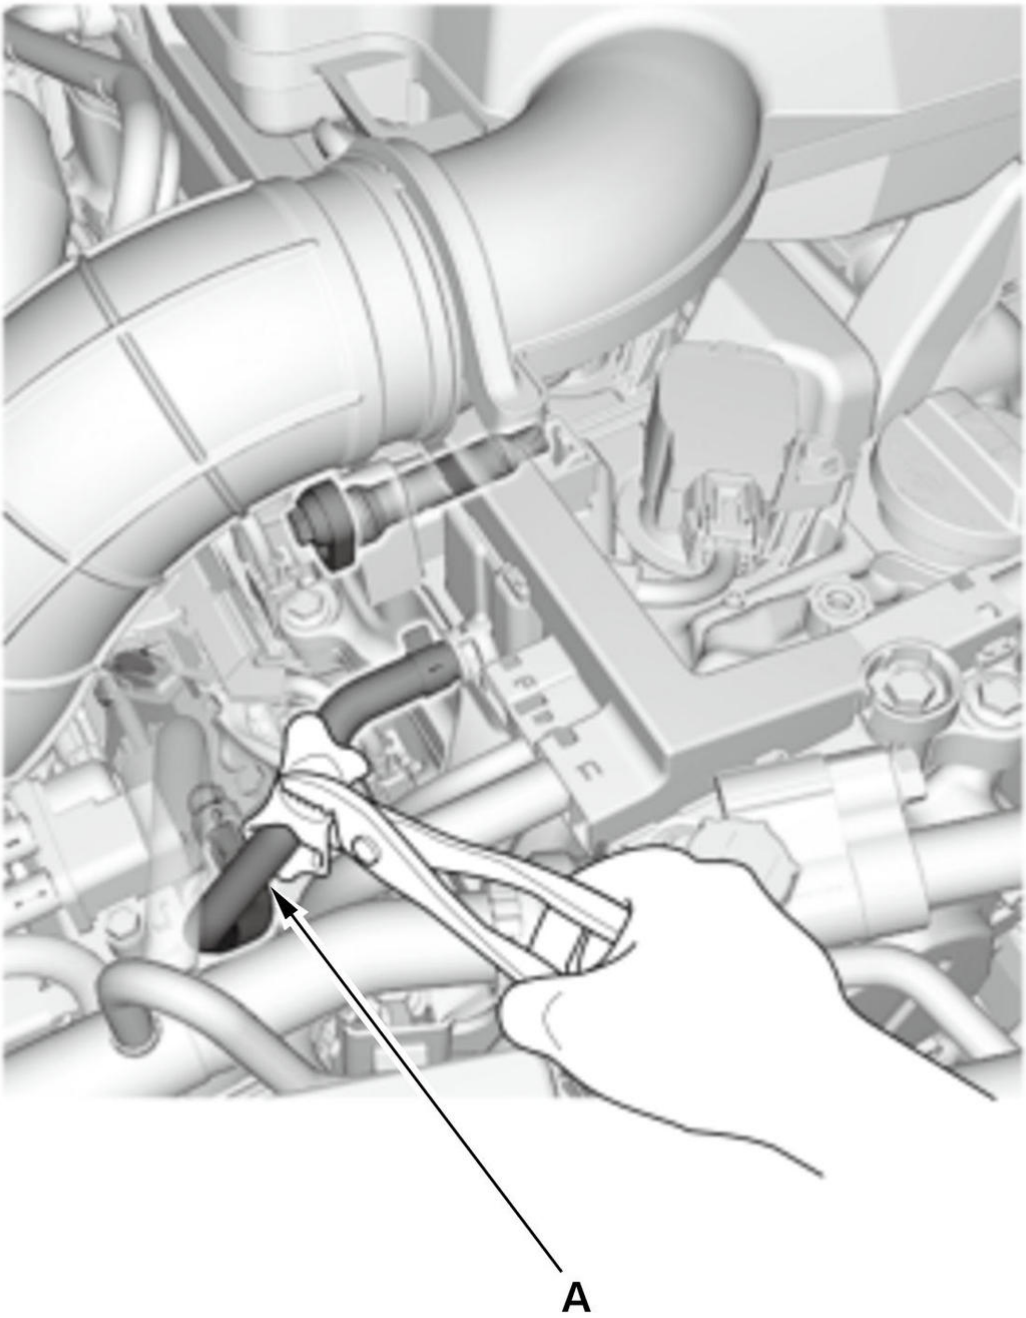
NO

The MAF sensor read value is incorrect. Inspect for a cracked, damaged, or incorrectly installed air cleaner assembly. If OK, **replace MAF sensor/IAT sensor 1** .

6. Check engine oil

-1. Continue to let the engine idle.

-2. Gently pinch the PCV hose (A).



-3. Check the parameter (s) below with the HDS with the PCV hose pinched.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST Fuel Trim)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold?

YES

The engine oil is OK. Go to step 7.

NO

The engine oil is contaminated. Determine the cause of the contaminated oil (faulty injectors, etc.), then **replace the engine oil** and **oil filter** .

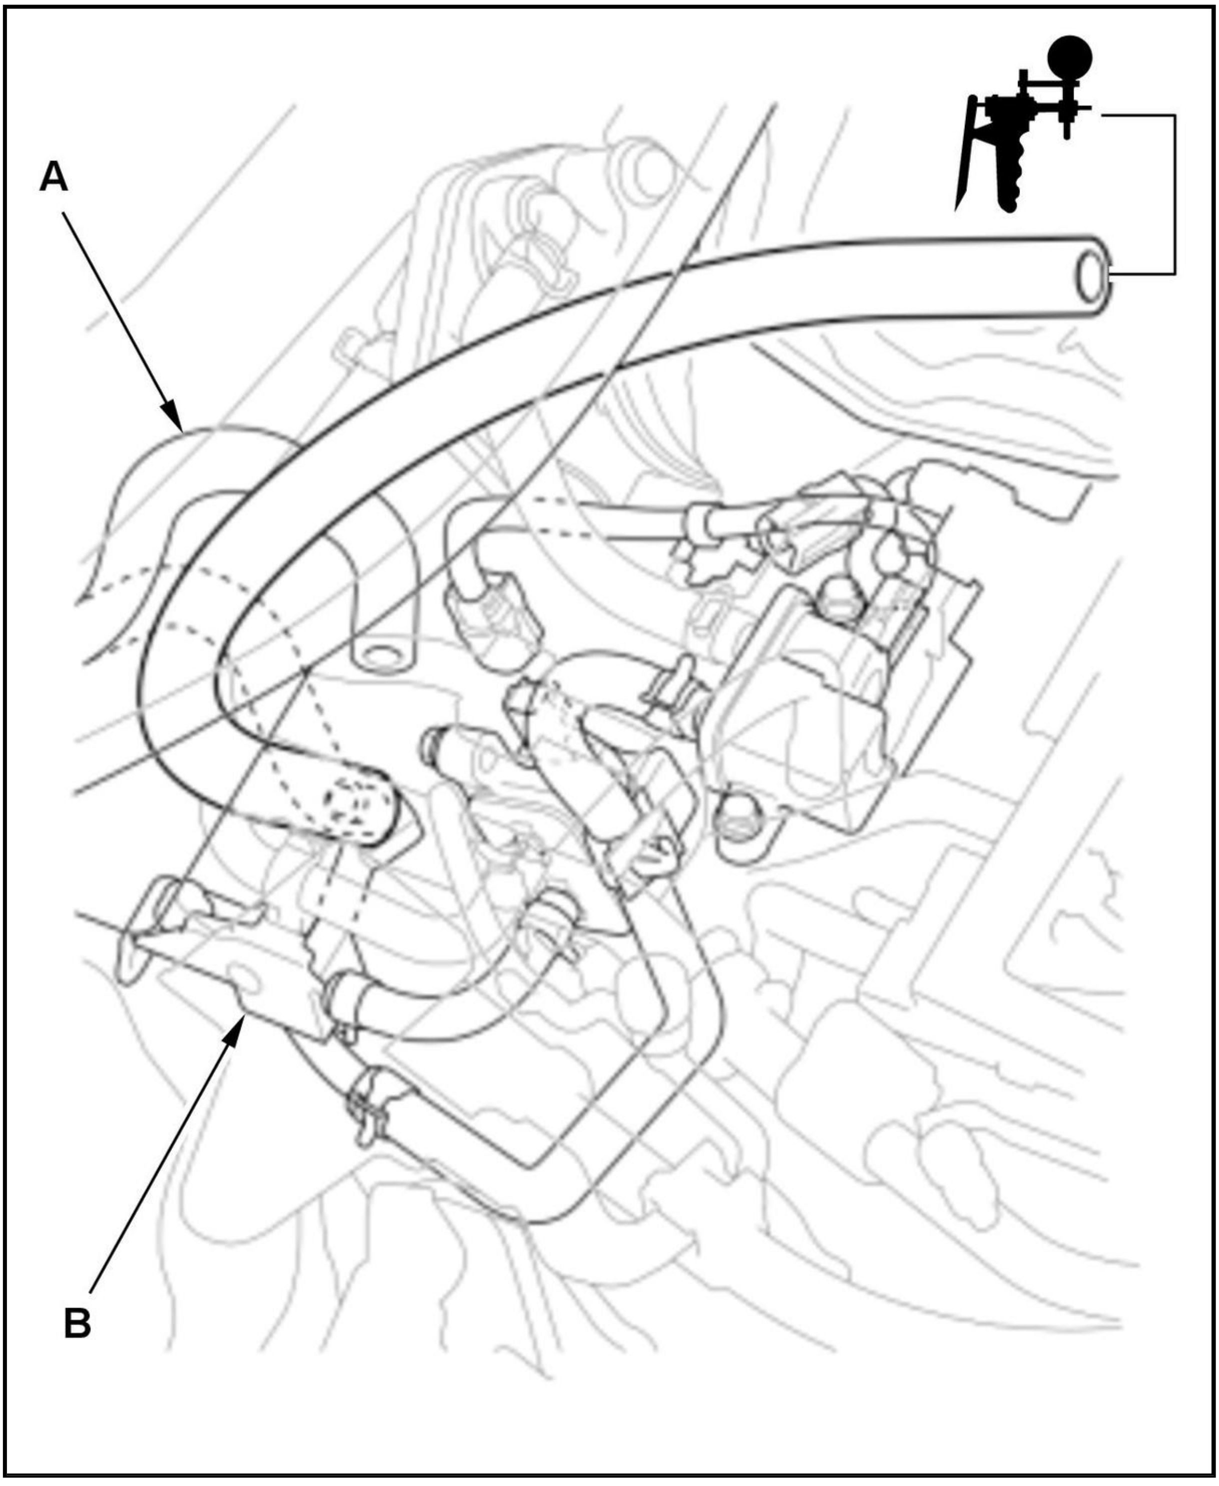
7. Check EVAP canister purge valve

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

EVAP canister purge valve 1 2P connector
EVAP canister purge valve 2 2P connector

-3. Disconnect the vacuum hose (purge line) (A) from the 3-way joint (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 inHg to the 3-way joint as shown.



-4. **Enter the maintenance mode, then start the engine** , and let it idle.

Is there vacuum?

YES

When the climate is warm, fuel vapor from the canister line to the fuel tank enters intake manifold, enriching mixture (excessively rich), causing the engine to stall in some cases. If needed, **replace EVAP canister purge valve 1 and/or EVAP canister purge valve 2** .

NO

Go to step 8.

8. Replace A/F sensor (Sensor 1)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Replace the A/F sensor (Sensor 1) with a known-good sensor** .

   -3. **Enter the maintenance mode, then start the engine** , and let it idle.

   -4. Operate the vehicle under the same conditions where AF FB (ST FUEL TRIM) was 0.79 or less.

Engine Speed	B
Vehicle Speed	B
REL TP Sensor	B
APP Sensor	B

On-board Snapshot

Signal	Current conditions	
	Values	Unit
Engine Speed	B	B
Vehicle Speed	B	B
REL TP Sensor	B	B
APP Sensor	B	B

-5. With the help of an assistant, check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST Fuel Trim)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The A/F sensor (Sensor 1) is not the cause of the low AF FB (ST FUEL TRIM) value. Reinstall the original A/F sensor (Sensor 1), then go to step 9.

NO

The A/F sensor (Sensor 1) was causing the low AF FB (ST FUEL TRIM) value. **Replace the original A/F sensor (Sensor 1)** .

9. Replace injectors

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Replace the injectors with known-good injectors .

-3. Enter the maintenance mode, then start the engine , and let it idle.

-4. Operate the vehicle under the same conditions where AF FB (ST FUEL TRIM) was 0.79 or less.

Engine Speed	B
Vehicle Speed	B
REL TP Sensor	B
APP Sensor	B

On-board Snapshot

Signal	Current conditions	
	Values	Unit
Engine Speed	B	B
Vehicle Speed	B	B
REL TP Sensor	B	B
APP Sensor	B	B

-5. With the help of an assistant, check the parameter (s) below with the HDS while driving.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
AF FB (ST Fuel Trim)	Less than 0.79	B	B	B

Do the current condition (s) match the threshold under the on-board snapshot conditions?

YES

The injectors are not the cause of the low AF FB (ST FUEL TRIM) value. Substitute a known-good PCM , then recheck.

NO

The injectors were causing the low AF FB (ST FUEL TRIM) value. Replace the original injectors .

DTC P0201, P0202, P0203, P0204

DTC P0201 : No. 1 Cylinder Injector Circuit Malfunction

DTC P0202 : No. 2 Cylinder Injector Circuit Malfunction

DTC P0203 : No. 3 Cylinder Injector Circuit Malfunction

DTC P0204 : No. 4 Cylinder Injector Circuit Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC
P0201 No. 1 Cylinder Injector Circuit Malfunction	B	B
P0202 No. 2 Cylinder Injector Circuit Malfunction	B	B
P0203 No. 3 Cylinder Injector Circuit Malfunction	B	B
P0204 No. 4 Cylinder Injector Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0201 No. 1 Cylinder Injector Circuit Malfunction	B	B
P0202 No. 2 Cylinder Injector Circuit Malfunction	B	B
P0203 No. 3 Cylinder Injector Circuit Malfunction	B	B
P0204 No. 4 Cylinder Injector Circuit Malfunction	B	B

Is DTC P0201, P0202, P0203, and/or P0204 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the injector and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Injector internal resistance check

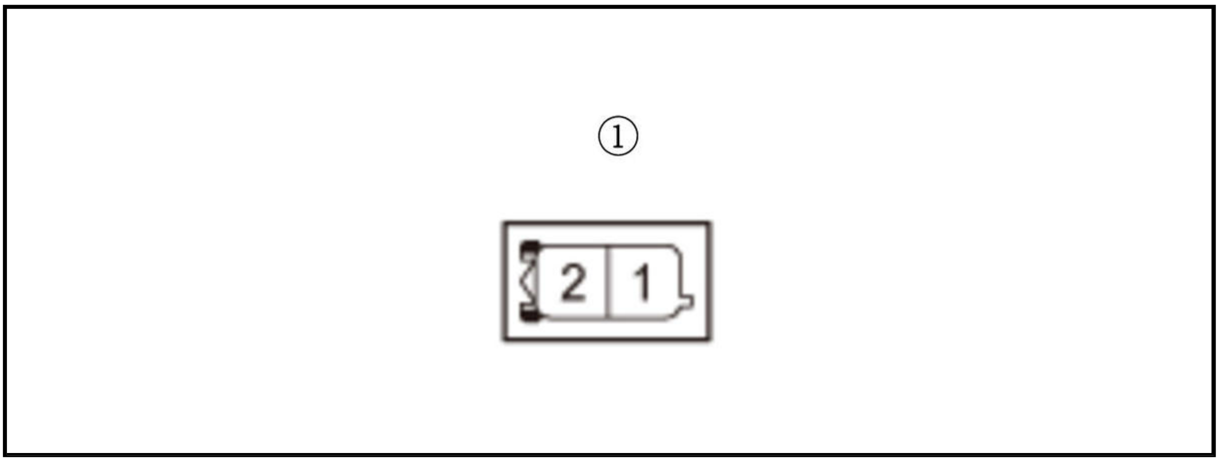
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector (s).

Injector 2P connector (problem cylinder)

-3. At the injector side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Injector 2P connector (problem cylinder) : disconnected
Test point 1	Injector 2P connector (male terminals) No. 1 (injector side) : ①
Test point 2	Injector 2P connector (male terminals) No. 2 (injector side) : ①



Is there 9.8 - 11 Ω at room temperature?

YES

The injector is OK. Go to step 3.

NO

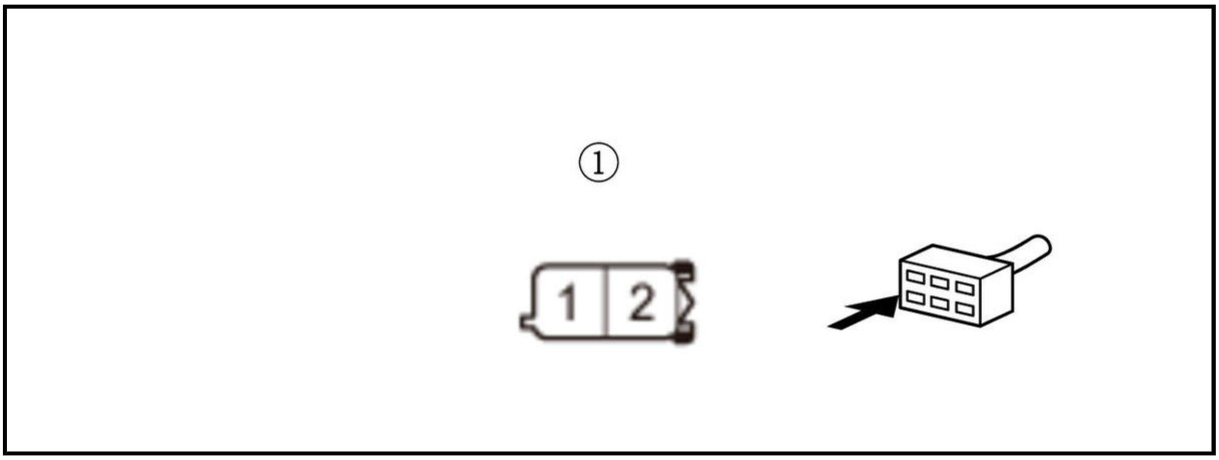
Replace the problem injector .

3. Open wire check (IGP (INJ) //IGP (MAIN) /FI_MAIN_RLY_OUT line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Injector 2P connector (problem cylinder) : disconnected
Test point 1	Injector 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Repair an open in the IGP (INJ) //IGP (MAIN) /FI_MAIN_RLY_OUT wire between the injector and the relay circuit board.

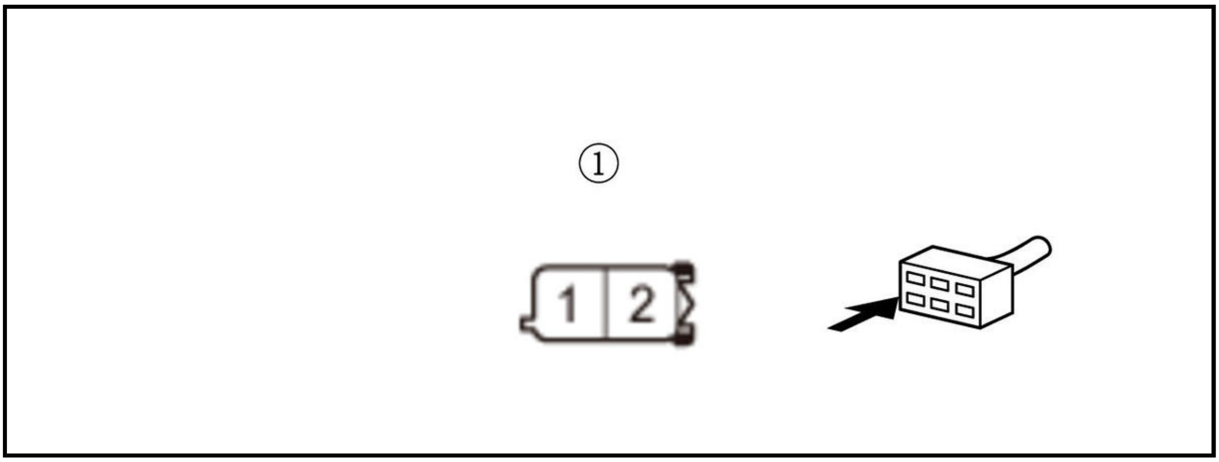
4. Determine possible failure area (short in INJ line, open in INJ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between body ground and the appropriate injector 2P connector terminal No. 2 of the problem cylinder (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Injector 2P connector (problem cylinder) : disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0201	Injector 2P connector (female terminals) : ①	No. 1
No. 2	P0202		
No. 3	P0203		
No. 4	P0204		



Is there 1 MΩ or more?

YES

Go to step 6.

NO

Go to step 5.

5. Shorted wire check (INJ lines)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

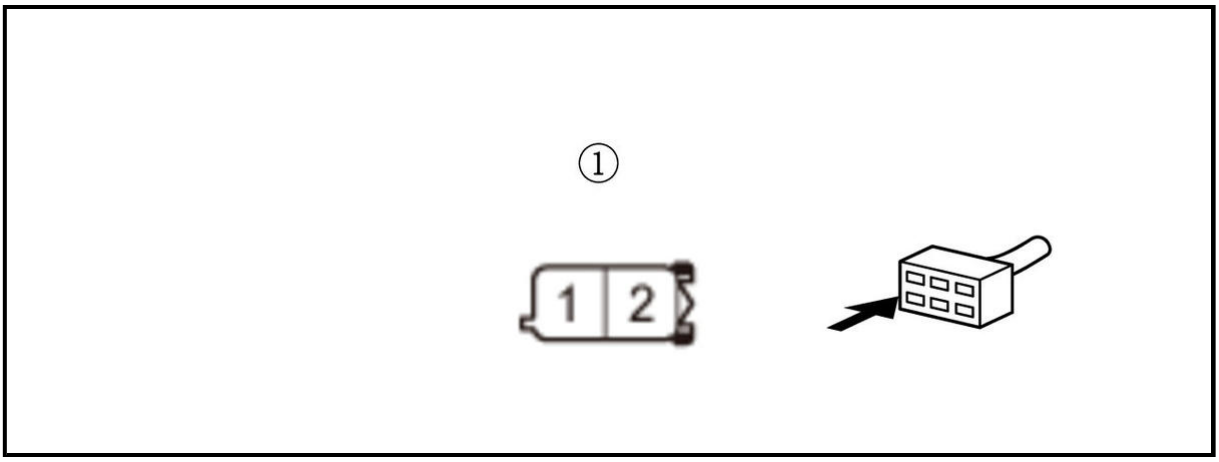
-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between body ground and the appropriate injector 2P connector terminal No. 1 of the problem cylinder (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Injector 2P connector (problem cylinder) : disconnected
B	PCM connector E (80P) : disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0201	Injector 2P connector (female terminals) : ①	No. 2
No. 2	P0202		
No. 3	P0203		
No. 4	P0204		



Is there 1 MΩ or more?

YES

The INJ wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the INJ wire between the PCM and the injector.

6. Open wire check (INJ lines)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

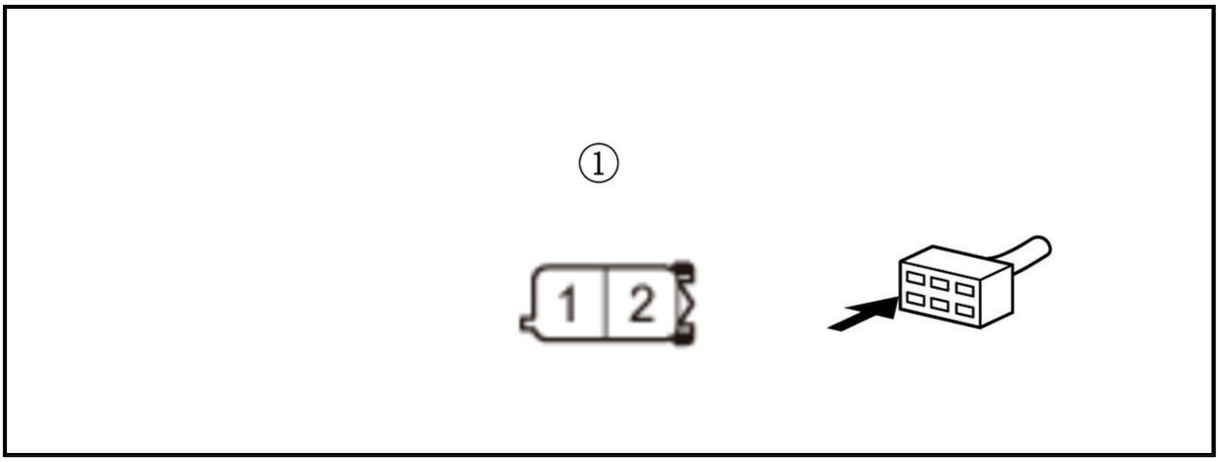
   -2. Disconnect the following connector.

PCM connector E (80P)

   -3. Measure the resistance between appropriate injector 2P connector terminal No. 2: ① and the appropriate PCM connector terminal of the problem cylinder (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Injector 2P connector (problem cylinder) : disconnected
B	PCM connector E (80P) : disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0201	**PCM connector E (80P)**	No. 18
No. 2	P0202		No. 21
No. 3	P0203		No. 20
No. 4	P0204		No. 19



Is there 1.0 Ω or less?

YES

The INJ wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the INJ wire between the PCM and the injector.

DTC P0221

DTC P0221 : TP Sensor B Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0221 TP Sensor B Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP Sensor B	Less than 0.50	V	B	B

   Do the current condition (s) match the threshold?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Go to step 2.

2. Problem verification 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
TP Sensor B	More than 4.63	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 7.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

3. Determine possible failure area (THL2 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

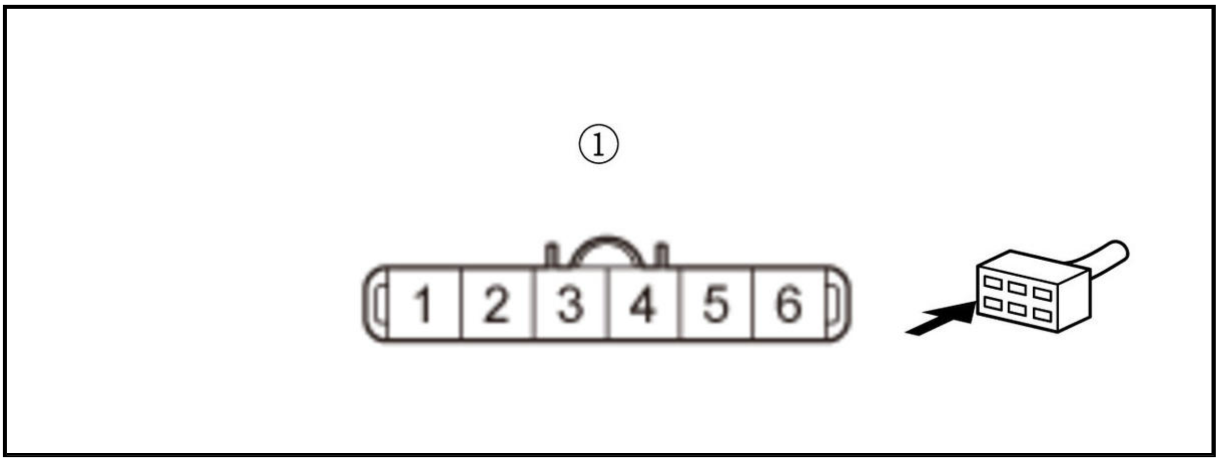
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P) : disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the THL2 wire between the PCM (E51) and the throttle body.

5. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

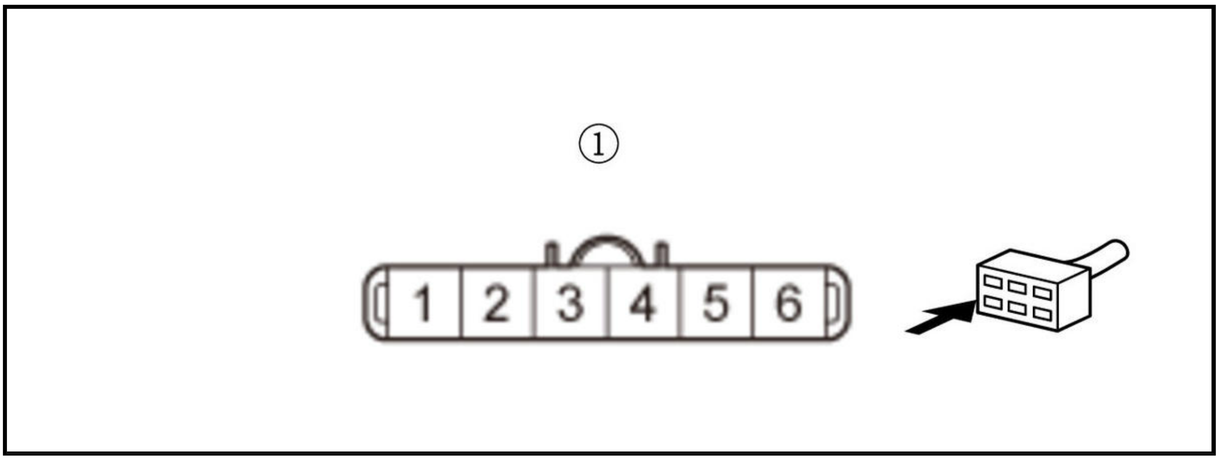
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 6.

6. Open wire check (VCC3 (DBW) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

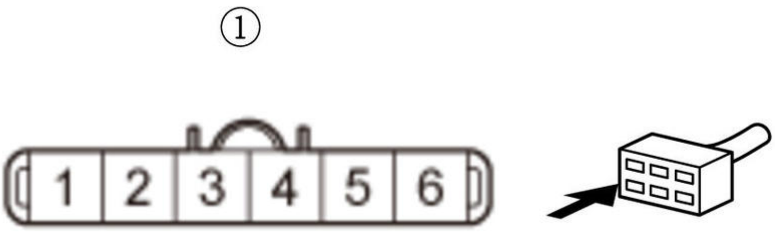
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	PCM connector E (80P) No. 75



Is there 1.0 Ω or less?

YES

The VCC3 (DBW) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the VCC3 (DBW) wire between the PCM (E75) and the throttle body.

7. Determine possible failure area (SG3 (DBW) line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0121 TP Sensor A Out of Range	B	B
P0221 TP Sensor B Out of Range	B	B

Are DTC P0121 and P0221 indicated at the same time?

YES

Go to step 10.

NO

Go to step 8.

8. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

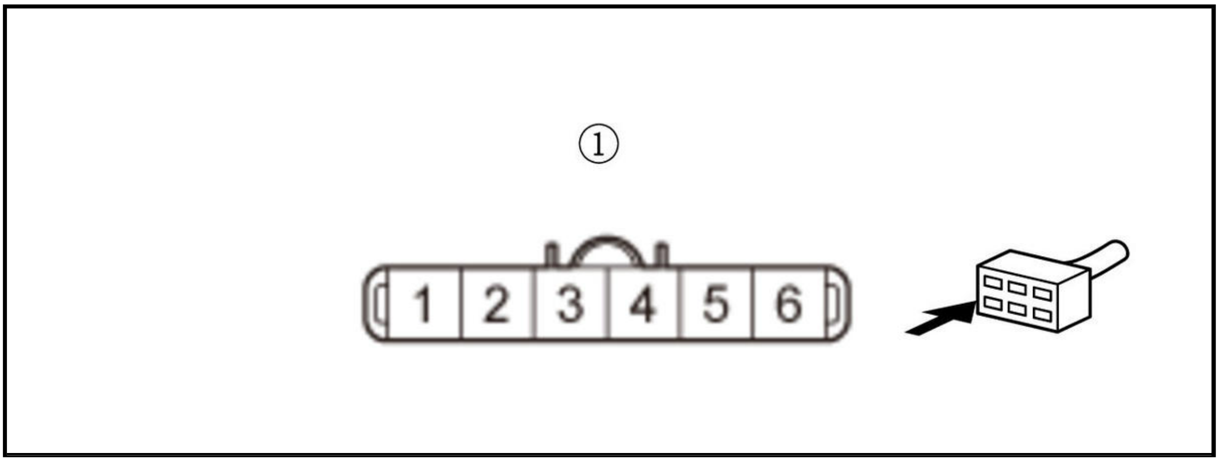
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 9.

9. Open wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

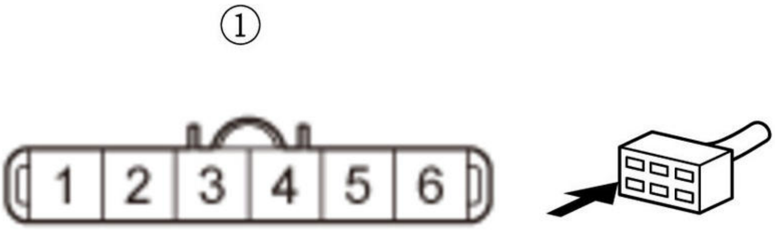
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 51**



Is there 1.0 Ω or less?

YES

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the THL2 wire between the PCM (E51) and the throttle body.

10. Open wire check (SG3 (DBW) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

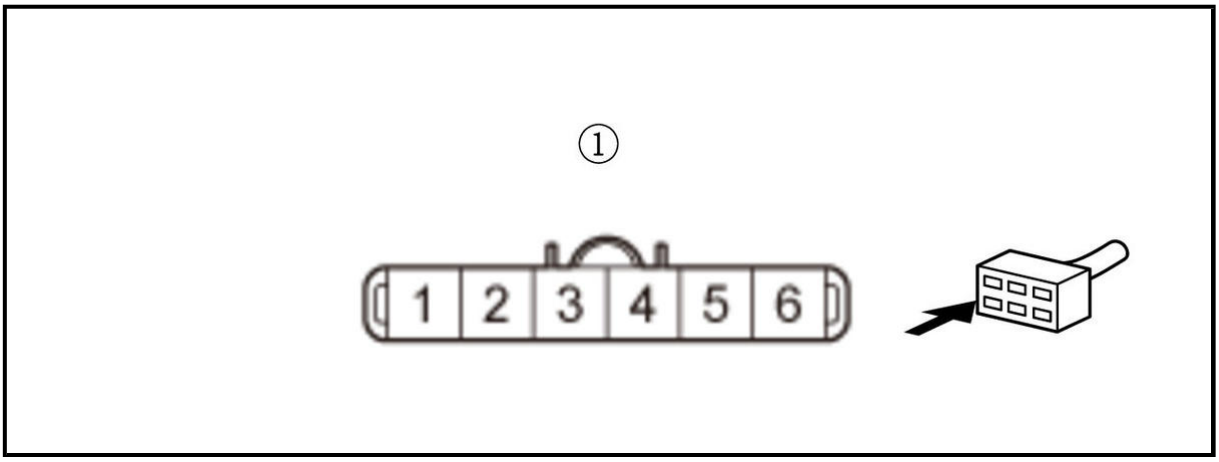
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P) : disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 76**



Is there 1.0 Ω or less?

YES

The SG3 (DBW) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG3 (DBW) wire between the PCM (E76) and the throttle body.

DTC P0222

DTC P0222 : TP Sensor B Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0222 TP Sensor B Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP Sensor B	Less than 0.3	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (THL2 line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0122 TP Sensor A Circuit Low Voltage	B	B
P0222 TP Sensor B Circuit Low Voltage	B	B

Are DTC P0122 and P0222 indicated at the same time?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

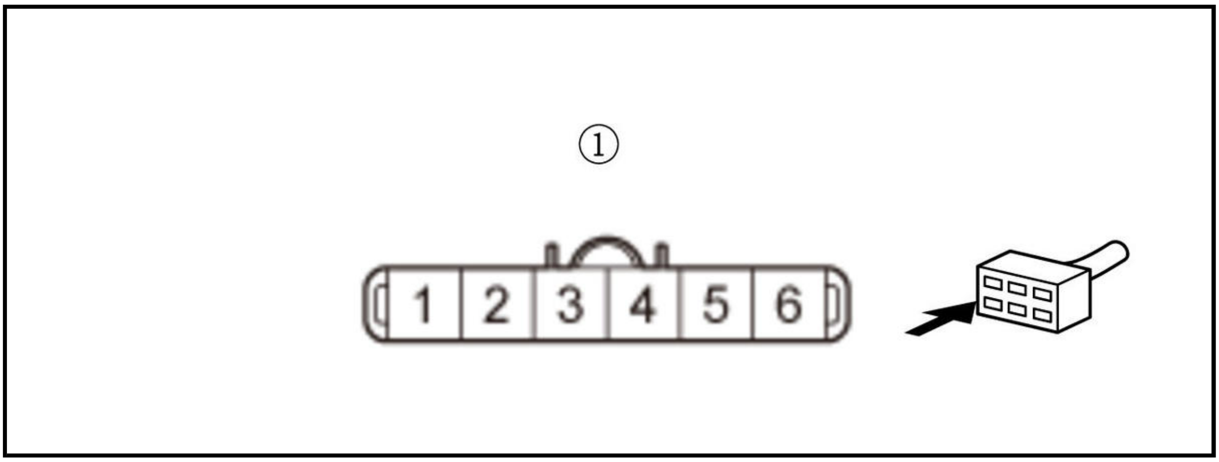
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P) : disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair a short in the THL2 wire between the PCM (E51) and the throttle body.

4. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

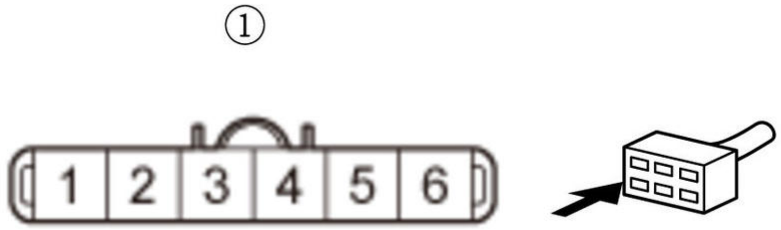
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 5.

5. Open wire check (VCC3 (DBW) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

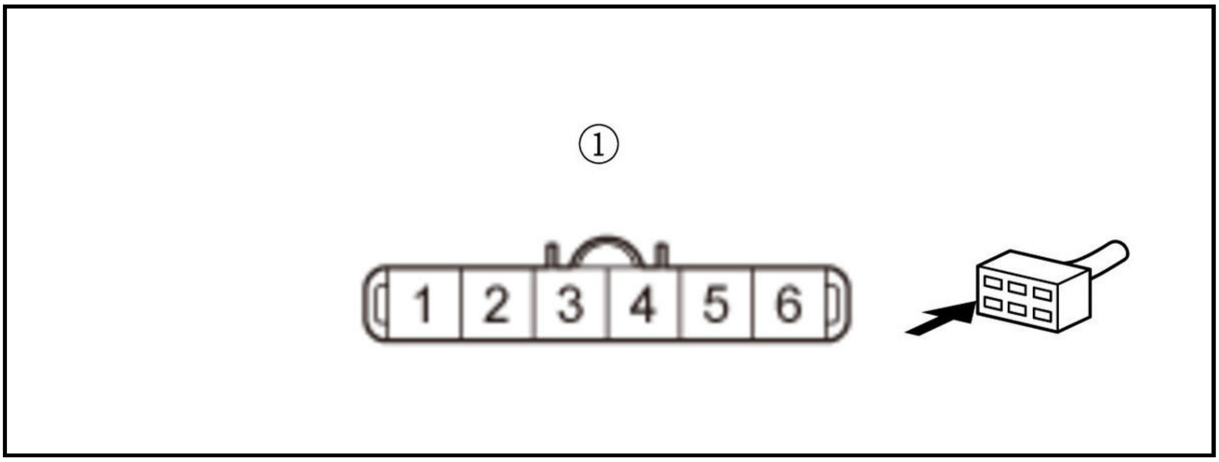
-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Throttle body 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 75**



Is there 1.0 Ω or less?

YES

The VCC3 (DBW) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC3 (DBW) wire between the PCM (E75) and the throttle body.

DTC P0223

DTC P0223 : TP Sensor B Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0223 TP Sensor B Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
TP Sensor B	More than 4.8	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (SG3 (DBW) line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0123 TP Sensor A Circuit High Voltage	B	B
P0223 TP Sensor B Circuit High Voltage	B	B

Are DTC P0123 and P0223 indicated at the same time?

YES

Go to step 5.

NO

Go to step 3.

3. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

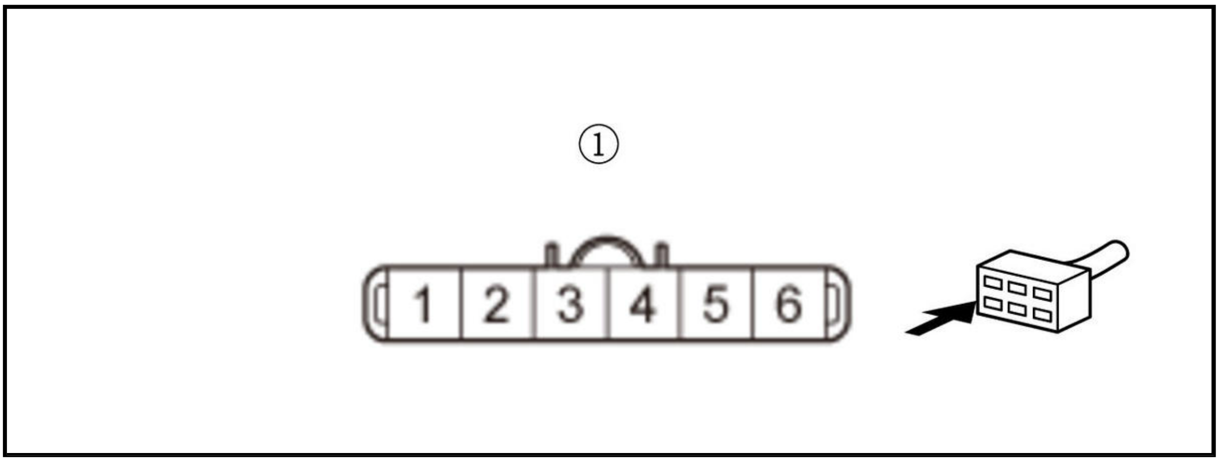
-2. Disconnect the following connector.

Throttle body 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the throttle body .

NO

Go to step 4.

4. Open wire check (THL2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

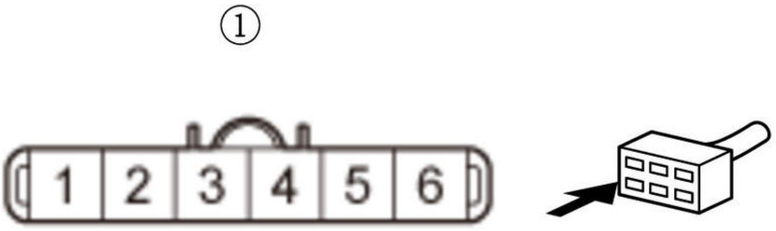
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Throttle body 6P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 4: ①
Test point 2	PCM connector E (80P) No. 51



Is there 1.0 Ω or less?

YES

The THL2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the THL2 wire between the PCM (E51) and the throttle body.

5. Open wire check (SG3 (DBW) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

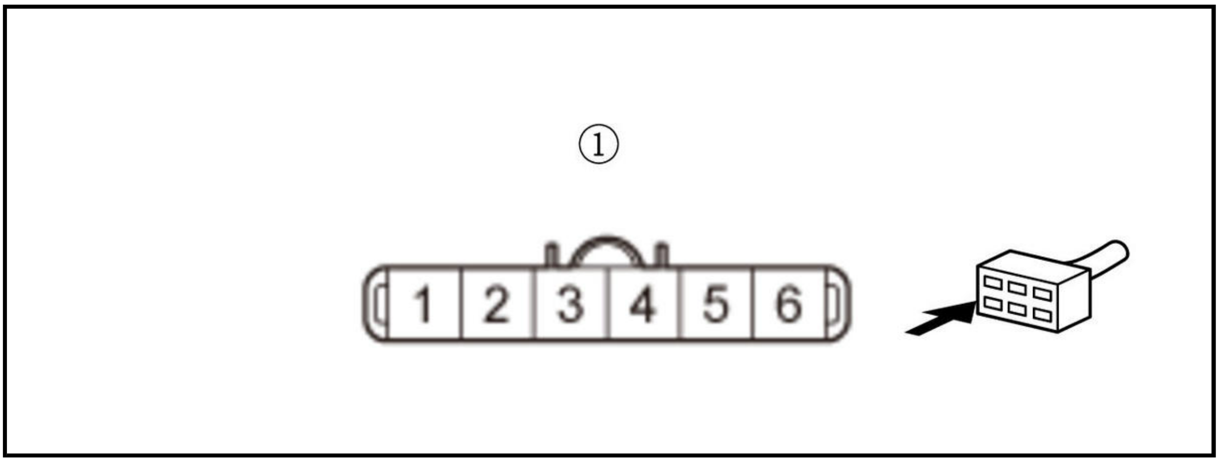
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P) : disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 76**



Is there 1.0 Ω or less?

YES

The SG3 (DBW) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG3 (DBW) wire between the PCM (E76) and the throttle body.

DTC P027E (2021)

DTC P027E : Cold Start Air Fuel Ratio Control System Command Lean

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P027E Cold Start Air Fuel Ratio Control System Command Lean	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT SENSOR 1 is 77 deg.F (25 deg.C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P027E Cold Start Air Fuel Ratio Control System Command Lean	B	B

Is DTC P027E indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** ,

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

DTC P027F (2021)

DTC P027F : Cold Start Air Fuel Ratio Control System Command Rich

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P027F Cold Start Air Fuel Ratio Control System Command Rich	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT SENSOR 1 is 77 deg.F (25 deg.C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P027F Cold Start Air Fuel Ratio Control System Command Rich	B	B

Is DTC P027F indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

DTC P0300, P0301, P0302, P0303, P0304

DTC P0300 : Random Misfire

DTC P0301 : No. 1 Cylinder Misfire

DTC P0302 : No. 2 Cylinder Misfire

DTC P0303 : No. 3 Cylinder Misfire

DTC P0304 : No. 4 Cylinder Misfire

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the misfire is frequent enough to trigger detection of increased emissions during two consecutive driving cycles, the MIL will come on, and DTC P0300 (and some combination of P0301 through P0304) will be stored.
- If the misfire is frequent enough to damage the catalyst, the MIL will flash whenever the misfire occurs, and DTC P0300 (and some combination of P0301 through P0304) will be stored. When the misfire stops, the MIL will remain on.
- Troubleshoot the following DTCs first, if any of them were stored along with the random misfire DTC (s) (Because parts can sometimes fail without setting DTCs you should also do a physical inspection of the systems listed below) :

  P0010, P0011, P100A, P100B, P100C, P100D: VTC system

  P006A, P0101, P0102, P0103: MAF sensor

  P0105, P0106, P0107, P0108: MAP sensor

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector (s)

  P0335, P0339: CKP sensor

  P0365, P0369: CMP sensor B

  P0351, P0352, P0353, P0354 : No. 1-No. 4 cylinder ignition coil (s)

  P0400, P0401, P0404, P0405, P0406, P046C, P049D, P2413: EGR system

  P2646, P2647, P2648, P2649: VTEC system

DTC Description	Confirmed DTC	Pending DTC
P0300 Random Misfire	B	B
P0301 No1 Cylinder Misfire	B	B
P0302 No2 Cylinder Misfire	B	B
P0303 No3 Cylinder Misfire	B	B
P0304 No4 Cylinder Misfire	B	B

DTC (PGM-FI)

1. Problem verification - Idle

-1. Record the On-board Snapshot with the HDS.

-2. **Enter the maintenance mode, then start the engine** , and let it idle.

-3. Monitor these parameters in the DATA LIST:

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Are the misfire counts increasing on any cylinder at idle?

YES

The engine is misfiring at idle, go to step 2.

NO

The engine does not misfire at idle, go to step 3.

2. Determine Affected Cylinders

-1. Continue to monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Are the misfire counts generally isolated to a single cylinder?

YES (The misfire is isolated to a single cylinder.)

Go to Single Cylinder Continuous Misfire at Idle troubleshooting on step 6.

YES (The misfire is isolated to a single cylinder.)

Go to Single Cylinder Non-Continuous Misfire at Idle troubleshooting on step 21.

NO (The misfire affects multiple cylinders.)

Go to Multiple Cylinder Continuous Misfire at Idle troubleshooting on step 30.

NO (The misfire affects multiple cylinders.)

Go to Multiple Cylinder Non-Continuous Misfire at Idle troubleshooting on step 48.

3. Problem verification - Static Load

   -1. Increase the engine speed to 3, 500 rpm.

   -2. Hold the engine speed steady, and monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

   Are the misfire counts increasing on any cylinder?

   YES

   The engine is misfiring under load. Go to step 4.

   NO

   The engine does not misfire under a static load. Go to step 5.

4. Determine Affected Cylinders

   -1. Continue to monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

   Are misfire counts generally isolated to a single cylinder?

   YES

   The misfire is isolated to a single cylinder, go to Single Cylinder Misfire. Under Load troubleshooting on step 56.

   NO

   The misfire affects multiple cylinders, go to Multiple Cylinder Misfire. Under Load troubleshooting on step 63.

5. Problem verification - On-board Snapshot

   -1. Open the On-board Snapshot with the HDS.

   -2. Scroll through the snapshot, and find when the MISFIRE value begins to increase.

-3. Record the value of these parameters as the MISFIRE value increases:

Signal	Values	Unit
ECT Sensor 1	B	deg.F
Engine Speed	B	RPM
Vehicle Speed	B	MPH
MAP Sensor	B	V
TP Sensor	B	V

On-board Snapshot

-4. Drive the vehicle according to the conditions you identified above while monitoring the misfire counts.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
Engine Speed	B	B
Vehicle Speed	B	B
MAP Sensor Voltage	B	B
TP Sensor Voltage	B	B

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Are the misfire counts increasing on any cylinder?

YES

The engine is misfiring under the specific operating conditions above.

- If the misfire occurred when the engine was cold, go to Misfire When Cold troubleshooting on step 70.
- If the misfire occurred when the engine was loaded, go to step 4.

NO

Intermittent failure; the engine is not misfiring at this time.

NOTE: If the misfire cannot be reproduced, there is a possibility that the problem may have been caused by poor quality fuel. The problem may have disappeared after refueling with fresh fuel. The MIL DIST (MIL Distance) value in the Data List in combination with the fuel level may help you make this determination.

6. Check Ignition Coil Spark

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the ignition coil from the problem cylinder .

-3. Connect a commercially available spark tester between the ignition coil and engine ground.

-4. **Enter the maintenance mode, then start the engine** with the ignition coil connected.

Does the ignition coil produce a sparkΩ

YES

The ignition coil wiring is OK. Go to step 14.

NO

There is a problem with the ignition coil, or the ignition coil circuit. Go to step 7.

7. Ignition Coil Check

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Connect a commercially available spark tester between the ignition coil and engine ground.

-3. **Enter the maintenance mode, then start the engine** with the ignition coil connected.

Does the ignition coil produce a sparkΩ

YES

The ignition coil has a failure. **Replace the ignition coil** .

NO

There is a problem with the ignition coil circuit. Go to step 8.

8. Check Ignition Coil Power and Ground

-1. Disconnect the ignition coil 3P connector from the problem cylinder.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between ignition coil 3P connector terminals No. 1 (power) and No. 2 (ground).

NOTE: After the vehicle is turned to the OFF (LOCK) mode, this circuit may still show battery voltage for a period of time. This is normal.

Is there about 4 V or more?

YES

The ignition coil control circuit is shorted to power. Go to step 10.

NO

The ignition coil control circuit is not shorted to power. Go to step 11.

10. Isolate Ignition Coil Control Short to Power

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Jump the SCS line with the HDS, and wait more than 1 minute.

    -3. Disconnect the PCM connectors.

    -4. Turn the vehicle to the ON mode.

    -5. Measure the voltage between ignition coil 3P connector terminals No. 3 (Ignition Control) and body ground.

G101

Is there battery voltage between the ignition coil power terminal and engine ground?

YES

The power circuit is OK. Repair the open circuit between the ignition coil (3P connector terminal No. 2) and G101.

NO

Repair the open circuit between the ignition coil and the ignition coil relay.

14. Inspect Ignition Coil

-1. Inspect the ignition coil and spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and spark plug tube. Replace the spark plug tube seals in the cylinder head cover .

NO

Go to step 15.

15. Exchange Spark Plug and Ignition Coil

-1. Exchange the spark plug and the ignition coil with one from a normally operating cylinder .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 17.

NO

There is a failure in the ignition coil or the spark plug. Go to step 16.

16. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

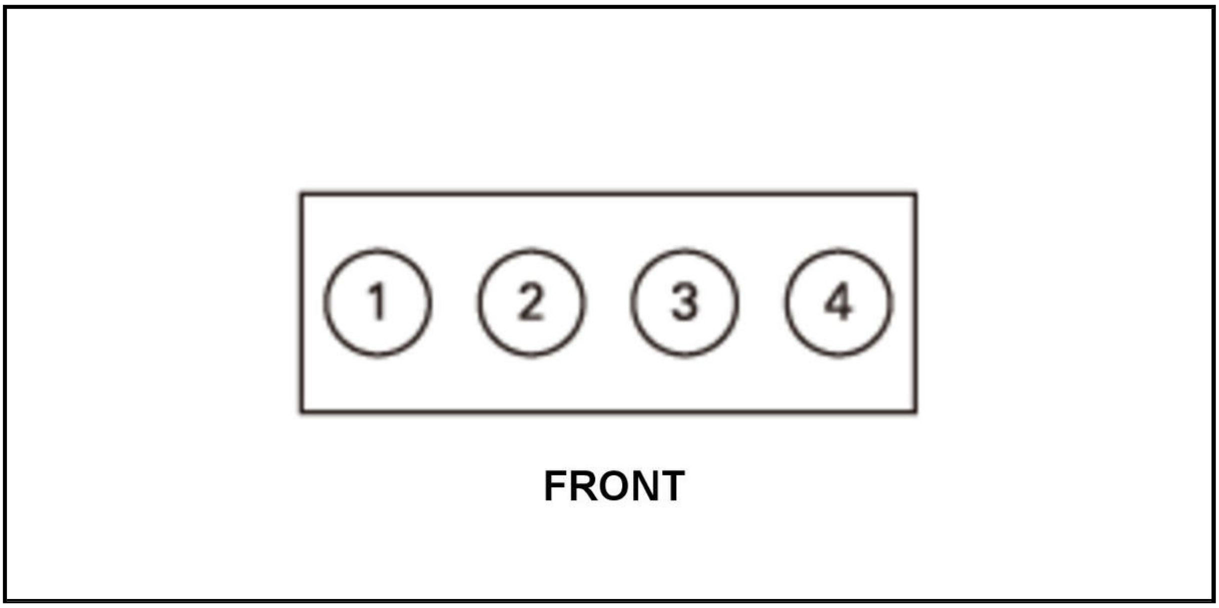
NO

The ignition coil has a failure. **Replace the ignition coil** .

17. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

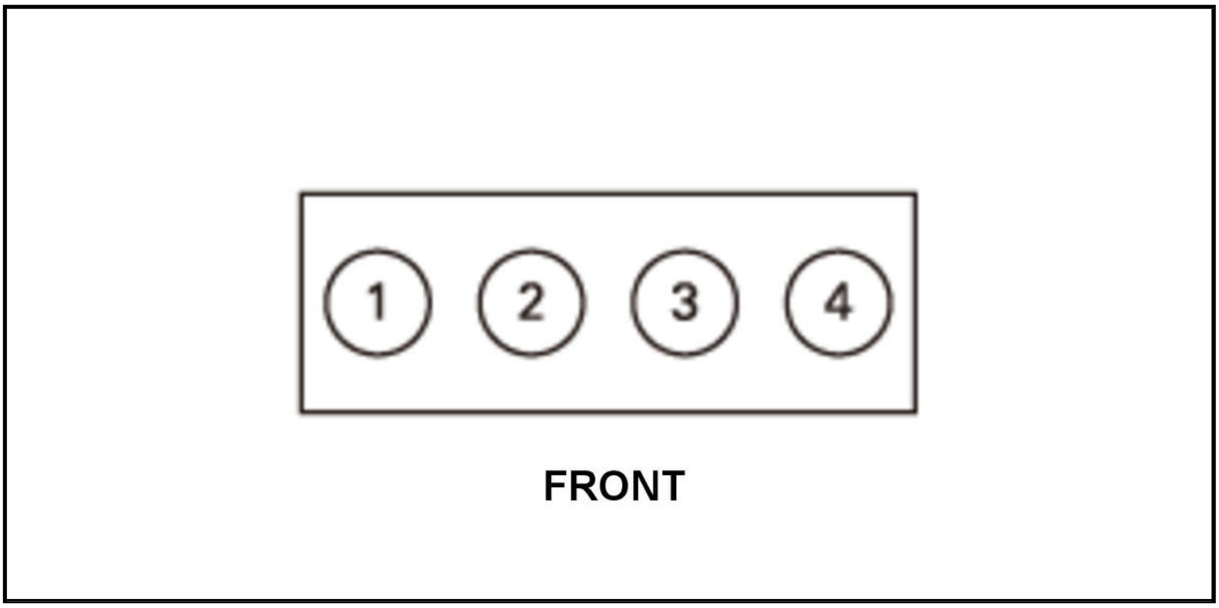
   NO

   The engine compression and the cylinder leakage are normal. Go to step 18.

18. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust valve clearance to specification (cold), then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 19.

19. Exchange Fuel Injector

-1. Exchange the fuel injector from the problem cylinder with one from another cylinder .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B

Signal	Current conditions	
	Values	Unit
Cyl4 Misfire	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 20.

NO

The fuel injector is faulty. **Replace the fuel injector** .

20. CKP Pattern Clear/Pattern Learn

-1. Select CRANK (CKP) PATTERN in the Adjustment Menu with the HDS.

-2. **Select CRANK (CKP) PATTERN CLEAR, and clear the CKP pattern** .

CRANK (CKP) PATTERN CLEAR

Select CRANK (CKP) PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK (CKP) PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

21. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 22.

22. Inspect Ignition Coil

-1. Inspect the ignition coil and the spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and the spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 23.

23. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 25.

NO

There is a failure in the ignition coil or the spark plug. Go to step 24.

24. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

25. Check MAP Sensor Fluctuation

-1. **Enter the maintenance mode, then start the engine** , and let it idle until the cooling fans cycle twice.

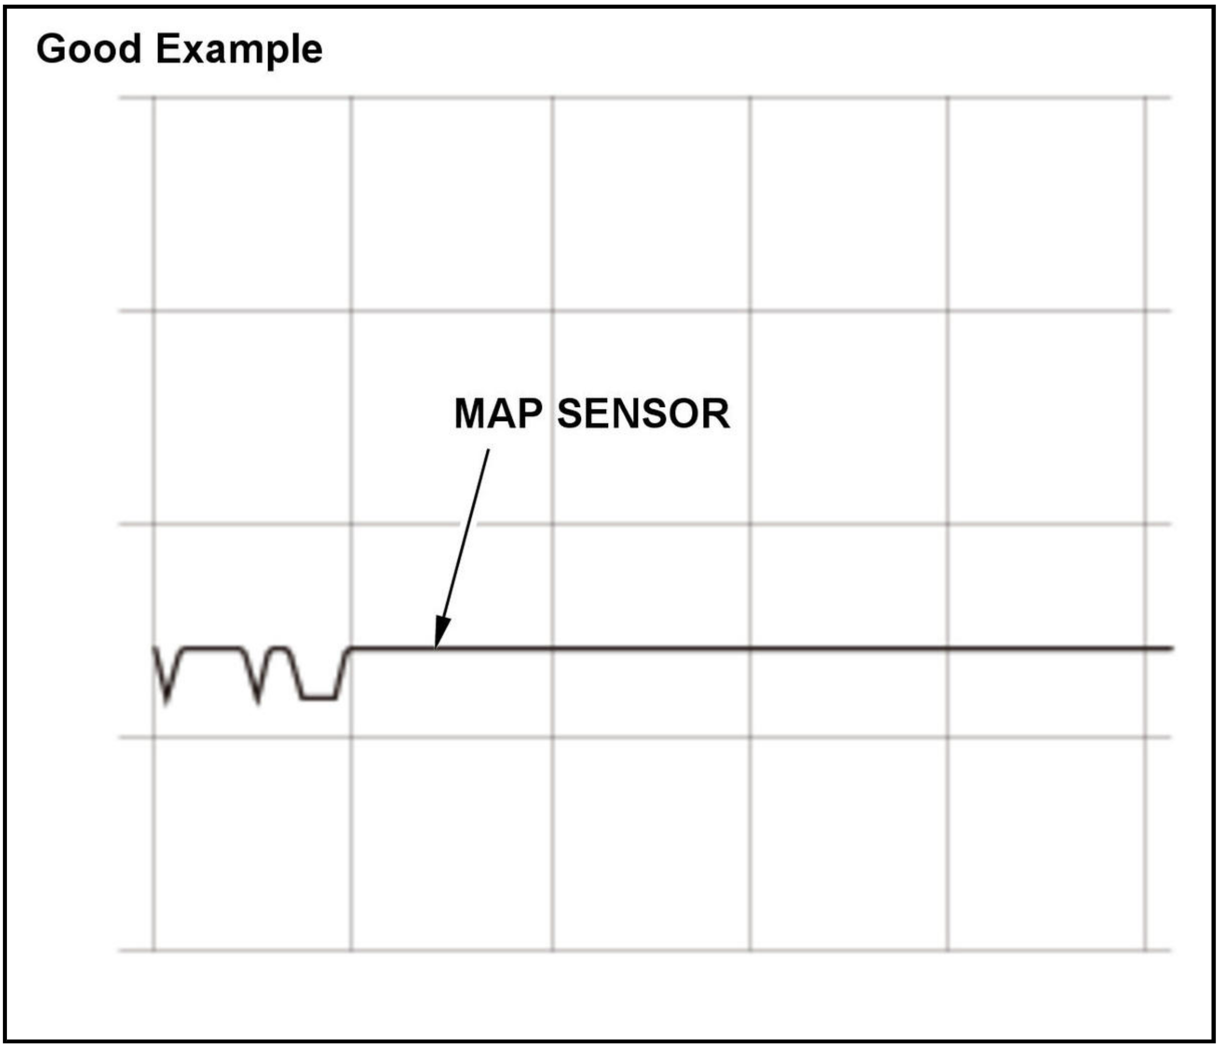
-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

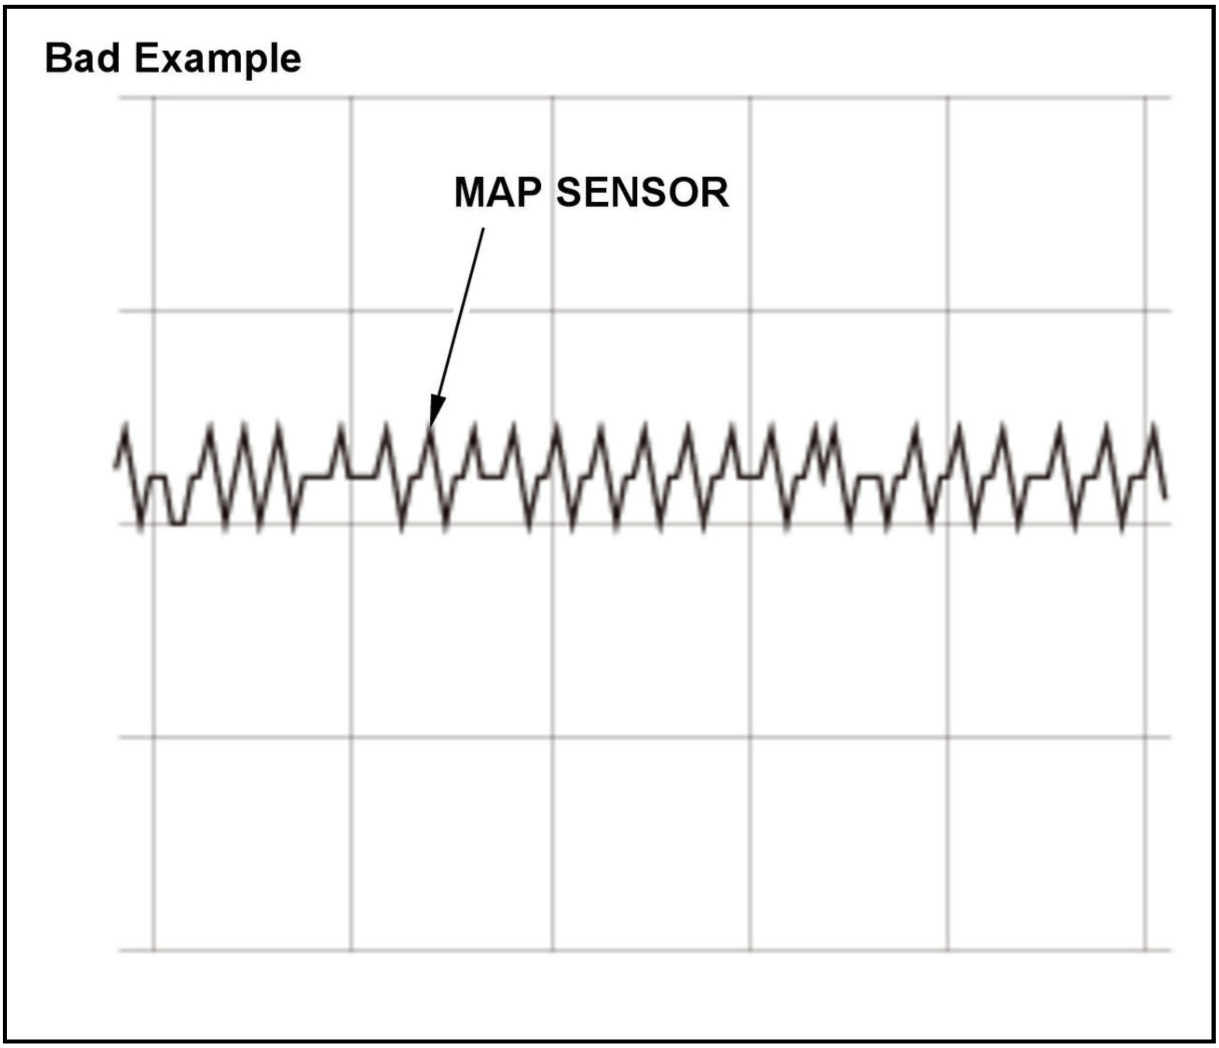
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 26.

NO

The intake manifold vacuum fluctuation is OK. Go to step 29.

26. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg.F (38 deg.C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 27.

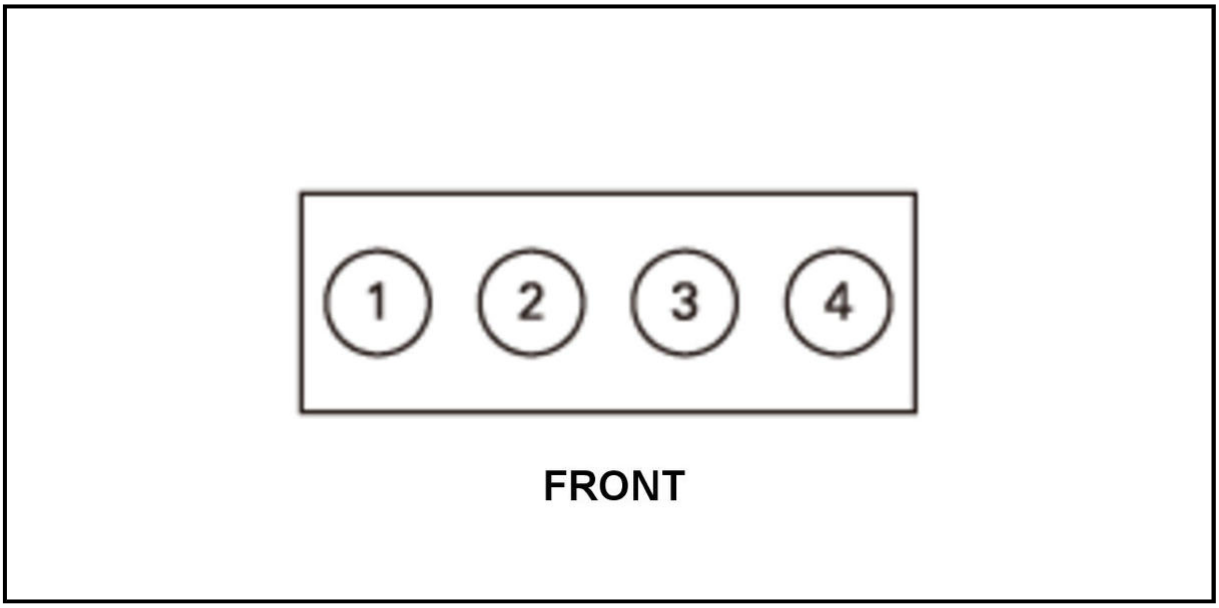
NO

The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

27. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

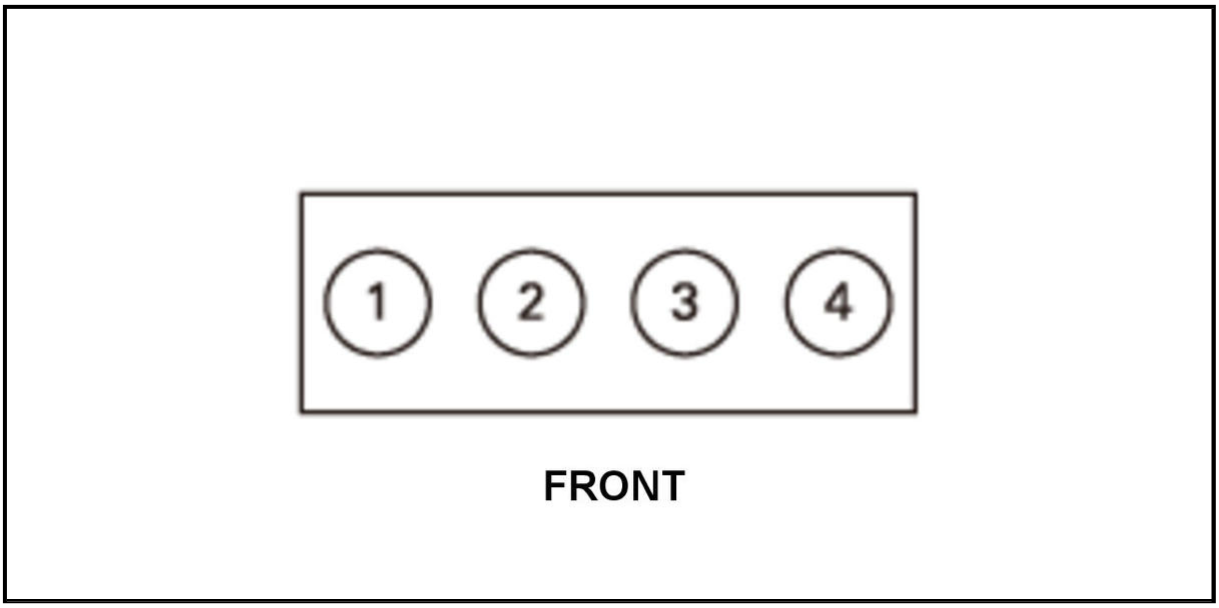
   NO

   The engine compression and the cylinder leakage are normal. Go to step 28.

28. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 29.

29. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. All of the failures have been checked for this type of misfire. Go to step 1 in the Problem verification procedure and ensure you selected the correct troubleshooting procedure.

NO

The fuel injector is faulty. **Replace the fuel injector** .

30. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 31.

31. Check Ignition Coil Spark

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the ignition coil from the problem cylinder** .

-3. Connect a commercially available spark tester between the ignition coil and engine ground.

-4. **Enter the maintenance mode, then start the engine** with the ignition coil connected.

Does the ignition coil produce a sparkΩ

YES

The ignition coil wiring is OK. Go to step 39.

NO

There is a problem with the ignition coil, or the Ignition coil circuit. Go to step 32.

32. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Connect a commercially available spark tester between the ignition coil and engine ground.

-3. **Enter the maintenance mode, then start the engine** with the ignition coil connected.

Does the ignition coil produce a sparkΩ

YES

The ignition coil has a failure. **Replace the ignition coil** .

NO

There is a problem with the ignition coil circuit. Go to step 33.

33. Check Ignition Coil Power and Ground

-1. Disconnect the ignition coil 3P connector from the problem cylinder.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between ignition coil 3P connector terminals No. 1 (power) and No. 2 (ground).

NOTE: After the vehicle is turned to the OFF (LOCK) mode, this circuit may still show battery voltage for a period of time. This is normal.

Is there about 4 V or more?

YES

The ignition coil control circuit is shorted to power. Go to step 35.

NO

The ignition coil control circuit is not shorted to power. Go to step 36.

35. Isolate Ignition Coil Control Short to Power

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the PCM connectors.

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between ignition coil 3P connector terminals No. 3 (Ignition Control) and body ground.

Is there about 4 V or more?

YES

There is a short to power on the ignition coil control circuit. Find and repair the failure.

NO

The PCM is malfunctioning. **Replace the PCM** .

36. Check Ignition Coil Control Open Circuit

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the PCM connectors.

-4. Measure the resistance between the ignition coil control terminal at the PCM connector and at the ignition coil 3P connector terminal No. 3.

G101

Is there battery voltage between the ignition coil power terminal and engine ground?

YES

The power circuit is OK. Repair the open circuit between the ignition coil (3P connector terminal No. 2) and G101.

NO

Repair the open circuit between the ignition coil and the ignition coil relay.

39. Inspect Ignition Coil

-1. Inspect the ignition coil and spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 40.

40. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with one from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and spark plug are OK. Go to step 42.

NO

There is a failure in the ignition coil or the spark plug. Go to step 41.

41. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

42. Check MAP Sensor Fluctuation

-1. **Enter the maintenance mode, then start the engine** , and let it idle until the cooling fans cycle twice.

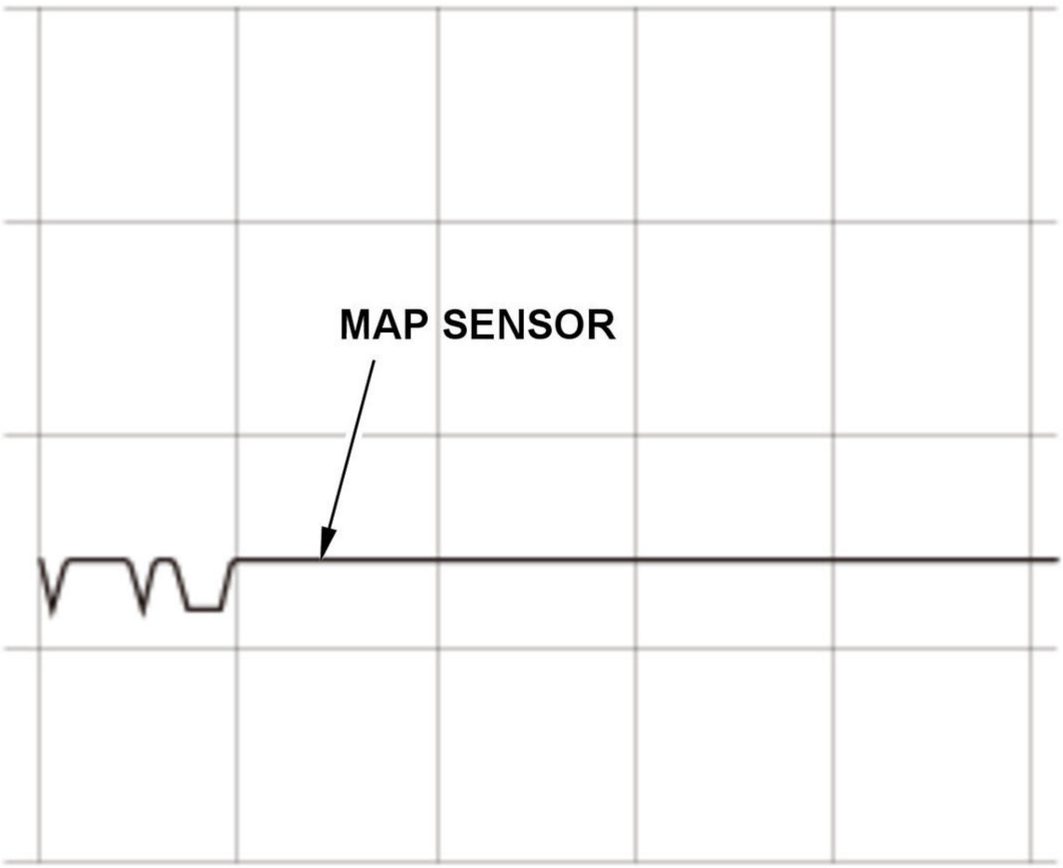
-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

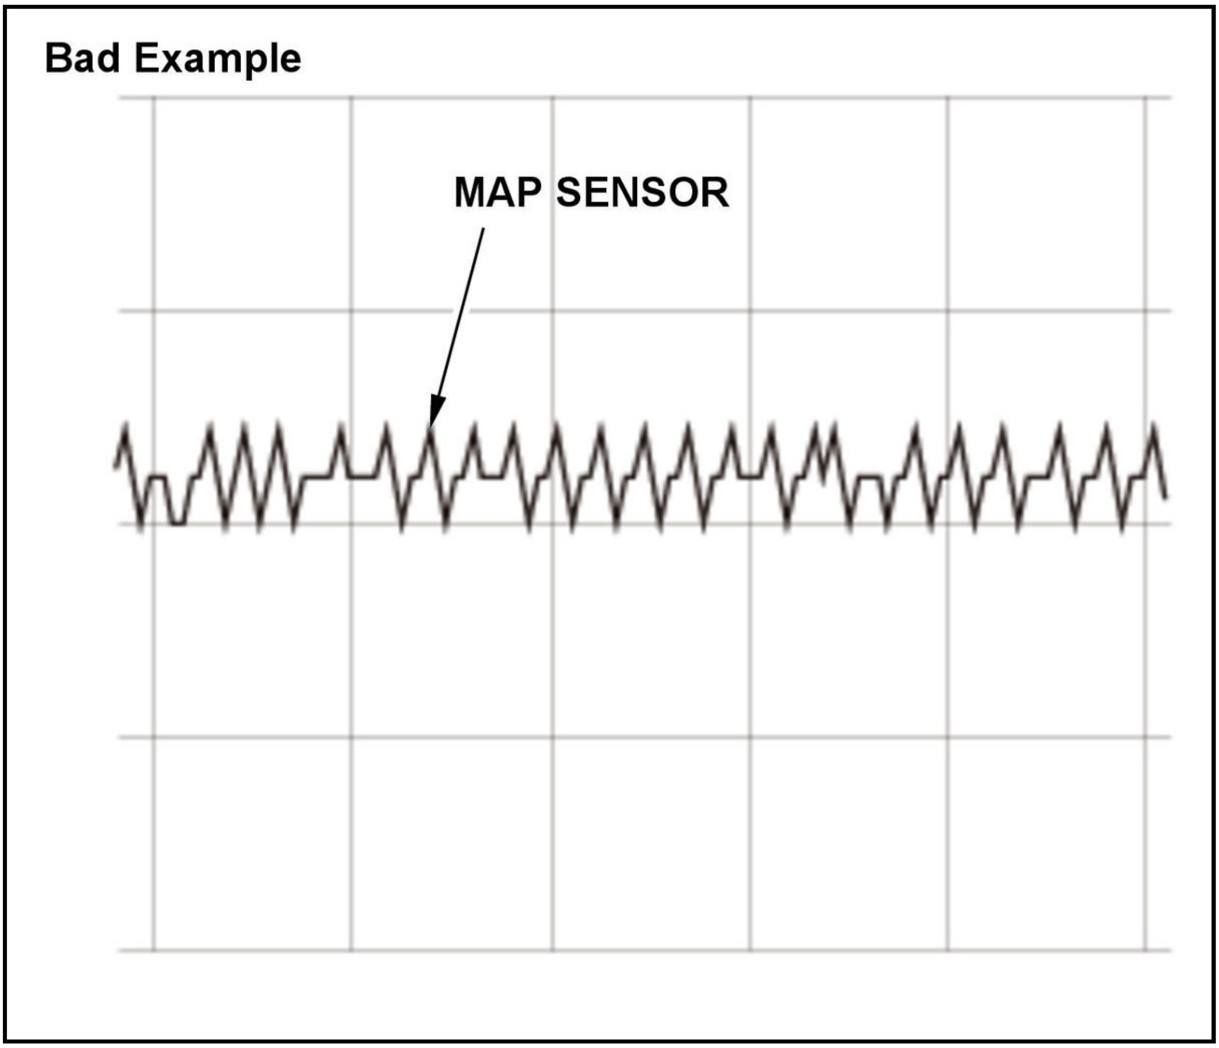
-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.



Good Example



Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 43.

NO

The intake manifold vacuum fluctuation is OK. Go to step 46.

43. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg.F (38 deg.C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 44.

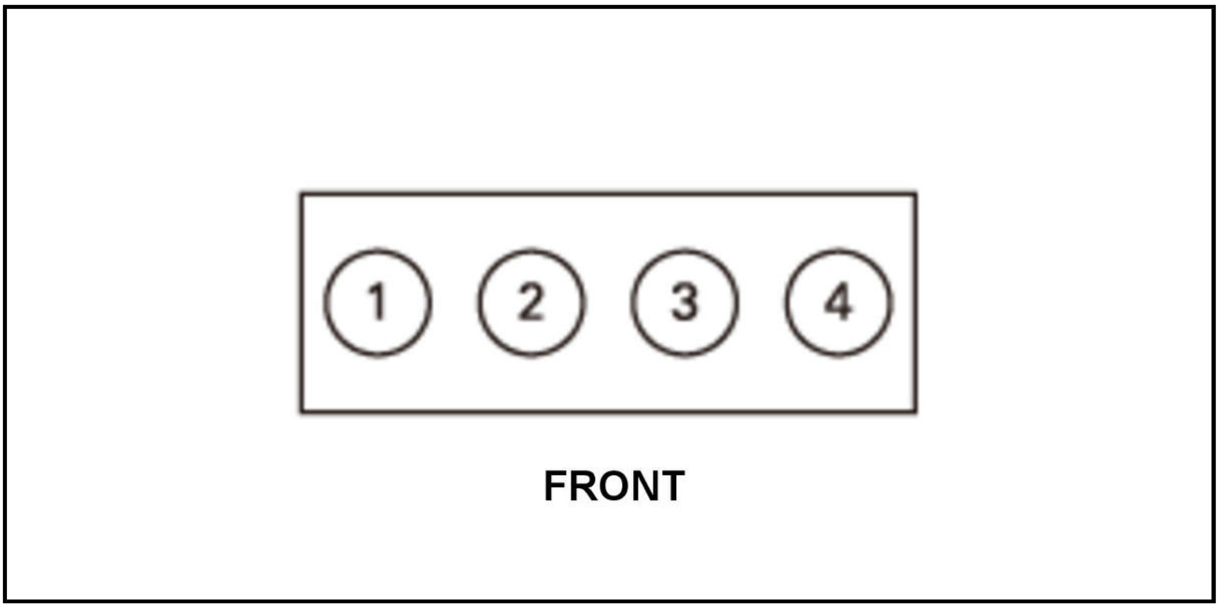
NO

The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

44. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

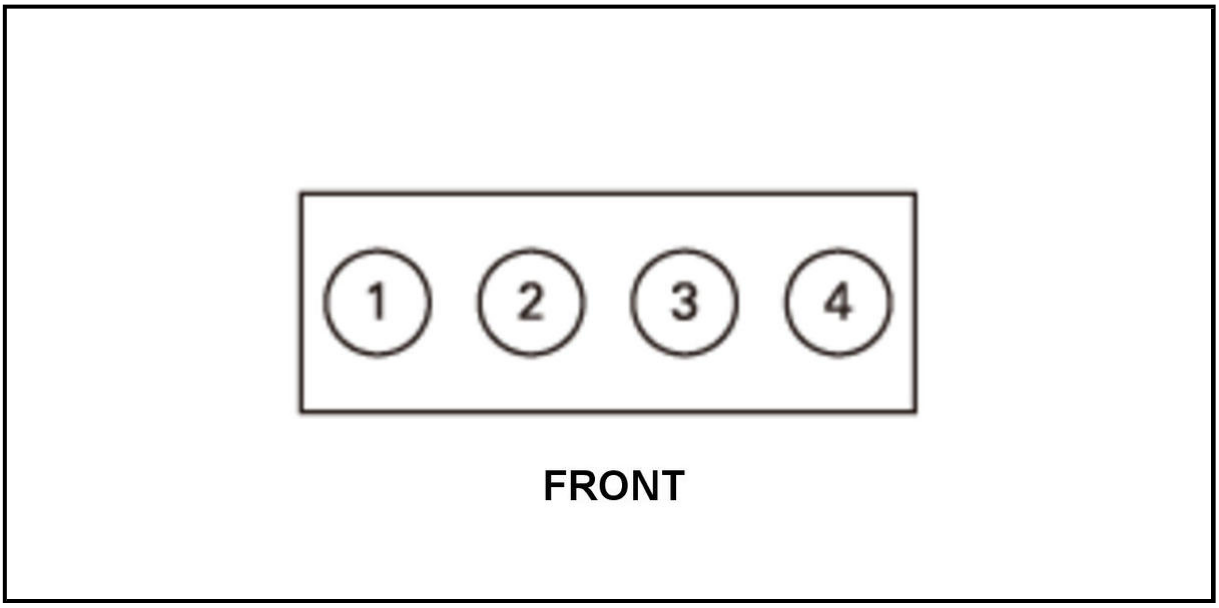
   NO

   The engine compression and the cylinder leakage are normal. Go to step 45.

45. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 46.

46. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 47.

NO

The fuel injector is faulty. **Replace the fuel injector** .

47. CKP Pattern Clear/Pattern Learn

-1. Select CRANK (CKP) PATTERN in the Adjustment Menu with the HDS.

-2. **Select CRANK (CKP) PATTERN CLEAR, and clear the CKP pattern** .

CRANK (CKP) PATTERN CLEAR

Select CRANK (CKP) PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK (CKP) PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

48. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 49.

49. Check MAP Sensor Fluctuation

-1. **Enter the maintenance mode, then start the engine** , and let it idle until the cooling fans cycle twice.

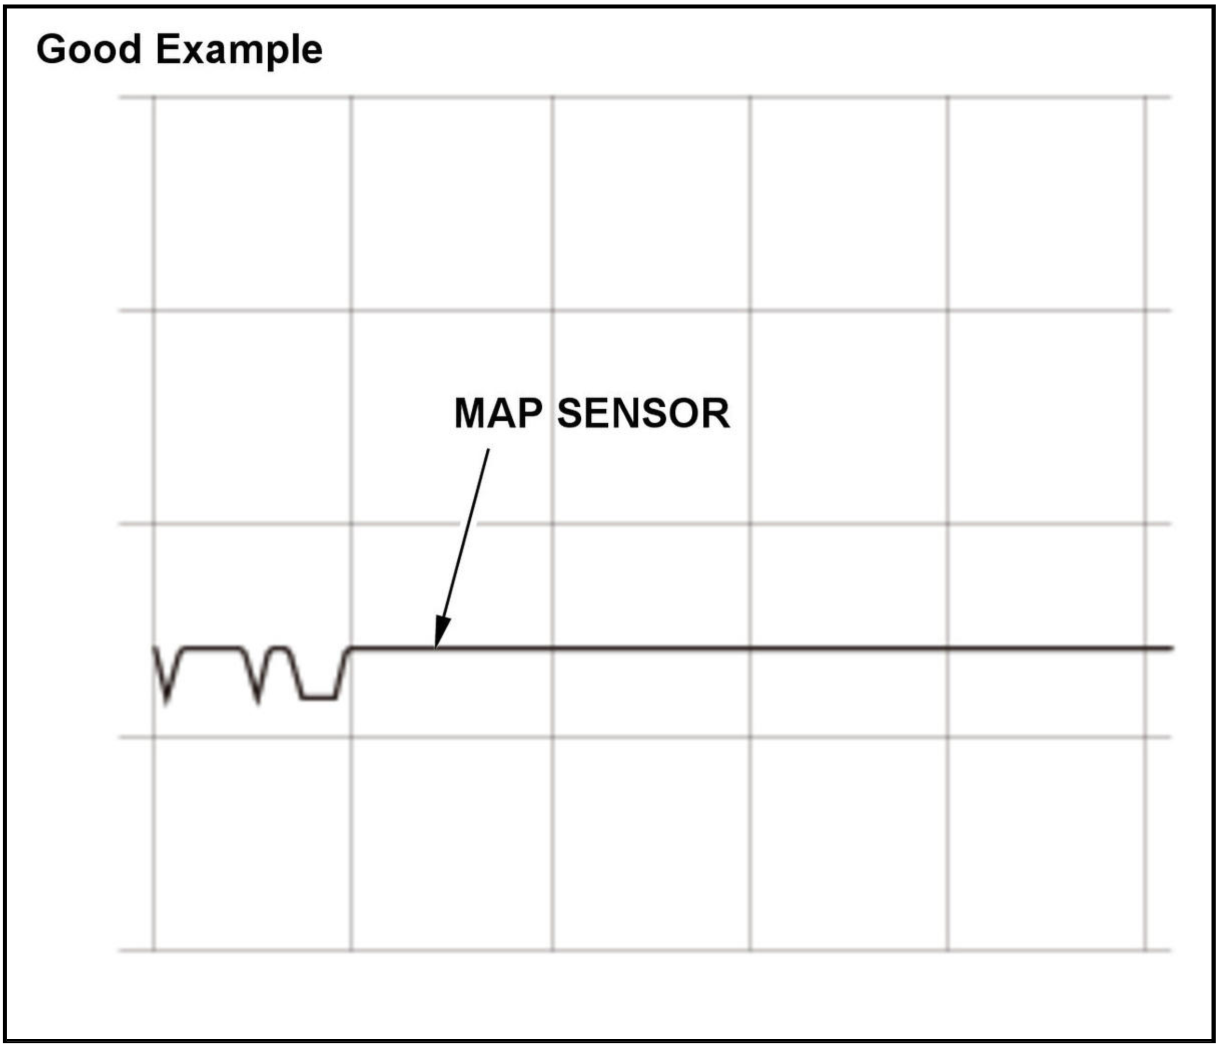
-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

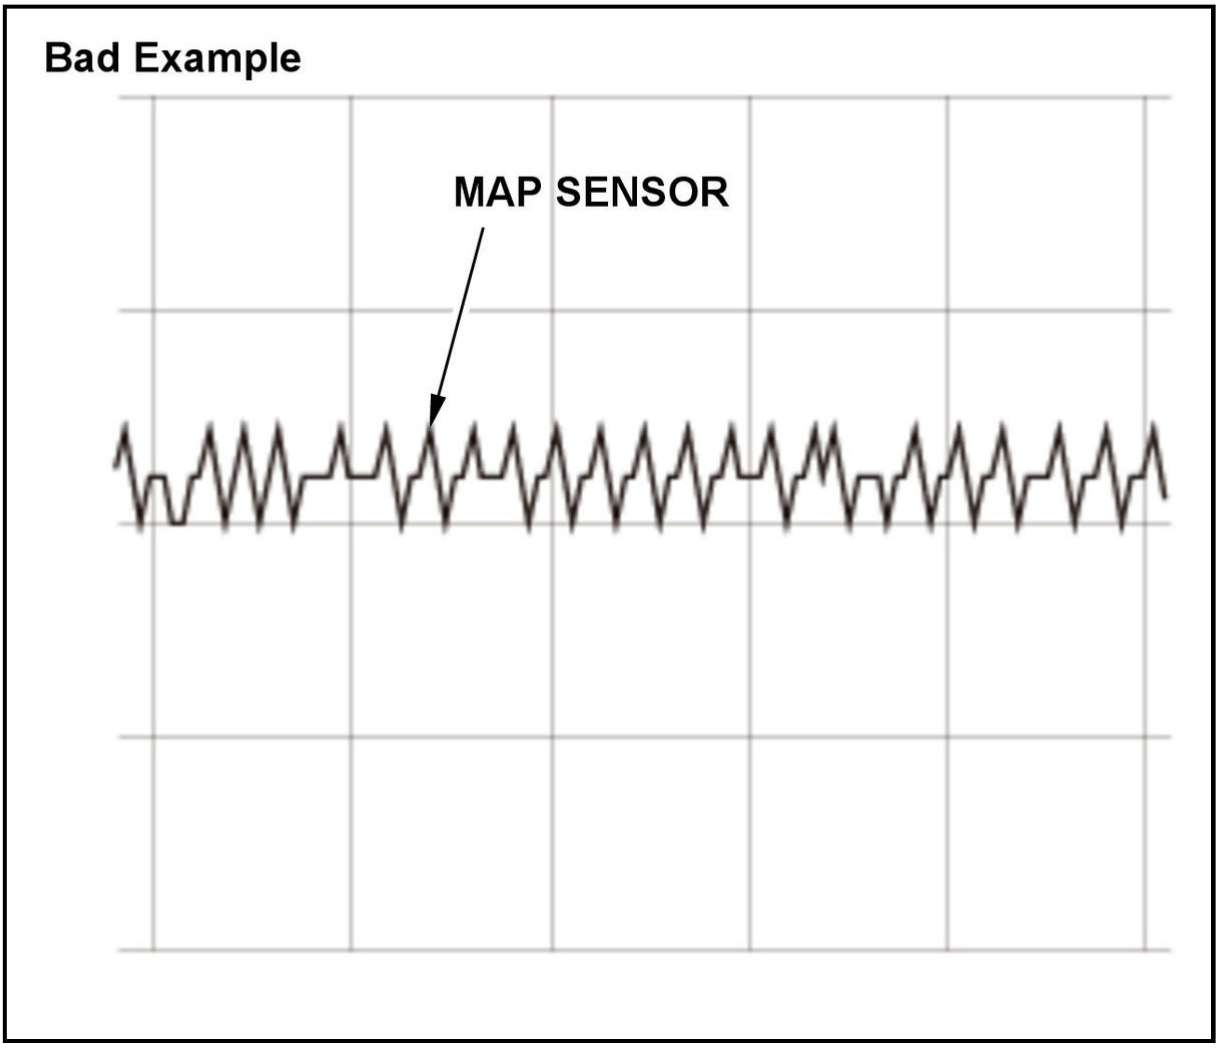
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 50.

NO

The intake manifold vacuum fluctuation is OK. Go to step 53.

50. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg.F (38 deg.C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 51.

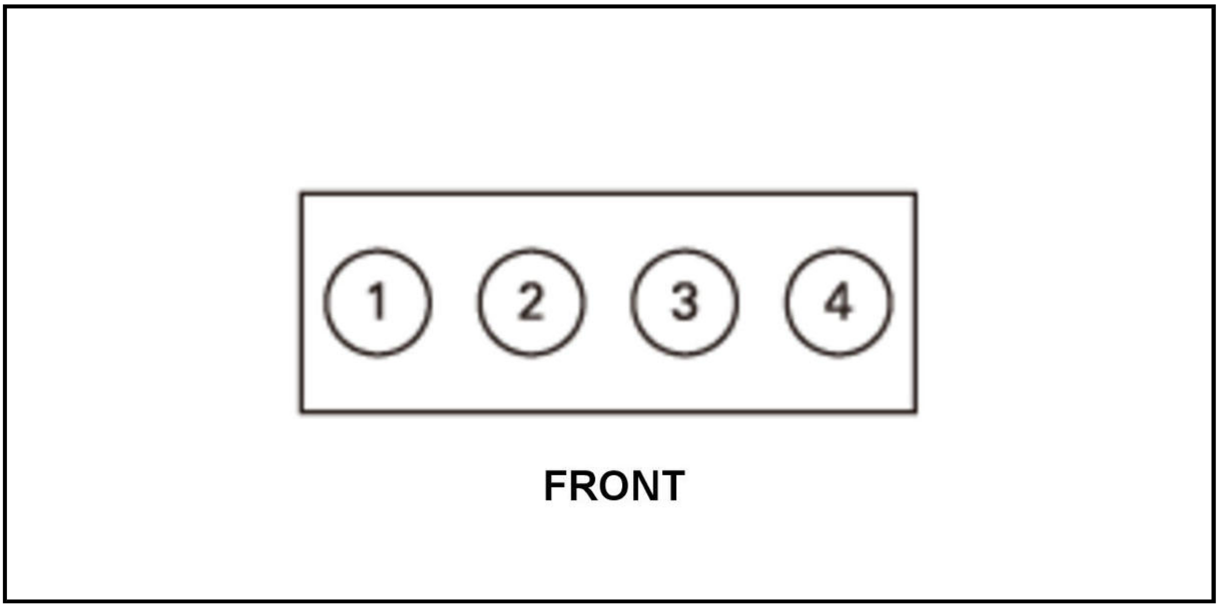
NO

The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

51. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

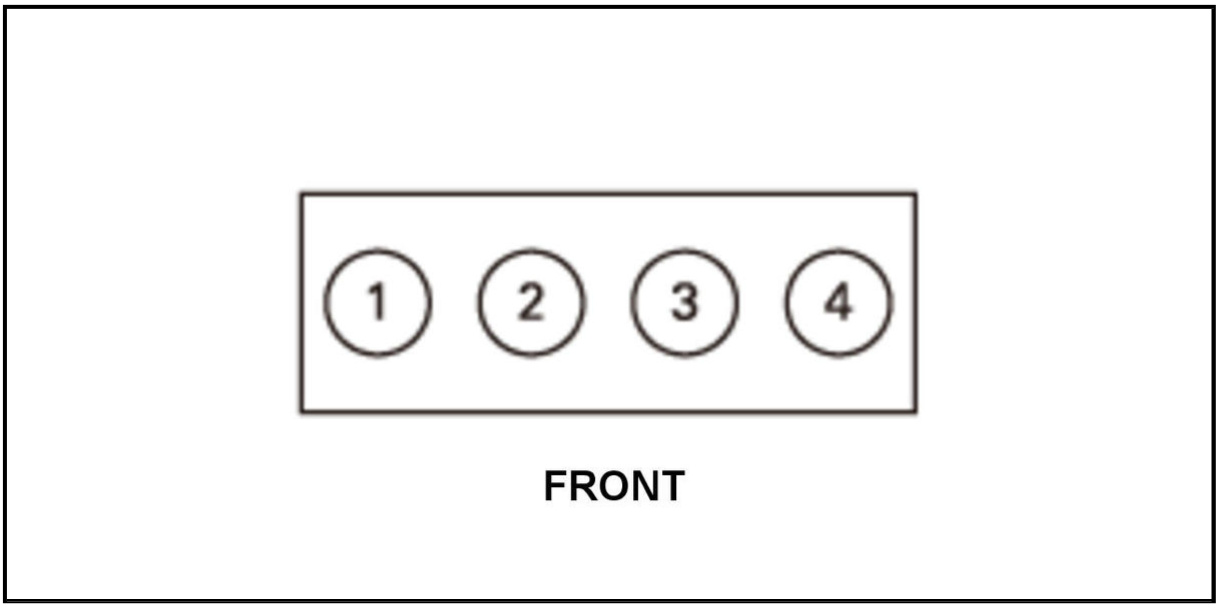
   NO

   The engine compression and the cylinder leakage are normal. Go to step 52.

52. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

NO

The cylinders are sealing properly. Go to step 53.

53. Check Fuel Pressure

-1. **Relieve the fuel pressure** .

-2. **Attach the fuel pressure gauge set and the fuel pressure gauge** .

-3. Locate and record the fuel pressure specification for your vehicle.

Minimum Pressure (kPa)	Maximum Pressure (kPa)
B	B

-4. **Enter the maintenance mode, then start the engine** , and record the fuel pressure under the conditions the misfire was duplicated.

Fuel Pressure (kPa)
B

Is the fuel pressure within specifications?

YES

The fuel pressure is OK. Go to step 54.

NO

Check for pinched or damaged fuel lines. If OK, **replace the fuel tank unit** .

54. Check Fuel Contamination

-1. **Remove the fuel tank unit** .

-2. Inspect for evidence of fuel contamination such as diesel fuel, water, rust, or debris.

NOTE: If the misfire occurred shortly after refueling, the likely cause is poor fuel quality. The MIL DIST (MIL distance) value in the DATA LIST, along with the fuel level, can help you make this determination. Incorrect or contaminated fuel typically affects multiple cylinders. But a problem such as water in the fuel can cause a single cylinder misfire that occurs randomly.

Is there evidence of fuel contamination?

YES

Replace the fuel filter and then drain/refill the fuel tank with known-good fuel.

NO

The fuel system has no signs of fuel contamination. Go to step 55.

55. Check MAF Sensor g/s

-1. Locate and record the MAF SENSOR g/s specification for your vehicle. This can be found in troubleshooting procedure for DTC P0171.

Minimum g/s	Maximum g/s	Specified RPM
B	B	B

Ensure the vehicle meets these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 176 deg.F (80 deg.C)
- Transmission in P or N
- All electrical loads off

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Monitor the ENGINE SPEED in the DATA LIST with the HDS. Raise and hold the engine speed steady at the specified rpm.

Signal	Current conditions	
	Values	Unit
Engine Speed	B	B

-4. While holding the rpm steady, check the MAF SENSOR in the DATA LIST.

Signal	Current conditions	
	Values	Unit
MAF Sensor	B	B

Is the MAF Sensor g/s value within specifications?

YES

The MAF sensor is reading correctly. **Replace the fuel injector** .

NO

The MAF sensor is not reading correctly. **Replace MAF sensor/IAT sensor 1** .

56. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 57.

57. Inspect Ignition Coil

-1. Inspect the ignition coil and the spark plug tube for engine oil contamination.

Is the ignition coil covered in engine oil?

YES

Clean the oil from the ignition coil and the spark plug tube. **Replace the spark plug tube seals in the cylinder head cover** .

NO

Go to step 58.

58. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and the spark plug are OK. Go to step 60.

NO

There is a failure in the ignition coil or the spark plug. Go to step 59.

59. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

60. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 61.

NO

The fuel injector is faulty. **Replace the fuel injector** .

61. Inspect VTEC System

-1. **Perform the VTEC rocker arm test** .

Does the engine pass the VTEC rocker arm test?

YES

Go to step 62.

NO

Repair the VTEC system.

62. CKP Pattern Clear/Pattern Learn

-1. Select CRANK (CKP) PATTERN in the Adjustment Menu with the HDS.

-2. **Select CRANK (CKP) PATTERN CLEAR, and clear the CKP pattern** .

CRANK (CKP) PATTERN CLEAR

Select CRANK (CKP) PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK (CKP) PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

63. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 64.

64. Check Fuel Pressure

-1. **Relieve the fuel pressure** .

-2. **Attach the fuel pressure gauge set and the fuel pressure gauge** .

-3. Locate and record the fuel pressure specification for your vehicle.

Minimum Pressure (kPa)	Maximum Pressure (kPa)
B	B

-4. **Enter the maintenance mode, then start the engine** , and record the fuel pressure under the conditions the misfire was duplicated.

Fuel Pressure (kPa)
B

Is the fuel pressure within specifications?

YES

The fuel pressure is OK. Go to step 65.

NO

Check for pinched or damaged fuel lines. If OK, **replace the fuel tank unit** .

65. Check Fuel Contamination

-1. **Remove the fuel tank unit** .

-2. Inspect for evidence of fuel contamination such as diesel fuel, water, rust, or debris.

NOTE: If the misfire occurred shortly after refueling, the likely cause is poor fuel quality. The MIL DIST (MIL distance) value in the DATA LIST, along with the fuel level, can help you make this determination. Incorrect or contaminated fuel typically affects multiple cylinders. But a problem such as water in the fuel can cause a single cylinder misfire that occurs randomly.

Is there evidence of fuel contamination?

YES

Replace the fuel filter and then drain/refill the fuel tank with a known-good fuel.

NO

The fuel system has no signs of fuel contamination. Go to step 66.

66. Exchange Fuel Injector

-1. **Exchange the fuel injector from the problem cylinder with one from another cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B

Signal	Current conditions	
	Values	Unit
Cyl2 Misfire	B	B

Signal	Current conditions	
	Values	Unit
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Do the misfire counts stay on the problem cylinder when the fuel injector is swapped?

YES

The fuel injector is OK. Go to step 67.

NO

The fuel injector is faulty. **Replace the fuel injector** .

67. Inspect VTEC System

-1. **Perform the VTEC rocker arm test** .

Does the engine pass the VTEC rocker arm test?

YES

Go to step 68.

NO

Repair the VTEC system.

68. Check for Exhaust Restrictions

-1. Reinstall all removed parts, and reconnect all connectors.

-2. Record the MAP SENSOR value while the engine is off.

Signal	Current conditions	
	Values	Unit
MAP Sensor	B	B

-3. **Enter the maintenance mode, then start the engine** , and monitor the ENGINE SPEED and MAP SENSOR in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor	B	B
Engine Speed	B	B

-4. Raise the engine speed to 3, 500 rpm and hold the throttle steady.

Does the MAP SENSOR read near atmospheric pressure (engine off value) ?

YES

There is a restriction in the exhaust system. Check for catalyst damage and repair as necessary.

NO

Go to step 69.

69. CKP Pattern Clear/Pattern Learn

-1. Select CRANK (CKP) PATTERN in the Adjustment Menu with the HDS.

-2. **Select CRANK (CKP) PATTERN CLEAR, and clear the CKP pattern** .

CRANK (CKP) PATTERN CLEAR

Select CRANK (CKP) PATTERN LEARNING with the HDS, and follow the screen prompts .

CRANK (CKP) PATTERN LEARNING

Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** .

NO

The misfire problem has been fixed.

70. Check MAP Sensor Fluctuation

-1. **Enter the maintenance mode, then start the engine** , and let it idle until the cooling fans cycle twice.

-2. Turn off all engine and electrical loads (A/C, audio, lights, etc.).

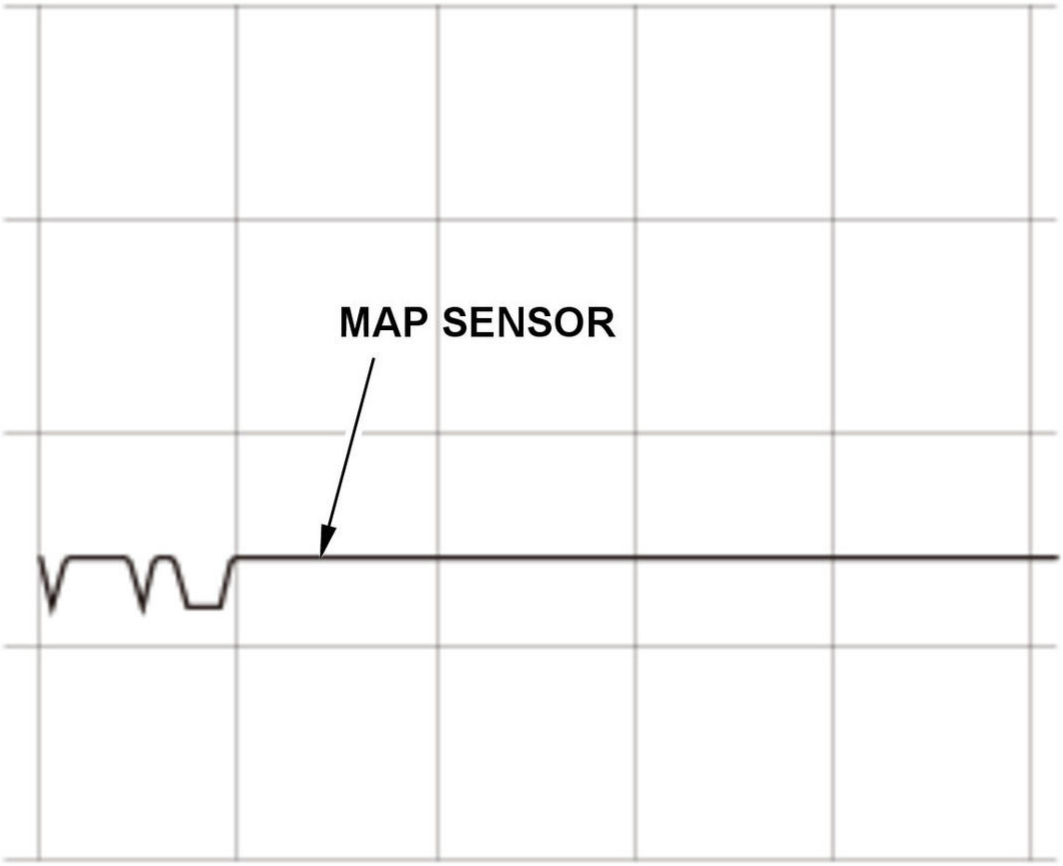
-3. Configure a HIGH-SPEED SNAPSHOT, and select only the MAP SENSOR.

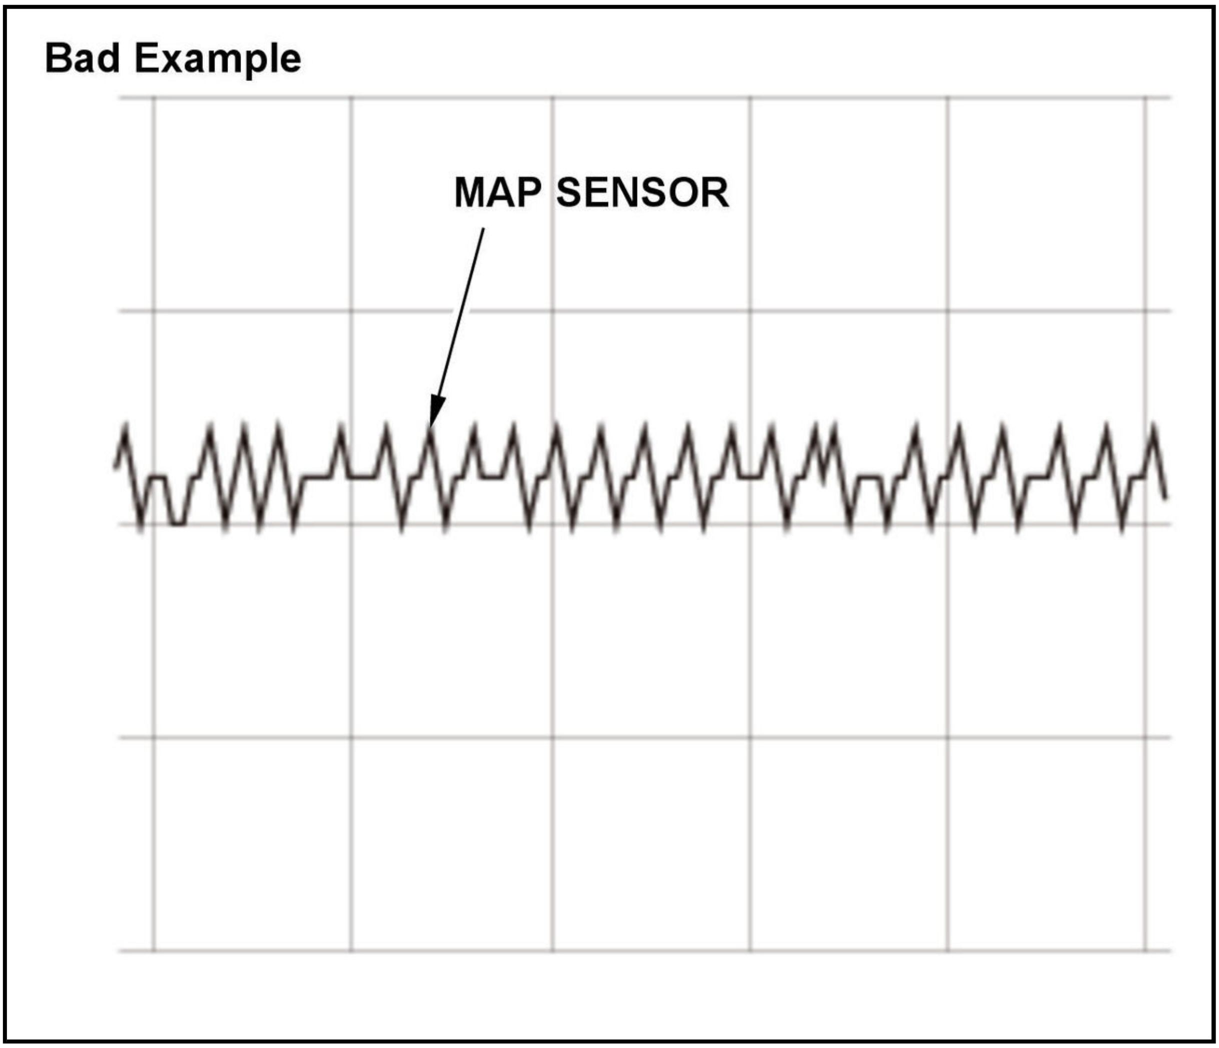
-4. Begin displaying live vehicle data on a line graph.

-5. Configure the MAP SENSOR line graph range for 1.2 V MAX and 0.8 V MIN.

-6. Watch the MAP SENSOR fluctuation. See examples below.

Good Example





Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

The intake manifold pressure fluctuation indicates a mechanical engine failure. Go to step 71.

NO

The intake manifold vacuum fluctuation is OK. Go to step 74.

71. Adjust Valve Clearance

-1. **Adjust the valve clearances** , and inspect the camshaft for excessive wear or grooves.

NOTE: ECT Sensor 1 must read less than 100 deg.F (38 deg.C) before adjusting the valve clearance. Shortcutting this step may cause incorrect valve clearance and engine misfire.

-2. Recheck the MAP SENSOR fluctuation at idle.

Does the MAP SENSOR continuously fluctuate 0.04 V or more at idle, no loads, engine hot?

YES

Adjusting the valve clearance did not correct the excessive MAP sensor fluctuation. Go to step 72.

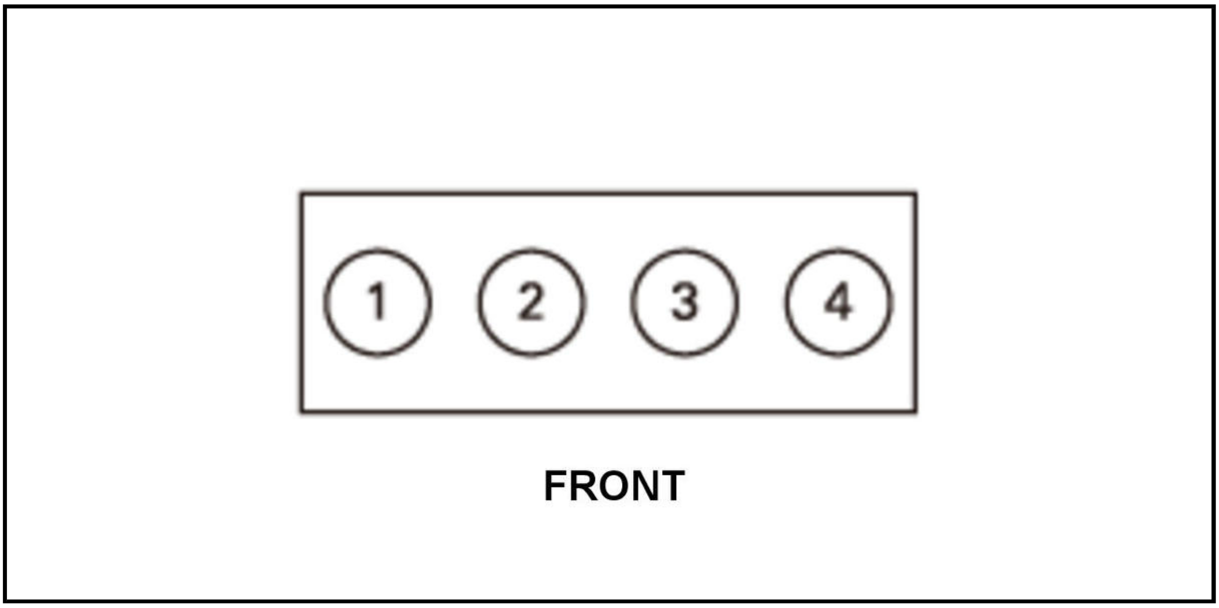
NO

The excessive MAP sensor fluctuation was caused by incorrect valve clearance.

72. Check Cylinder Compression

-1. **Perform a cylinder compression test** .

-2. Record your test results in a chart similar to the one shown below.



B	Compression (PSI)
No. 1	B
No. 2	B
No. 3	B
No. 4	B

Highest Reading (PSI)	Lowest Reading (PSI)	Variation (%)
B	B	B

Does the compression vary more than 10 % between cylinders, or does any cylinder read below 150 PSI?

1. **YES**

   The cylinder leakage is normal, but the engine compression is low. Check for each of the conditions below and repair as needed.

   - Incorrect camshaft timing.
   - A bent (short) connecting rod.
   - Worn or damaged camshaft lobes.

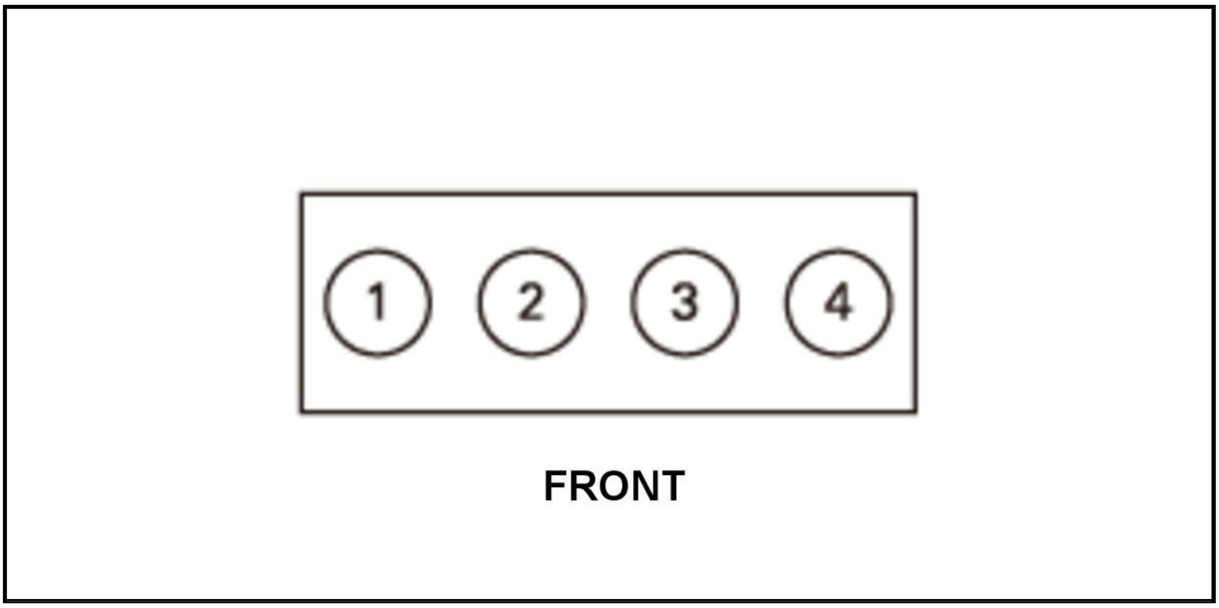
   NO

   The engine compression and the cylinder leakage are normal. Go to step 73.

73. Check Cylinder Leakage

-1. **Perform a cylinder leakage test** .

-2. Record your test results in the chart shown below.



B	Leakage (%)	Leakage Area
No. 1	B	B
No. 2	B	B
No. 3	B	B
No. 4	B	B

Does any cylinder have leakage greater than 10 %?

YES

If the majority of the air is escaping from exhaust pipe or throttle body, check for tight valve clearance and adjust each cylinder as needed, then retest. Determine the cause of the cylinder leakage and repair the engine as needed.

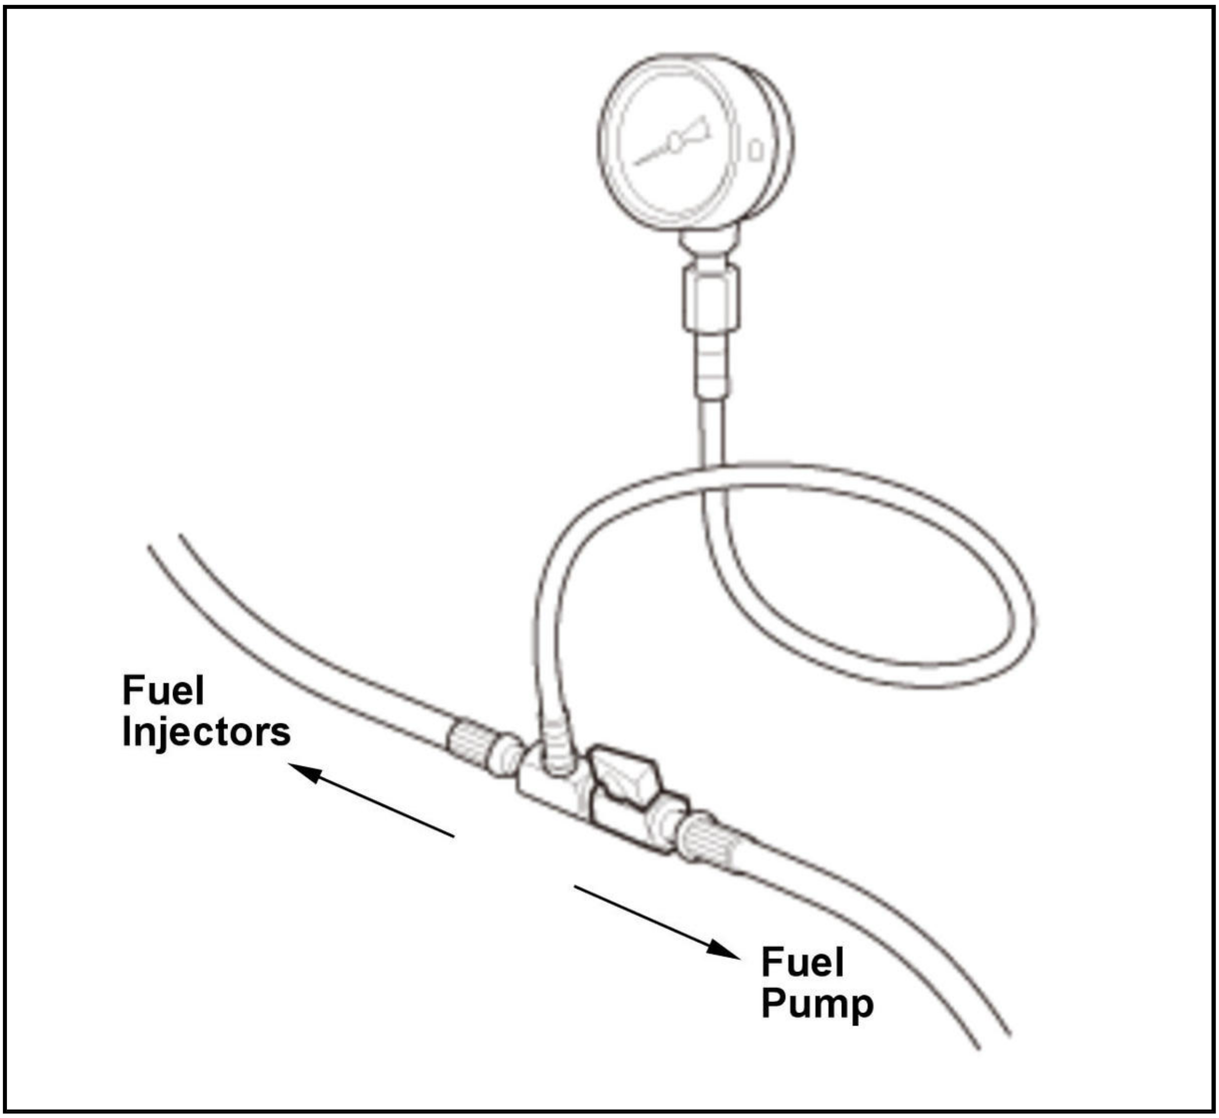
NO

The cylinders are sealing properly. Go to step 74.

74. Check Fuel Injector Leak Down

-1. **Connect the fuel pressure gauge set** .

-2. Ensure that the fuel shut off valve is on the fuel pump side of the pressure gauge.



-3. **Enter the maintenance mode, then start the engine** , and then shut it off.

-4. Turn the shut off valve 90 deg. to isolate the pressure between the fuel injectors and the fuel pressure gauge.

-5. Record the initial fuel pressure reading.

-6. Let the vehicle sit for 10 minutes.

-7. Check the fuel pressure.

Does the pressure drop more than 10 PSI within 10 minutes?

YES

The fuel injectors are leaking. **Replace thel fuel injector** .

NO

Go to step 75.

75. Inspect Spark Plug

-1. **Remove the spark plug from the problem cylinder** .

-2. Inspect the spark plug for signs of failure. Also make sure the spark plugs are the correct part number for the vehicle.

Does the spark plug show any signs of failure or is it not the correct part number?

YES

Replace the spark plug .

NO

Go to step 76.

76. Exchange Spark Plug and Ignition Coil

-1. **Exchange the spark plug and the ignition coil with ones from a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The ignition coil and the spark plug are OK. Go to step 78.

NO

There is a failure in the ignition coil or the spark plug. Go to step 77.

77. Exchange Ignition Coil

-1. **Exchange the ignition coil on the problem cylinder with a normally operating cylinder** .

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	Current conditions	
	Values	Unit
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay on the problem cylinder?

YES

The spark plug has a failure. **Replace the spark plug** .

NO

The ignition coil has a failure. **Replace the ignition coil** .

78. Engine Carbon Removal

-1. Perform a top engine cleaning following the product manufacturer's instructions.

-2. Drive the vehicle under the conditions when the misfire was duplicated.

-3. Monitor the misfire parameters in the DATA LIST.

Signal	**Current conditions**	
	Values	**Unit**
Cyl1 Misfire	B	B
Cyl2 Misfire	B	B
Cyl3 Misfire	B	B
Cyl4 Misfire	B	B

Did the misfire counts stay?

YES

The carbon removal procedure did not correct the misfire. **Replace the fuel injector** .

NO

The carbon removal procedure corrected the misfire.

DTC P0326

DTC P0326 : Knock Sensor Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	**Confirmed DTC**	**Pending DTC**
P0326 Knock Sensor Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. **Enter the maintenance mode, then start the engine** .

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Hold the engine speed at 1, 800 rpm or more without load (in P or N) for at least 5 seconds.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	**Confirmed DTC**	**Pending DTC**
P0326 Knock Sensor Malfunction	B	B

Is DTC P0326 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Knock sensor installation check

   -1. Check that the knock sensor is installed correctly.

   Is the knock sensor installed correctly?

   YES

   Installation is OK. **Replace the knock sensor** .

   NO

   Installation is not correct, reinstall the knock sensor.

DTC P0327

DTC P0327 : Knock Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0327 Knock Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0327 Knock Sensor Circuit Low Voltage	B	B

   Is DTC P0327 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the**

failure under the same conditions with the on-board snapshot.

2. Determine possible failure area (knock sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Knock sensor 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

Is DTC P0328 indicated?

YES

Replace the knock sensor .

NO

Go to step 3.

3. Shorted wire check (KS line to KSGND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

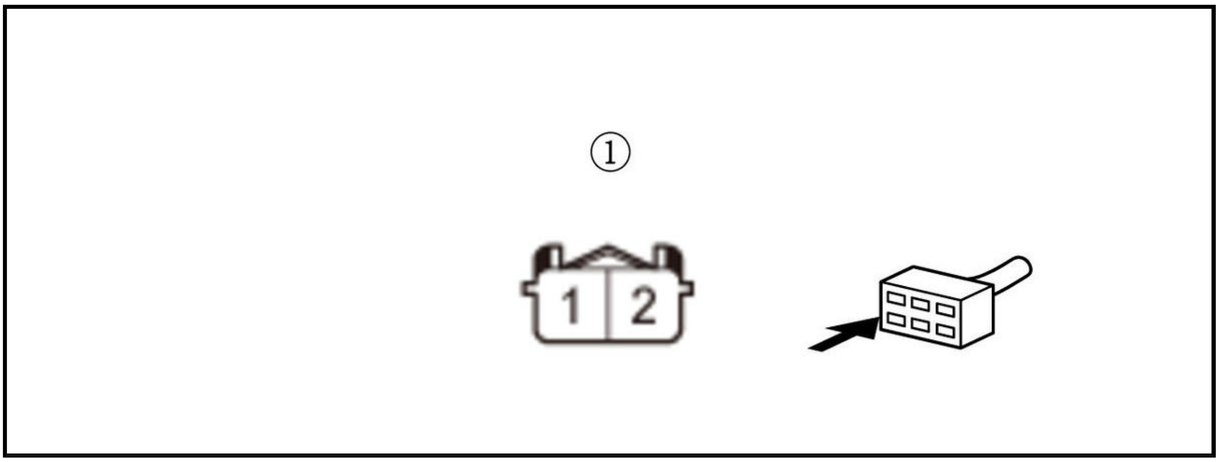
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Knock sensor 2P connector: disconnected
B	PCM connector E (80P) disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	Knock sensor 2P connector (female terminals) No. 2: ①



Is there 1 MΩ or more?

YES

Go to step 4.

NO

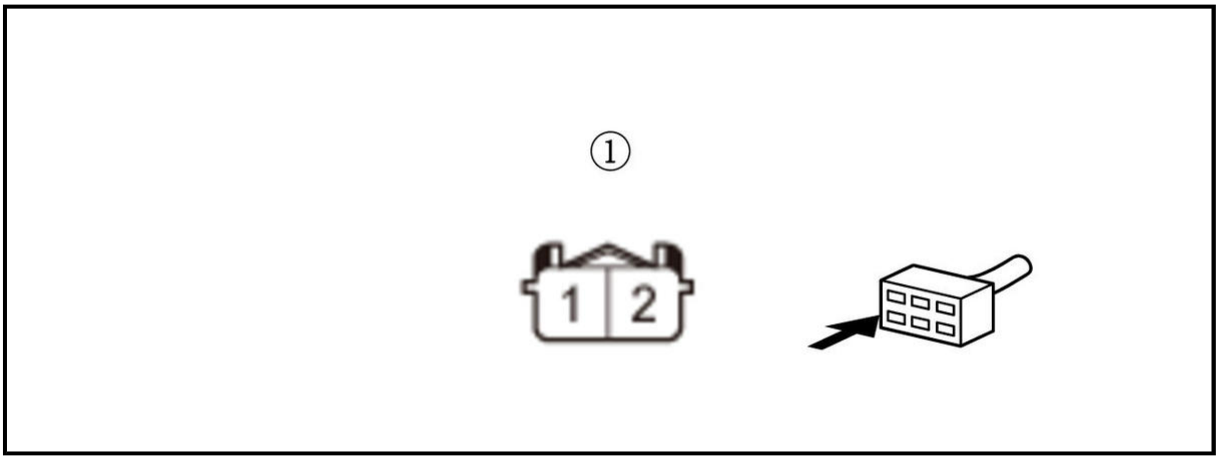
Repair a short in the KS wire to the KSGND wire between the PCM and the knock sensor.

4. Shorted wire check (KS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Knock sensor 2P connector: disconnected

B	PCM connector E (80P) disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The KS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the KS wire between the PCM (E35) and the knock sensor.

DTC P0328

DTC P0328 : Knock Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0328 Knock Sensor Circuit High Voltage	B	B

   Is DTC P0328 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot**.

2. Determine possible failure area (knock sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

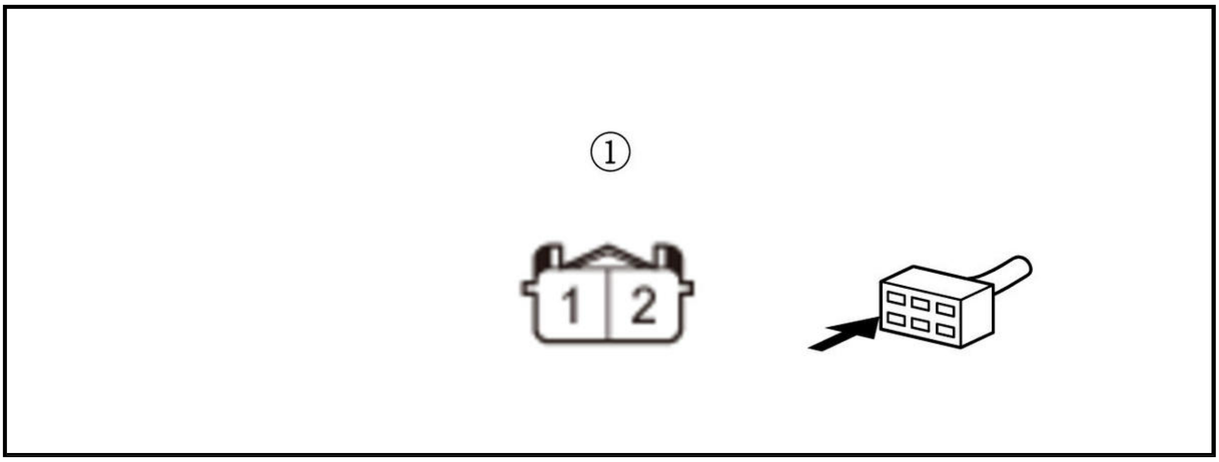
   -2. Disconnect the following connector.

Knock sensor 2P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	Knock sensor 2P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

[Replace the knock sensor](#) .

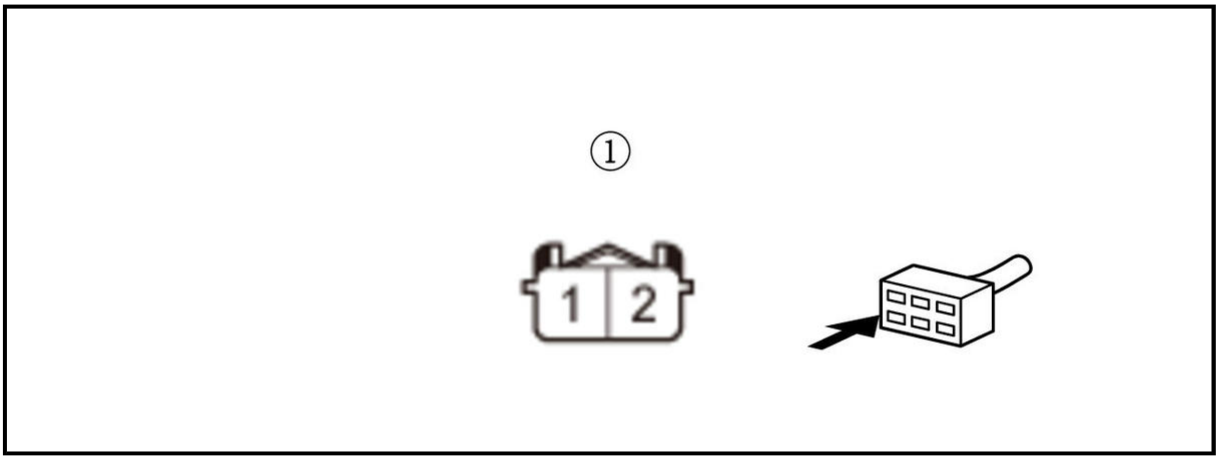
NO

Go to step 3.

3. Determine possible failure area (KS line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Knock sensor 2P connector: disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (KSGND line)

-1. Turn the vehicle to the OFF (LOCK) mode.
